	1. Disconnect the connectors (A) from the cable reel. 2. For some models: Disconnect the connector (B) from the cable reel. 3. Release the lock tabs (C), then remove the cable reel (D).

Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- Before installing the steering wheel, make sure the front wheels are aligned straight ahead.
- The new cable reel is locked by a yellow tab for center adjustment. When installing a new cable reel there is no need to rotate the cable reel. After installation of the cable reel, remove the tab and discard it.
- If the driver's airbag deployed, the cable reel cannot be reused because of thermal damage.

1. Cable Reel - Install

	1. Install the cable reel (A). 2. Connect the connectors (B) to the cable reel. 3. For some models: Connect the connector (C) to the cable reel.

2. Column Cover - Install
3. Cable Reel - Align

For some models  **For some models** 	1. Make sure the front wheels are pointing straight ahead. 2. Rotate the cable reel (A) clockwise until it stops. 3. Rotate the cable reel counterclockwise until the arrow mark (B) on the cable reel points straight up. 4. Rotate the cable reel counterclockwise two full turns. The arrow mark on the cable reel should point straight up.

4. Steering Wheel - Install
5. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

DRIVER'S AIRBAG REMOVAL AND INSTALLATION

Removal

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: If replacing the driver's airbag after deployment, **refer to Component Replacement/Inspection After Deployment** for a complete list of other parts that must also be replaced.

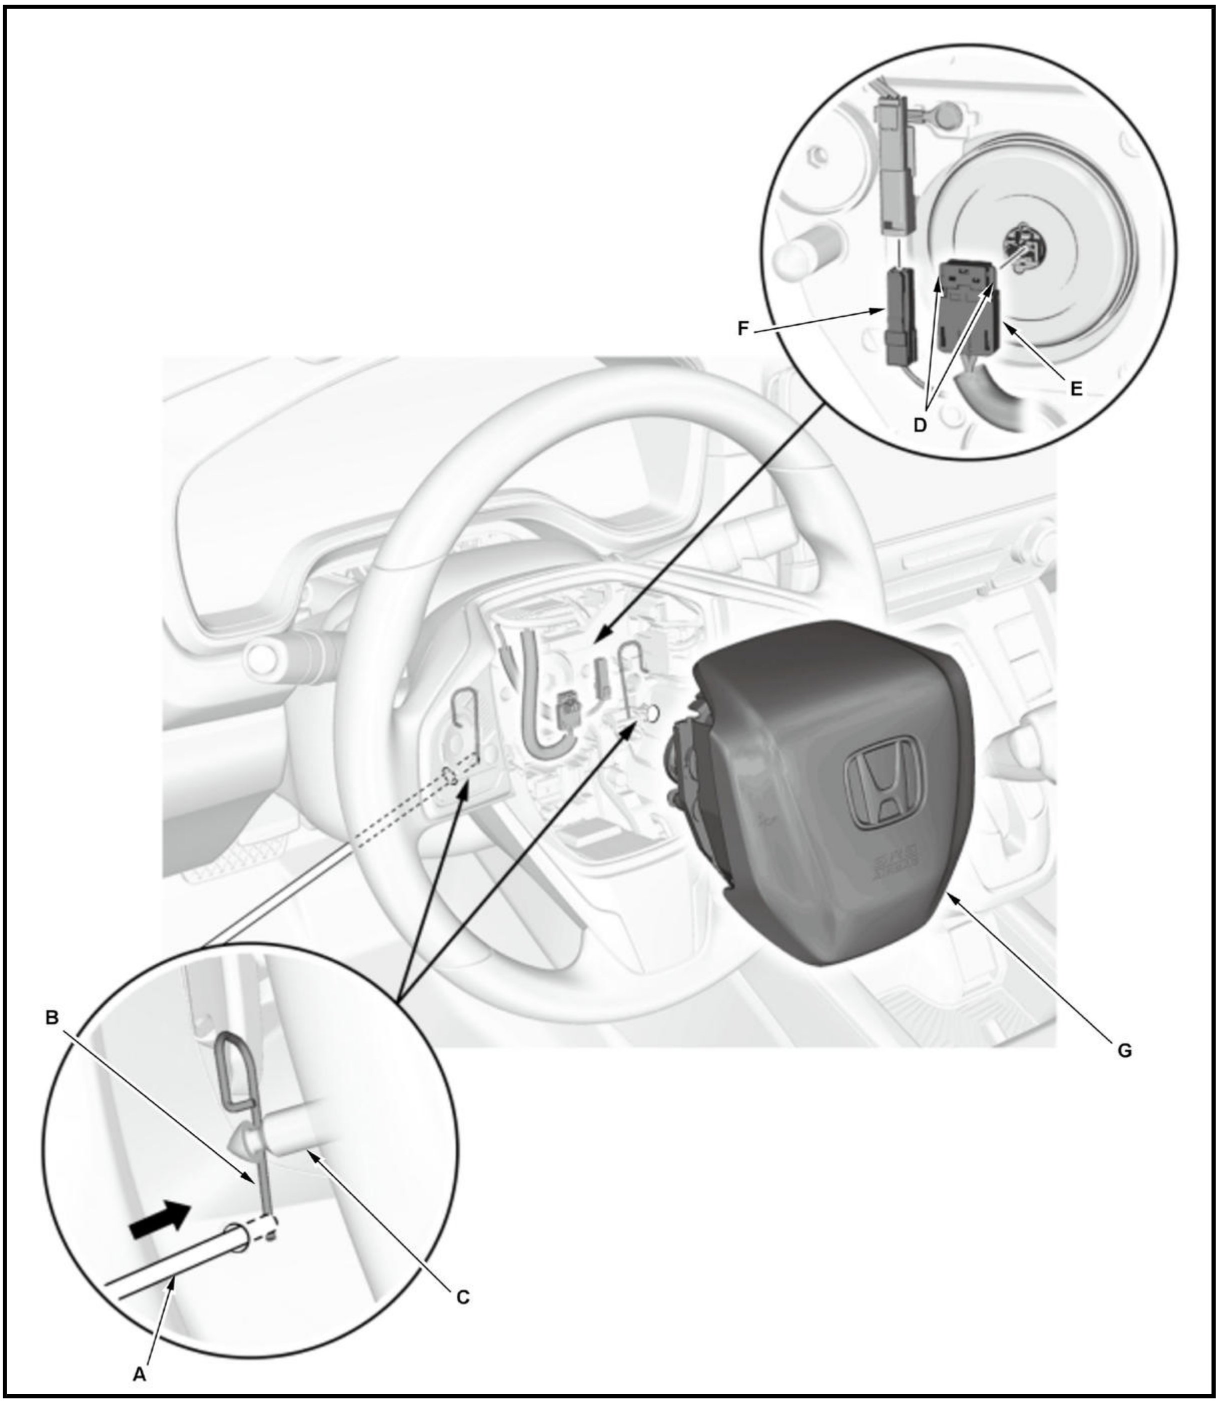
1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

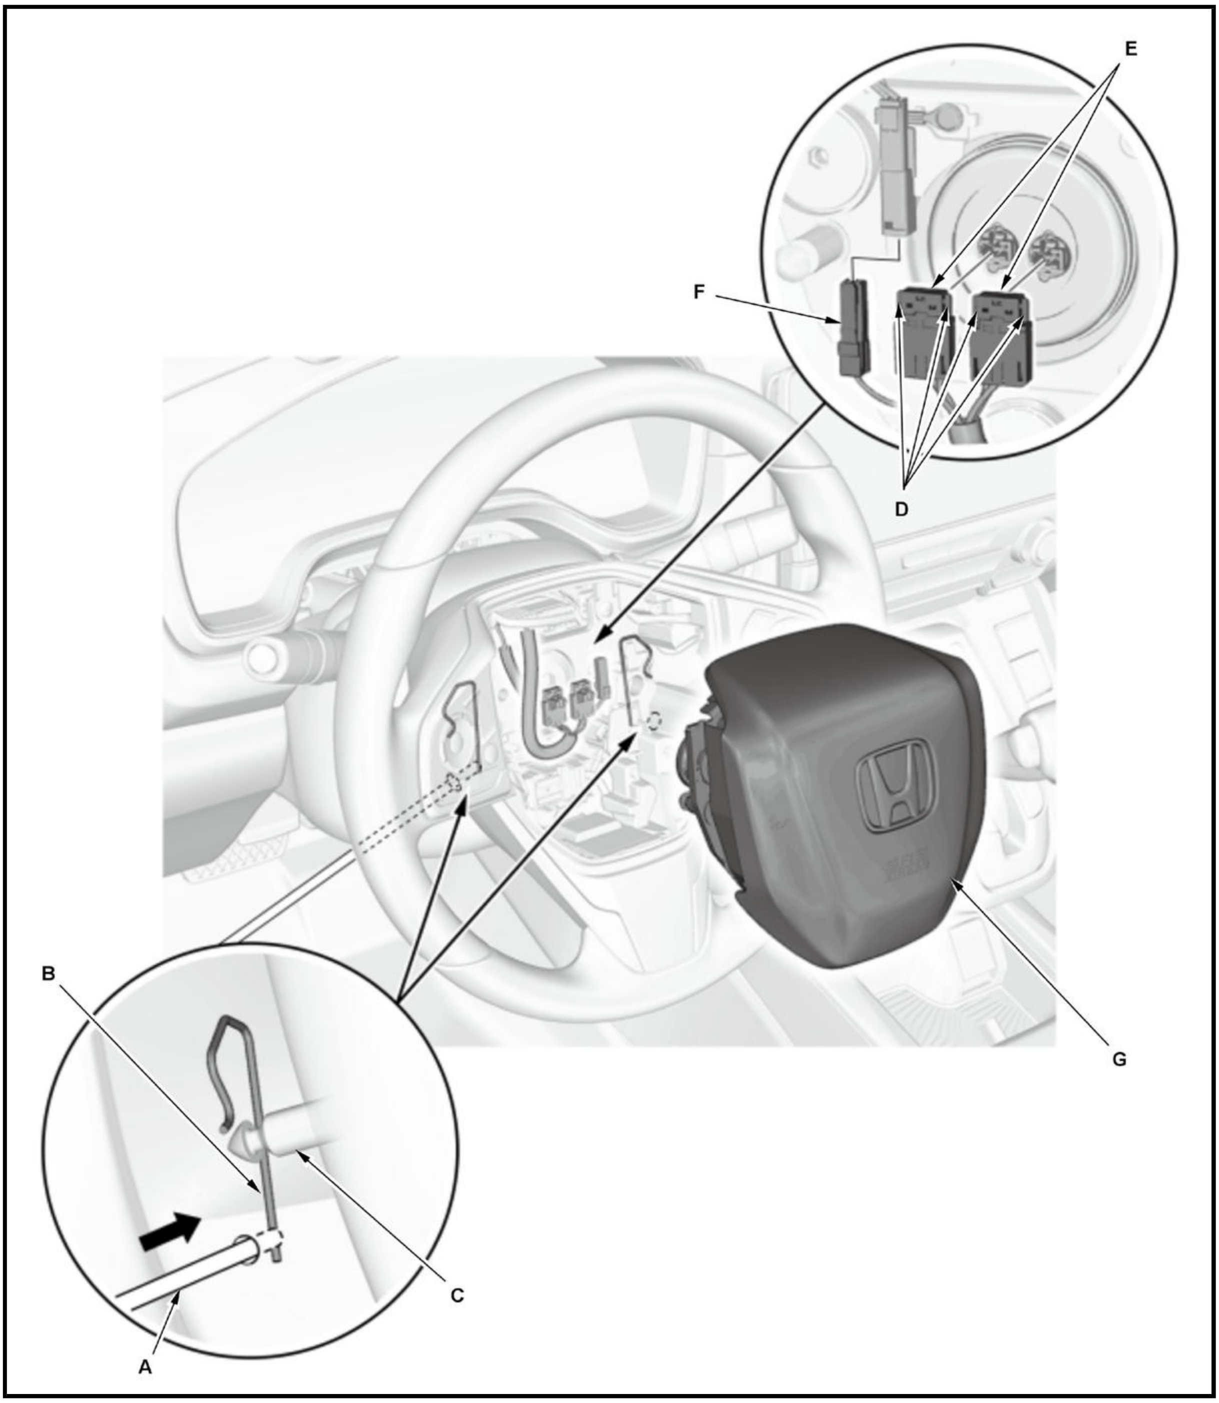
2. Driver's Airbag - Remove

   1. Insert a punch (A) (diameter of 5.5 mm) through the left hole of the steering wheel cover and push the spring (B) to release the front airbag pin (C) while pulling out the airbag. Repeat for the right side.

   Single Inflator Type



Dual Inflators Type



2. Pull up on both locking tabs (D) to disconnect the connector (E).

NOTE: Be careful not to damage the connectors.

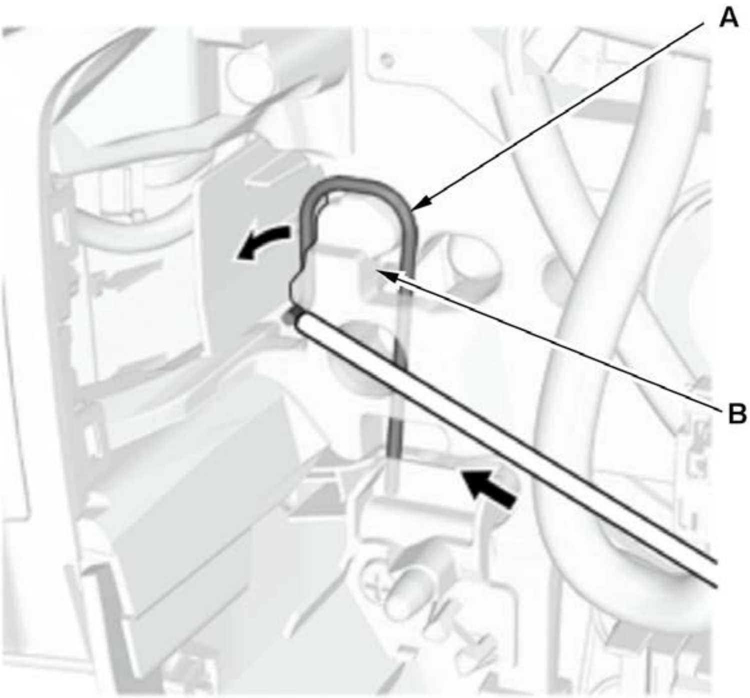
3. Disconnect the connector (F).

4. Remove the driver's airbag (G).

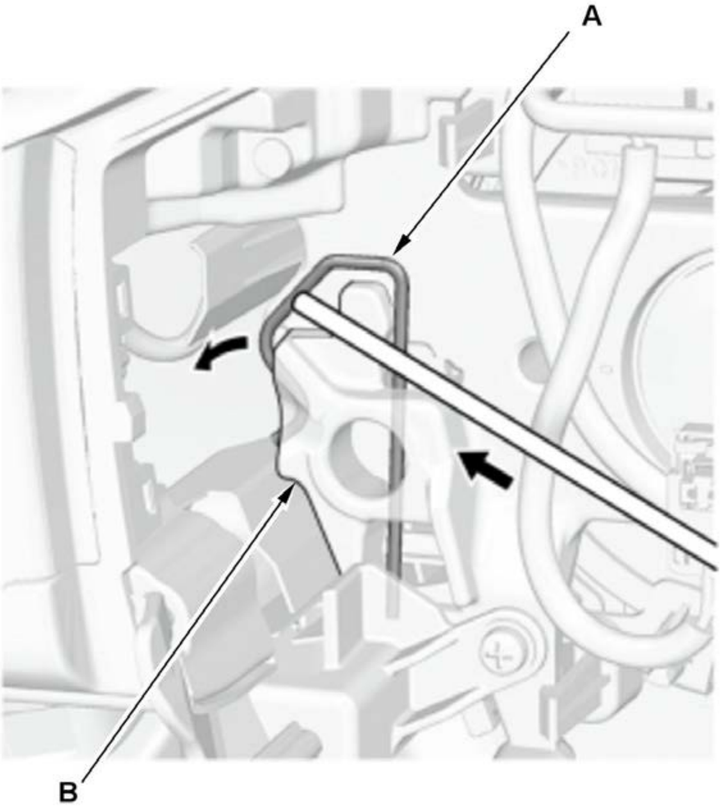
3. Spring - Removal (If necessary)

<table>
<tr>
<td>

Single Inflator Type



Dual Inflators Type



</td>
<td>1. Remove the springs (A) from the steering wheel (B).
NOTE: Be careful not to damage the steering wheel.</td>
</tr>
</table>

Installation

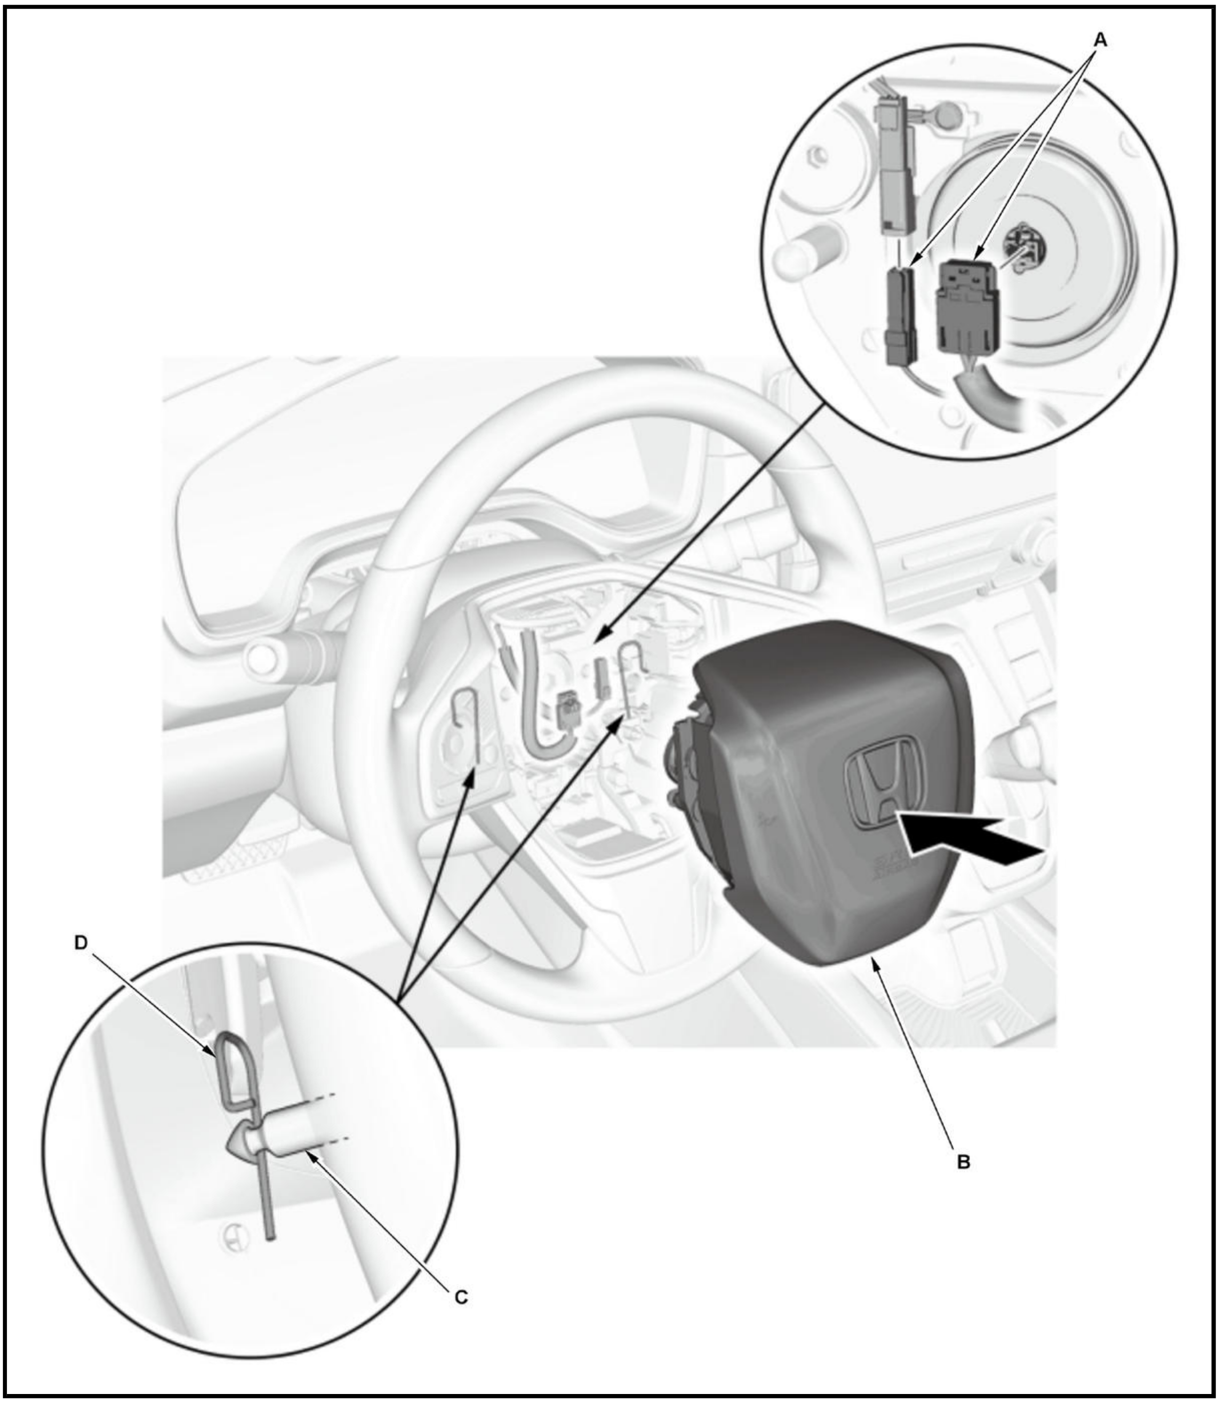
1. Spring - Install (If necessary)

Single Inflator Type  **Dual Inflators Type** 	1. Install the springs (A) to the steering wheel (B). **NOTE:** • The springs are different between the left and right side. Note the orientation during installation (single inflator type). • Make sure that the springs are installed properly.

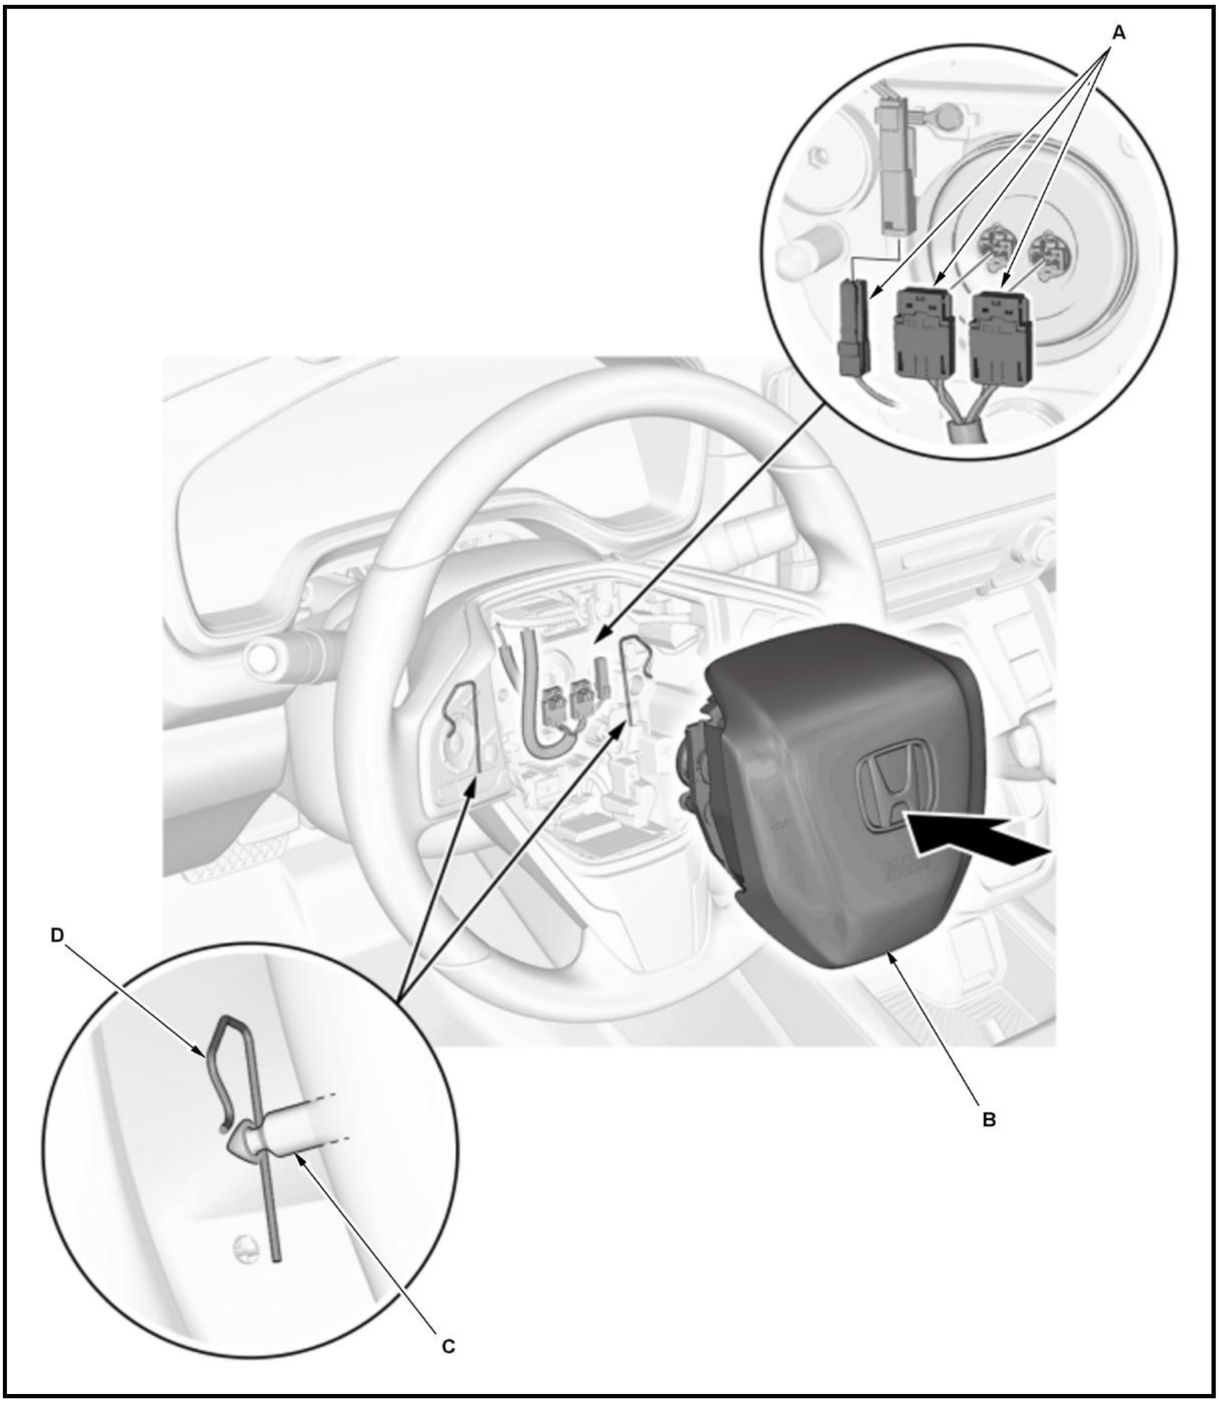
2. Driver's Airbag - Install

   1. Connect the connectors (A).

   Single Inflator Type



Dual Inflators Type



2. Install the driver's airbag (B) by pushing it in until you hear a click.

NOTE: Confirm that the front airbag pins (C) are securely mounted to the springs (D).

	3. Make sure the clearance (A) between the steering wheel and horn pad is the specified value. 4. After connecting the negative cable to the 12 volt battery, make sure the horn works properly.

3. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

DRIVER'S SEAT POSITION SENSOR REMOVAL AND INSTALLATION (KA/KC)

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- **How to read the torque specifications** .
- Do not turn the vehicle to the ON mode, while removing or installing the driver's seat position sensor.

1. **Front Seat - Remove**

   NOTE: Raise the driver's seat all the way up.

2. Driver's Seat Position Sensor - Remove

	1. Disconnect the connector (A). 2. Remove the nut (B), then remove the driver's seat position sensor (C).

3. All Removed Parts - Install

> 1. Install the all removed parts in the reverse order of removal.
> **NOTE:**
> - Be sure to install the harness so it is not pinched or interferes with other parts.
> - After replacing the driver's seat position sensor with a new one, **check the driver's seat position sensor operation** .

4. **Driver's Seat Position Sensor - Operation Check**
5. SRS Operation - Confirm

> 1. Turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

FRONT PASSENGER'S AIRBAG CUTOFF INDICATOR REMOVAL AND INSTALLATION(KA/KC)

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Climate Control panel / Front Passenger's Airbag Cutoff Indicator - Remove**
3. All Removed Parts - Install

> 1. Install the all removed parts in the reverse order of removal.

4. SRS Operation - Confirm

> 1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

FRONT PASSENGER'S AIRBAG REMOVAL AND INSTALLATION

Removal

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- **How to read the torque specifications** .
- If replacing the front passenger's airbag after deployment, **refer to Component Replacement/Inspection After Deployment** for a complete list of other parts that must also be replaced.

Removal Before the Front Passenger's Airbag Deployment

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Blower Unit - Remove**
3. Front Passenger's Airbag - Remove

	1. Disconnect the connector (A).

	2. Remove the mounting bolts (A). 3. Release the hooks (B) from the front passenger's airbag housing holes (C) of the dashboard. **NOTE:** • When prying with a flat-tip screwdriver, wrap it with protective tape to prevent damage. • Take care not to damage the front passenger's airbag housing holes of the dashboard. • Take care not to damage the front passenger's airbag. 4. Lower the front passenger's airbag and release the hooks of the engine room side, then remove the airbag from the dashboard.

Removal After the Front Passenger's Airbag Deployment

4. 12 Volt Battery Terminal - Disconnect

NOTE: Wait at least 3 minutes before starting work.

5. Glove Box - Remove
6. Front Passenger's Airbag Inflator Connector - Disconnect

	1. Disconnect the connector (A).

7. **Front Passenger's Airbag/Dashboard - Remove**

Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: **How to read the torque specifications** .

Installation Before the Front Passenger's Airbag Deployment

1. Front Passenger's Airbag - Install

 C 23 (2.3, 17) ☒ B A D 4.4 (0.45, 3.2) ☒	1. Insert the hooks (A) into the front passenger's airbag housing holes (B). **NOTE:** - Make sure there are no objects between the airbag and the dashboard. - Make sure the airbag is fully seated, and make sure the dashboard is not deformed or damaged after the airbag is in place. - Make sure the hooks are set properly. 2. Tighten the new mounting bolts (C, D).

	3. Connect the connector (A).

2. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

3. Blower Unit - Install

Installation After the Front Passenger's Airbag Deployment

4. Front Passenger's Airbag - Install

	1. Insert the hooks (A) of the front passenger's airbag into the housing holes (B). **NOTE:** - Make sure there are no objects between the airbag and the dashboard. - Make sure the airbag is fully seated, and make sure the dashboard is not deformed or damaged after the airbag is in place. - Make sure the hooks are set properly. 2. Tighten the new bolts (C).

5. **Front Passenger's Airbag/Dashboard - Install**
6. Front Passenger's Airbag Inflator Connector - Connect

	1. Connect the connector (A).

7. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

8. **Glove Box - Install**

FRONT PASSENGER'S WEIGHT SENSOR REMOVAL AND INSTALLATION(KA/KC)

Removal

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- **Removal of the front passenger's weight sensors must be done according to Precautions and Procedures** .
- Manual seat: The front passenger's weight sensor is part of the seat frame and must be replaced as an assembly.
- Power seat: The front passenger's weight sensor is part of the seat rail and must be replaced as an assembly.

Manual Seat

1. **12 Volt Battery Terminal - Disconnect**

NOTE: Wait at least 3 minutes before starting work.

2. **Front Seat Frame (Passenger's side) - Remove**
3. **Front Passenger's Seat Frame/Front Passenger's Weight Sensors - Remove**

Power Seat

4. **12 Volt Battery Terminal - Disconnect**

NOTE: Wait at least 3 minutes before starting work.

5. **Front Seat Frame (Passenger's side) - Remove**
6. **Front Passenger's Seat Rail/Front Passenger's Weight Sensors - Remove**

Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- Be sure to install the harness wires so they are not pinched or interfering with other parts.
- Manual seat: The front passenger's weight sensor is part of the seat frame and must be replaced as an assembly.
- Power Seat: The front passenger's weight sensor is part of the seat rail and must be replaced as an assembly.

Manual Seat

1. **Front Passenger's Seat Frame/Front Passenger's Weight Sensors - Install**
2. **Front Seat Frame (Passenger's side) - Install**
3. **12 Volt Battery Terminal - Connect**
4. Seat Operation - Confirm

1. Move the front seat and the seat-back through their full ranges of movement, making sure the harness is not pinched or interfering with other parts.

5. **Front Passenger's Weight Sensor - Initialize**
6. **Front Passenger's Weight Sensor - Operation Check**
7. SRS Operation - Confirm

1. Turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

Power Seat

8. **Front Passenger's Seat Rail/Front Passenger's Weight Sensors - Install**
9. **Front Seat Frame (Passenger's side) - Install**
10. **12 Volt Battery Terminal - Connect**
11. Seat Operation - Confirm

1. Move the front seat and the seat-back through their full ranges of movement, making sure the harness is not pinched or interfering with other parts.

12. **Front Passenger's Weight Sensor - Initialize**
13. **Front Passenger's Weight Sensor - Operation Check**

14. SRS Operation - Confirm

1. Turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

IMPACT SENSOR REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: **How to read the torque specifications** .

Front Impact Sensor

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Front Bumper - Remove**
3. Front Impact Sensor - Remove

	1. Disconnect the connector (A). 2. Remove the bolts (B), then remove the front impact sensor (C). 3. Remove the bolt (D), then remove the bracket (E).

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.
NOTE:

- During installation, install the new bolt to the specified torque.
- Before installing the front inner fender, make sure the SRS indicator works normally.

5. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

Side Impact Sensor (First)

6. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

7. **B-pillar Lower Trim Cover - Remove**
8. Side Impact Sensor (First) - Remove

	1. Disconnect the connector (A). 2. Remove the bolt (B), then remove the side impact sensor (first) (C).

9. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

- During installation, install the new bolt to the specified torque.
- Before installing the B-pillar lower trim, make sure the SRS indicator works normally.

10. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

Side Impact Sensor (Second)

11. **12 Volt Battery Terminal - Disconnect**

    NOTE: Wait at least 3 minutes before starting work.

12. **Rear Side Trim Panel - Remove**
13. Side Impact Sensor (Second) - Remove

	1. Disconnect the connector (A). 2. Remove the bolt (B), then remove the side impact sensor (second) (C).

14. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

- During installation, install the new bolt to the specified torque.
- Before installing the rear side trim panel, make sure the SRS indicator works normally.

15. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

SRS UNIT REMOVAL AND INSTALLATION

Removal and Installation

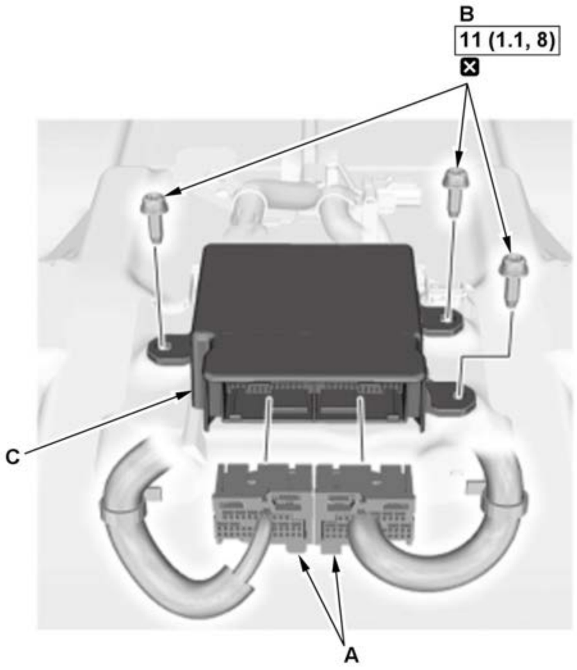
SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE: **How to read the torque specifications** .

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

2. **Center Console - Remove**
3. SRS Unit - Remove

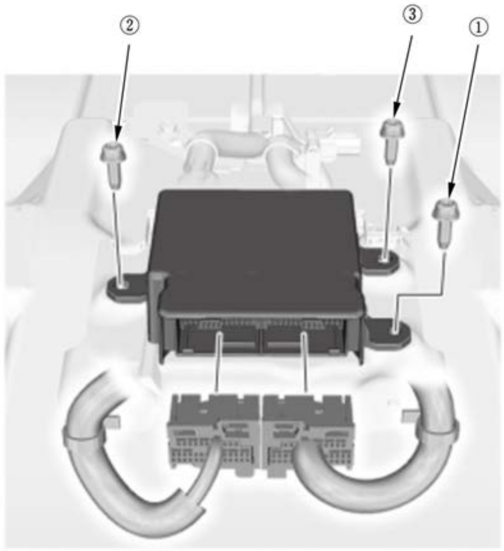


1. Disconnect the connectors (A).
NOTE: The SRS unit connectors have lever locks. **Release the locks before disconnecting the connectors**

2. Remove the bolts (B).

3. Remove the SRS unit (C).

4. All Removed Parts - Install



1. Install the parts in the reverse order of removal.
NOTE:

- During installation, install the new bolts to the specified torque.
- Before installing the center console, make sure the SRS indicator works normally.
- Make sure the SRS unit has the latest software. If it does not have the latest, **update the software in the SRS unit** .
- Tighten the bolts to specified torque in the numbered sequence shown.

5. **Yaw Rate-Acceleration Neutral Position - Memorize**

NOTE: After replacing the SRS unit with a new one, memorize the yaw rate-acceleration neutral position.

6. **Front Passenger's Weight Sensor - Initialize**

NOTE: After replacing the SRS unit with a new one, initialize the front passenger's weight sensors.

7. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

SIDE AIRBAG REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

NOTE:

- **How to read the torque specifications** .
- If replacing the side airbag after deployment, **refer to Component Replacement/Inspection After Deployment** for a complete list of other parts that must also be replaced.
- Before the front power seat is removed, slide the front power seat to the half-way position, then raise the seat to the highest position.
- When troubleshooting, do not remove the front seat. Disconnect only the side airbag inflator connector from under the front seat.

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

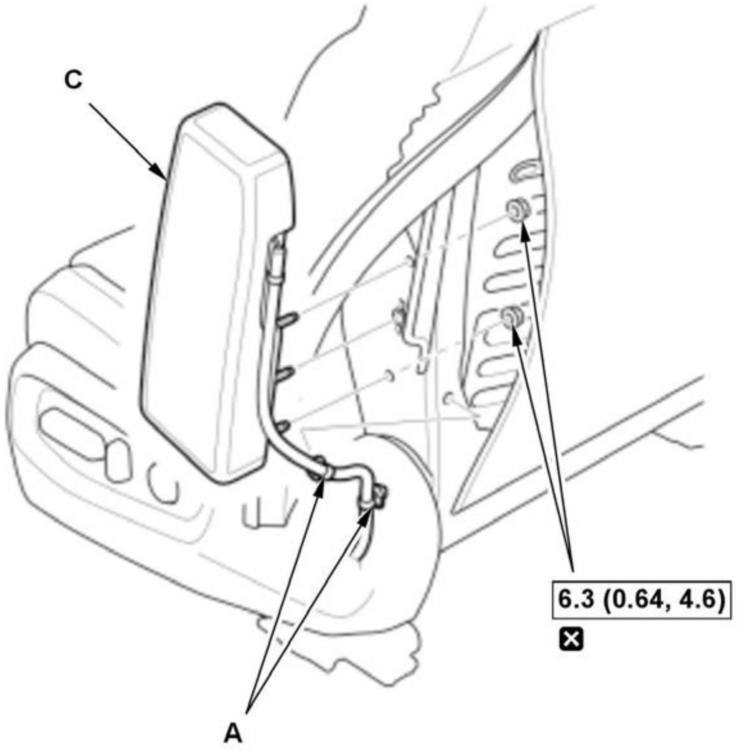
2. **Front Seat - Remove**
3. Front Seat-Back Cover/Pad - Remove

   1. **Remove the front seat-back cover/pad and harness clips as needed** .

4. Side Airbag - Remove

One Mounting Nut Type  **Two Mounting Nuts Type**	1. Release the harness clips (A). 2. Remove the mounting nut (B), then remove the side airbag (C).



5. All Removed Parts - Install

1. Install the all removed parts in the reverse order of removal.

NOTE:

- During installation, install the new mounting nut to the specified torque.
- If the side airbag cover is secured with tape, remove the tape.
- Do not open the lid on the side airbag cover.
- Make sure that the seat-back cover/pad is installed properly. Improper installation may prevent proper deployment.
- Be sure to install the harness so that they are not pinched or interfering with other parts.

6. Seat Operation - Confirm

1. Move the front seat and the seat-back through their full ranges of movement, making sure the harness are not pinched or interfering with other parts.

7. SRS Operation - Confirm

1. Turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

SIDE CURTAIN AIRBAG REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

NOTE:

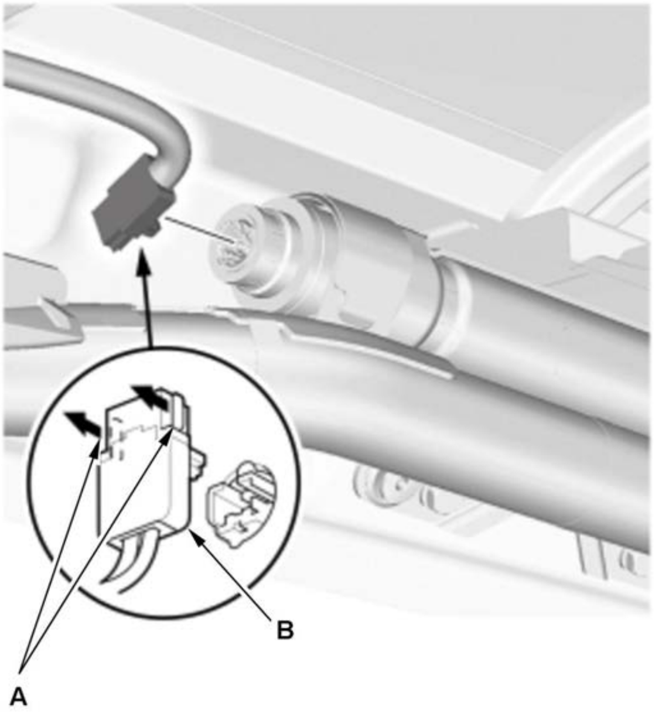
- How to read the torque specifications .

- If replacing the side curtain airbag after deployment, **refer to Component Replacement/Inspection After Deployment** for a complete list of other parts that must also be replaced.
- **Review the interior trim replacement procedure before doing repair or service** .

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes before starting work.

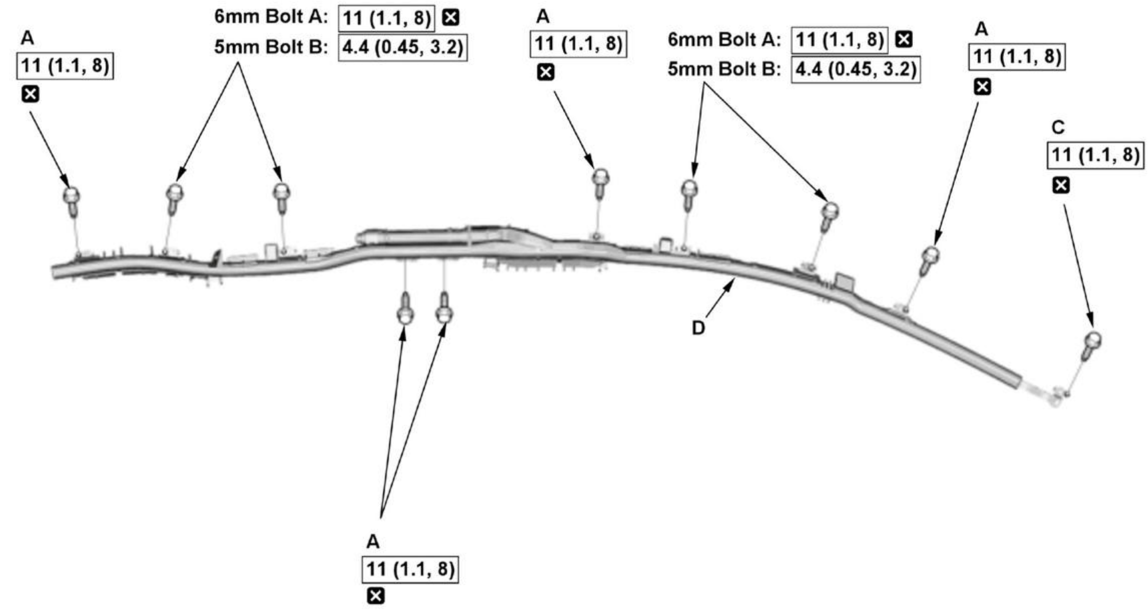
2. **Headliner - Remove**
3. Side Curtain Airbag - Remove



1. Pull up on both locking tabs (A) to disconnect the connector (B).
NOTE: Be careful not to damage the connector.

2. Remove the bolts (A, B).

NOTE: Depending on the model, the side curtain airbag mounting bolts are either a 5mm or 6mm bolt.



A
11 (1.1, 8)
☒
6mm Bolt A: 11 (1.1, 8) ☒
5mm Bolt B: 4.4 (0.45, 3.2)

11 (1.1, 8)
☒

3. For some models: Remove the bolt (C).

4. Remove the side curtain airbag (D).

4. All Removed Parts - Install

1. Install all of the removed parts in reverse order.
NOTE:

- During installation, install the new side curtain airbag mounting bolts to the specified torque.
- If the side curtain airbag is frayed, or has any other visible damage, replace it. Do not attempt to repair an airbag.
- When you install the side curtain airbag, make sure it is not twisted, and that it is not caught between the inflator bracket by the bracket bolts.
- Make sure that the side curtain airbag inflator retainer is installed properly. Otherwise the side curtain airbag could incorrectly deploy and cause damage or injuries.
- If there is any damage to the side curtain airbag, do not try to repair it. Replace any damaged side curtain airbag.
- Before installing the headliner, make sure the SRS indicator works normally.

5. SRS Operation - Confirm

1. Do the 12 volt battery terminal reconnection procedure, turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then goes off.

6. **Headliner/Pillar Trim Overlap - Confirm**

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

FRONT PASSENGER'S AIRBAG CUTOFF INDICATOR DOES NOT COME ON

Diagnostic procedure

- Check for DTCs. If any DTC is indicated, go to the DTC troubleshooting

Also check for

DTC B00D5-14 troubleshooting

FRONT PASSENGER'S AIRBAG CUTOFF INDICATOR FLASHES

Diagnostic procedure

- Check for DTCs. If any DTC is indicated, go to the DTC troubleshooting

Also check for

Front passenger's weight sensor initialization

FRONT SEAT BELT REMINDER INDICATOR DOES NOT COME ON, TURN OFF, OR FLASH

Diagnostic procedure

Also check for

-

SRS INDICATOR DOES NOT COME ON

Diagnostic procedure

- Symptom Troubleshooting

Also check for

-

SRS INDICATOR STAYS ON, BUT NO DTCS ARE STORED, OR CANNOT BE READ

Diagnostic procedure

NOTE: If any of the CAN communication failure DTC is indicated in other system, troubleshoot the DTC first.

- Check for open wire or shorted wire in the F-CAN circuit;
-
    - -

      Between the SRS unit and the CAN gateway (F-CAN C_H, F-CAN C_L)
    - -

Between the CAN gateway and the gauge control module (F-CAN D_H, F-CAN D_L)

- Check the SRS unit power circuit (IG1_SRS).
- Check the SRS unit ground circuit (GND).
- Do the gauge control module self-diagnostic function .

Also check for

- Check the deployed history.

Refer to the followings about the circuit troubleshooting;

- Gauge control module connector for inputs and outputs
- SRS unit connector for inputs and outputs
- SRS system circuit diagram
- Fuse to components index
- Ground to component index

DESCRIPTION & OPERATION

SRS SYSTEM DESCRIPTION

This vehicle is equipped with SRS components that includes driver's and front passenger's airbags, side airbags, side curtain airbags, seat belt outer lap tensioners, and seat belt tensioners.

Trouble Diagnosis Function

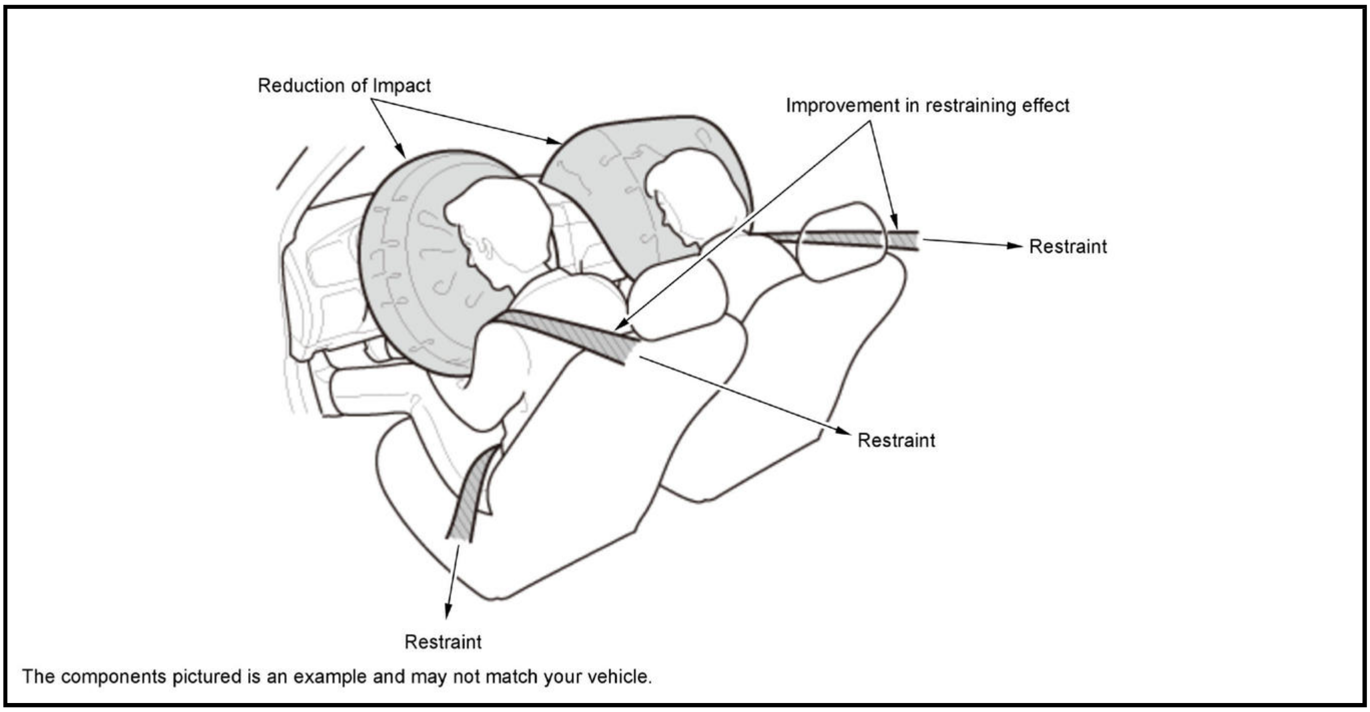
For troubleshooting information, refer to the General Troubleshooting Information .

Driver's and Front Passenger's Airbag

In case of a frontal collision, the vehicle has a function to mitigate the impact forces acting on the head and chest of the front seat occupant that is used in combination with a seat belt tensioner as a body restraint device in addition to the impact-absorbing construction of the body shell.

Seat Belt Tensioner and Seat Belt Outer Lap Tensioner

The seat belt tensioner and the seat belt outer lap tensioner instantaneously retracts the seat belt at the time of a collision, and the effect of the seat belt is increased further by securely restraining the occupant in the seat. In the case of a low-speed collision, since the seat belt can adequately secure the occupant, only the seat belt tensioner and the seat belt outer lap tensioner are activated to retract the seat belt without deploying the airbags. In the case of a medium to high speed collision, the airbags, seat belt tensioners, and seat belt outer lap tensioners are activated to improve the restraining effect of the occupant and safety performance.



Reduction of Impact
Improvement in restraining effect
Restraint
Restraint
Restraint

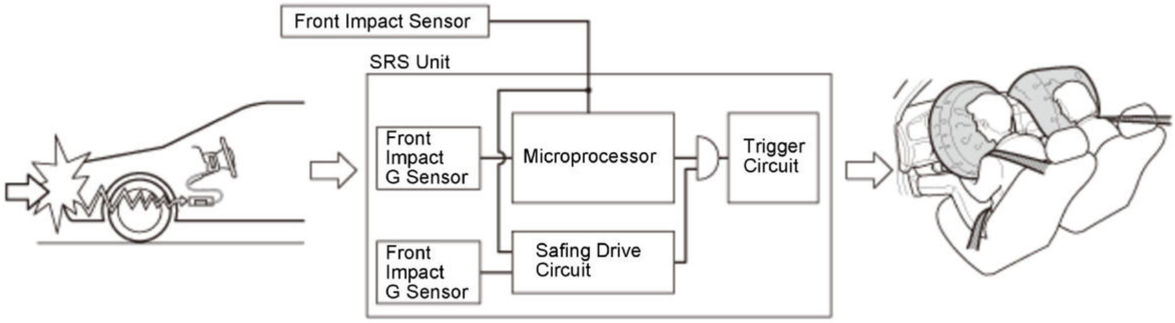
The components pictured is an example and may not match your vehicle.

Operating process of driver's/front passenger's airbag/tensioner deployment:

1. The impact force generated by a frontal collision is transmitted through the vehicle's structural components and input from each of the front impact sensors, front impact G sensors, and the safing drive circuit inside the SRS unit.

2. The front impact sensor converts the collision force into electrical signals, which are sent to the microprocessor and the safing drive circuit inside the SRS unit. At the same time, the front impact G sensors inside the SRS unit converts the collision force input into waveform electrical signals and sends them to the microprocessor and the safing drive circuit.

3. The microprocessor outputs actuation signals if the outputs from the front impact sensors and front impact G sensor exceed the preset threshold value. At this time, if the output from the safing drive circuit inside the SRS unit exceeds the preset threshold value, current flows through a trigger circuit, which deploys the SRS airbag and/or operates the seat belt tensioners and the seat belt outer lap tensioners.

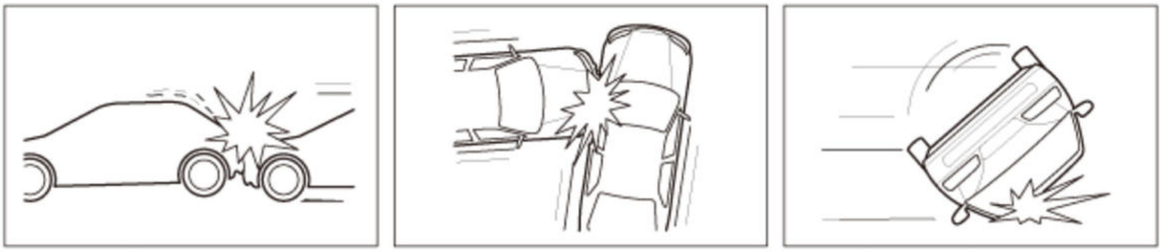


Front Impact Sensor
SRS Unit
Front Impact G Sensor
Microprocessor
Trigger Circuit
Front Impact G Sensor
Safing Drive Circuit

The components pictured is an example and may not match your vehicle.

SRS airbags do not deploy in the following cases:

The SRS airbags deploy when a strong impact comes from the left-front or right-front direction, within 30 degrees from the front face when the vehicle is in the ON mode. Therefore, in the following cases, the SRS airbags does not deploy because there is no effect on occupant protection but it may deploy depending on the state of the collision.



Rear impacts

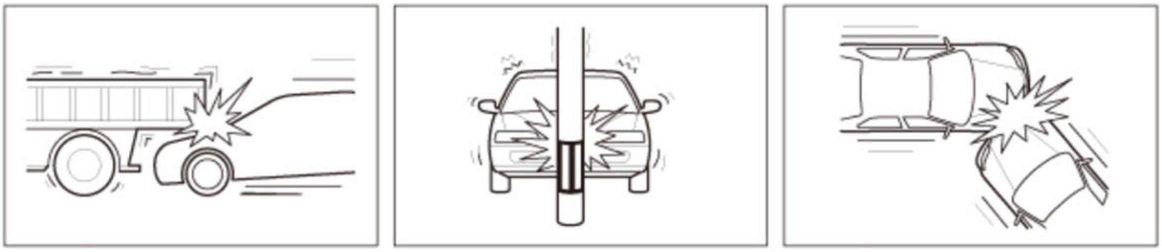
Side impacts

Rollover or Overturn

The components pictured is an example and may not match your vehicle.

SRS airbags may not deploy in the following cases:

The deployment of the SRS airbags are designed based on the scale of the impact felt by the occupant(s). Therefore, the deployment of the SRS airbags are not always related to the amount of damage to the vehicle.



Creeping under a truck

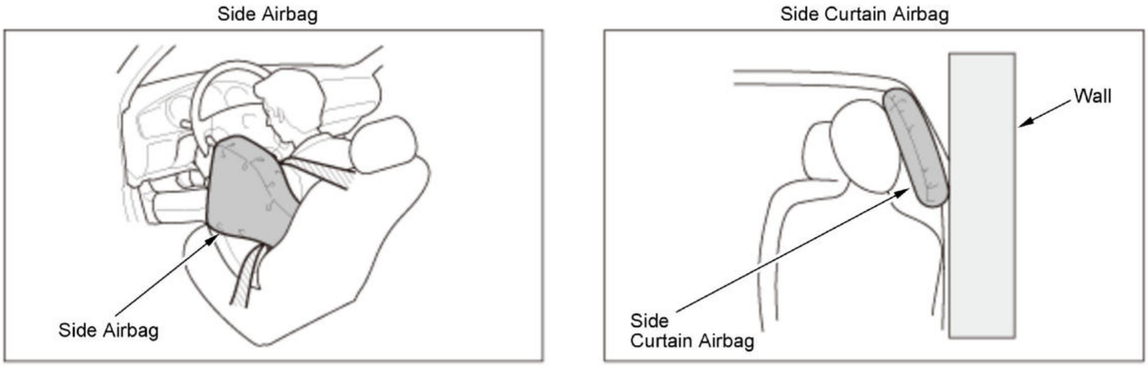
Colliding into a pole or tree

Partial collision or
oblique direction collision

The components pictured is an example and may not match your vehicle.

Side Airbag System and Side Curtain Airbag System

In case of a side impact, the side airbag, the side curtain airbag, and the seat belt tensioner on the side impacted operate in addition to the impact-absorbing body shell of the vehicle, which mitigates the impact forces acting on the head and chest of the occupant. Moreover, the side impact sensors detect the various states of collision so that the airbag deploys accordingly. The side airbag uses a variable volume type which it's construction and deployment process of the airbag pressure chamber have been improved and enable a safe deployment regardless of the position of the occupant. Due to this design, conventional parts related to OPDS* are not equipped.*: Occupant Position Detection System



The components pictured is an example and may not match your vehicle.

Side airbag and side curtain airbag deployment process:

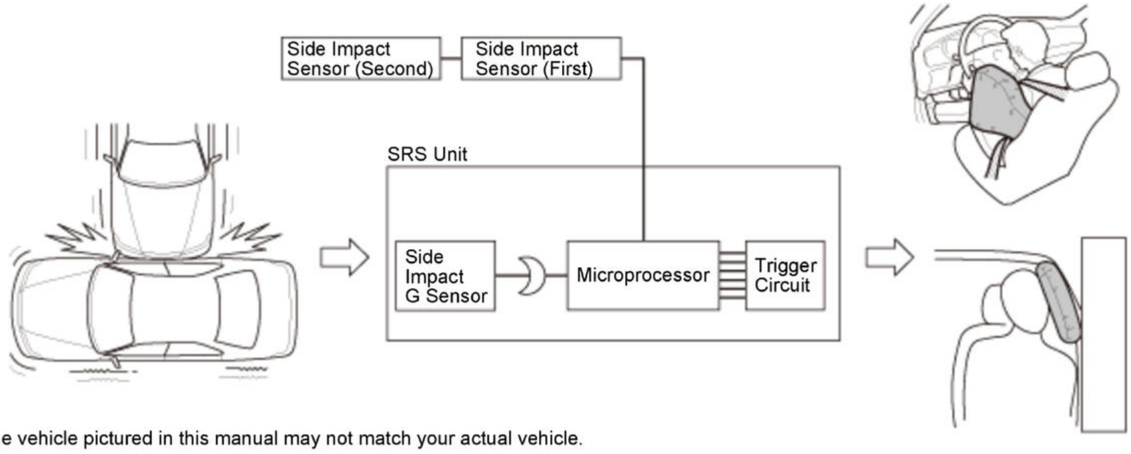
1. The collision force generated from the side impact is inputted to each of the side impact sensors and the side impact G sensor inside the SRS unit.

2. If the microprocessor inside the SRS unit determines that the side impact sensor(s) output exceeds a preset threshold value, and if the output from the side impact G sensor inside the SRS unit exceeds a preset threshold

value, the circuit creates an actuation signal.

3. The actuation signal is sent from the microprocessor to the trigger circuit, which deploys the side airbag, the side curtain airbag, and the seat belt tensioner.

NOTE: In cases of a strong frontal collision, the threshold value for a side impact is exceeded in the SRS unit, the side curtain airbag may deploy.

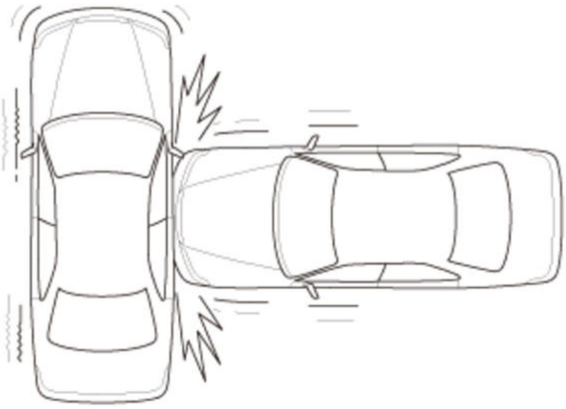


The vehicle pictured in this manual may not match your actual vehicle.

Side airbag and side curtain airbag deployment conditions:

When the vehicle is subject to a strong side impact and the side impact G sensor detects an impact that exceeds the preset threshold value, the side airbags and side curtain airbags on the side receiving the impact will deploy.

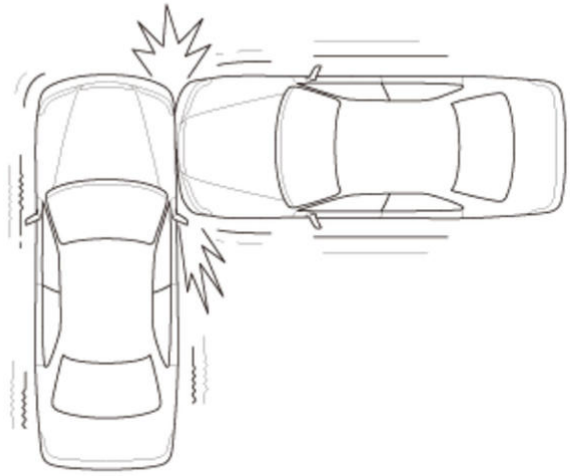
NOTE: The side curtain airbags may deploy along with the front airbags during a front-end collision in order to protect the heads of occupants if the collision force to the side of the vehicle exceeds a certain value.



The components pictured is an example and may not match your vehicle.

Conditions in which side airbag and side curtain airbag may not deploy:

Since the side airbags and the side curtain airbags are designed to deploy when an impact force to the vehicle side exceeds a preset value, they may not deploy when impact forces are reduced by the vehicle's crush zone, or when a side impact is applied in the front or behind the passenger compartment. Also, these airbags may deploy in the case of side slip collision or when the vehicle roll overs, but in such cases, will not provide full occupant protection.



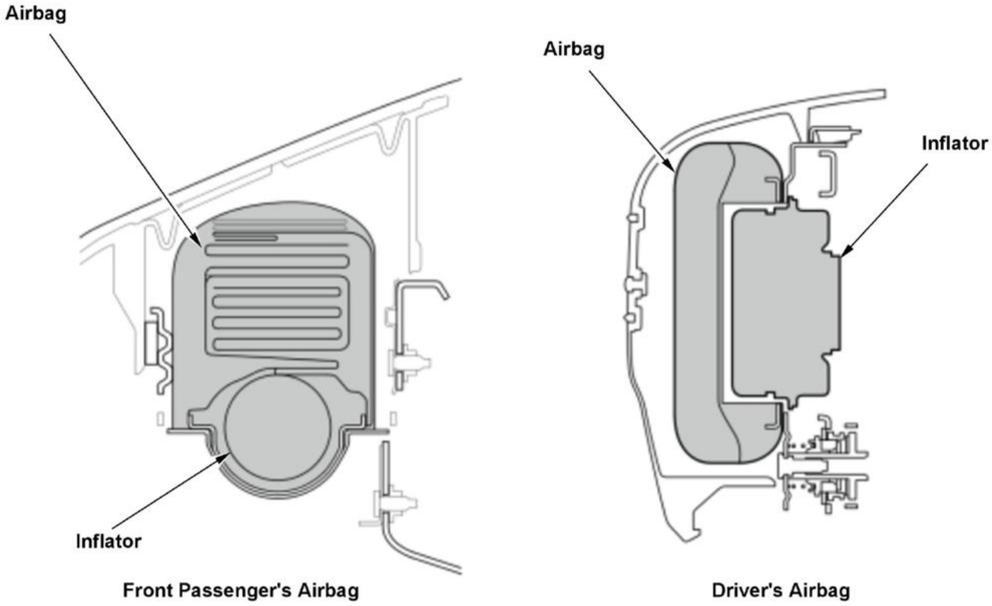
The components pictured is an example and may not match your vehicle.

SRS SYSTEM DESCRIPTION - COMPONENTS

Driver's and Front Passenger's Airbag

Airbag

The driver's airbag is located in the center of the steering wheel. The front passenger's airbag is located in the dashboard on the front passenger's side.



Airbag
Airbag
Inflator
Inflator
Front Passenger's Airbag
Driver's Airbag

The components pictured is an example and may not match your vehicle.

Dual Inflators

The airbag modules adopt dual inflators for the driver's and the front passenger's airbags. The dual inflators increase airbag effectiveness by properly adjusting the timing when the two inflators are to be ignited (together or sequentially) based on speed or impact.

Driver's Airbag (Continuous Capacity Change Type)

The driver's airbag is a spiral stitched, continuous capacity changing airbag with an exhaust air control valve to help lower the impact of the airbag while helping to protect the occupant effectively. The spiral stitched airbag inflates in a shorter time at the correct pressure with a small amount of air inside However, it does not compromise the ability to help protect the occupant.

Safety Vent

The front passenger's airbag (A) is equipped with safety vents (B). When airbag deployment occurs near the occupant, releasing gas from the safety vents reduces the possibility of injury to the occupant. When the airbag is fully deployed, the safety vents close and holds the internal pressure to ensure occupant restraint and protection performance.

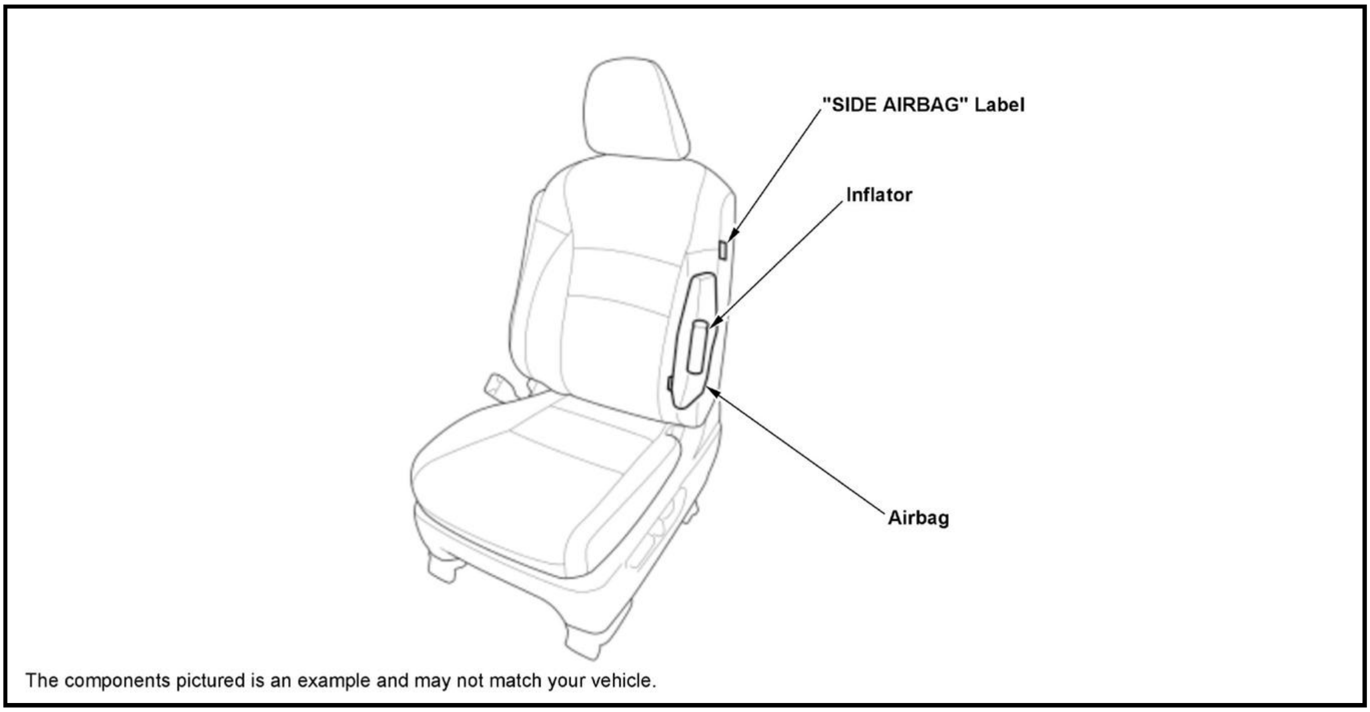
Deployment near the Occupant
Deployment Completion
The components pictured is an example and may not match your vehicle.

Side Airbag and Side Curtain Airbag

Side Airbag

The side airbags are located at the outside position of the seat-back of the driver's seat and the front passenger's seat. Being installed at the seat-back enables operation in optimal condition for the occupants regardless of the seat slide and recline position.

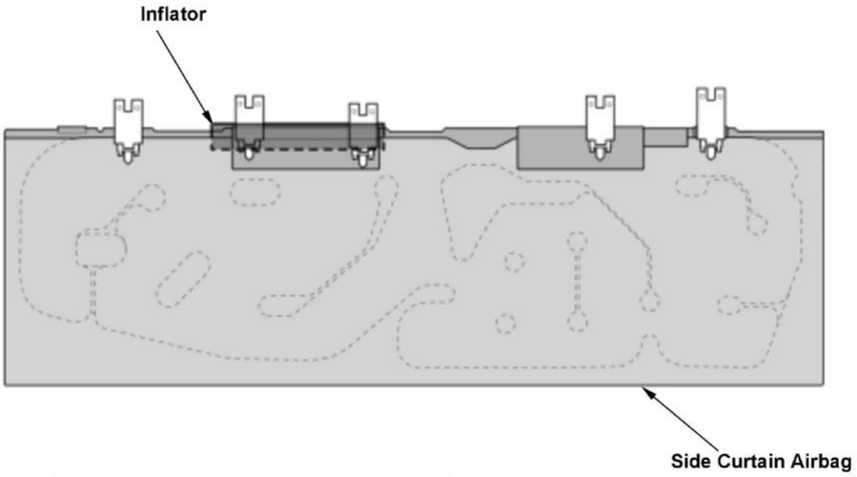
The side airbag assembly is configured with an inflator and an airbag. It is designed in a way that the airbag tears open the seam of the seat-back to enable efficient deployment. Objects adjacent to deployment or using a seat cover other than the one dedicated for the side airbag may prevent proper operation of the side airbag.



"SIDE AIRBAG" Label
Inflator
Airbag
The components pictured is an example and may not match your vehicle.

Side Curtain Airbag

A side curtain airbag inflates the full area of the window to protect the occupant's head from hitting the window or frame pillar in a side-impact collision. The side curtain airbags are located under the roof side panels. The side curtain airbags are deployed by triggering a gas inflator located near the B-pillar. Objects adjacent to deployment or attaching parts other than the ones dedicated for side curtain airbags may prevent proper operation of the side curtain airbags.



The components pictured is an example and may not match your vehicle.

Impact Sensor

The G-force sensor within the impact sensor detects the force upon a collision. If the impact exceeds a preset threshold value, it is converted into an electrical signal that is sent to the SRS unit.

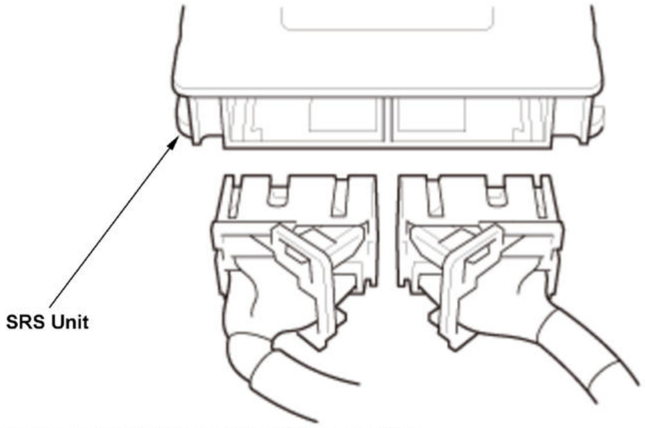
- Front impact sensor: The front impact sensors are installed at the right and left front side frame. They detect the frontal vehicle impacts.
- Side impact sensor: The first and second side impact sensors are installed at the right and left floor near the center pilllars. They detect the lateral vehicle impacts.

SRS Unit

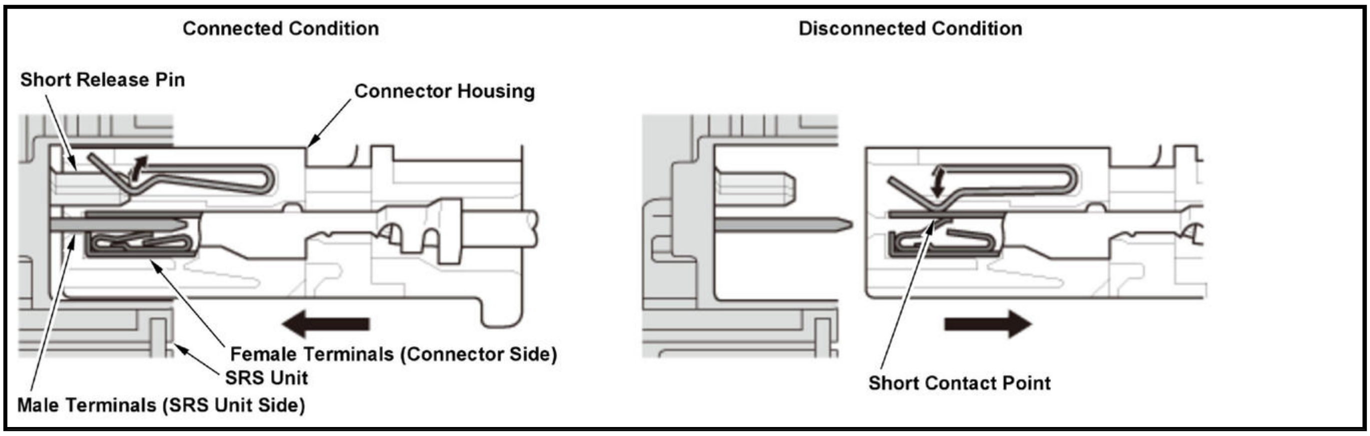
The SRS unit is located on the rear side of the center console. When airbags or tensioners are about to be deployed, a large amount of current passes through the SRS unit. After the airbags and tensioners are deployed, the internal components of the SRS unit are damaged and must be replaced.

Automatic Short-Circuit Mechanism of SRS Unit Connectors

When the SRS unit connectors are disconnected from the SRS unit, the automatic short-circuit mechanism in the connectors creates short-circuits to prevent accidental deployment of an airbag. This automatic short-circuit mechanism is configured in such a way that the respective deployment circuits (adjacent terminal) are short-circuited when the connector is disconnected.



The components pictured is an example and may not match your vehicle.



Connected Condition
Disconnected Condition
Short Release Pin
Connector Housing
Female Terminals (Connector Side)
SRS Unit
Male Terminals (SRS Unit Side)
Short Contact Point

Electrical Terminal Fit Detection System

The connectors connected to the SRS unit are equipped with a terminal that short-circuits the fit detection terminals with each other. If the connectors are properly connected, the fit detection terminals are short-circuited to each other and the SRS unit detects the fitting of the various connectors. When the vehicle is turned to the ON mode while a fitting is not detected, poor terminal fitting is judged and a DTC is stored.

Rollover Detection

A sensor integrated into the SRS unit performs rollover detection. The sensor detects the degree of vehicle roll and converts it to an electrical signal. If the SRS unit determines that a vehicle rollover is occurring, one or both side curtain airbags and seat belt tensioners will be deployed depending on the direction and number of rollover events.

Driver's Seat Position Sensor

The driver's seat position sensor is mounted to the driver's seat rail. When the driver's seat is moved to the full-forward position, a metal part of the seat track interrupts the sensor signal. This change in signal is then sent to the SRS unit for processing. If a frontal airbag deployment becomes necessary, the driver's airbag will deploy at the slowest rate, regardless of impact severity. With the seat moved further back, the SRS unit commands the appropriate deployment force based on impact severity.

The components pictured is an example and may not match your vehicle.

Front Passenger's Weight Sensor

Overview

The front passenger's weight sensors for load detection are equipped inside the front passenger's seat. The SRS unit receives the load information from the weight sensors via LIN communication and performs an occupant judgment of the front passenger's seat, and adjusts the front passenger's airbag deployment and performance. In addition, there are two types of weight sensors, a two sensor type and a four sensor type. The HDS can determine which type is used.

Operation

The weight of the front passenger's seat is detected by the weight sensors and sent to the SRS unit via LIN communication. If the weight is above a threshold level, front passenger's airbag operation is allowed, and if the weight is below a threshold level, the system will automatically turn the front passenger's airbag off. Also, the front passenger's airbag cutoff indicator turns on to inform the occupant that the front passenger's airbag will not deploy.

NOTE: The front passenger's weight sensors measure only the weight that's actually on the seat cushion. They do not measure the weight of the front passenger's legs extending to the floor or arms resting on the armrests. A front seat passenger who weighs near the airbag's cutoff threshold may cause the airbag and indicator to turn on and off just by moving around in the seat and shifting the occupant weight. This may cause some occupants to believe there's something wrong with the airbag system when it is operating normally. Also, although the measured weight of the two sensor type differs by the seating state of the occupant, load detection by the weight sensors is performed accurately.

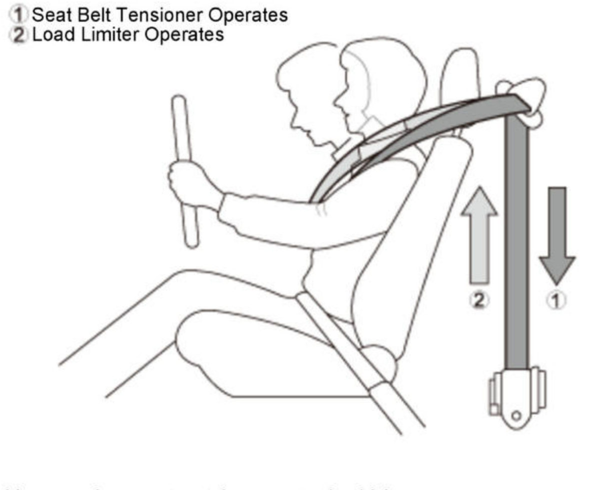
Seat Belt Tensioner

Overview

When the seat belt tensioner operates, it quickly tightens the seat belt, and improves the occupant's initial restraining effect (preventing the occupant's body from being moved forward). When the load exceeds the preset value, the load limiter keeps the restraining effect while sending out the seat belt to protect the chest of the passenger.



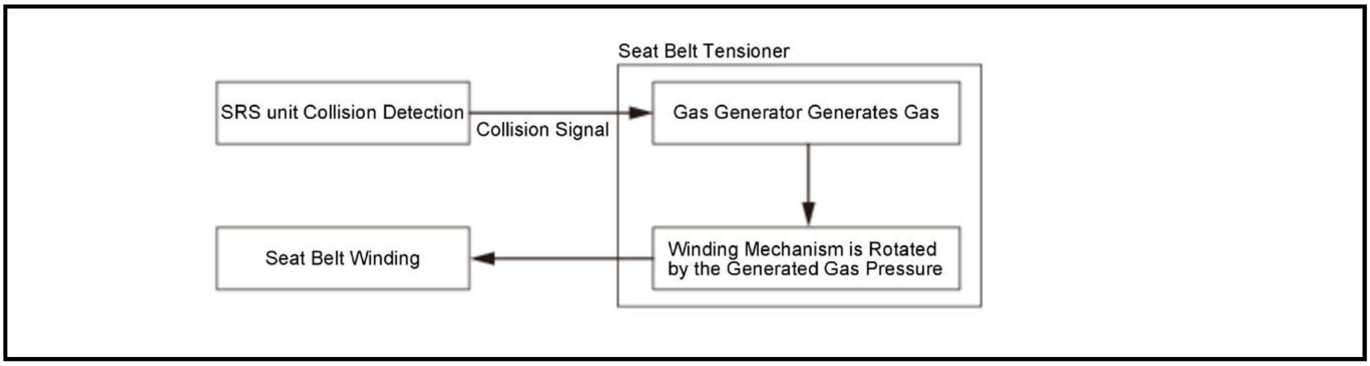
① Seat Belt Tensioner Operates
② Load Limiter Operates
②
①

The component pictured in this manual may not match your actual vehicle.

Operation of Seat Belt Tensioner

1. When the SRS unit detects a collision signal at the time of an impact acting upon the vehicle, it sends the actuation signal to the seat belt tensioner and the internal gas generator to generate gas.

2. The winding mechanism is rotated by the generated gas pressure and winds the seat belt.



Seat Belt Tensioner
SRS unit Collision Detection
Collision Signal
Gas Generator Generates Gas
Seat Belt Winding
Winding Mechanism is Rotated by the Generated Gas Pressure

Operation of Load Limiter

3. After the seat belt tensioner actuation, or if the seat belt is rapidly pulled out, the ELR lock mechanism of the seat belt retractor is activated and locks the seat belt.

4. When the load applied to the seat belt exceeds the specified load, the load limiter is actuated and releases a certain amount of the seat belt to reduce the extra load.

ELR (Emergency Locking Retractor) Lock Mechanism

If the seat belt is rapidly pulled out (occupant sliding forward during a collision), the ELR lock mechanism of the seat belt retractor is actuated and locks the seat belt to secure the occupant's body.

Seat Belt Outer Lap Tensioner

Overview

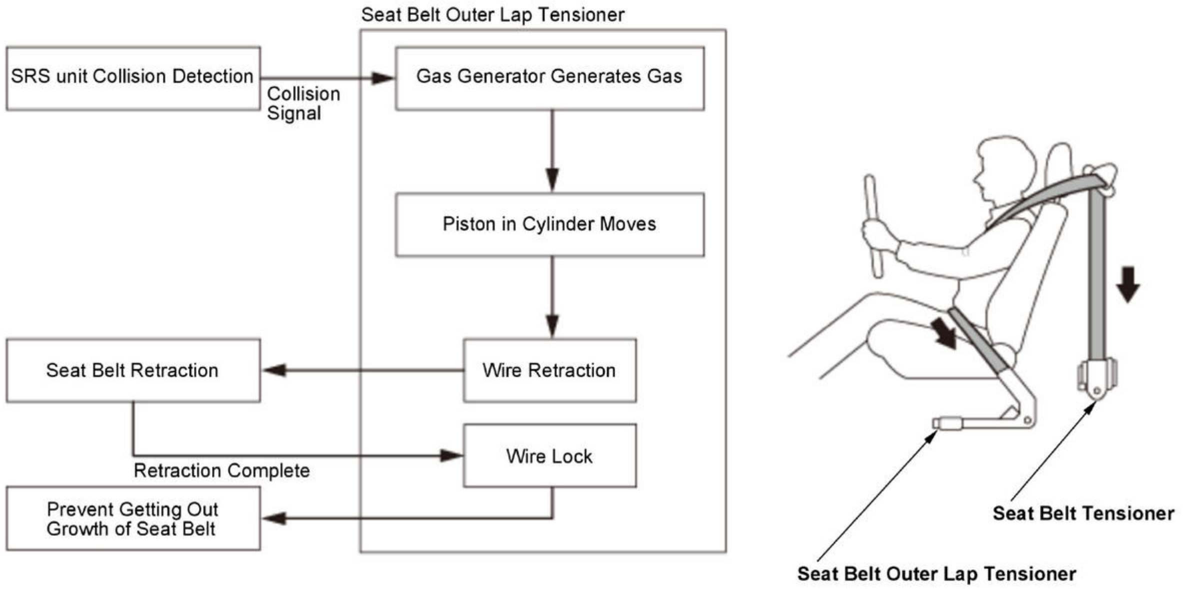
In the event of a collision, the seat belt outer lap tensioner coordinates with the seat belt tensioner and instantaneously retracts the seat belt. This ensures the seat belt's ability to restrain and protect the occupant at the chest and waist by firmly securing the occupant to the seat.

Operation

1. When the SRS unit detects a collision signal at the time of an impact, it sends an actuation signal to the seat belt outer lap tensioner, and the internal gas generator generates gas.

2. A piston in the cylinder moves by the generated gas pressure and pulls the wire and seat belt.

3. After the retraction is complete, the seat belt outer lap tensioner locks the wire to prevent growth of the seat belt by the forward movement of the occupant.



Seat Belt Outer Lap Tensioner

The components pictured is an example and may not match your vehicle.

Selectable Energy Absorption Device

When the seat belt tensioner operates, it instantly retracts the seat belt, enhancing its ability to immediately restrain the occupant. Also, a selectable energy absorption device is fitted within the front passenger's seat belt tensioner that reduces the burden on the occupant's chest while properly maintaining the restraining force of the seat belt. To ensure the seat belt's ability to protect the occupant, the seat belt adjusts to its optimum energy absorption characteristic for the occupant by using the occupant weight information which is detected by the front passenger's weight sensor.

SRS SYSTEM DESCRIPTION - SYSTEM DIAGRAM

System Diagram

- Power supply circuit (booster circuit, backup power supply): Provides and maintains power when battery voltage is low or in case of power supply damage due to a collision.
- Front impact G sensors and side impact G sensor: Detect impact to the SRS unit as acceleration and converts it to an electrical signal.
- Rollover judgment circuit: Predicts an impending rollover using signals such as the one from the G sensor located inside of the SRS unit. Based on the rollover judgment and the seat belt buckle switch status, the circuit determines whether the seat belt tensioners and the side curtain airbags should deploy or not.
- Microprocessor: An impact decision algorithm decides whether or not the collision signal warrants deployment of the airbags or the tensioners.
- Diagnostic circuit: Performs self-diagnosis to determine whether system abnormalities are present. If an abnormality is detected, the SRS indicator in the gauge control module turns on.
- Non-volatile memory: Records fault conditions. The SRS memories are not erased even if the 12 volt battery terminal is disconnected.
- Communication circuit: Circuit for outputting or deleting memory contents.
- The SRS unit receives the load information from the weight sensors, performs an occupant judgment of the front passenger's seat, and adjusts the front passenger's airbag deployment and performance.

For locations of each component on vehicle, **refer to Component Location Index**.

When airbags or tensioners are about to be deployed, a large amount of current passes through the SRS unit. After the airbags and tensioners are deployed, the internal components of the SRS unit are damaged and must be replaced.

GENERAL INFORMATION

HOW TO READ DEPLOYED HISTORY

How to Read Deployed History

NOTE: Due to the amount of electrical current that flows within the SRS unit to deploy airbags and tensioners, the SRS unit will be severely damaged and will require replacement. Therefore, the SRS unit retains a history that indicate which airbags and tensioners that deployed in a collision. Airbags and tensioners that deployed cannot be reused and must be replaced.

1. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

2. Connect the HDS to the data link connector (DLC).

In the SRS MENU of the HDS, select SRS, then select Data List.

NOTE:

- **A value of ON with a unit of RED indicates that the airbag(s) and or tensioner has deployed.**
- **A value of OFF with a unit of GREEN indicates that the airbag(s) or tensioner did not deploy.**
- **When any airbags or tensioners have deployed, go to Component Replacement/Inspection After Deployment.**

Signal	Value	Unit
Left Front Airbag, Left Front/Rear Seat Belt Tensioner and/or Left Knee Airbag Deployed	OFF	•
Right Front Airbag, Right Front/Rear Seat Belt Tensioner and/or Right Knee Airbag Deployed	OFF	•
Left Side Airbag, Left Side Curtain Airbag, and/or Left Front/Rear Seat Belt Tensioner Deployed	ON	o
Right Side Airbag, Right Side Curtain Airbag, and/or Right Front/Rear Seat Belt Tensioner Deployed	OFF	•

• : Green

o : Red

4. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

5. Disconnect the HDS.

SYMPTOM TROUBLESHOOTING INDEX

SRS SYMPTOM TROUBLESHOOTING INDEX

Symptom	Diagnostic procedure	Also check for
SRS indicator does not come on	Symptom Troubleshooting	-
SRS indicator stays on, but no DTCs are stored, or cannot be read	**NOTE:** If any of the CAN communication failure DTC is indicated in other system, troubleshoot the DTC first. • Check for open wire or shorted wire in the F-CAN circuit; • • - Between the SRS unit and the CAN gateway (F-CAN C_H, F-CAN C_L) • - Between the CAN gateway and the gauge control module (F-CAN D_H, F-CAN D_L) • Check the SRS unit power circuit (IG1_SRS).	• Check the deployed history. Refer to the followings about the circuit troubleshooting; • Gauge control module connector for inputs and outputs • SRS unit connector for inputs and outputs • SRS system circuit diagram • Fuse to components index • Ground to component index

Symptom	Diagnostic procedure	Also check for
	- Check the SRS unit ground circuit (GND). - Do the gauge control module self-diagnostic function .	
Front passenger's airbag cutoff indicator flashes	Check for DTCs. If any DTC is indicated, go to the DTC troubleshooting	Front passenger's weight sensor initialization
Front passenger's airbag cutoff indicator does not come on	Check for DTCs. If any DTC is indicated, go to the DTC troubleshooting	DTC B00D5-14 troubleshooting
Front seat belt reminder indicator does not come on, turn off, or flash	Symptom Troubleshooting	-

REWRITE

SRS UNIT UPDATE

Procedure

1. SRS Unit - Update
2. Yaw Rate-Acceleration Neutral Position - Memorize
3. Front Passenger's Weight Sensor - Initialize

INSPECTION REPLACEMENT

SRS COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT

Inspection

1. Component Replacement/Inspection After Deployment - Inspect

NOTE:

- **Before doing any SRS repairs after a collision, check the deployed history and check for DTCs with the HDS to determine the components that need replacement.**
- **Do not repair damaged SRS wiring, connectors or terminals. Replace the affected wiring harness(es).**
- **When replacing the front seat belt tensioner, check the seat belt mounting portion for deformation. If any deformation is found, repair it as needed.**

After a collision where the seat belt outer lap tensioner deployed, replace these items:

- SRS unit
- Front seat belt(s)
- Seat belt outer lap tensioner(s)
- Front impact sensor(s)

After a collision where the front airbag(s) deployed, replace these items:

- SRS unit
- Deployed front airbag(s)
- Front seat belt(s)
- Front impact sensor(s)

- Cable reel (deployed driver's airbag)
- Dashboard (deployed front passenger's airbag)
- **Springs**

After a collision where the side airbag deployed, replace the items for the side(s) that deployed:

- SRS unit
- Deployed side airbag(s)
- Front seat belt(s)
- Side impact sensor(s) (first)
- Side impact sensor(s) (second)
- B-pillar lower trim
- Seat frame and related parts

After a collision where the side curtain airbag deployed, replace the items for the side(s) that deployed:

- SRS unit
- Deployed side curtain airbag(s)
- Front seat belt(s)
- Side impact sensor(s) (first)
- Side impact sensor(s) (second)
- A-pillar trim
- B-pillar upper trim
- Quarter pillar trim
- Front grab handle
- Rear grab handle
- All related trim clips
- Sunvisor
- Headliner

After a moderate to severe side or rear collision, inspect for any damage on the side curtain airbag or other related components. **Replace the pillar trims and related clips as needed** .

During the repair process, inspect these areas:

- Inspect all the SRS wire harnesses. Replace, do not repair, any damaged harnesses, connectors or terminals.
- Inspect the cable reel for heat damage. If there is any damage, **replace the cable reel** .

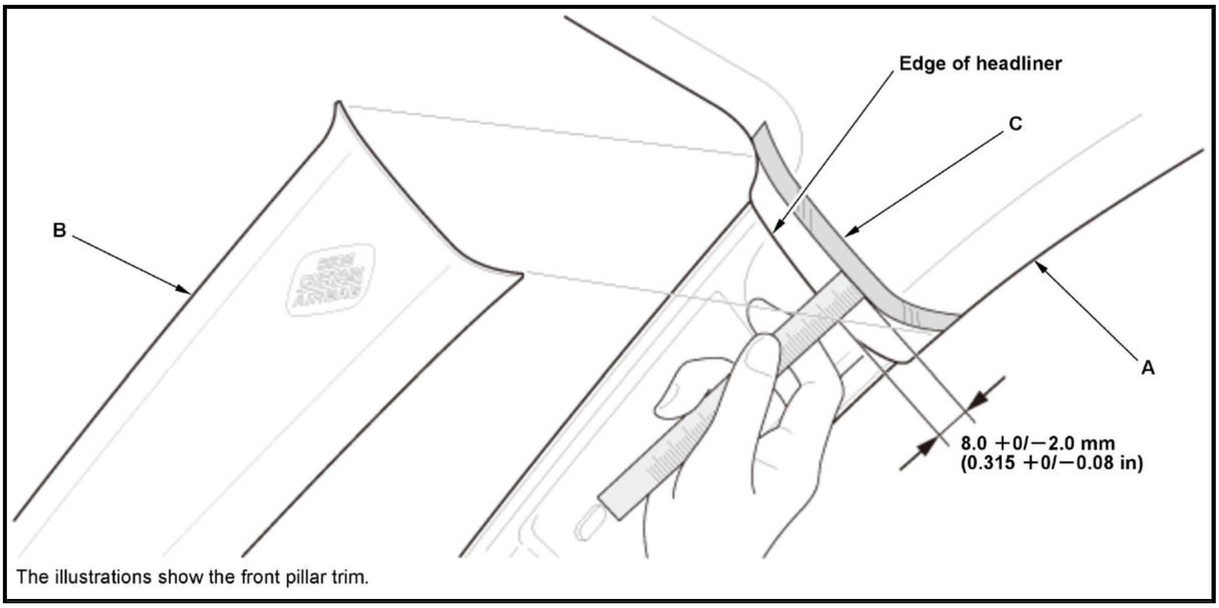
After the vehicle is completely repaired, turn the vehicle to the ON mode. If the SRS indicator comes on for about 6 seconds and then goes off, the SRS is OK. If the indicator does not function properly, use the HDS to **check for the DTCs** . If you cannot retrieve a code, do the SRS Symptom Troubleshooting.

2. Headliner/Pillar Trim Overlap - Check

Checking and Adjusting the Headliner/Pillar Trim Overlap

To prevent the side curtain airbag from deploying and damaging the pillar trim (A-pillar trim, B-pillar upper trim, and quarter pillar trim), the overlap between the headliner and pillar trim must be 8.0 +0/-2.0 mm (0.315 +0/-0.08 in). To check the overlap, do this:

1. Install the headliner (A) and the pillar trim (B).



The illustrations show the front pillar trim.

2. Apply masking tape (C) to the headliner to mark the upper edge of the pillar trim.

3. Remove the pillar trim, and measure the headliner overlap.

   - If the overlap is 8.0 +0/-2.0 mm (0.315 +0/-0.08 in), remove the tape, and install the pillar trim.
   - If the overlap is more than 8.0 mm (0.315 in), go to step 4.

4. Carefully trim the headliner with a utility knife, reducing the overlap to 8.0 +0/-2.0 mm (0.315 +0/-0.08 in).

5. Remove the tape, and install the pillar trim.

INITIALIZATION

FRONT PASSENGER'S WEIGHT SENSOR INITIALIZATION

Procedure

NOTE:

- When you replace or update the SRS unit, initialize the front passenger's weight sensor with the HDS.
- When you replace or remove the front passenger's weight sensor, the front passenger's seat frame, or the front passenger's seat rail, initialize the front passenger's weight sensor with the HDS.

1. HDS - Connect
2. Front Passenger's Weight Sensor - Initialize

   NOTE:

   - Before doing this procedure, clear the DTCs.
   - Before doing this procedure, make sure the 12 volt battery is fully charged.
   - Make sure the front passenger's seat and all components of the seat are correctly installed.
   - Make sure nothing is on the front passenger's seat, including aftermarket seat covers or mats.
   - Make sure there is nothing in the front passenger's seat-back pocket.
   - Make sure the vehicle is on level ground.
   - When you perform this procedure, the vehicle temperature must be between 41- 113 deg.F (5 - 45 deg.C).
   - When the vehicle is exposed to intense cold or intense heat, move the vehicle inside, open the windows and moonroof (if equipped) and perform this procedure after one hour or more.

- Do not expose the front passenger's seat to sudden temperature changes.
- Do not use the A/C and the heater.
- Do not touch the front passenger's seat and keep the vehicle stationary during this procedure.
- Do not attach the seat belt tongue into the buckle.
- If possible, do all of the above procedures inside.

1. Position the front passenger's seat all the way rearward and lowermost (if equipped with the height adjuster), then adjust the seat-back to the forward most position.

NOTE: Do not move the seat from this position until the initialization is completed.

2. From SRS of the System Selection Menu, select SRS/SWS, then Adjustment. In the Adjustment, select SWS Initialization. Follow the prompts until the front passenger's weight sensor initialization has been completed.

3. From SRS of the System Selection Menu, select SRS/SWS, then Data List. In the Data List, select FRONT PASSENGER'S WEIGHT. The weight (T0) of the front passenger's seat is displayed by the HDS. Write this measurement down as "T0" on a piece of paper.

- If the reading on the HDS (T0) is within +/-0.35 kg (+/-0.77 lbs), go to step 4.
- If the reading on the HDS (T0) is at or not within +/-0.35 kg (+/-0.77 lbs), do the following and repeat the procedure from step 1.
-
    - -

      Confirm that the seat has no interference with surrounding components.
    - -

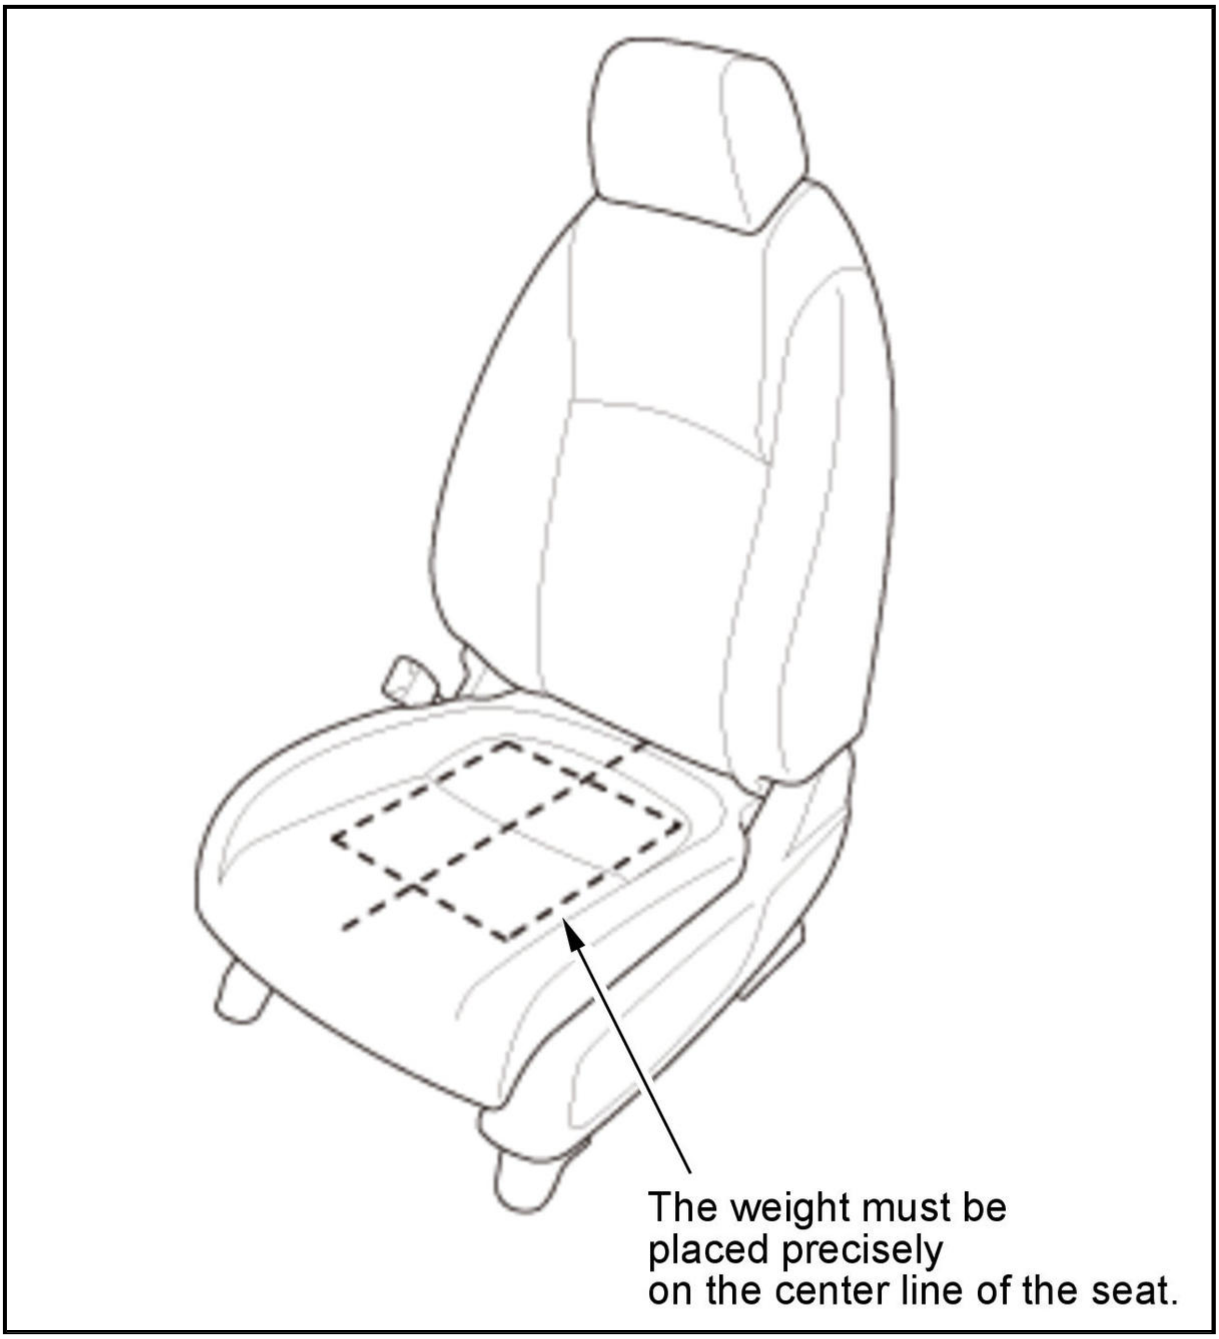
      Remove the front passenger's weight sensors (If they were not reinstalled), reinstall them, then repeat this procedure from the step 1.
- If after reinstalling the front passenger's weight sensors, the HDS (T0) is still at or not within +/-0.35 kg (+/-0.77 lbs), replace the front passenger's weight sensors, then repeat this procedure from the beginning.

4. Prepare a weight between 10 kg (22 lbs) - 20 kg (44 lbs) then measure and note its actual weight (M) with a weight scale.

NOTE:

- **The accuracy of the weight scale must be within 1 kg (2 lbs).**
- **The weight must be uniform in shape and size to allow precise placement on the seat.**

5. Place the prepared weight precisely on the center of the front passenger's seat as shown.



The weight must be placed precisely on the center line of the seat.

6. From the Data List, select FRONT PASSENGER'S WEIGHT. The weight (T) of the front passenger's seat is displayed by the HDS. Write this measurement down as "T" on a piece of paper.

7. Divide (M) by 2. Write this calculation as "M1" on a piece of paper.

8. Calculate the variance between (M1) and the HDS (T) with the following formula.

Variance = (T)-(M1)	
Â	
T:	**Weight measured by the HDS with the weight on the seat.**
M1:	**Half of the weight measured by the weight scale.**

- If the variance is within +/-2.2 kg (+/-4.9 lbs), initialization is complete. Go to step 9.
- If the variance is at or not within +/-2.2 kg (+/-4.9 lbs), do the following and repeat the procedure from step 1.
-
    - -

  Confirm that the seat has no interference with surrounding components.

- -

  Confirm that the weight was placed precisely in the center of the seat.

- -

  Remove the front passenger's weight sensors , reinstall them, then repeat this procedure from the step 1. If the variance is still at or not within +/-2.2 kg (+/-4.9 lbs), replace the front passenger's weight sensors (if they were not replaced), then repeat this procedure from step 1.

9. Turn the vehicle to the OFF (LOCK) mode.

SYMPTOM TROUBLESHOOTING

SRS SYMPTOM TROUBLESHOOTING - FRONT SEAT BELT REMINDER INDICATOR DOES NOT COME ON, TURN OFF, OR FLASH

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed**.
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

1. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
Â	Â

   Are any SRS DTCs indicated?

   YES

   Go to SRS DTC troubleshooting.

   NO

   Go to step 2.

2. Body electrical system DTC check

   -1. Check for body electrical DTCs with the HDS.

DTC Description	DTC
U0151-00 Gauge control module lost communication with SRS unit	Â

   Is DTC U0151 indicated?

   YES

   Go to DTC U0151 troubleshooting .

   NO

   Go to step 3.

3. Gauge control module check

   -1. **Do the gauge control module self-diagnostic function** .

   Self diagnostic function - CAN METER

   Does the front seat belt reminder indicator blinkΩ

   YES

   Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

   NO

   Replace the gauge control module .

SRS SYMPTOM TROUBLESHOOTING - SRS INDICATOR DOES NOT COME ON

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed**.
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

1. Problem verification

   -1. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

   -2. Turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then go off.

   Does the SRS indicator come on for about 6 seconds and then go off?

   YES

   Intermittent failure, the vehicle is OK at this time.

   NO

   The failure is duplicated. Go to step 2.

2. Gauge control module check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Connect the HDS to the data link connector (DLC)** .

   -3. Turn the vehicle to the ON mode.

   -4. **Do the gauge control module self-diagnostic function** .

   Does the SRS indicator blinkΩ

   YES

   Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Replace the gauge control module .

SERVICE PROCEDURE

AIRBAG AND TENSIONER DISPOSAL

Special Tools Required

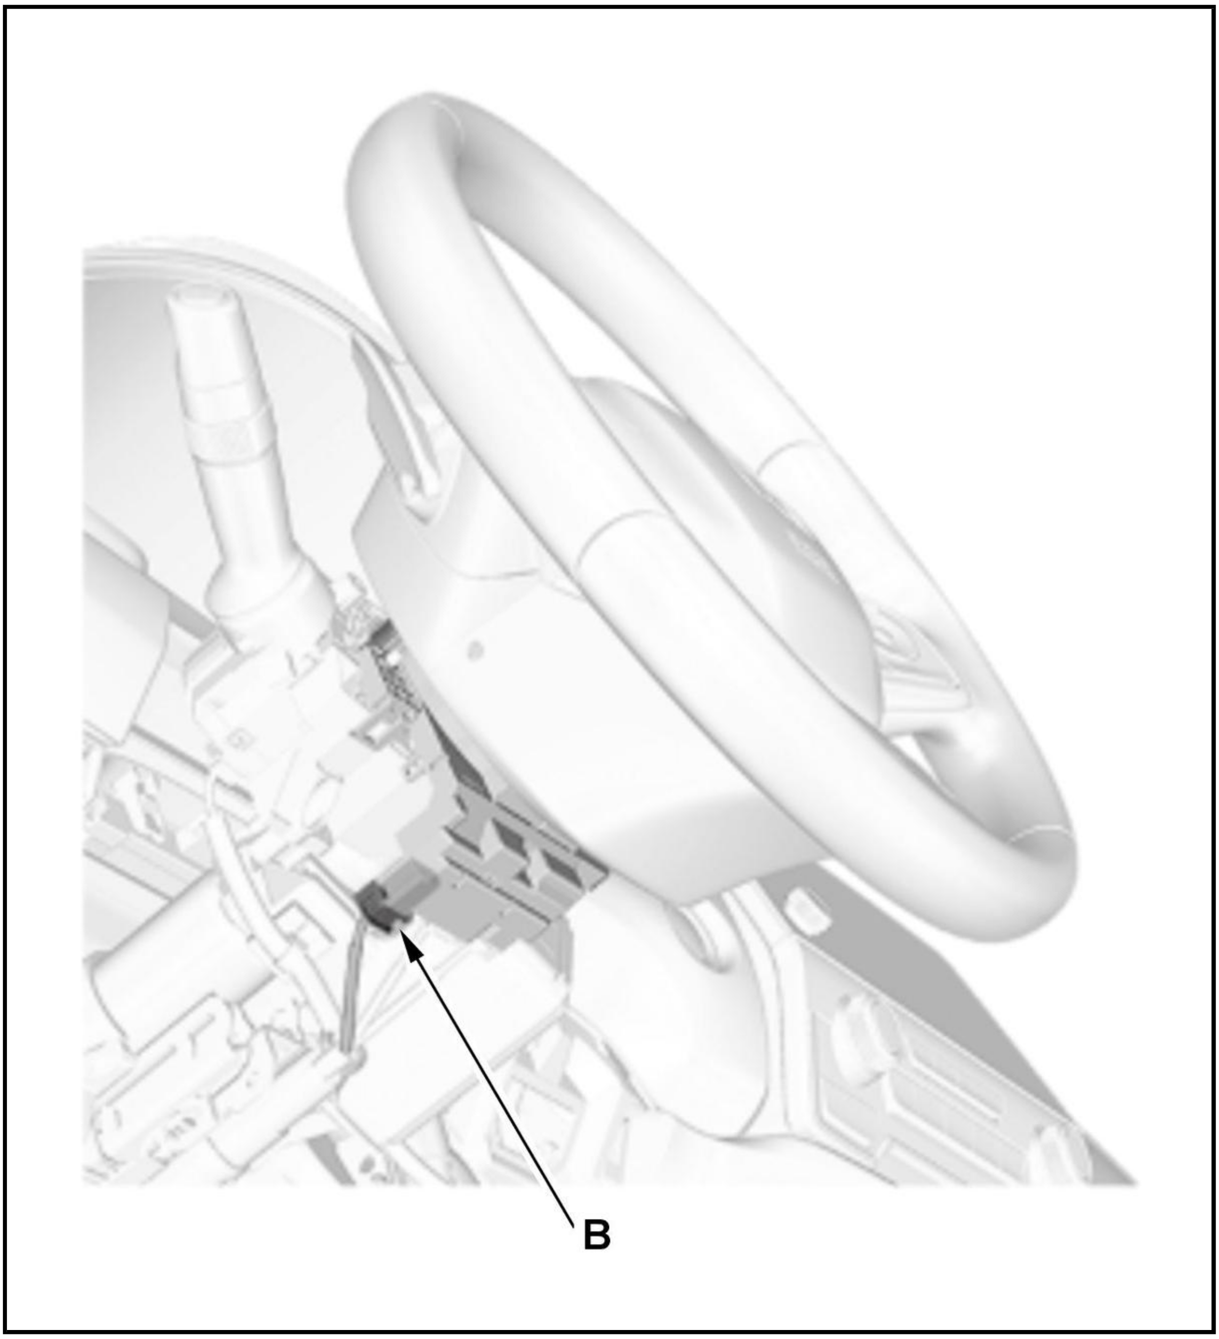
Image	Description/Tool Number
	Deployment Tool 07AAZ-000A100

Inspection

NOTE:

- Before scrapping any front airbags, side airbags, side curtain airbags, seat belt outer lap tensioners, or front seat belt tensioners (including those in a whole vehicle to be scrapped), the part(s) must be deployed. If the vehicle is still within the warranty period, the Honda District Parts and Service Manager must give approval and/or special instruction before deploying the part(s). Only after the part(s) have been deployed (as the result of vehicle collision, for example), can they be scrapped. If the parts appear intact (not deployed), treat them with extreme caution. Follow this procedure.
- Please read the tool manual precautions and procedures for more details of the deployment tool.
- Airbag deployment is prohibited by law in some regions. Always check local laws and requirements before deploying airbags.

1. Airbag and Tensioner - Dispose



Deploying Airbags in the Vehicle

If an SRS equipped vehicle is to be entirely scrapped, its front airbags, side airbags, side curtain airbags, seat belt outer lap tensioners, and front seat belt tensioners should be deployed while still in the vehicle. These parts should not be considered as salvageable parts and should never be installed in another vehicle.

1. Turn the vehicle to the OFF (LOCK) mode. **Do the 12 volt battery terminal disconnection procedure**

, then wait at least 3 minutes before starting work.

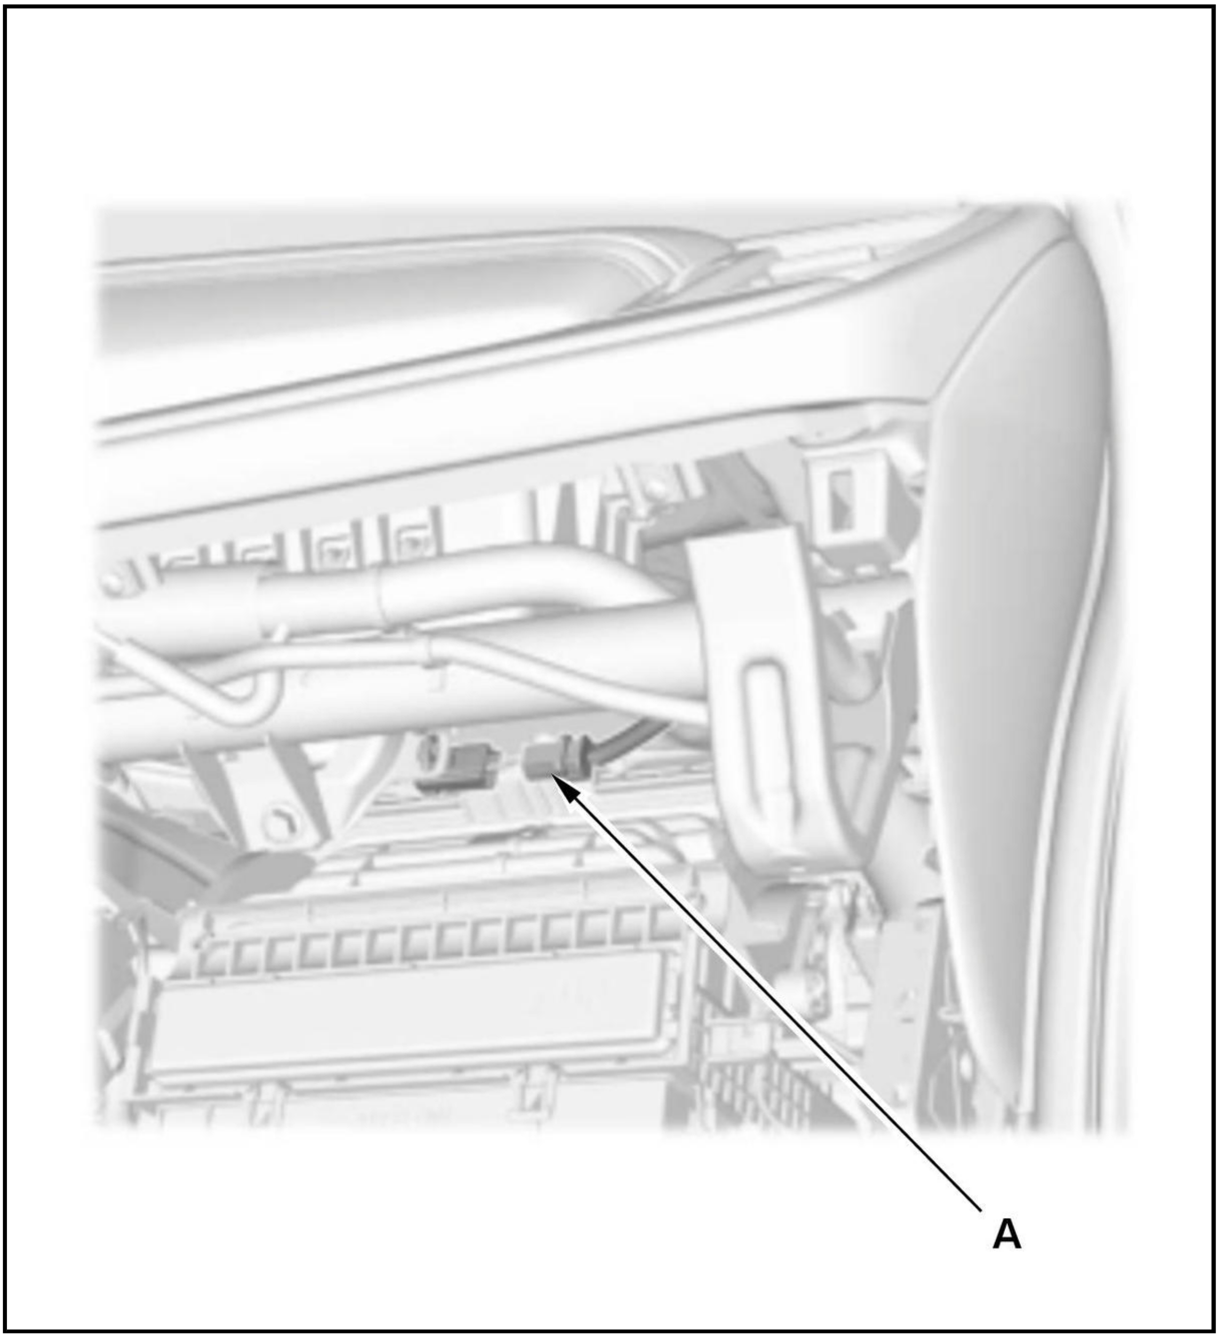
2. Confirm that each front airbag, side airbag, side curtain airbag, seat belt outer lap tensioner, or front seat belt tensioner is securely mounted.

3. Confirm that the deployment tool is functioning properly by following the check procedure on the tool label.

Driver's Airbag

4. **Remove the column covers** .

5. Locate the cable reel connector B on the dashboard wire harness. Do not disconnect the cable reel connector B.



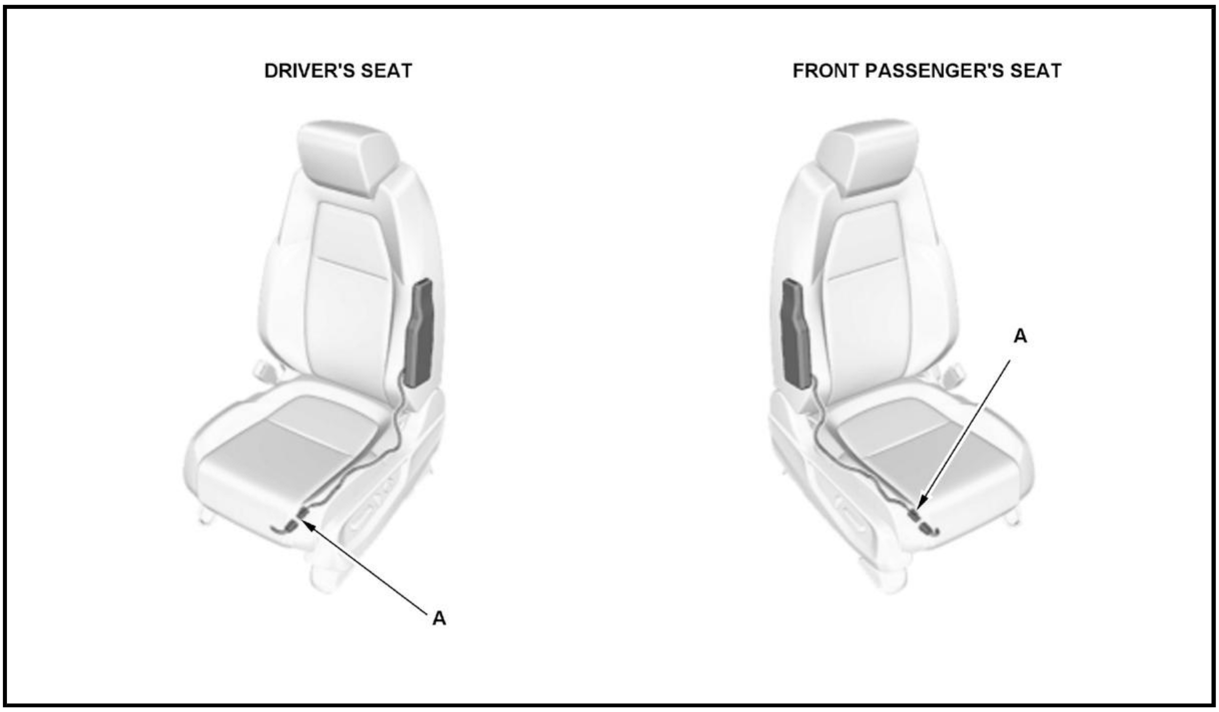
Front Passenger's Airbag

6. Remove the glove box .

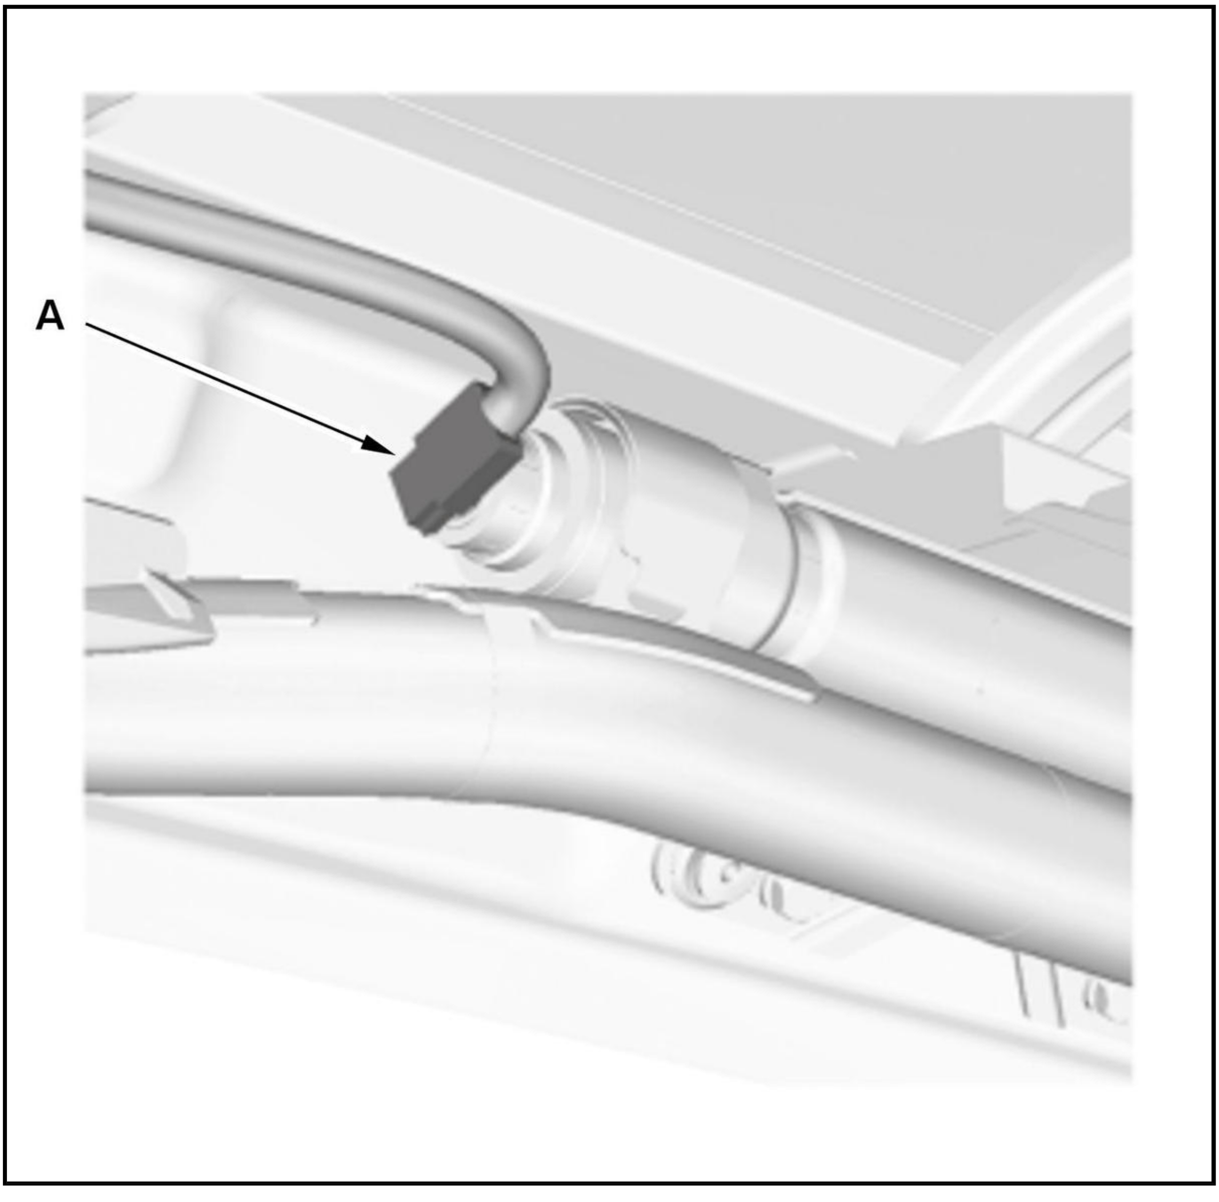
7. Disconnect the connector (A).

Side Airbag

8. Disconnect the connector (A) .



DRIVER'S SEAT
FRONT PASSENGER'S SEAT
A
A

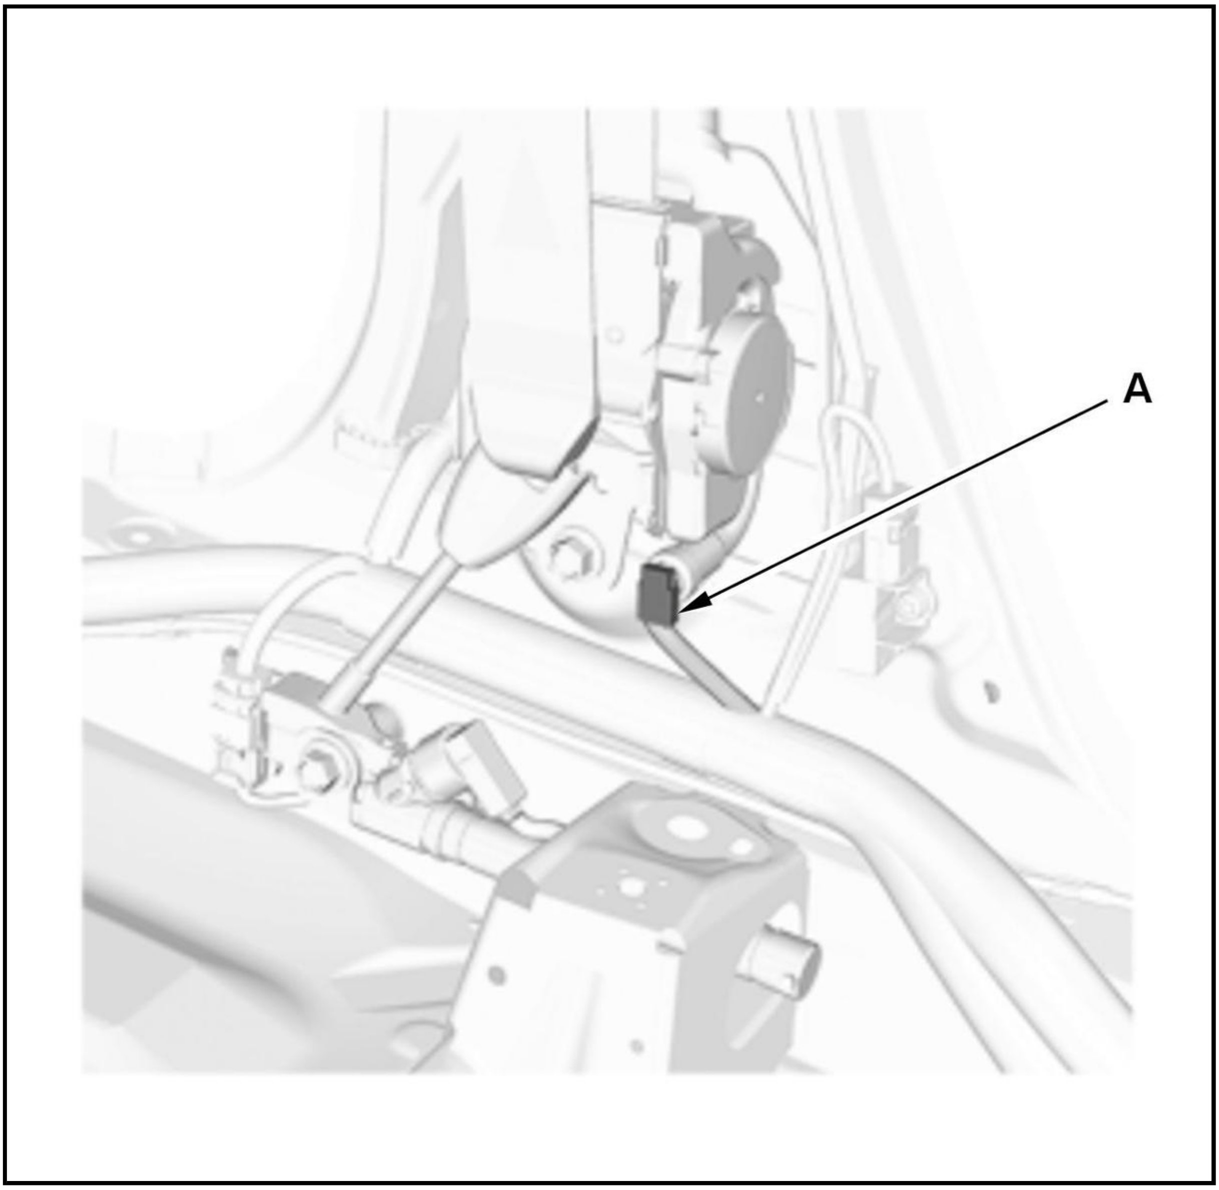


Side Curtain Airbag

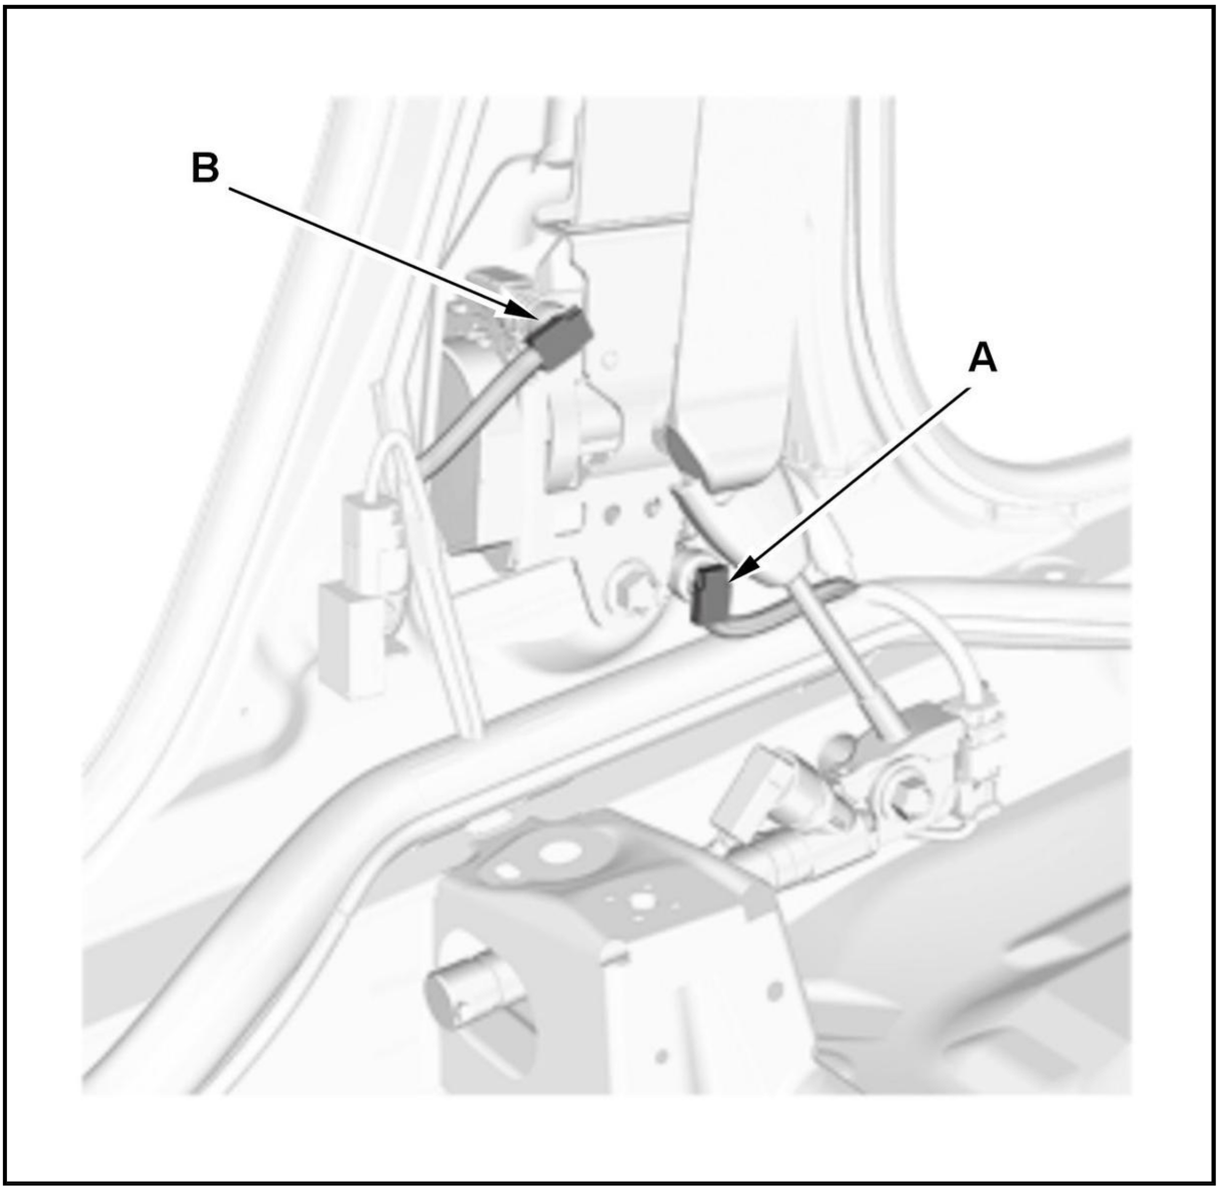
9. Remove the headliner .

10. Locate the right and left side curtain airbag inflator connectors (A) on the floor wire harness. Do not disconnect the side curtain airbag inflator connectors.

Driver's Side



Passenger's Side

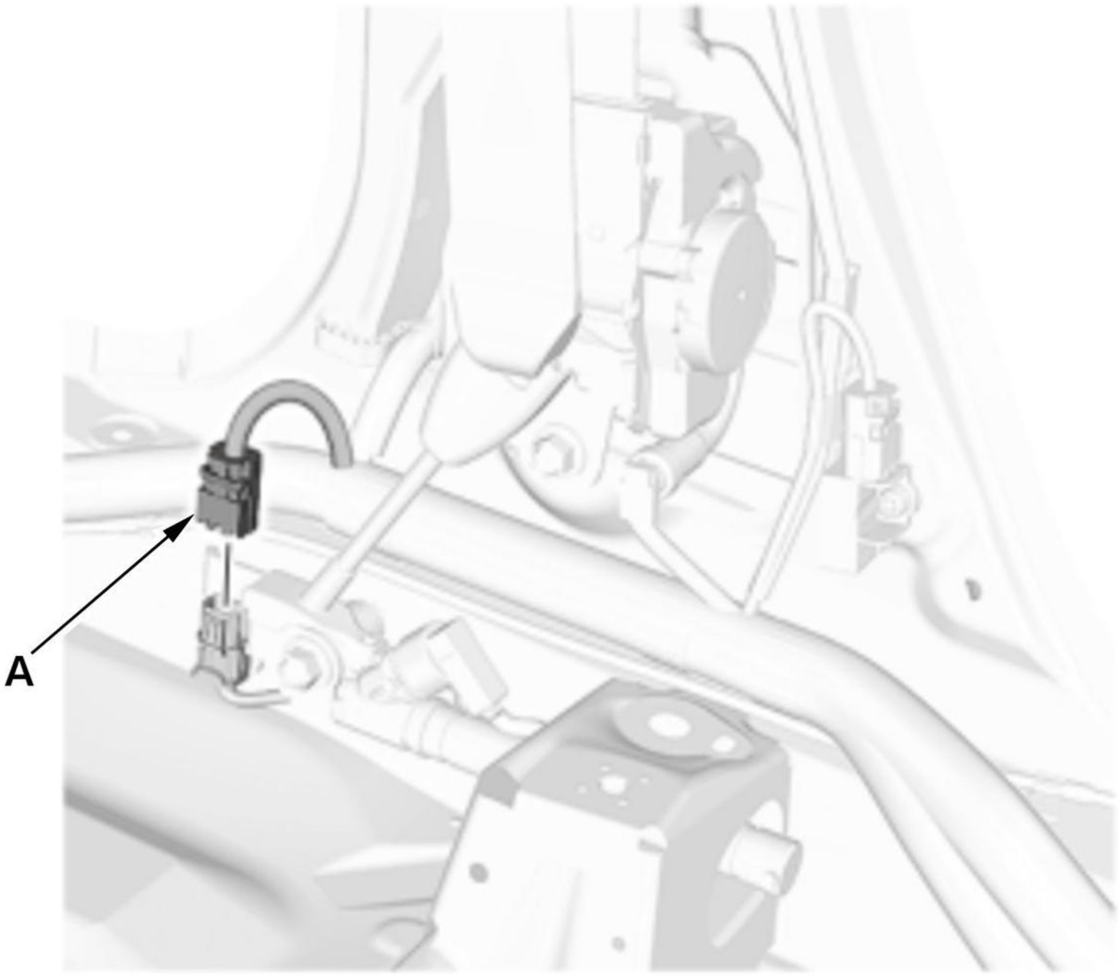


Front Seat Belt Tensioner

11. Remove the B-pillar lower trim cover

12. Locate the driver's and front passenger's seat belt tensioner connectors (A) on the floor wire harness. Do not disconnect the front seat belt tensioner connectors.

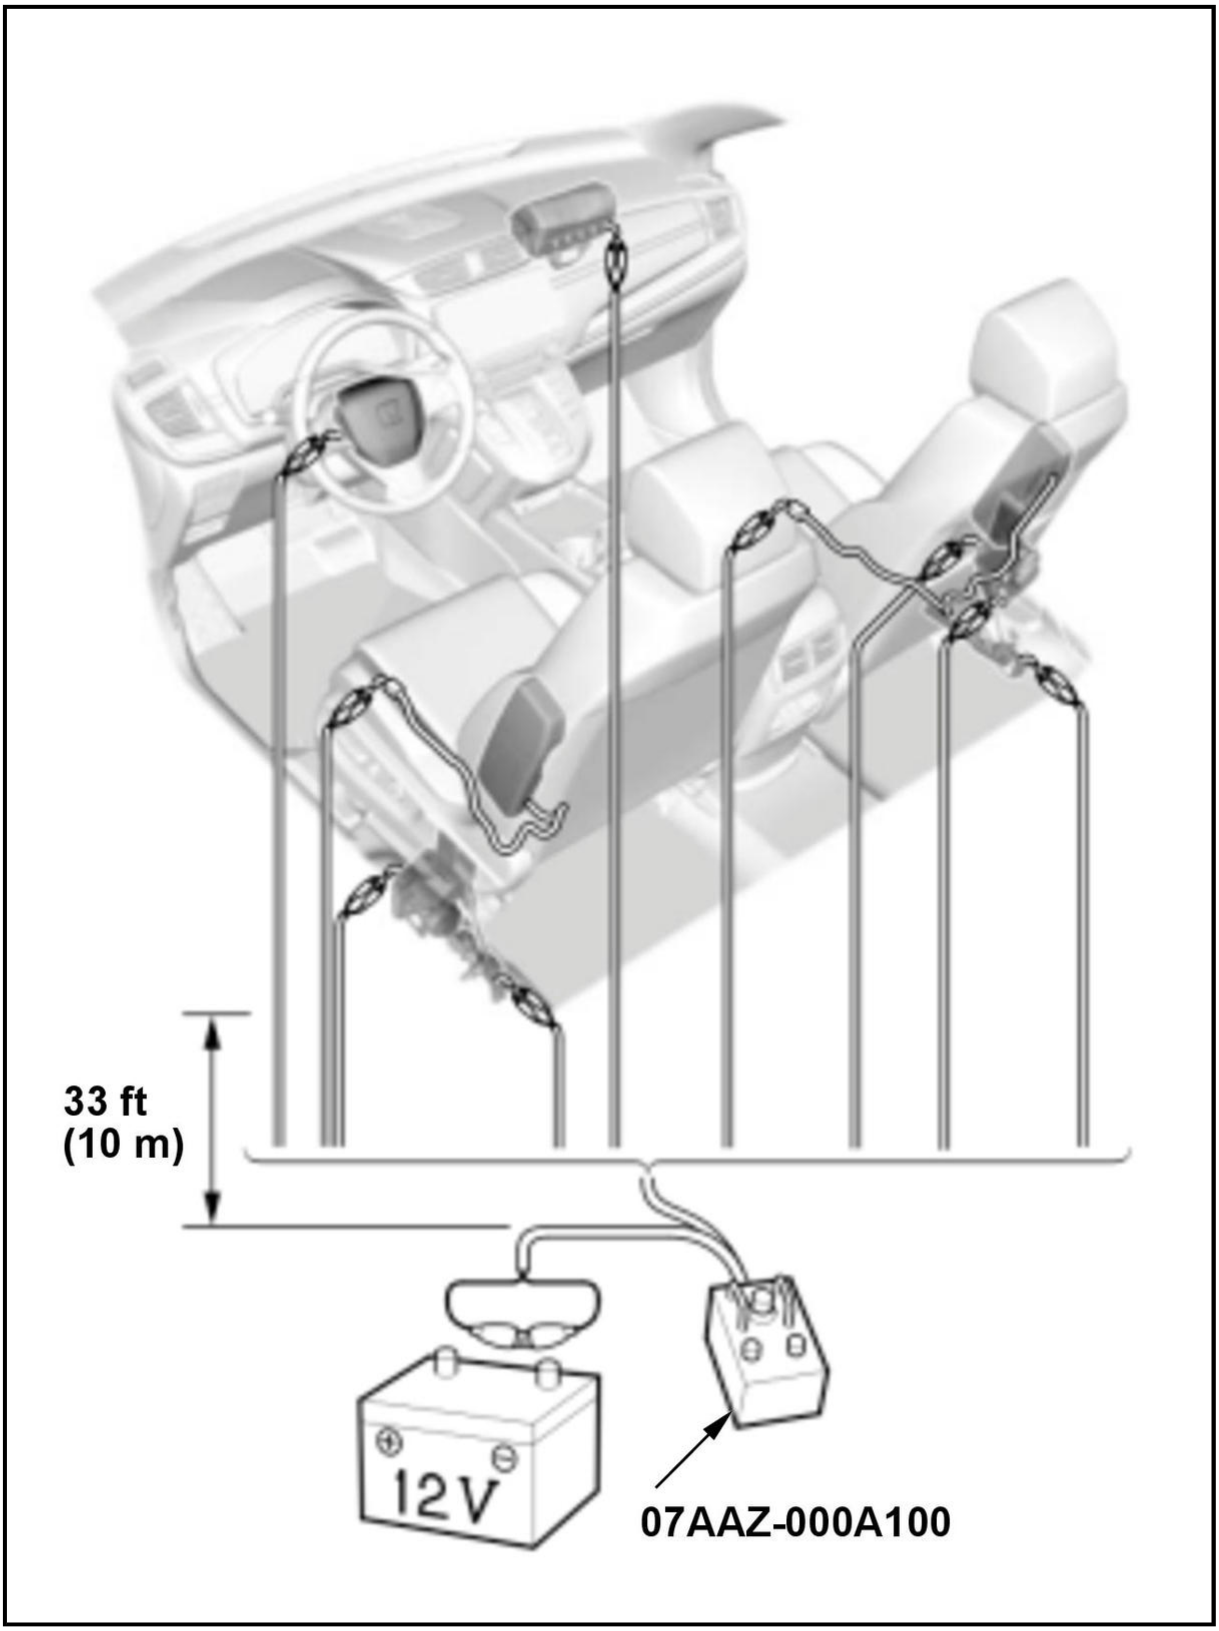
13. Front passenger's side: Locate the selectable energy absorption device connector (B) on the floor wire harness. Do not disconnect the selectable energy absorption device connector.



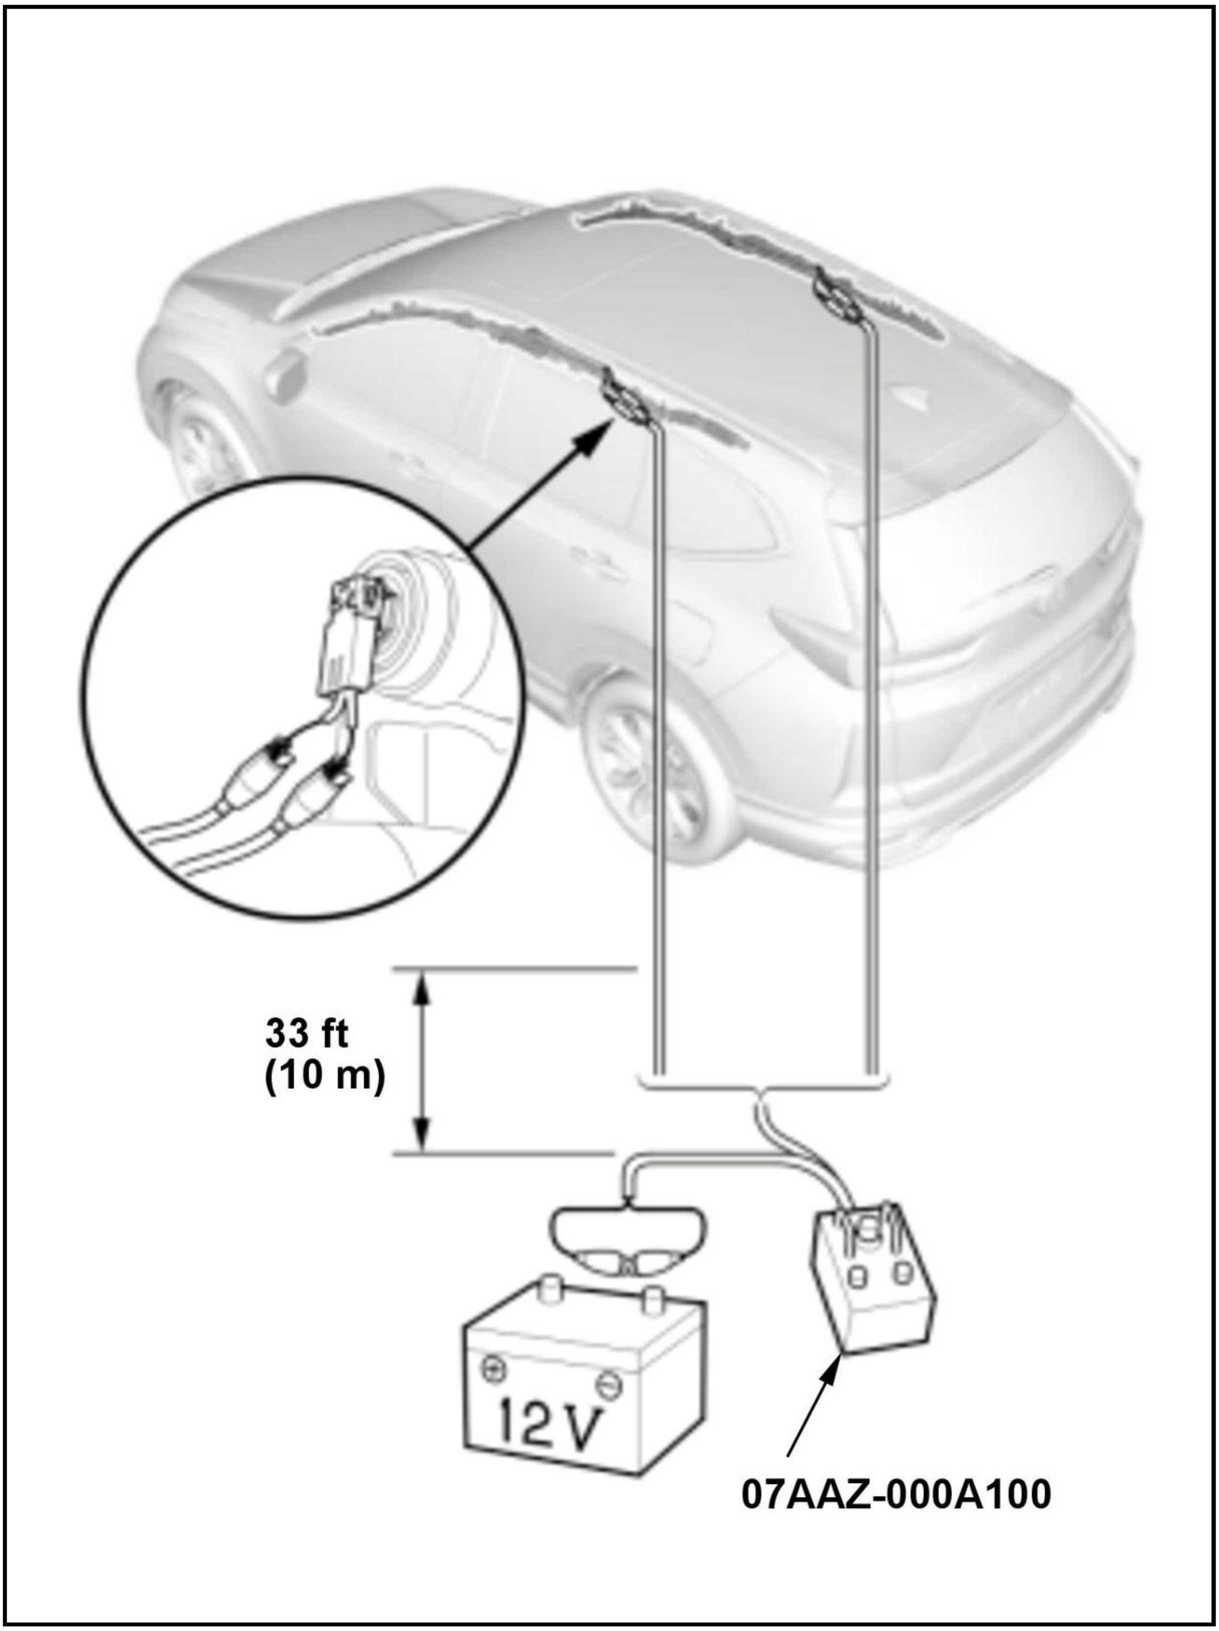
Seat Belt Outer Lap Tensioner

14. **Remove the B-pillar lower trim cover** .

15. Disconnect the connector (A).



33 ft
(10 m)
12V
07AAZ-000A100



16. Cut off each connector and strip the ends of the wires. To prevent inflators from being deployed unexpectedly, twist each pair of wires coming from each inflator to have each inflator short-circuited.

17. Select one pair of wires and untwist the wires. Clip an alligator clip (A) to each end of the wires, so that the inflator is ready to be deployed.

NOTE:

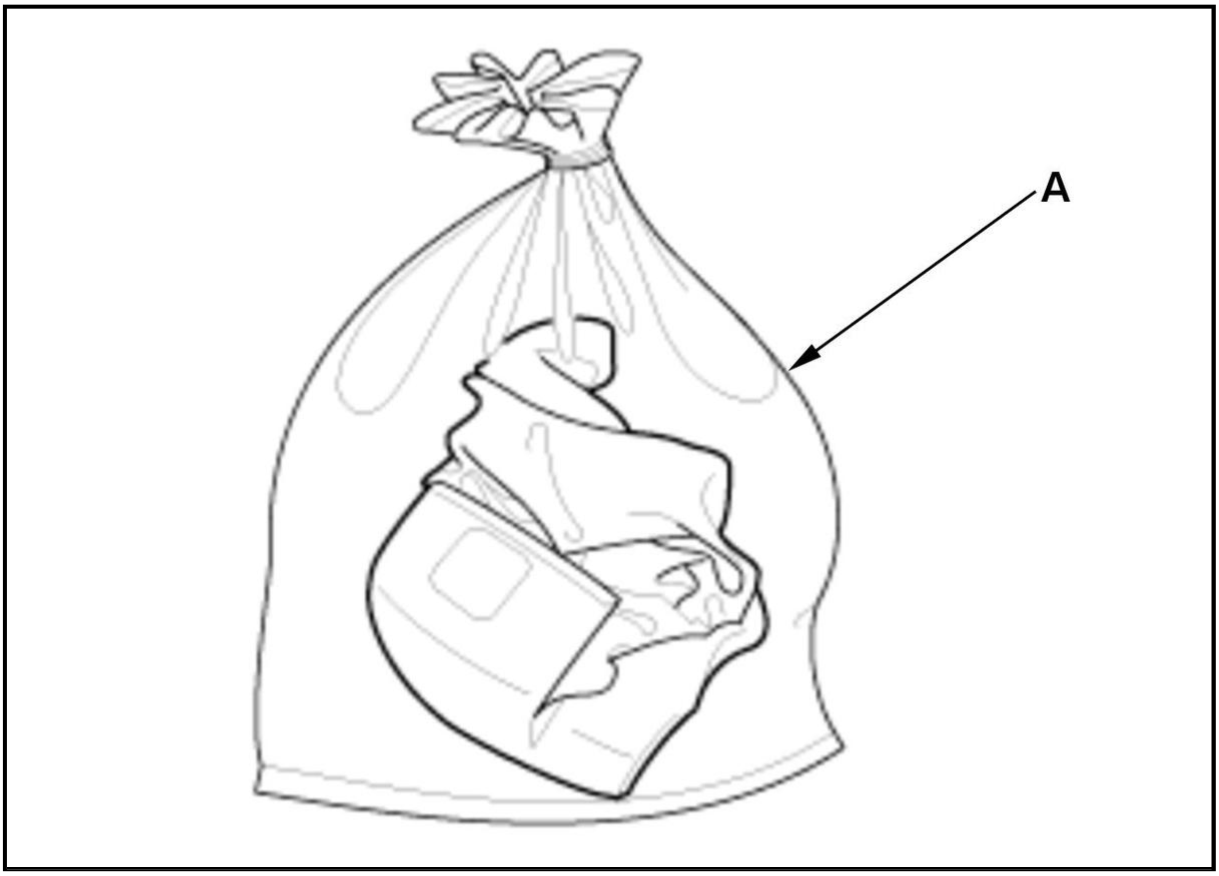
- **Place the deployment tool at least 33 ft (10 m) away from the vehicle.**
- **Since the Front passenger's airbag has dual inflators, make sure to twist the correct pair of wires to have each inflator short-circuited.**

18. Connect a 12 volt battery to the tool.

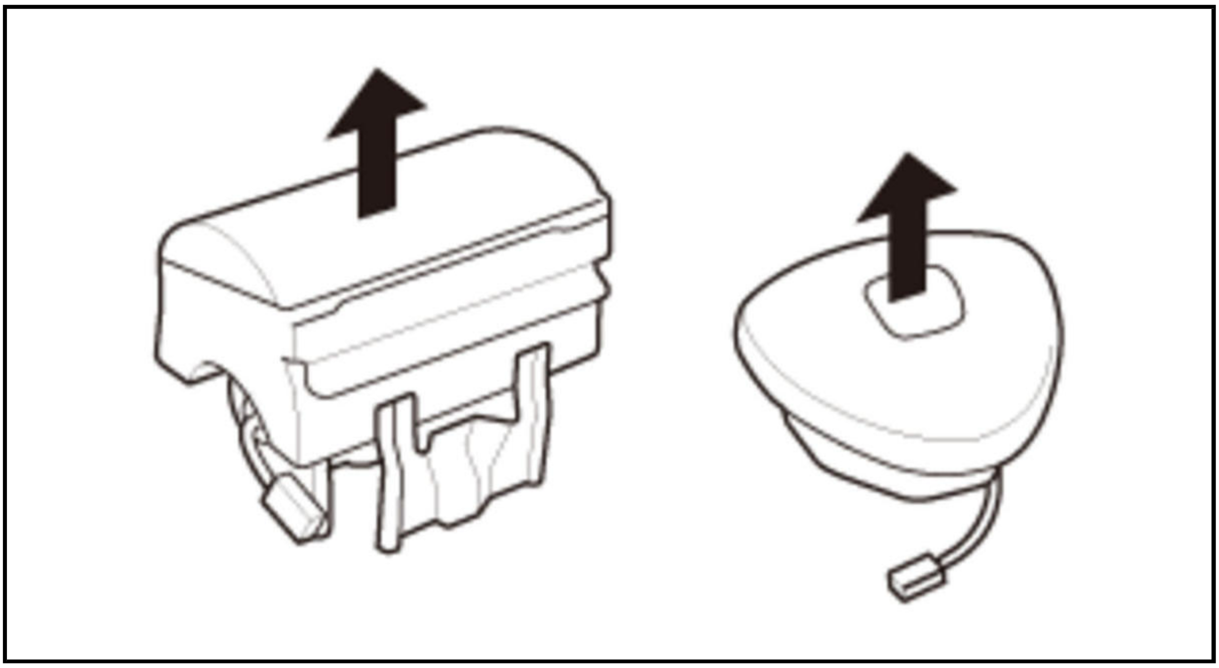
- If the green light on the tool comes on, the igniter circuit is defective and cannot deploy the component. Go to Disposal of Damaged Components.
- If the red light on the tool comes on, the component is ready to be deployed.

19. Push the tool's deployment switch. The airbags and tensioners should deploy (deployment is both highly audible and visible: A loud noise and rapid inflation of the bag, followed by slow deflation).

- If the components deploy and the green light on the tool comes on, continue with this procedure.
- If a component does not deploy, and the green light comes on, its igniter is defective. Go to Disposal of Damaged Components.
- During deployment, the airbags can become hot enough to burn you. Wait for 30 minutes after deployment before touching the airbags.

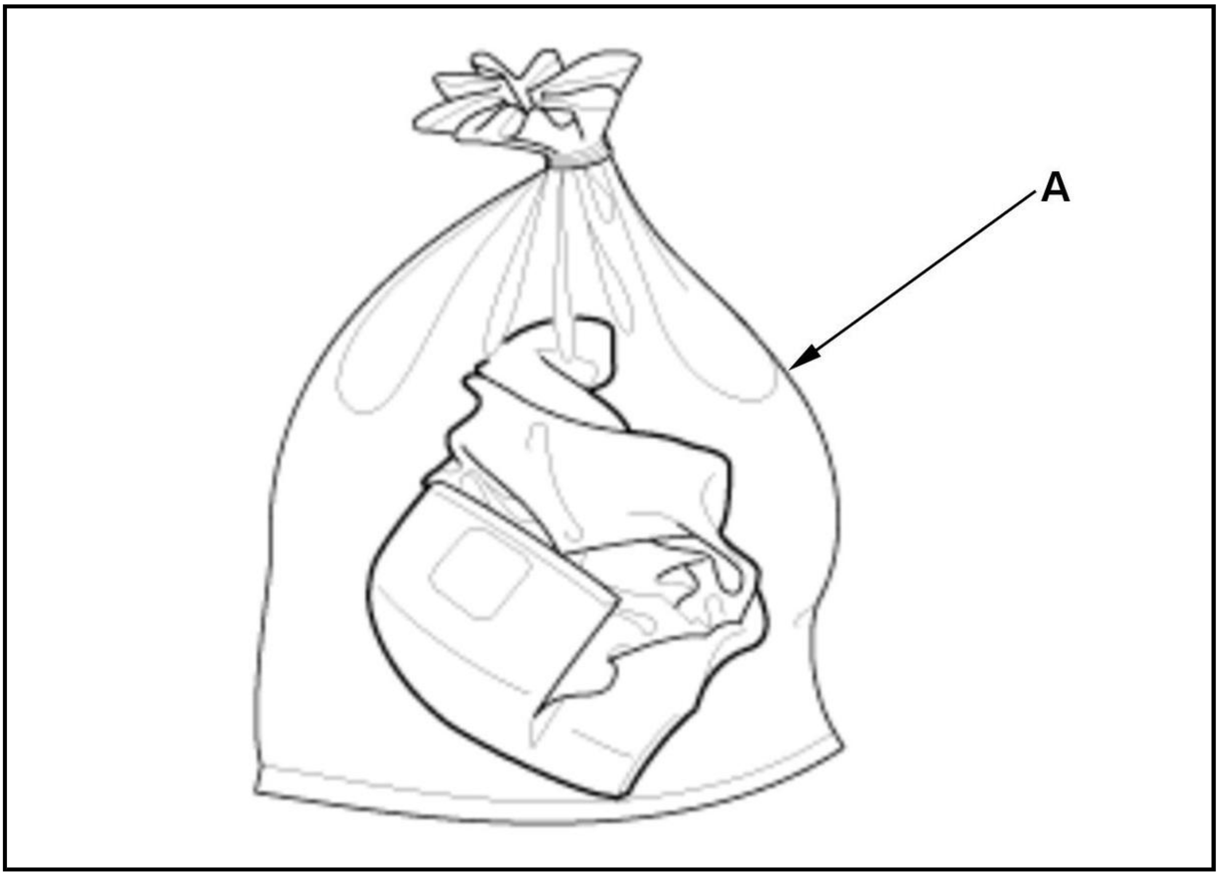


20. Dispose of the complete airbag or tensioner. No part of it can be reused. Place it in a sturdy plastic bag (A), and seal it securely. Dispose of the deployed airbag according to your local regulations.



Deploying Components Out of the Vehicle

If an intact airbag or tensioner has been removed from a scrapped vehicle, or has been found defective or damaged during transit, storage, or service, it should be deployed as follows:



1. Confirm that the deployment tool is functioning properly by following the check procedure Deploying Airbags in the Vehicle on the tool label.

2. Position the airbag face up, outdoors, on flat ground, at least 10 m (33 ft) from any obstacles or people.

3. Cut off each connector and strip the ends of the wires. To prevent inflators from being deployed unexpectedly, twist each pair of wires coming from each inflator to have each inflator short-circuited.

4. Select one pair of wires and untwist the wires. Clip an alligator clip to each end of the wires, so that the inflator is ready to be deployed.

NOTE: Since the front passenger's airbag has dual inflators, make sure to twist the correct pair of wires to have each inflator short-circuited.

5. Connect a 12 volt battery to the tool.

- If the green light on the tool comes on, the igniter circuit is defective and cannot deploy the component. Go to Disposal of Damaged Components.
- If the red light on the tool comes on, the component is ready to be deployed.

6. Push the tool's deployment switch. The airbags and tensioners should deploy (deployment is both highly audible and visible: A loud noise and rapid inflation of the bag, followed by slow deflation).

- If the components deploy and the green light on the tool comes on, continue with this procedure.
- If a component does not deploy, and the green light comes on, its igniter is defective. Go to Disposal of Damaged Components.
- During deployment, the airbags can become hot enough to burn you. Wait for 30 minutes after deployment before touching the airbags.

7. Dispose of the complete airbag or tensioner. No part of it can be reused. Place it in a sturdy plastic bag (A), and seal it securely. Dispose of the deployed airbag according to your local regulations.

Disposal of Damaged Components

1. If installed in a vehicle, follow the removal procedure for **the driver's airbag** , **the front passenger's airbag** , **the side airbag** , **the side curtain airbag** , **seat belt outer lap tensioner** , and **the front seat belt tensioner** .

2. In all cases, make a short circuit by cutting, stripping, and twisting together the two inflator wires.

NOTE: Since the front passenger's airbags have dual inflators, make sure to twist the correct pair of wires to have each inflator short-circuited.

3. Package the component in exactly the same packaging that the new replacement part came in.

4. Mark the outside of the box DAMAGED AIRBAG NOT DEPLOYED, DAMAGED SIDE AIRBAG NOT DEPLOYED, DAMAGED SIDE CURTAIN AIRBAG NOT DEPLOYED, DAMAGED DRIVER'S SEAT BELT OUTER LAP TENSIONER NOT DEPLOYED, or DAMAGED SEAT BELT TENSIONER NOT DEPLOYED so it does not get confused with your parts stock.

5. Contact your Honda District Parts and Service Manager for instructions on how and where to return it for disposal.

SRS PRECAUTIONS AND PROCEDURES

General Precautions

NOTE:

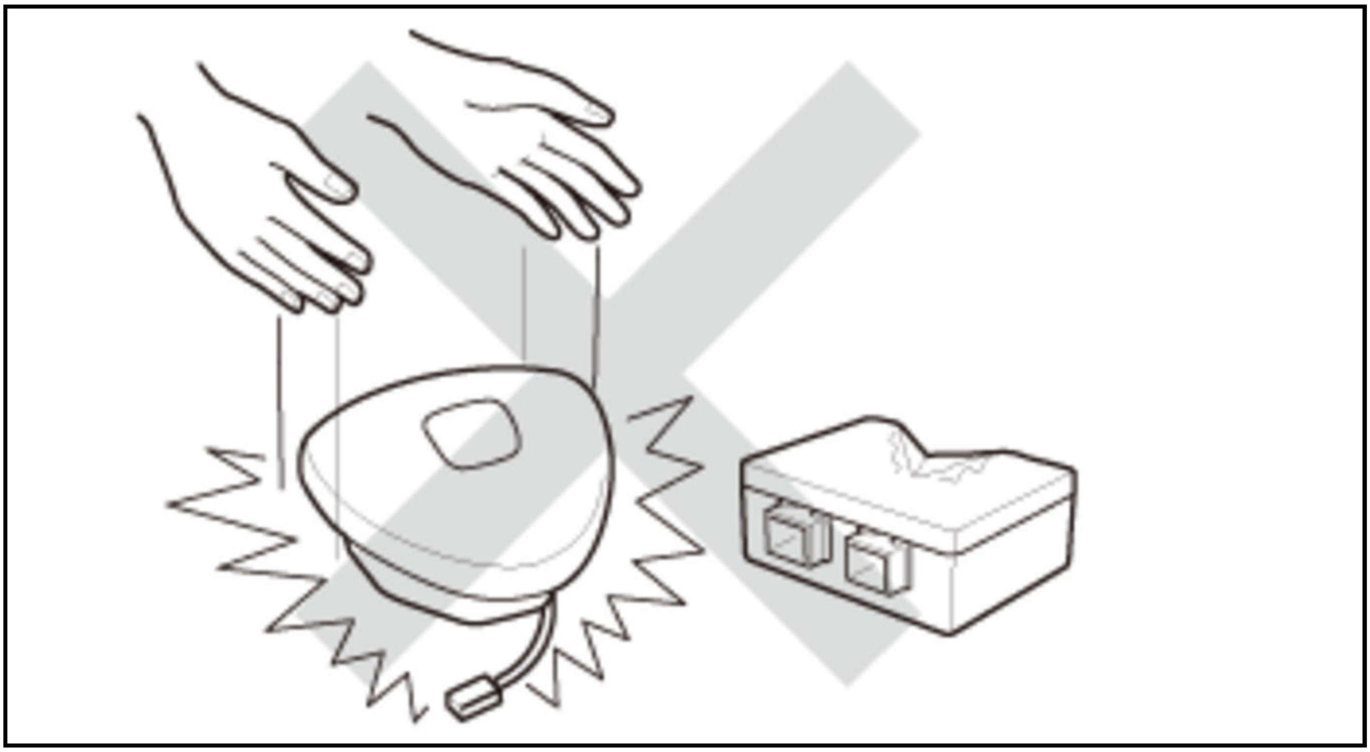
- Some systems store data in memory that is lost when the 12 volt battery is disconnected. Before disconnecting the 12 volt battery, **refer to 12 volt battery Terminal Disconnection and Reconnection** .

Please read the following precautions carefully before servicing the SRS, or the airbags could accidentally deploy and cause damage or injuries.

- Except when doing electrical inspections that require 12 volt battery power, always turn the vehicle to the OFF (LOCK) mode, disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes before starting work.

NOTE: The SRS memory is not erased even if the vehicle is turned to the OFF (LOCK) mode, or if the 12 volt battery cables are disconnected from the 12 volt battery.

- Use replacement parts which are manufactured to the same standards and quality as the original parts. Do not install used SRS parts. Use only new parts when making SRS repairs.
- Carefully inspect any SRS part before you install it. Do not install any part that shows signs of being dropped or improperly handled, such as dents, cracks or deformation.



- Before disconnecting the SRS unit connectors, always disconnect the appropriate SRS parts connectors.
- Use only a digital multimeter to check the system. If it is not a Honda multimeter, make sure its output is 10 mA (0.01 A) or less when switched to the lowest value in the ohmmeter range. A tester with a higher output could cause accidental deployment and possible injury.
- Do not put objects on the front passenger's airbag.

Steering-Related Precautions

Cable Reel Alignment

- Misalignment of the cable reel could cause an open in the wiring, making the SRS, remote steering wheel controls, or the horn inoperative. **Center the cable reel whenever you do the following** .
-
    - -

      Installation of the steering wheel.
    - -

      Installation of the cable reel.
    - -

      Installation of the steering column.
    - -

Other steering-related adjustment or installation.

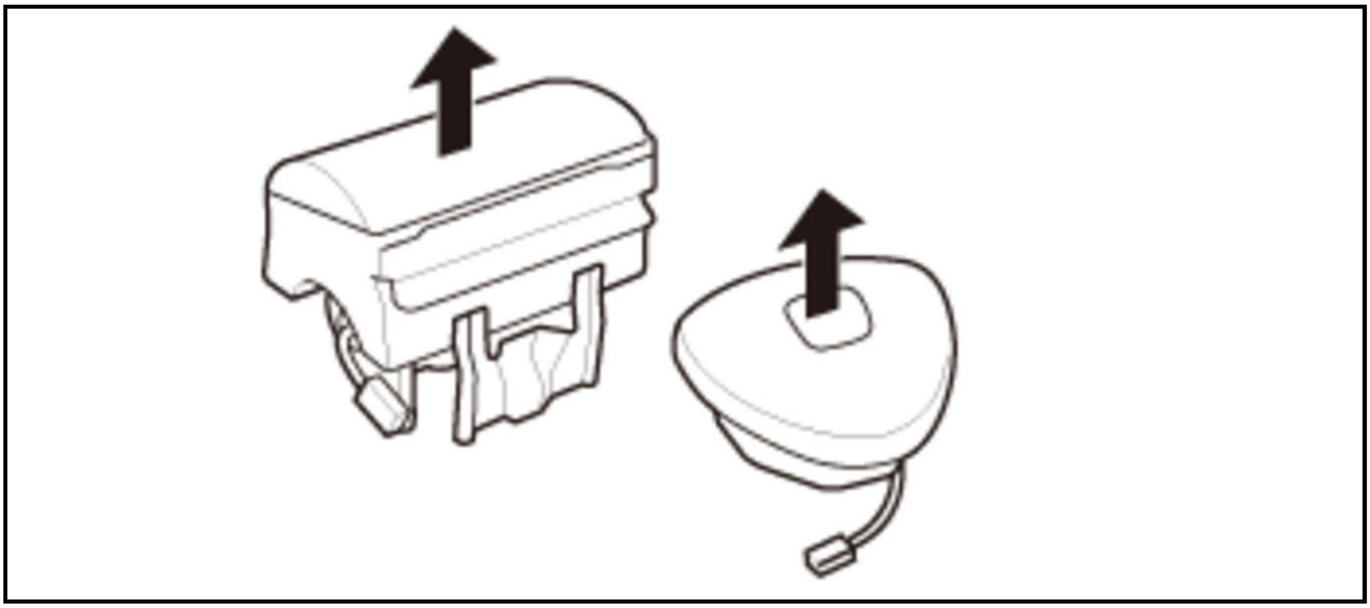
- Do not disassemble the cable reel.
- Do not apply grease to the cable reel.
- If the cable reel shows any signs of damage, replace it with a new one. For example, if the cable reel does not rotate smoothly, replace it.

Airbag Handling and Storage

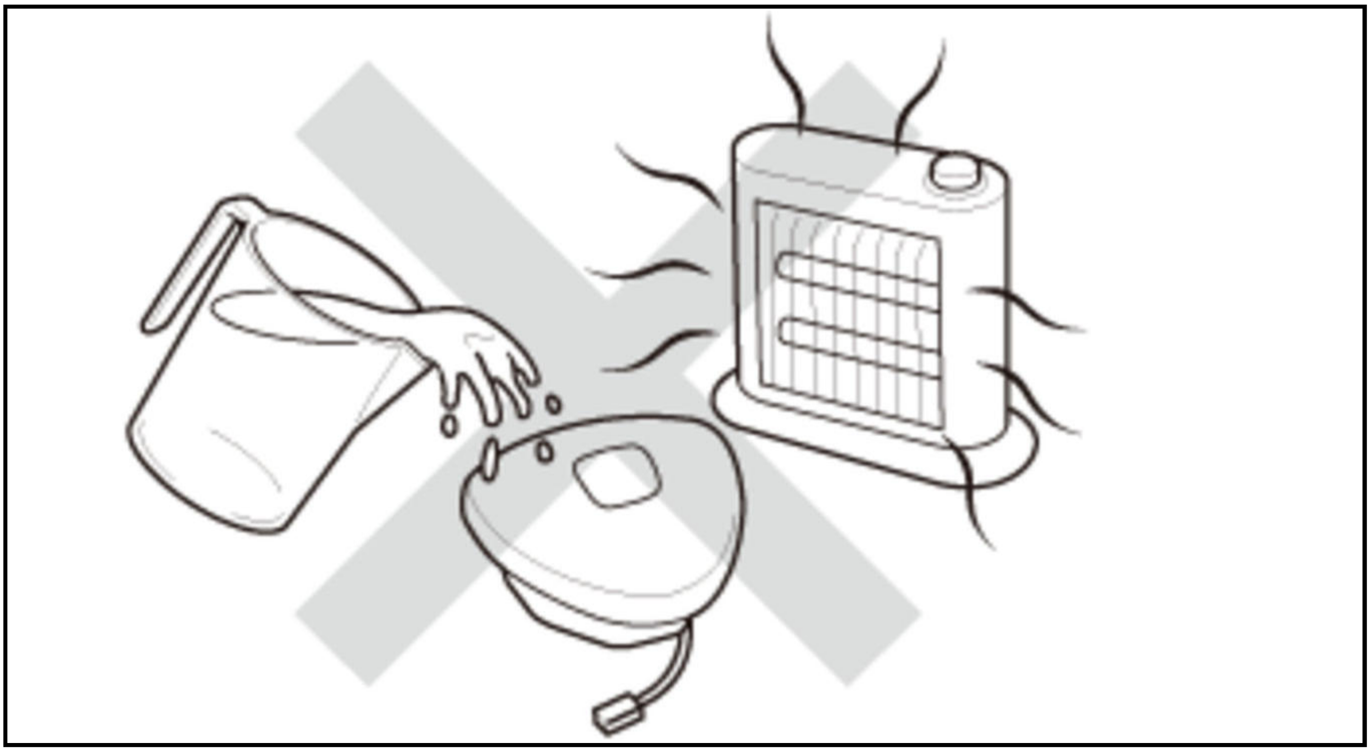
Do not disassemble an airbag. It has no serviceable parts. Once an airbag has been deployed, it cannot be repaired or reused.

For temporary storage of an airbag during service, observe the following precautions.

- Store the removed airbag with the pad surface up. Never put anything on the airbag.

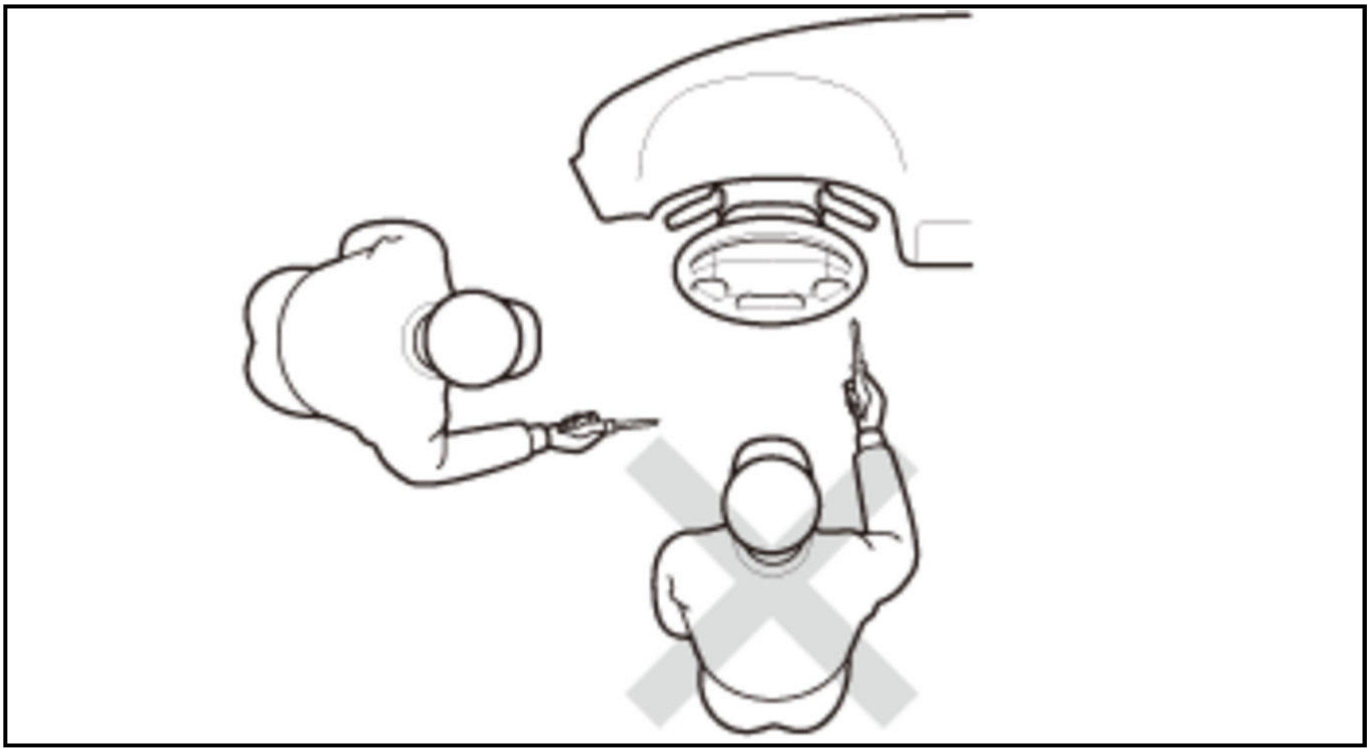


- To prevent damage to the airbag, keep it away from any oil, grease, detergent, or water.



- Store the removed airbag on a secure, flat surface away from any high heat source (exceeding 200 deg.F (93 deg.C)).

- Never do electrical tests on the airbags, such as measuring resistance.
- Do not position yourself in front of the airbag during removal, inspection, or replacement.

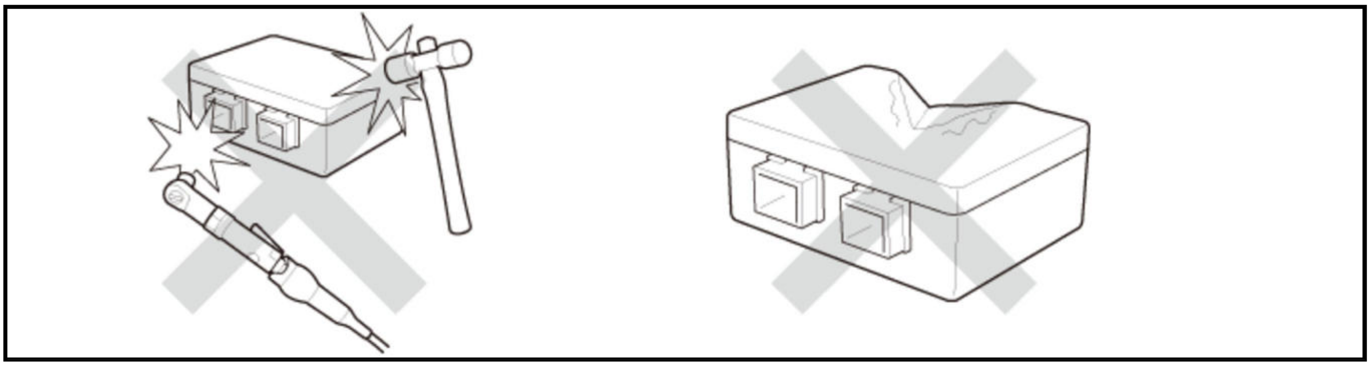


- For proper disposal of a damaged airbag or tensioner, **refer to Airbag and Tensioner Disposal**.

SRS Unit, Front and Side Impact Sensors, Driver's Seat Position Sensor, and Front Passenger's Weight Sensors

NOTE: Some systems store data in memory that is lost when the 12 volt battery is disconnected. Before disconnecting the 12 volt battery, **refer to 12 volt battery Terminal Disconnection and Reconnection** .

- Turn the vehicle to the OFF (LOCK) mode. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes before starting installation or replacement of the SRS unit, or disconnecting the connectors from the SRS unit.
- Be careful not to bump or impact the SRS unit, the front impact sensors, or the side impact sensors when the vehicle is in the ON mode, or for at least 3 minutes after the vehicle is turned to the OFF (LOCK) mode.
- Do not reconnect any connectors to the SRS unit until it is fully installed, including torquing the bolts.
- During installation or replacement, be careful not to bump (by impact wrench, hammer, etc.) the area around the SRS unit, the front impact sensors, or the side impact sensors. The airbags could accidentally deploy and cause damage or injury.



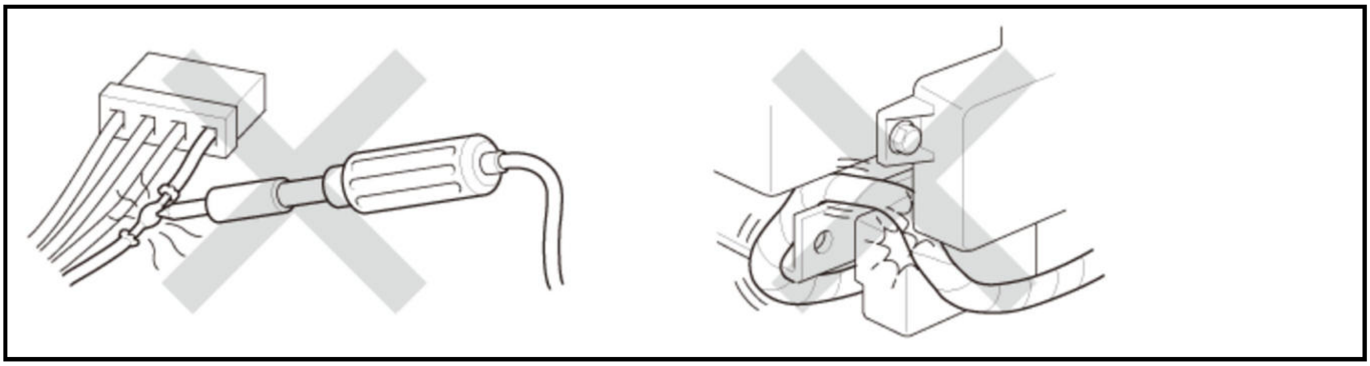
- After a collision where the front airbags, the side airbags, the side curtain airbags, the front seat belt tensioners, or the seat belt outer lap tensioner deploy, **go to Component Replacement/Inspection After Deployment**. After a collision where the airbags do not deploy, inspect for any damage or any deformation on the SRS unit, the front impact sensors, and the side impact sensors. If there is any damage, replace the SRS unit and/or the sensors. Replace all damaged parts.

- Do not disassemble the SRS unit, the front impact sensors, the side impact sensors, the driver's seat position sensor, or the front passenger's weight sensors.
- Always install the SRS unit, driver's seat position sensor, and the all impact sensors with the new bolts to the specified torque.
- Do not spill water or oil on the SRS unit or any of the sensors.

Wiring Precautions

Some of the SRS wiring can be identified by a special yellow outer covering, and the SRS connectors can be identified by their yellow color. Observe the following instructions.

- Never attempt to modify, splice, or repair SRS wiring. If there is an open or damage to the SRS wiring, replace the harness.



- Be sure to install the harness wires so they do not get pinched or interfere with other parts.
- Make sure all SRS ground locations are clean, and the grounds are securely fastened for optimum metal-to-metal contact. Poor grounds can cause intermittent problems that are difficult to diagnose.
- Do not use any silicone based cleaners or lubricants on any SRS connectors or terminals.

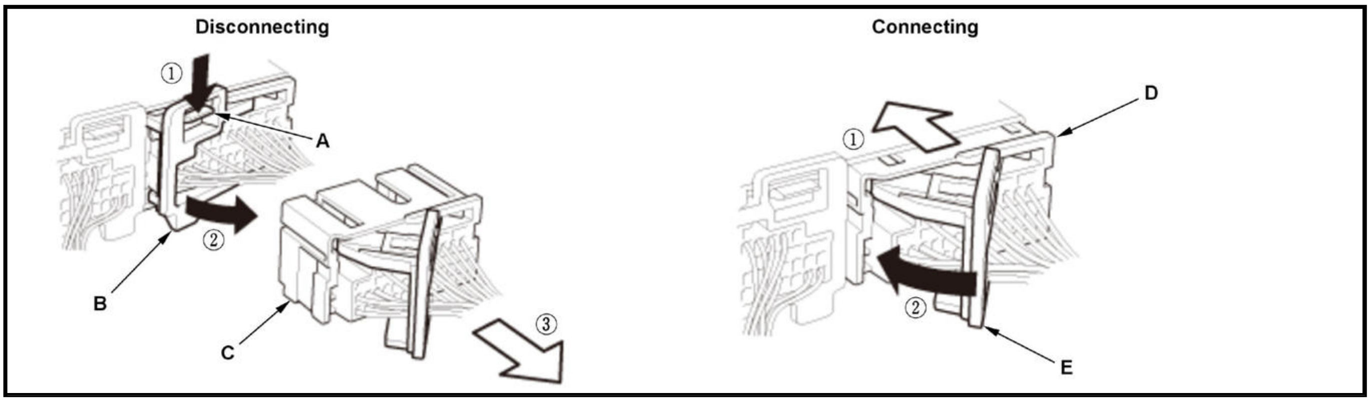
Lever-Locked Connector

The SRS unit connectors have a lever lock.

SRS Unit Connectors

Disconnecting/Connecting

- To release the lock (A), pull the lever (B) while pushing the lock on the outside of the connector, then pull out the connector (C).
- To reconnect the connector (D), push in on the connector. As the connector is pressed in, the lever (E) moves to the locked position.



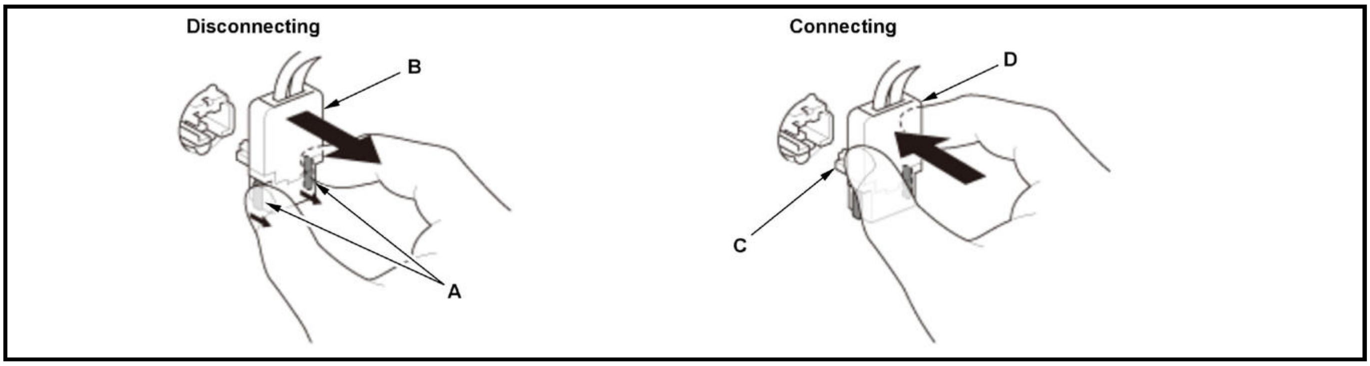
Spring-Loaded Lock Connector

Some SRS connectors have a spring-loaded lock.

Driver's Airbag Connector/Side Curtain Airbag Connector/Front Seat Belt Tensioner Connector

Disconnecting/Connecting

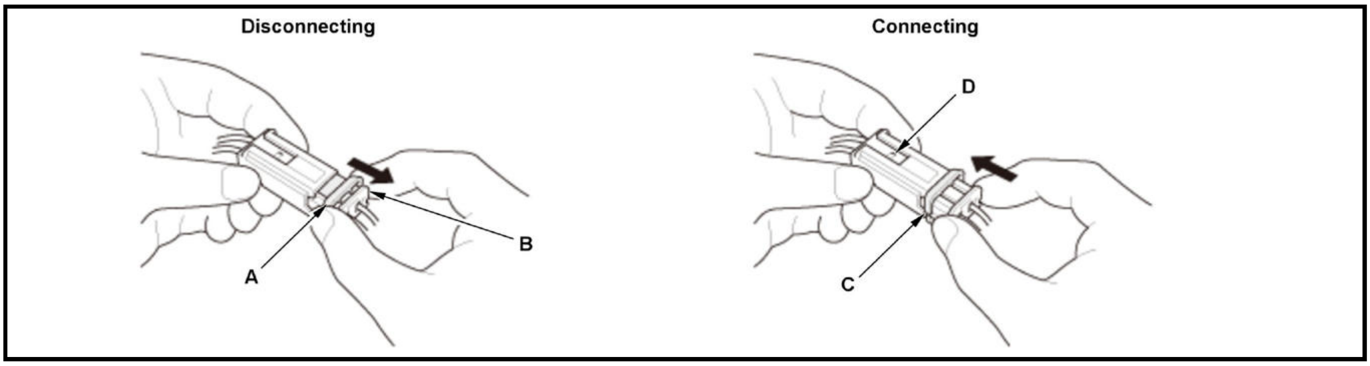
- Pull out on the locking tabs (A) to disconnect the connector (B). Be careful not to damage the connector.
- Align the guide tab (C) of the connector (D) with the ditch of the other side, and then connect the connector. Be careful not to damage the connector.



Front Passenger's Airbag Connector

Disconnecting/Connecting

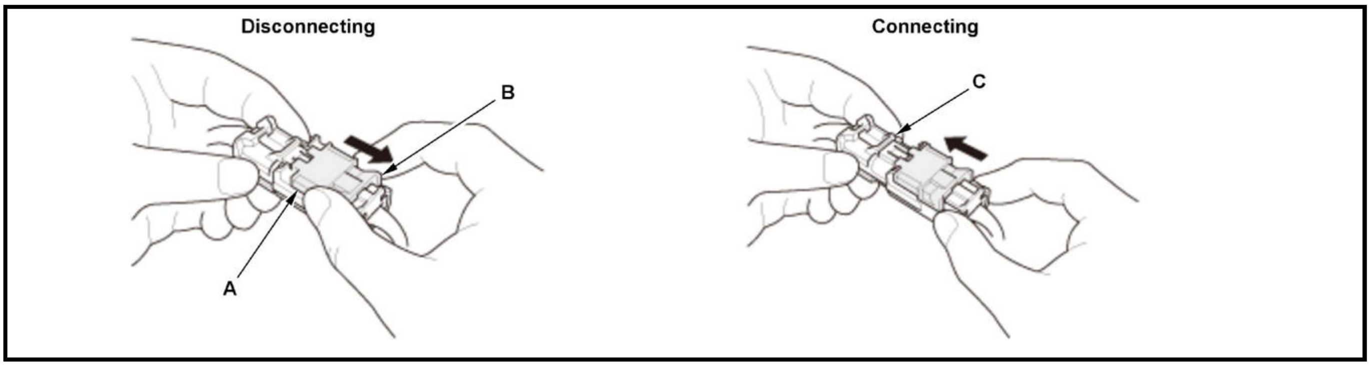
- To release the lock, pull the spring-loaded sleeve (A) toward the stop (B) while holding the opposite half of the connector, then pull the connector halves apart. Be sure to pull on the sleeve and not on the connector.
- To reconnect, hold the pawl-side connector, and press on the back of the sleeve-side connector in the direction shown. As the two connector halves are pressed together, the sleeve (C) is pushed back by the pawl (D). Do not touch the sleeve.



Side Airbag Connector/Front Seat Belt Outer Lap Tensioner Connector/Front Impact Sensor Connector/Side Impact Sensor Connector

Disconnecting/Connecting

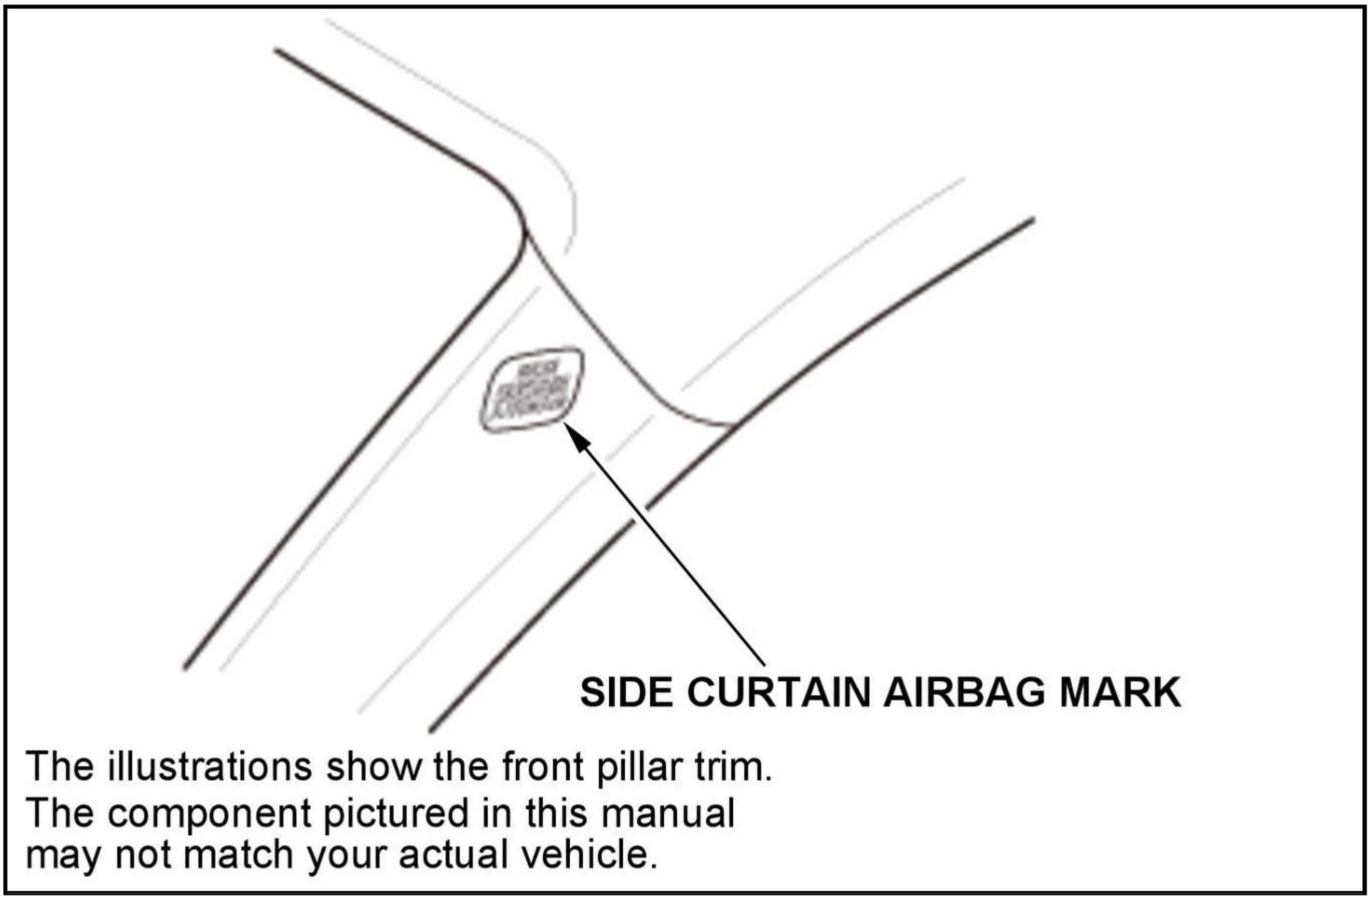
- To release the lock, pull the spring-loaded sleeve (A) toward the stop (B) while holding the opposite half of the connector, then pull the connector halves apart. Be sure to pull on the sleeve and not on the connector half.
- To reconnect, hold both connector halves and press them firmly together until the projection (C) of the sleeve-side connector clicks.



Disconnecting
B
A
Connecting
C

Side Curtain Airbags

The A-pillar trim and the quarter pillar trim with side curtain airbags have a "SIDE CURTAIN AIRBAG" mark.



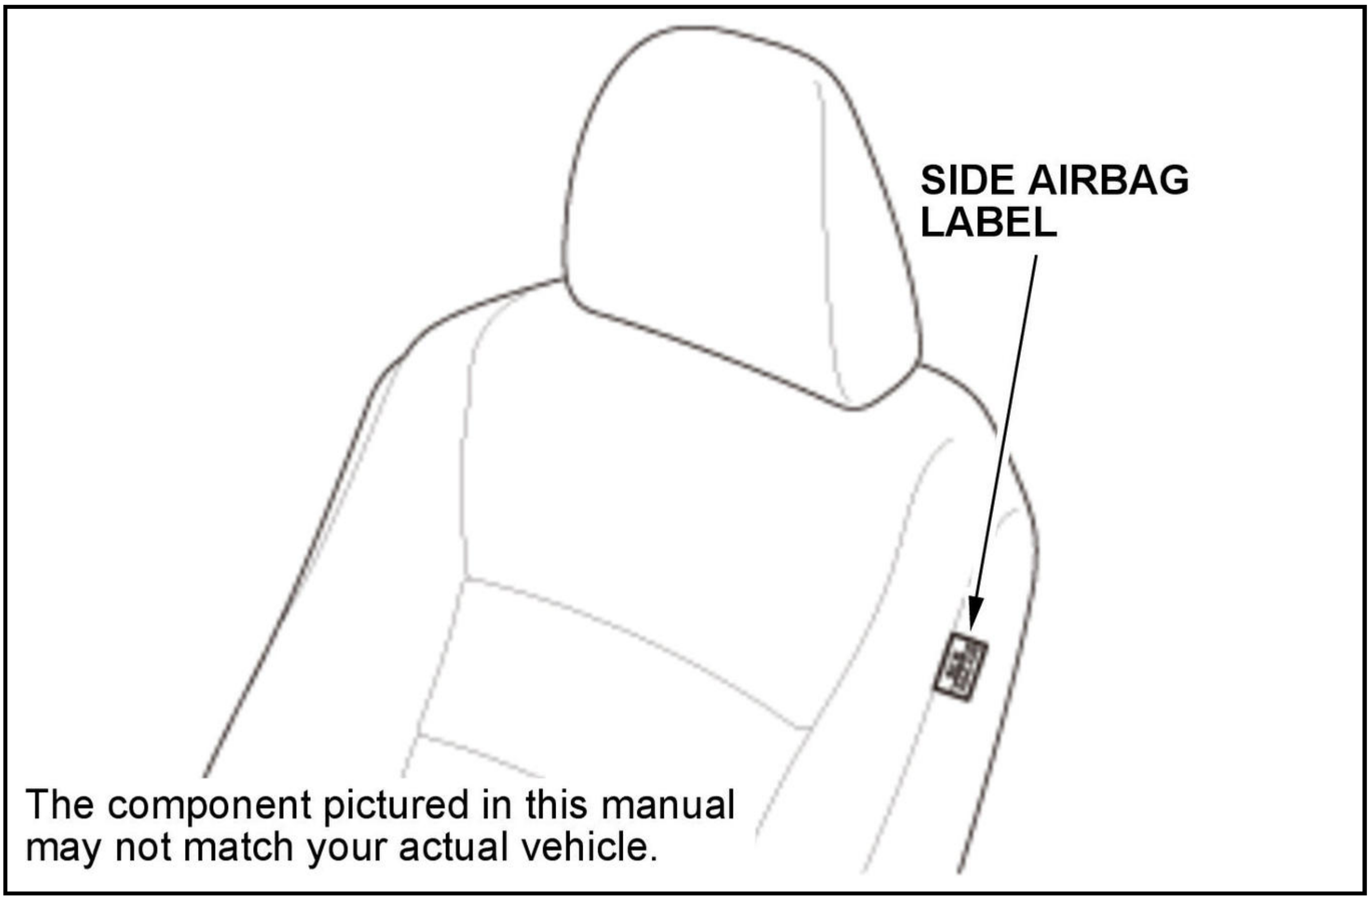
SIDE CURTAIN AIRBAG MARK
The illustrations show the front pillar trim.
The component pictured in this manual
may not match your actual vehicle.

The side curtain airbag module assembly is a long, jointed part containing an inflator, a flexible bag, and brackets. When removing or installing the side curtain airbag assembly, never:

- Handle the flexible bag.
- Drop the airbag assembly.
- Cut, tear, or unwrap the tape strips.

Front Seats With Side Airbags

Front seats with side airbags have a "SIDE AIRBAG" label on the seat-back.



SIDE AIRBAG LABEL
The component pictured in this manual may not match your actual vehicle.

- Clean the seats with a damp cloth. Do not soak the seats with liquid. Do not spray steam on the seats.
- Do not repair a torn or frayed seat-back cover/pad. Replace the seat-back cover/pad if it is damaged.
- After a collision where the side airbag was deployed, replace the side airbag and the seat frame with the new parts. If the seat-back cover is split, it must be replaced. **Refer to Component Replacement/Inspection After Deployment**.
- Never put aftermarket accessories on the seats (covers, pads, seat heaters, lights, etc.).

YAW RATE-ACCELERATION NEUTRAL POSITION MEMORIZATION

Procedure

NOTE:

- The VSA modulator-control unit receives the yaw rate and the acceleration information from the SRS unit. This information is corrected by the neutral position learning of VSA modulator-control unit, performs the VSA control. Follow the procedures of the VSA system for more details.
- When you replace or update the SRS unit, memorize the yaw rate-acceleration neutral position.

1. **VSA Sensor Neutral Position - Memorize**

CHECK

DRIVER'S SEAT POSITION SENSOR OPERATION CHECK

Procedure

NOTE: Check the driver's seat position sensor operation after the driver's seat position sensor replacement.

1. HDS - Connect
2. Driver's Seat Position Sensor - Operation Check

 The component pictured in this manual may not match your actual vehicle.	1. Make sure the driver's seat is in the full forward position. 2. From SRS in the HDS Main Menu, select SRS, then Data List. 3. Using two pieces of tape (A), make alignment marks (B) on the recline cover (C) and the front door sill trim (D) as shown. The driver's seat position sensor should read NEAR on the HDS. 4. Move the seat back in small increments (about 5 mm, (0.20 in)) until the driver's seat position sensor reads NOT-NEAR on the HDS. The seat should be about 45 mm (1.77in) from the front. **NOTE:** It takes a few seconds for the HDS to change display, so wait for about 5 seconds between each movement. If the driver's seat position sensor data does not work as described above,

	check the driver's seat position sensor for damage, and replace parts as needed. 5. Turn the vehicle to the OFF (LOCK) mode.

FRONT PASSENGER'S WEIGHT SENSOR OPERATION CHECK AFTER REPLACING FRONT PASSENGER'S SEAT COMPONENT(S)

Procedure

NOTE:

- Check the front passenger's weight sensor operation after replacing or removing front passenger's seat component(s) (except front passenger's weight sensor, the front passenger's seat frame, or the front passenger's seat rail).
- Check the front passenger's weight sensor operation after front passenger's seat replacement or removal.
- When any of the following procedures are performed, **go to Front Passenger's Weight Sensor Initialization**.
-
    - -

      The SRS unit was replaced/updated.
    - -

      The front passenger's weight sensor, the front passenger's seat frame, and/or the front passenger's seat rail was replaced/removed.

1. **HDS - Connect**
2. Front Passenger's Weight Sensor - Operation Check

   NOTE:

   - Before doing this procedure, clear the DTCs.
   - Before doing this procedure, make sure the 12 volt battery is fully charged.
   - Make sure the front passenger's seat and all components of the seat are correctly installed.
   - Make sure nothing is on the front passenger's seat, including aftermarket seat covers or mats.
   - Make sure there is nothing in the front passenger's seat-back pocket.
   - Make sure the vehicle is on level ground.
   - When you perform this procedure, the vehicle temperature must be between 41- 113 deg.F (5 - 45 deg.C).
   - When the vehicle is exposed to intense cold or intense heat, move the vehicle inside, open the windows and moonroof (if equipped) and perform this procedure after one hour or more.
   - Do not expose the front passenger's seat to sudden temperature changes.
   - Do not use the A/C and the heater.
   - Do not touch the front passenger's seat and keep the vehicle stationary during this procedure.
   - Do not attach the seat belt tongue into the buckle.
   - If possible, do all of the above procedures inside.

   1. Position the front passenger's seat all the way rearward and lowermost (if equipped with the height adjuster), then adjust the seat-back to the forward most position.

   NOTE: Do not move the seat from this position until the operation check is completed.

2. From SRS of the System Selection Menu, select SRS/SWS, then Data List. In the Data List, select FRONT PASSENGER'S WEIGHT. The weight (T0) of the front passenger's seat is displayed by the HDS. Write this measurement down as "T0" on a piece of paper.

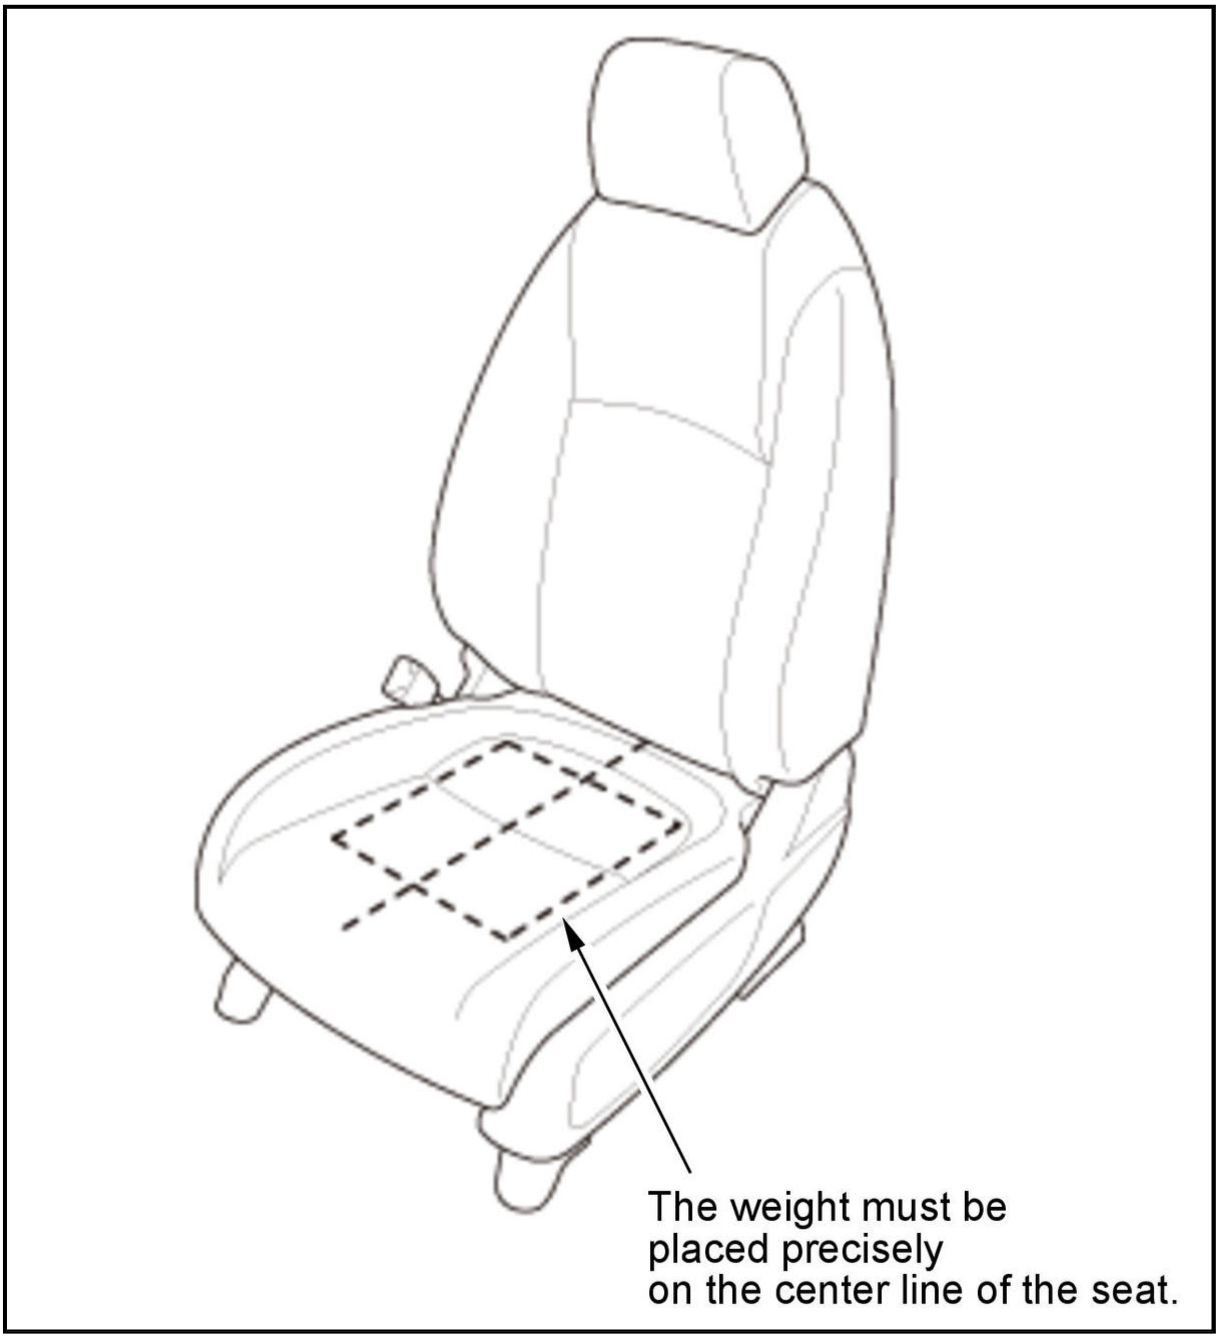
- If the reading on the HDS (T0) is within +/-2.1 kg (+/-4.6 lbs), go to step 3.
- If the reading on the HDS (T0) is at or not within +/-2.1 kg (+/-4.6 lbs), turn the vehicle to the OFF (LOCK) mode, and **go to the Front Passenger's Weight Sensor Initialization**.

3. Prepare a weight between 10 kg (22 lbs) - 20 kg (44 lbs) then measure and note its actual weight (M) with a weight scale.

NOTE:

- **The accuracy of the weight scale must be within 1 kg (2 lbs).**
- **The weight must be uniform in shape and size to allow precise placement on the seat.**

4. Place the prepared weight precisely on the center of the front passenger's seat as shown.



5. From the Data List, select FRONT PASSENGER'S WEIGHT. The weight (T1) of the front passenger's seat is displayed by the HDS. Write this measurement down as "T1".

6. Divide (M) by 2. Write this calculation as "M1" on a piece of paper.

7. Calculate the variance between the weight measured by the weight scale and the HDS with the formula.

Variance = ((T1)-(T0)-(M1))	
Â	
T1:	**Weight measured by the HDS with the weight on the seat.**
T0:	**Weight measured by the HDS with no load on the seat.**
M1:	**Half of the weight measured by the weight scale.**

- If the variance is within +/-2.2 kg (+/-4.9 lbs), initialization is complete. Go to step 8.
- If the variance is at or not within +/-2.2 kg (+/-4.9 lbs), do the following and then **go to the Front Passenger's Weight Sensor Initialization**.
-
    - -

      Confirm that the seat has no interference with surrounding components.
    - -

      Confirm that the weight was placed precisely in the center of the seat.
    - -

      Remove the front passenger's weight sensors and reinstall them .

8. Turn the vehicle to the OFF (LOCK) mode.

FRONT PASSENGER'S WEIGHT SENSOR OUTPUT CHECK AFTER A VEHICLE COLLISION

Procedure

NOTE:

- Check the front passenger's weight sensor output after a vehicle collision, regardless if the airbags and seatbelt tensioners deployed or not.
- When any of the following procedures are performed, **go to Front Passenger's Weight Sensor Initialization**.
-
    - -

      The SRS unit was replaced/updated.
    - -

      The front passenger's weight sensor, the front passenger's seat frame, and/or the front passenger's seat rail was replaced/removed.

1. **HDS - Connect**
2. Front Passenger's Weight Sensor - Output Check After a Vehicle Collision

   NOTE:

   - Before doing this procedure, clear the DTCs.
   - Before doing this procedure, make sure the 12 volt battery is fully charged.

- Make sure the front passenger's seat and all components of the seat are correctly installed.
- Make sure nothing is on the front passenger's seat, including aftermarket seat covers or mats.
- Make sure there is nothing in the front passenger's seat-back pocket.
- Make sure the vehicle is on level ground.
- When you perform this procedure, the vehicle temperature must be between 41- 113 deg.F (5 - 45 deg.C).
- When the vehicle is exposed to intense cold or intense heat, move the vehicle inside, open the windows and moonroof (if equipped) and perform this procedure after one hour or more.
- Do not expose the front passenger's seat to sudden temperature changes.
- Do not use the A/C and the heater.
- Do not touch the front passenger's seat and keep the vehicle stationary during this procedure.
- Do not attach the seat belt tongue into the buckle.
- If possible, do all of the above procedures inside.

1. Position the front passenger's seat all the way rearward and lowermost (if equipped with the height adjuster), then adjust the seat-back to the forward most position.

NOTE: Do not move the seat from this position until the output check is completed.

2. From SRS of the System Selection Menu, select SRS/SWS, then Data List. In the Data List, select FRONT PASSENGER'S WEIGHT. The weight (T0) of the front passenger's seat is displayed by the HDS. Write this measurement down as "T0" on a piece of paper.

- If the reading on the HDS (T0) is within +/-2.1 kg (+/-4.6 lbs), go to step 3.
- If the reading on the HDS (T0) is at or not within +/-2.1 kg (+/-4.6 lbs), do the following and then **go to the Front Passenger's Weight Sensor Initialization**.
-
    - -

      Confirm that the seat has no interference with surrounding components.
    - -

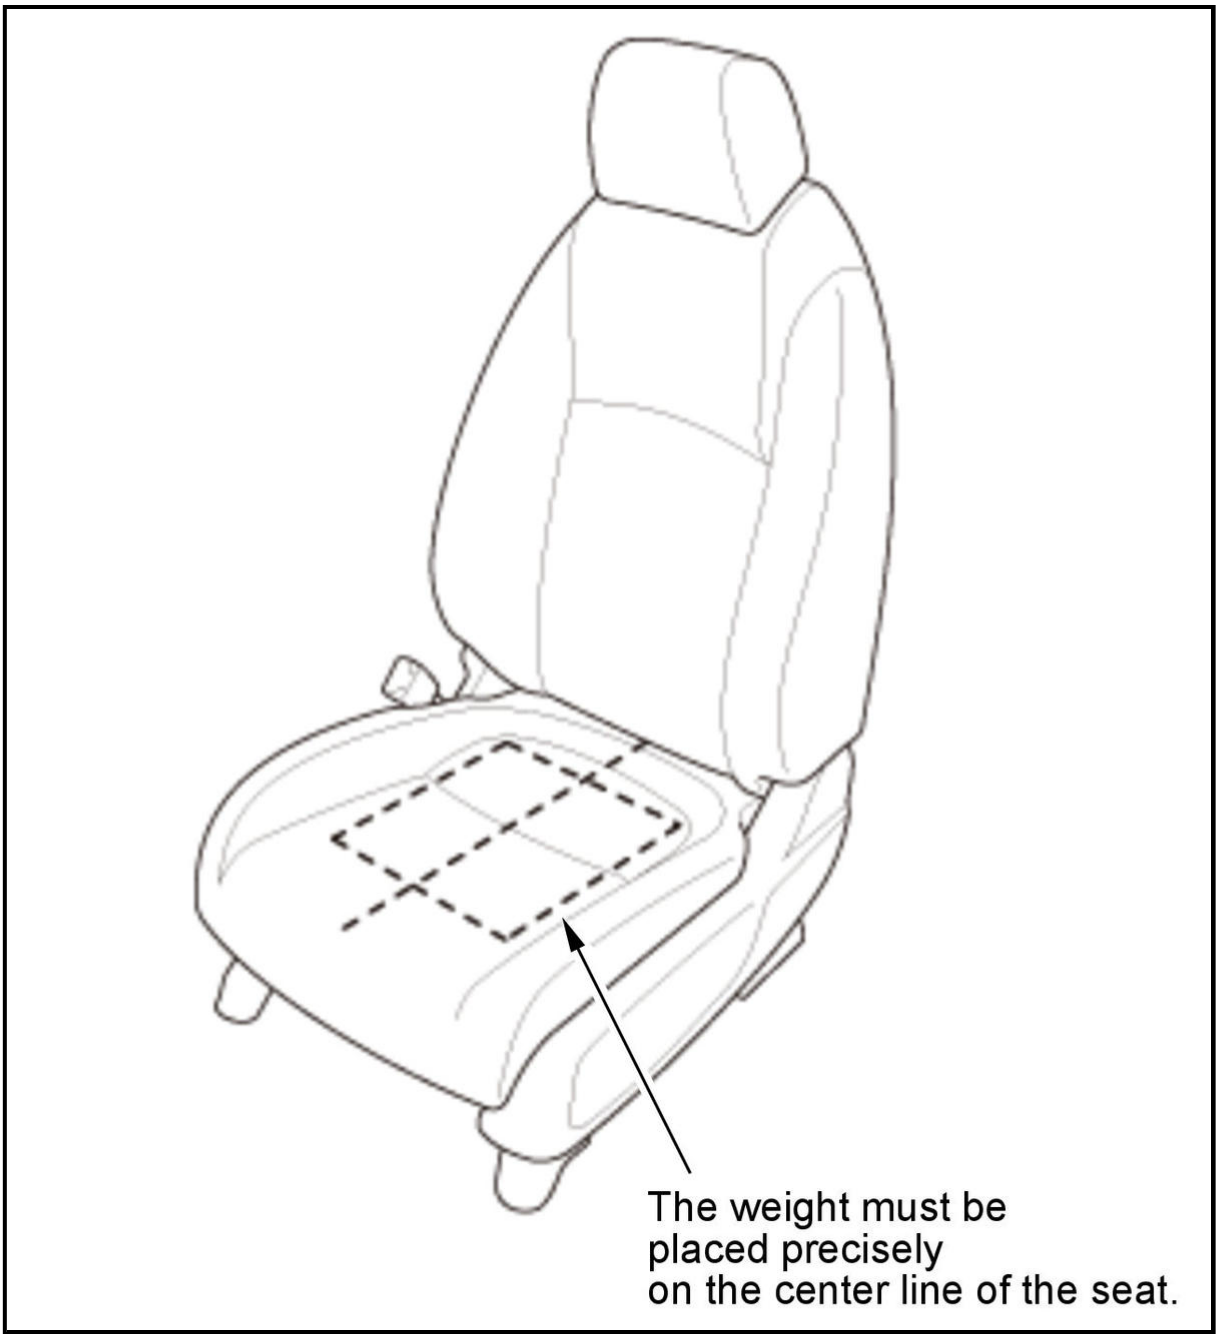
      Remove the front passenger's weight sensors and inspect them for damage. If damage is found, replace the sensors. If no damage is found, reinstall the sensors.

3. Prepare a weight between 10 kg (22 lbs) - 20 kg (44 lbs) then measure and note its actual weight (M) with a weight scale.

NOTE:

- **The accuracy of the weight scale must be within 1 kg (2 lbs).**
- **The weight must be uniform in shape and size to allow precise placement on the seat.**

4. Place the prepared weight precisely on the center of the front passenger's seat as shown.



5. From the Data List, select FRONT PASSENGER'S WEIGHT. The weight (T1) of the front passenger's seat is displayed by the HDS. Write this measurement down as "T1".

6. Divide (M) by 2. Write this calculation as "M1" on a piece of paper.

7. Calculate the variance between the weight measured by the weight scale and the HDS with the formula.

Variance = ((T1)-(T0)-(M1))	
Â	
T1:	**Weight measured by the HDS with the weight on the seat.**
T0:	**Weight measured by the HDS with no load on the seat.**
M1:	**Half of the weight measured by the weight scale.**

- If the variance is within +/-2.2 kg (+/-4.9 lbs), initialization is complete. Go to step 8.
- If the variance is at or not within +/-2.2 kg (+/-4.9 lbs), do the following and then go to the Front Passenger's Weight Sensor Initialization.
-

- -

  Confirm that the seat has no interference with surrounding components.

- -

  Confirm that the weight was placed precisely in the center of the seat.

- -

  Remove the front passenger's weight sensors and reinstall them .

8. Turn the vehicle to the OFF (LOCK) mode.

DESCRIPTION AND OPERATION

SRS SYSTEM

SRS System Description

This vehicle is equipped with SRS components including driver's and front passenger's airbags, side airbags, side curtain airbags, seat belt outer lap tensioners, and seat belt tensioners.

SRS Airbag System (Driver's and Front Passenger's Airbag)

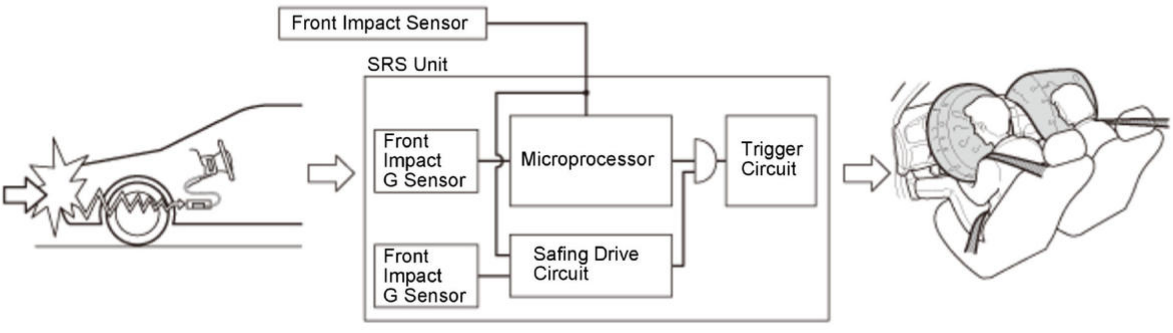
In case of a frontal collision, the SRS airbag system uses a seat belt tensioner as a body restraint device in addition to the impact-absorbing construction of the body shell as a function to mitigate the impact forces acting on the head and chest of the front seat occupant. The driver's airbag and the front passenger's airbag uses two inflators for a dual-stage output control system. In case of a collision at low or medium speed, the airbag is deployed while reducing the inflator output by means of a dual-stage ignition of each inflator, which helps to reduce the possibility of injury to the occupant. In case of a sudden collision at high speed, both inflators are ignited at the same time to restrain and protect the occupants. The system registers when a seated occupant is wearing the seat belt, and in some cases, like a low-speed collision, the occupant may be restrained by the seat belt only. This vehicle adopts a continuous capacity changing airbag for the driver's airbag that is designed to satisfy both protection of occupants and gentle deployment of the airbag.

Operating process of the SRS airbag:

1. The impact force generated by a frontal collision is transmitted via the vehicle's structural components and input from each of the front impact sensors, front impact G sensors and the safing drive circuit inside the SRS unit.

2. The front impact sensor converts the collision force into electrical signals which are sent to the microprocessor and the safing drive circuit inside the SRS unit. At the same time, the front impact G sensors inside the SRS unit converts the collision force input into waveform electrical signals and sends them to the microprocessor and the safing drive circuit.

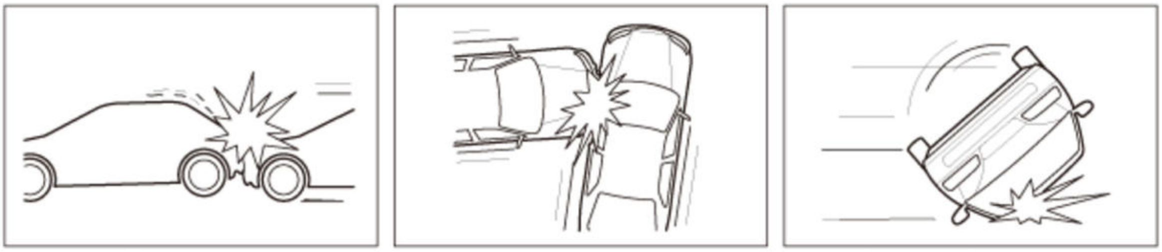
3. The microprocessor outputs actuation signals if the outputs from the front impact sensors and front impact G sensor exceed the preset threshold value. At this time, if the output from the safing drive circuit inside the SRS unit exceeds the preset threshold value, current flows through a trigger circuit, which deploys the SRS airbag and operates the seat belt tensioner and the seat belt outer lap tensioner.



The vehicle pictured in this manual may not match your actual vehicle.

SRS airbags do not deploy in the following cases:

The SRS airbag deploys when a strong impact comes from the front right or left direction within 30 degrees from the front face when the vehicle is in the ON mode. Therefore, in the following cases, the SRS airbag does not deploy because there is no effect on the occupant protection. Note that it may deploy depending on the state of collision.



Rear impacts

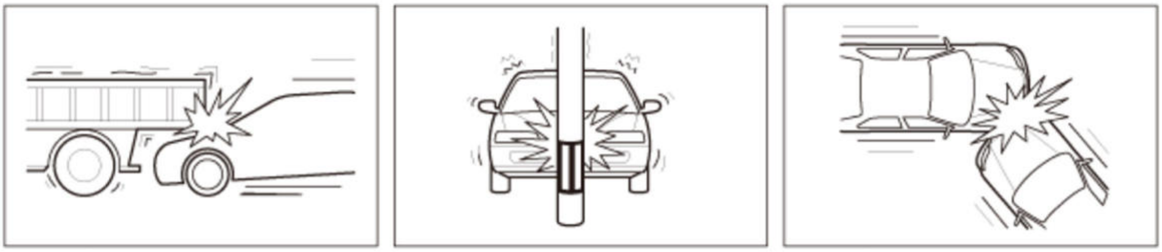
Side impacts

Rollover or Overthrown

The vehicle pictured in this manual may not match your actual vehicle.

SRS airbags may not deploy in the following cases:

The deployment of the SRS airbag is designed based on the scale of the impact felt by the occupant. Therefore, the deployment of the SRS airbag is not always related to the amount of damage to the vehicle.



Creeping under the truck

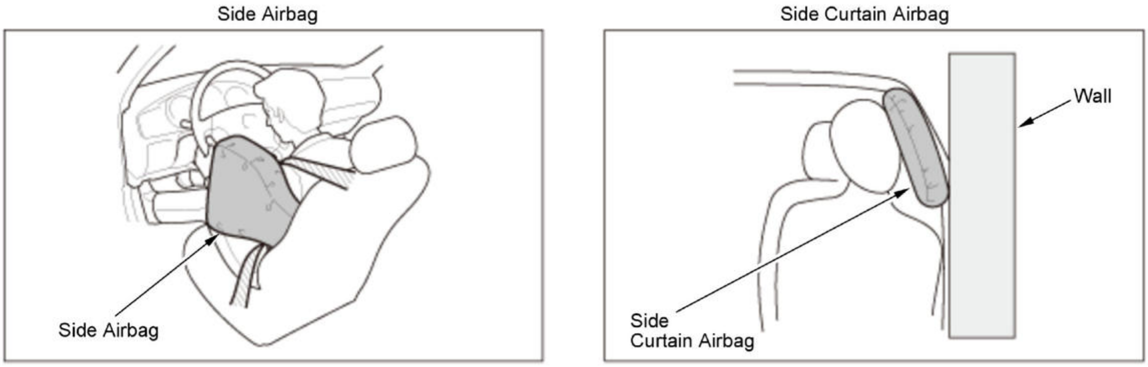
Colliding into a pole or tree

Partial collision or
oblique direction collision

The vehicle pictured in this manual may not match your actual vehicle.

Side Airbag System and Side Curtain Airbag System

In case of a side impact, the side airbag, the side curtain airbag, and the seat belt tensioner on the impact side operate in addition to the impact-absorbing body shell of the vehicle, which mitigates the impact forces acting on the head and chest of the occupant. Moreover, the left and the right side impact sensors detect the various states of collision so that the airbag deploys accordingly. The side airbag uses a variable volume type; the construction and the deployment process of the airbag pressure chamber have been improved, and enable a safe deployment regardless of the position of the occupant. Therefore, conventional OPDS related parts are not equipped.*OPDS: Occupant Position Detection System



Side Airbag

Side Curtain Airbag

The vehicle pictured in this manual may not match your actual vehicle.

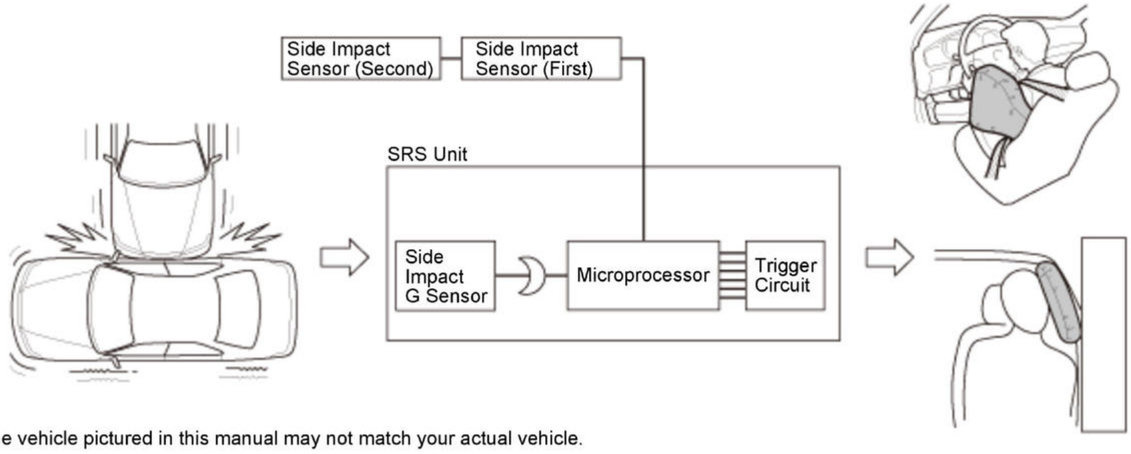
Side airbag and side curtain airbag deployment process:

1. The collision force generated from the side impact is input to each of the side impact sensors and the side impact G sensor inside the SRS unit.

2. If the microprocessor inside the SRS unit determines that the side impact sensor output exceeds a preset threshold value, and if the output from the side impact G sensor inside the SRS unit exceeds a preset threshold value, the circuit creates an actuation signal.

3. The actuation signal is sent from the microprocessor to the trigger circuit, which deploys the side airbag, the side curtain airbag, and the seat belt tensioner.

NOTE: In cases of a strong frontal collision, the threshold value for a side impact is exceeded in the SRS unit, the side curtain airbag may deploy.

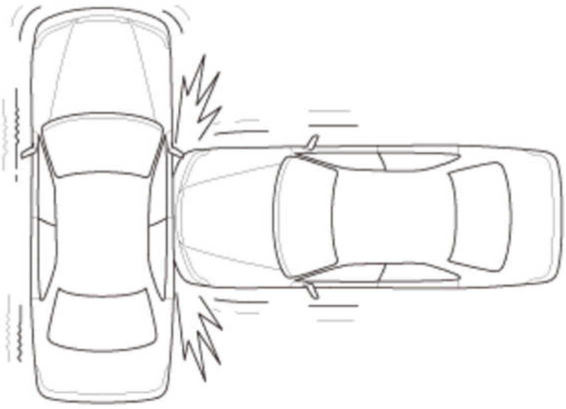


The vehicle pictured in this manual may not match your actual vehicle.

Side airbag and side curtain airbag deployment conditions:

When the vehicle is subject to strong side impact and the side impact G sensor detects an impact that exceeds the preset threshold value, the side airbags and side curtain airbags on the side receiving the impact will deploy.

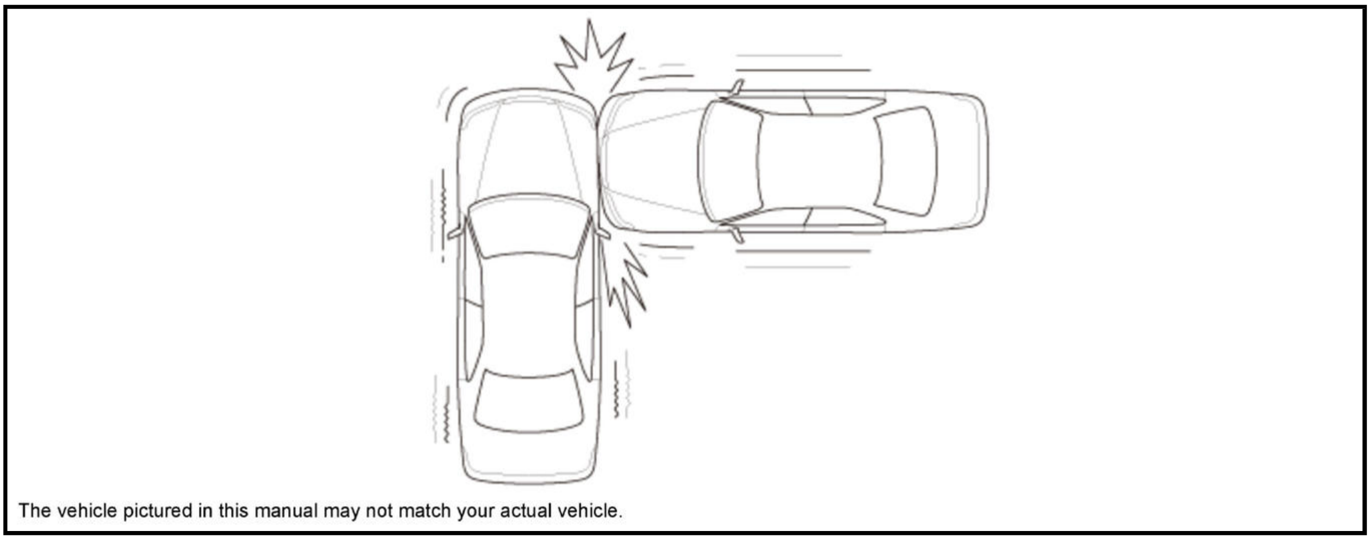
NOTE: The side curtain airbags may deploy along with the front airbags during a front-end collision in order to protect the heads of occupants if the collision force to the side of the vehicle exceeds a certain value.



The vehicle pictured in this manual may not match your actual vehicle.

Conditions in which side airbag and side curtain airbag may not deploy:

Since the side airbags and the side curtain airbags are designed to deploy when an impact force to the vehicle side exceeds a preset value, they may not deploy when impact forces are reduced by the vehicle's crush zone, or when a side impact is applied in the front or behind the passenger compartment. Also, these airbags may deploy in the case of side slip collision or when the vehicle roll overs, but in such cases, will not provide full occupant protection.



The vehicle pictured in this manual may not match your actual vehicle.

Seat Belt Tensioner and Seat Belt Outer Lap Tensioner

The seat belt tensioner and the seat belt outer lap tensioner instantaneously retract the seat belt at the time of a collision, and the effect of the seat belt is increased further by securely restraining the occupant in the seat. In the case of a low to medium speed or high speed collision, the airbags, seat belt tensioner, and seat belt outer lap tensioner are activated to improve the restraining effect of the occupant and safety performance. The seat belt tensioner and the seat belt outer lap tensioner instantaneously retract the seat belt at the time of a collision, and the effect of the seat belt is increased further by securely restraining the occupant in the seat. In the case of a low-speed collision, since the seat belt can adequately secure the occupant, only the seat belt tensioner and the seat belt outer lap tensioner are activated to retract the seat belt without deploying the airbags. In the case of a medium speed to high speed collision, the airbags, seat belt tensioner, and seat belt outer lap tensioner are activated to improve the restraining effect of the occupant and the safety performance.

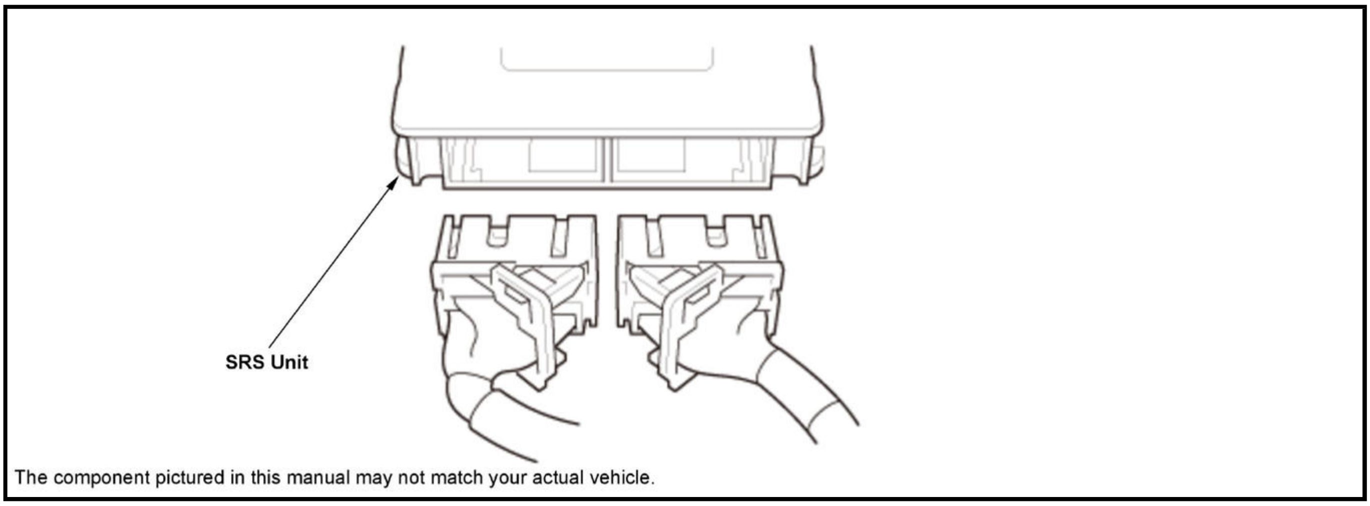
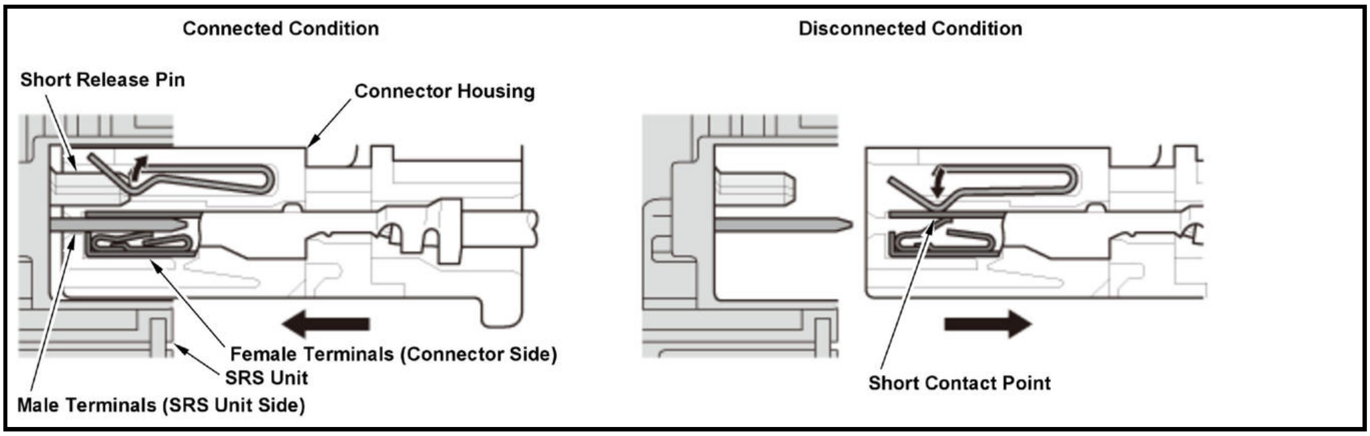
Components (2017 2018)

SRS Unit (Automatic Short-Circuit Mechanism of SRS Unit Connectors)

When the SRS unit connectors are disconnected from the SRS unit, the automatic short-circuit mechanism in the connectors creates short-circuits to prevent accidental deployment of airbags or tensioners. This automatic short-circuit mechanism is configured in such a way that the respective deployment side circuits (adjacent terminal) are short-circuited when the connector is disconnected.



The component pictured in this manual may not match your actual vehicle.



Connected Condition
Disconnected Condition
Short Release Pin
Connector Housing
Female Terminals (Connector Side)
SRS Unit
Male Terminals (SRS Unit Side)
Short Contact Point

SRS Unit (Electrical Terminal Fit Detection System)

The connectors connected to the SRS unit are equipped with a terminal that short-circuits the fit detection terminals with each other. If the connectors are properly connected, the fit detection terminals are short-circuited to each other and the SRS unit detects the fitting of the various connectors. When the vehicle is turned to the ON mode while a fitting is not detected, poor terminal fitting is judged and a DTC is stored.

SRS Unit (Rollover Detection)

A sensor integrated into the SRS unit performs rollover detection. The sensor detects the degree of vehicle roll and converts it to an electrical signal. If the SRS unit determines that a vehicle rollover is occurring, one or both side curtain airbags and seat belt tensioners will be deployed depending on the direction and number of rollover events.

Driver's and Front Passenger's Airbag

Airbag

The driver's airbag is located in the center of the steering wheel. The front passenger's airbag is located in the dashboard on the front passenger's side.

The component pictured in this manual may not match your actual vehicle.

Driver's Airbag (Continuous Capacity Change Type)

For the driver's airbag, the continuous capacity changing airbag that is spiral stitched coming with the exhaust air control valve helps lower the impact of airbag while protecting the occupants effectively. The spiral stitched airbag can get inflated in a shorter time at the suitable air-pressure with a small amount of inside-air; however it does not compromise the ability of protecting the occupants. The exhaust air control valve on the airbag adjusts the air-pressure properly, and tearing the spiral stitches on the airbag will increase its air-capacity inside the airbag so that the system can keep its proper air-pressure.

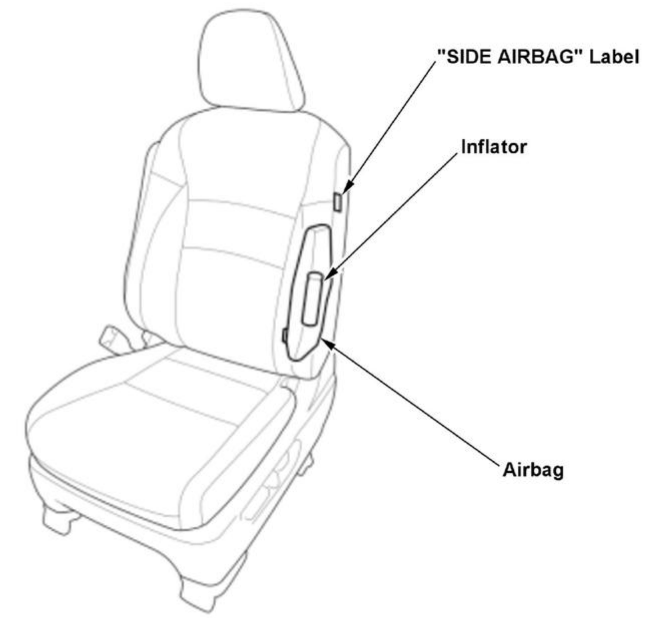
The component pictured in this manual may not match your actual vehicle.

Side Airbag and Side Curtain Airbag

Side Airbag

The side airbags are located at the outside position of the seat-back of the driver's seat and the front passenger's seat. Being installed at the seat-back enables operation in optimal condition for the occupants regardless of the seat slide and recline position.

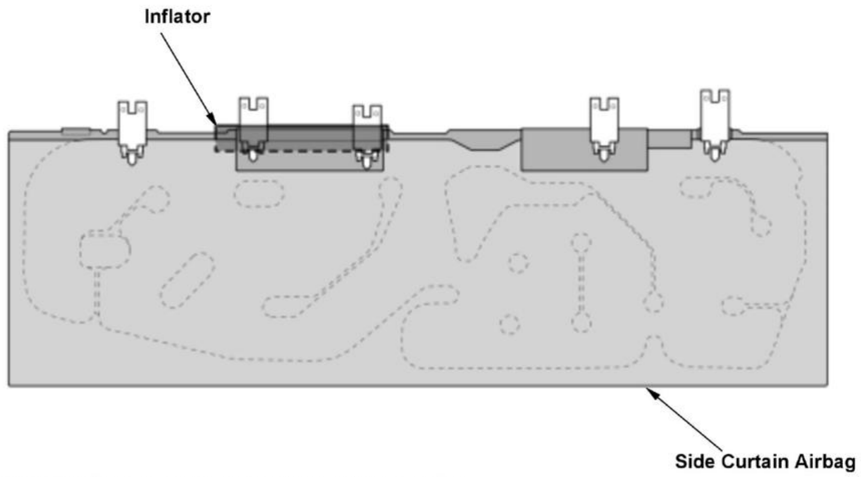
The side airbag assembly is configured with an inflator and an airbag. It is designed in a way that the airbag tears open the seam of the seat-back to enable efficient deployment. Objects adjacent to deployment or using a seat cover other than the one dedicated for the side airbag may prevent proper operation of the side airbag.



The component pictured in this manual may not match your actual vehicle.

Side Curtain Airbag

A side curtain airbag inflates the full area of the window to protect your head from hitting the window or frame pillar in a side-impact collision. The side curtain airbags are located under the roof side panels. The side curtain airbags are deployed by triggering a gas inflator located near the B-pillar. Objects adjacent to deployment or attaching parts other than the ones dedicated for side curtain airbags is subject to prevent proper operation of the side curtain airbags.



The component pictured in this manual may not match your actual vehicle.

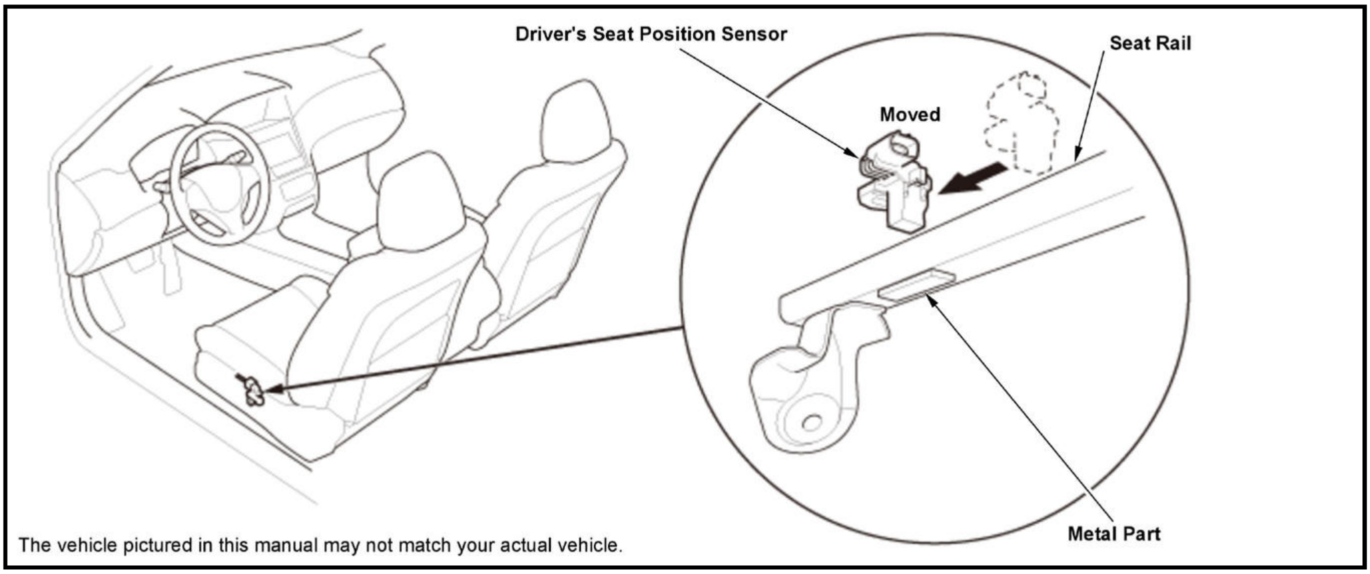
Impact Sensor

The G-force sensor within the impact sensor detects the force upon a collision. If the impact exceeds a preset threshold value, it is converted into an electrical signal that is sent to the SRS unit.

- Front impact sensor: The front impact sensors are installed at the right and left front side frame. They detect the frontal vehicle impacts.
- Side impact sensor: The first and second side impact sensors are installed at the right and left floor near the center pillars. They detect the lateral vehicle impacts.

Driver's Seat Position Sensor

The driver's seat position sensor is mounted to the driver's seat rail. When the driver's seat is moved to the full-forward position, a metal part of the seat track interrupts the sensor signal. This change in signal is then sent to the SRS unit for processing. If a frontal airbag deployment becomes necessary, the driver's airbag will deploy at the slowest rate, regardless of impact severity. With the seat moved further back, the SRS unit commands the appropriate deployment force based on impact severity.



Driver's Seat Position Sensor
Seat Rail
Moved
Metal Part
The vehicle pictured in this manual may not match your actual vehicle.

Front Passenger's Weight Sensor

Overview

The front passenger's weight sensors for load detection are equipped inside the front passenger's seat. The SRS unit receives the load information from the weight sensors, performs an occupant judgment of the front passenger's seat, and adjusts the front passenger's airbag deployment and performance. In addition, there are two types of weight sensors, a two sensor type and a four sensor type. The HDS can determine which type is used.

Operation

The weight of the front passenger's seat is detected by the weight sensors and sent to the SRS unit. If the weight is above a threshold level, front passenger's airbag operation is allowed, and if the weight is below a threshold level, the system will automatically turn the front passenger's airbag off. Also, the front passenger's airbag cutoff indicator turns on to inform the occupant that the front passenger's airbag will not deploy.

NOTE: The front passenger's weight sensors measure only the weight that's actually on the seat cushion. They do not measure the weight of the front passenger's legs extending to the floor or arms resting on the armrests. A front seat passenger who weighs near the airbag's cutoff threshold may cause the airbag and indicator to turn on and off just by moving around in the seat and shifting the occupant weight. This may cause some occupants to believe there's something wrong with the airbag system when it is operating normally. Also, although the measured weight of the two sensor type differs by the seating state of the occupant, load detection by the weight sensors is performed accurately.

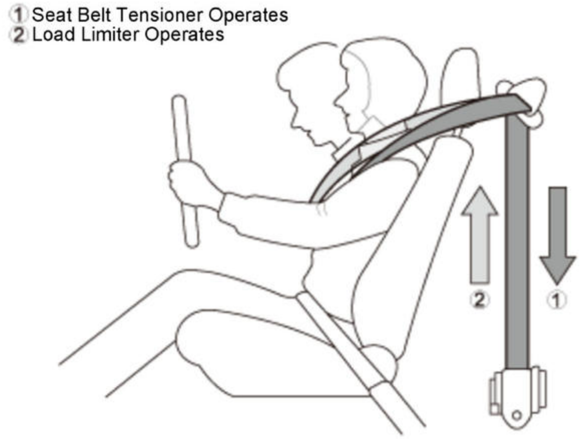
Seat Belt Tensioner

Overview

When the seat belt tensioner operates, it quickly tightens the seat belt, and improves the occupant's initial restraining effect (preventing the occupant's body from being moved forward). When the load exceeds the preset value, the load limiter keeps the restraining effect while sending out the seat belt to protect the chest of the passenger.



① Seat Belt Tensioner Operates
② Load Limiter Operates
②
①

The component pictured in this manual may not match your actual vehicle.

Operation of Seat Belt Tensioner

1. When the SRS unit detects a collision signal at the time of an impact acting upon the vehicle, it sends the actuation signal to the seat belt tensioner and the internal gas generator to generate gas.

2. The winding mechanism is rotated by the generated gas pressure and winds the seat belt.

ELR (Emergency Locking Retractor) Lock Mechanism

If the seat belt is rapidly pulled out (occupant sliding forward during a collision), the ELR lock mechanism of the seat belt retractor is actuated and locks the seat belt to secure the occupant's body.

Seat Belt Outer Lap Tensioner

Overview

In the event of a collision, the seat belt outer lap tensioner coordinates with the seat belt tensioner and instantaneously retracts the seat belt. This ensures the seat belt's ability to restrain and protect the occupant at the chest and waist by firmly securing the occupant to the seat.

Operation

1. When the SRS unit detects a collision signal at the time of an impact, it sends an actuation signal to the seat belt outer lap tensioner, and the internal gas generator generates gas.

2. A piston in the cylinder moves by the generated gas pressure and pulls the wire and seat belt.

3. After the retraction is complete, the seat belt outer lap tensioner locks the wire to prevent growth of the seat belt by the forward movement of the occupant.

The component pictured in this manual may not match your actual vehicle.

Selectable Energy Absorption Device

When the seat belt tensioner operates, it instantly retracts the seat belt, enhancing its ability to immediately restrain the occupant. Also, a selectable energy absorption device is fitted within the front passenger's seat belt tensioner that reduces the burden on the occupant's chest while properly maintaining the restraining force of the seat belt. To ensure the seat belt's ability to protect the occupant, the seat belt adjusts to its optimum energy absorption characteristic for the occupant by using the occupant weight information which is detected by the front passenger's weight sensor.

Operation

1. When the SRS unit detects a collision signal at the time of an impact, it sends an actuation signal to the seat belt outer lap tensioner, and the internal gas generator generates gas.

2. A piston in the cylinder moves by the generated gas pressure and pulls the wire and seat belt.

3. After the retraction is complete, the seat belt outer lap tensioner locks the wire to prevent growth of the seat belt by the forward movement of the occupant.

Selectable Energy Absorption Device

When the seat belt tensioner operates, it instantly retracts the seat belt, enhancing its ability to immediately restrain the occupant. Also, a selectable energy absorption device is fitted within the front passenger's seat belt tensioner that reduces the burden on the occupant's chest while properly maintaining the restraining force of the seat belt. To ensure the seat belt's ability to protect the occupant, the seat belt adjusts to its optimum energy absorption characteristic for the occupant by using the occupant weight information which is detected by the front passenger's weight sensor.

Seat Belt Reminder

Driver's Seat Belt Reminder Function

The SRS unit turns on the seat belt reminder indicator in order to urge the driver to wear their seat belt if the system detects that the seat belt is not buckled.

Passenger's Seat Belt Reminder Function

The SRS unit turns on the seat belt reminder indicator in order to urge the passenger to wear their seat belt if the system detects that there is a passenger and their seat belt is not buckled.

System Diagram

System Diagram

- Power supply circuit (booster circuit, backup power supply): Provides and maintains power when battery voltage is low or in case of power supply damage due to a collision.
- Front impact G sensors and side impact G sensor: Detect impact to the SRS unit as acceleration and converts it to an electrical signal.

- Rollover judgment circuit: Predicts an impending rollover using signals such as the one from the G sensor located inside of the SRS unit. Based on the rollover judgment and the seat belt buckle switch status, the circuit determines whether the seat belt tensioners and the side curtain airbags should deploy or not.
- Microprocessor: An impact decision algorithm decides whether or not the collision signal warrants deployment of the airbags or the tensioners.
- Diagnostic circuit: Performs self-diagnosis to determine whether system abnormalities are present. If an abnormality is detected, the SRS indicator in the gauge control module turns on.
- Non-volatile memory: Records fault conditions. The SRS memories are not erased even if the 12 volt battery terminal is disconnected.
- Communication circuit: Circuit for outputting or deleting memory contents.
- The SRS unit receives the load information from the weight sensors, performs an occupant judgment of the front passenger's seat, and adjusts the front passenger's airbag deployment and performance.

For locations of each component on vehicle, **refer to Component Location Index**.

CHECK

DRIVER'S SEAT POSITION SENSOR OPERATION CHECK (KA/KC)

Procedure

NOTE: Check the driver's seat position sensor operation after the driver's seat position sensor replacement.

1. HDS - Connect
2. Driver's Seat Position Sensor - Operation Check

 The component pictured in this manual may not match your actual vehicle.	1. Make sure the driver's seat is in the full forward position. 2. From SRS in the HDS Main Menu, select SRS, then Data List. 3. Using two pieces of tape (A), make alignment marks (B) on the recline cover (C) and the front door sill trim (D) as shown. The driver's seat position sensor should read NEAR on the HDS. 4. Move the seat back in small increments (about 5 mm, (0.20 in)) until the driver's seat position sensor reads NOT-NEAR on the HDS. The seat should be about 45 mm (1.77in) from the front. **NOTE:** It takes a few seconds for the HDS to change display, so wait for about 5 seconds between each movement. If the driver's seat position sensor data does not work as described above, check the driver's seat position sensor for damage, and replace parts as needed. 5. Turn the vehicle to the OFF (LOCK) mode.

FRONT PASSENGER'S WEIGHT SENSOR OPERATION CHECK AFTER REPLACING FRONT PASSENGER'S SEAT COMPONENT(S) (KA/KC)

Procedure

NOTE:

- Check the front passenger's weight sensor operation after replacing or removing front passenger's seat component(s) (except front passenger's weight sensor, the front passenger's seat frame, or the front passenger's seat rail).
- Check the front passenger's weight sensor operation after front passenger's seat replacement or removal.
- When any of the following procedures are performed, **go to Front Passenger's Weight Sensor Initialization**.
-
    - The SRS unit was replaced/updated.
    - The front passenger's weight sensor, the front passenger's seat frame, and/or the front passenger's seat rail was replaced/removed.

1. **HDS - Connect**
2. Front Passenger's Weight Sensor - Operation Check

   NOTE:

    - Before doing this procedure, clear the DTCs.
    - Before doing this procedure, make sure the 12 volt battery is fully charged.
    - Make sure the front passenger's seat and all components of the seat are correctly installed.
    - Make sure nothing is on the front passenger's seat, including aftermarket seat covers or mats.
    - Make sure there is nothing in the front passenger's seat-back pocket.
    - Make sure the vehicle is on level ground.
    - When you perform this procedure, the vehicle temperature must be between 41- 113 deg.F (5 - 45 deg.C).
    - When the vehicle is exposed to intense cold or intense heat, move the vehicle inside, open the windows and moonroof (if equipped) and perform this procedure after one hour or more.

- Do not expose the front passenger's seat to sudden temperature changes.
- Do not use the A/C and the heater.
- Do not touch the front passenger's seat and keep the vehicle stationary during this procedure.
- Do not attach the seat belt tongue into the buckle.
- If possible, do all of the above procedures inside.

1. Position the front passenger's seat all the way rearward and lowermost (if equipped with the height adjuster), then adjust the seat-back to the forward most position.

NOTE: Do not move the seat from this position until the operation check is completed.

2. From SRS of the System Selection Menu, select SRS/SWS, then Data List. In the Data List, select FRONT PASSENGER'S WEIGHT. The weight (T0) of the front passenger's seat is displayed by the HDS. Write this measurement down as "T0" on a piece of paper.

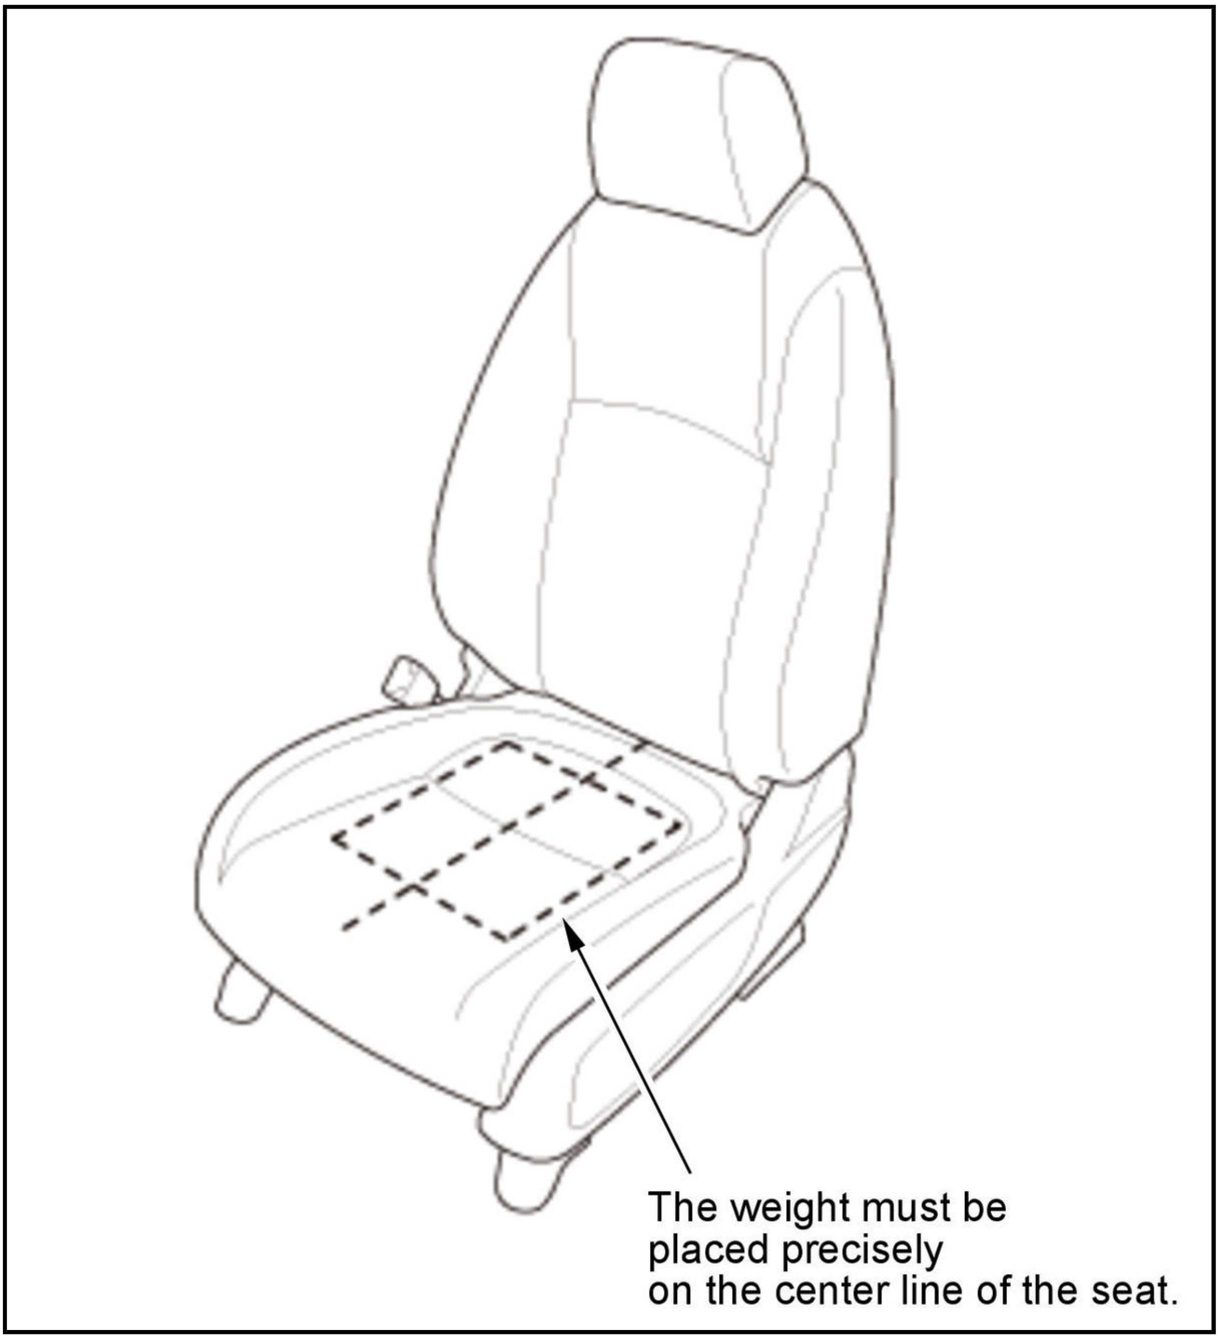
- If the reading on the HDS (T0) is within +/-2.1 kg (+/-4.6 lbs), go to step 3.
- If the reading on the HDS (T0) is at or not within +/-2.1 kg (+/-4.6 lbs), turn the vehicle to the OFF (LOCK) mode, and **go to the Front Passenger's Weight Sensor Initialization**.

3. Prepare a weight between 10 kg (22 lbs) - 20 kg (44 lbs) then measure and note its actual weight (M) with a weight scale.

NOTE:

- The accuracy of the weight scale must be within 1 kg (2 lbs).
- The weight must be uniform in shape and size to allow precise placement on the seat.

4. Place the prepared weight precisely on the center of the front passenger's seat as shown.



5. From the Data List, select FRONT PASSENGER'S WEIGHT. The weight (T1) of the front passenger's seat is displayed by the HDS. Write this measurement down as "T1".

6. Divide (M) by 2. Write this calculation as "M1" on a piece of paper.

7. Calculate the variance between the weight measured by the weight scale and the HDS with the formula.

Variance = ((T1)-(T0)-(M1))	
Â	
T1:	**Weight measured by the HDS with the weight on the seat.**
T0:	**Weight measured by the HDS with no load on the seat.**
M1:	**Half of the weight measured by the weight scale.**

- If the variance is within +/-2.2 kg (+/-4.9 lbs), initialization is complete. Go to step 8.
- If the variance is at or not within +/-2.2 kg (+/-4.9 lbs), do the following and then **go to the Front Passenger's Weight Sensor Initialization**.
-

    - Confirm that the seat has no interference with surrounding components.
    - Confirm that the weight was placed precisely in the center of the seat.
    - **Remove the front passenger's weight sensors and reinstall them** .

8. Turn the vehicle to the OFF (LOCK) mode.

FRONT PASSENGER'S WEIGHT SENSOR OUTPUT CHECK AFTER A VEHICLE COLLISION(KA/KC)

Procedure

NOTE:

- Check the front passenger's weight sensor output after a vehicle collision, regardless if the airbags and seatbelt tensioners deployed or not.
- When any of the following procedures are performed, **go to Front Passenger's Weight Sensor Initialization**.
-
    - The SRS unit was replaced/updated.
    - The front passenger's weight sensor, the front passenger's seat frame, and/or the front passenger's seat rail was replaced/removed.

1. **HDS - Connect**
2. Front Passenger's Weight Sensor - Output Check After a Vehicle Collision

NOTE:

- Before doing this procedure, clear the DTCs.
- Before doing this procedure, make sure the 12 volt battery is fully charged.
- Make sure the front passenger's seat and all components of the seat are correctly installed.
- Make sure nothing is on the front passenger's seat, including aftermarket seat covers or mats.
- Make sure there is nothing in the front passenger's seat-back pocket.
- Make sure the vehicle is on level ground.
- When you perform this procedure, the vehicle temperature must be between 41- 113 deg.F (5 - 45 deg.C).
- When the vehicle is exposed to intense cold or intense heat, move the vehicle inside, open the windows and moonroof (if equipped) and perform this procedure after one hour or more.
- Do not expose the front passenger's seat to sudden temperature changes.
- Do not use the A/C and the heater.
- Do not touch the front passenger's seat and keep the vehicle stationary during this procedure.
- Do not attach the seat belt tongue into the buckle.
- If possible, do all of the above procedures inside.

1. Position the front passenger's seat all the way rearward and lowermost (if equipped with the height adjuster), then adjust the seat-back to the forward most position.

NOTE:

Do not move the seat from this position until the output check is completed.

2. From SRS of the System Selection Menu, select SRS/SWS, then Data List. In the Data List, select FRONT PASSENGER'S WEIGHT. The weight (T0) of the front passenger's seat is displayed by the HDS. Write this measurement down as "T0" on a piece of paper.

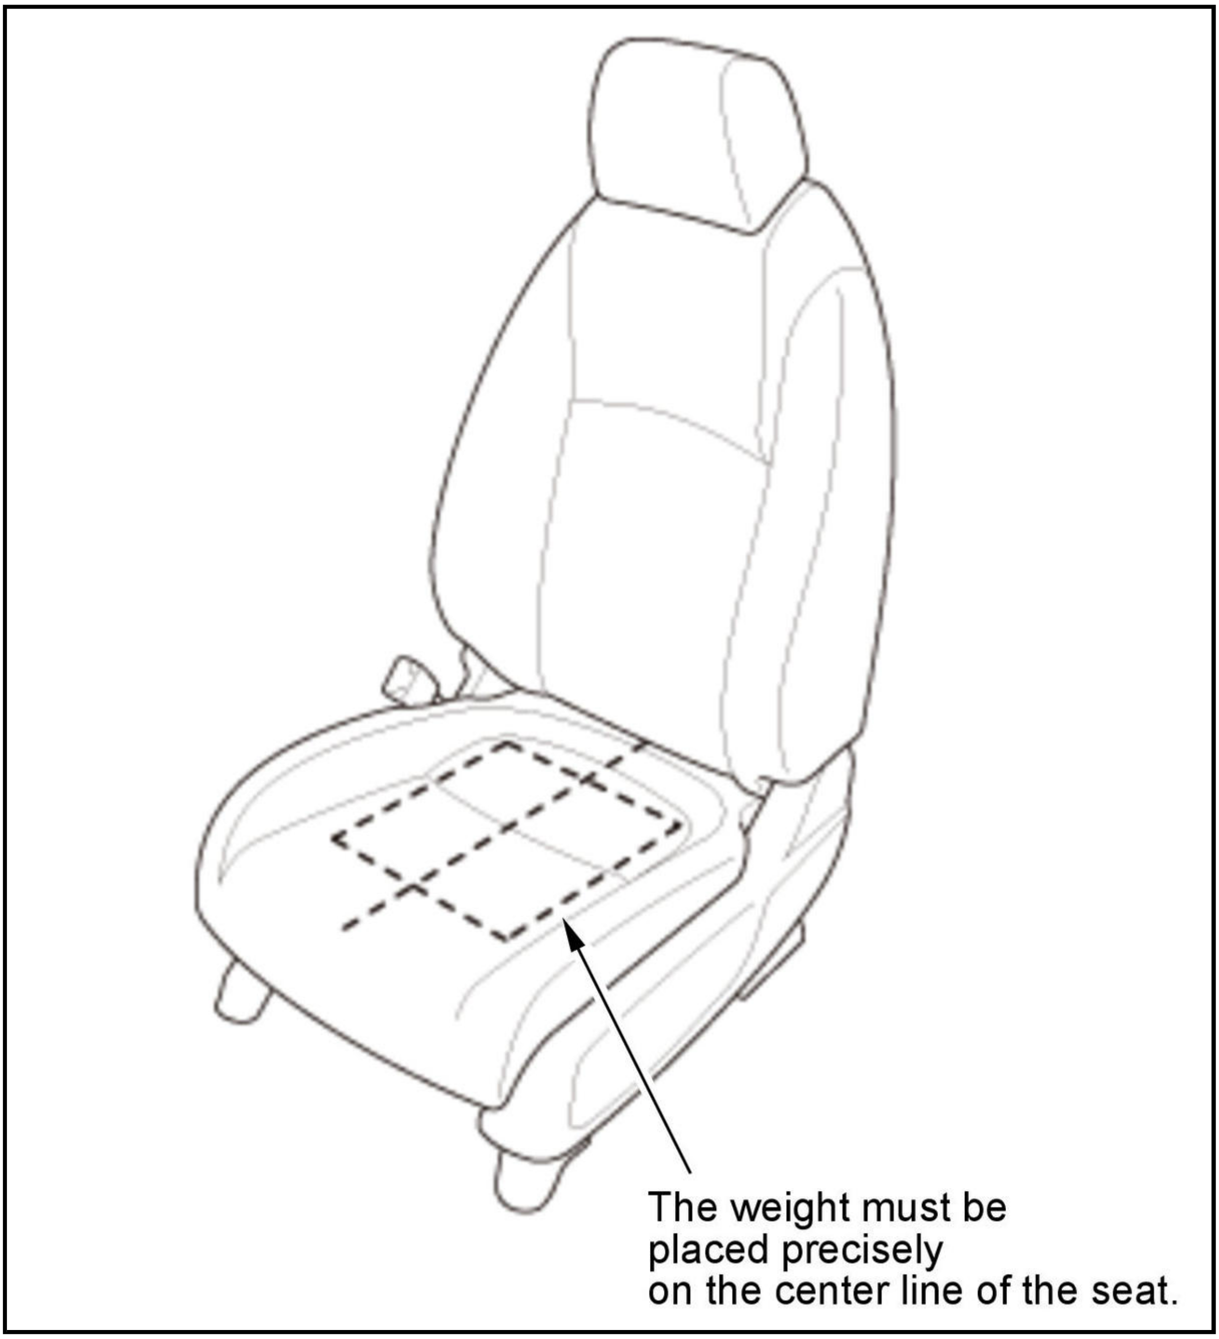
- If the reading on the HDS (T0) is within +/-2.1 kg (+/-4.6 lbs), go to step 3.
- If the reading on the HDS (T0) is at or not within +/-2.1 kg (+/-4.6 lbs), do the following and then **go to the Front Passenger's Weight Sensor Initialization**.
-
    - Confirm that the seat has no interference with surrounding components.
    - **Remove the front passenger's weight sensors** and inspect them for damage. If damage is found, replace the sensors. If no damage is found, reinstall the sensors.

3. Prepare a weight between 10 kg (22 lbs) - 20 kg (44 lbs) then measure and note its actual weight (M) with a weight scale.

NOTE:

- The accuracy of the weight scale must be within 1 kg (2 lbs).
- The weight must be uniform in shape and size to allow precise placement on the seat.

4. Place the prepared weight precisely on the center of the front passenger's seat as shown.



The weight must be placed precisely on the center line of the seat.

5. From the Data List, select FRONT PASSENGER'S WEIGHT. The weight (T1) of the front passenger's seat is displayed by the HDS. Write this measurement down as "T1".

6. Divide (M) by 2. Write this calculation as "M1" on a piece of paper.

7. Calculate the variance between the weight measured by the weight scale and the HDS with the formula.

Variance = ((T1)-(T0)-(M1))	
Â	
T1:	**Weight measured by the HDS with the weight on the seat.**
T0:	**Weight measured by the HDS with no load on the seat.**
M1:	**Half of the weight measured by the weight scale.**

- If the variance is within +/-2.2 kg (+/-4.9 lbs), initialization is complete. Go to step 8.
- If the variance is at or not within +/-2.2 kg (+/-4.9 lbs), do the following and then **go to the Front Passenger's Weight Sensor Initialization**.
-
    - Confirm that the seat has no interference with surrounding components.
    - Confirm that the weight was placed precisely in the center of the seat.
    - **Remove the front passenger's weight sensors and reinstall them** .

8. Turn the vehicle to the OFF (LOCK) mode.

INSPECTION REPLACEMENT

SRS COMPONENT REPLACEMENT/INSPECTION AFTER DEPLOYMENT

Inspection

1. Component Replacement/Inspection After Deployment - Inspect

NOTE:

- Before doing any SRS repairs after a collision, **check the deployed history** and **check for DTCs with the HDS** to determine the components that need replacement.
- Do not repair damaged SRS wiring, connectors or terminals. Replace the affected wiring harness(es).
- When replacing the front seat belt tensioner, check the seat belt mounting portion for deformation. If any deformation is found, repair it as needed.

After a collision where the seat belt outer lap tensioner deployed, replace these items:

- SRS unit
- Front seat belt(s)
- Seat belt outer lap tensioner(s)
- Front impact sensor(s)

After a collision where the front airbag(s) deployed, replace these items:

- SRS unit
- Deployed front airbag(s)
- Front seat belt(s)
- Front impact sensor(s)

- Cable reel (deployed driver's airbag)
- Springs (deployed driver's airbag)
- Dashboard (deployed front passenger's airbag)

After a collision where the side airbag deployed, replace the items for the side(s) that deployed:

- SRS unit
- Deployed side airbag(s)
- Front seat belt(s)
- Side impact sensor(s) (first)
- Side impact sensor(s) (second)
- B-pillar lower trim
- Seat frame and related parts

After a collision where the side curtain airbag deployed, replace the items for the side(s) that deployed:

- SRS unit
- Deployed side curtain airbag(s)
- Front seat belt(s)
- Side impact sensor(s) (first)
- Side impact sensor(s) (second)
- A-pillar trim
- B-pillar upper trim
- Quarter pillar trim
- Front grab handle
- Rear grab handle
- All related trim clips
- Sunvisor
- Headliner

After a moderate to severe side or rear collision, inspect for any damage on the side curtain airbag or other related components. Replace the pillar trims and related clips as needed .

During the repair process, inspect these areas:

- Inspect all the SRS wire harnesses. Replace, do not repair, any damaged harnesses, connectors or terminals.
- Inspect the cable reel for heat damage. If there is any damage, replace the cable reel .

After the vehicle is completely repaired, turn the vehicle to the ON mode. If the SRS indicator comes on for about 6 seconds and then goes off, the SRS is OK. If the indicator does not function properly, use the HDS to check for the DTCs. If you cannot retrieve a code, do the SRS Symptom Troubleshooting.

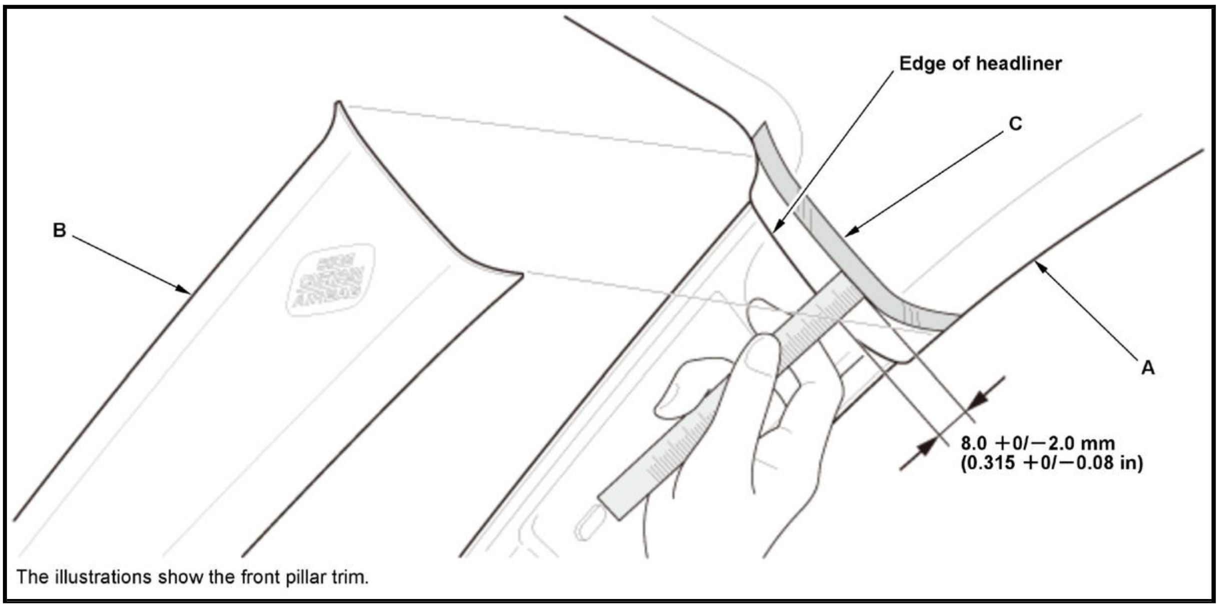
Â

2. Headliner/Pillar Trim Overlap - Check

Checking and Adjusting the Headliner/Pillar Trim Overlap

To prevent the side curtain airbag from deploying and damaging the pillar trim (A-pillar trim, B-pillar upper trim, and quarter pillar trim), the overlap between the headliner and pillar trim must be 8.0 +0/-2.0 mm (0.315 +0/-0.08 in). To check the overlap, do this:

1. Install the headliner (A) and the pillar trim (B).



Edge of headliner
C
B
A
8.0 +0/−2.0 mm
(0.315 +0/−0.08 in)
The illustrations show the front pillar trim.

2. Apply masking tape (C) to the headliner to mark the upper edge of the pillar trim.

3. Remove the pillar trim, and measure the headliner overlap.

- If the overlap is 8.0 +0/-2.0 mm (0.315 +0/-0.08 in), remove the tape, and install the pillar trim.
- If the overlap is more than 8.0 mm (0.315 in), go to step 4.

4. Carefully trim the headliner with a utility knife, reducing the overlap to 8.0 +0/-2.0 mm (0.315 +0/-0.08 in).

5. Remove the tape, and install the pillar trim.

REPAIR PROCEDURES, TESTS

AIRBAG AND TENSIONER DISPOSAL

Special Tools Required

Image	Description/Tool Number
	Deployment Tool 07AAZ-000A100

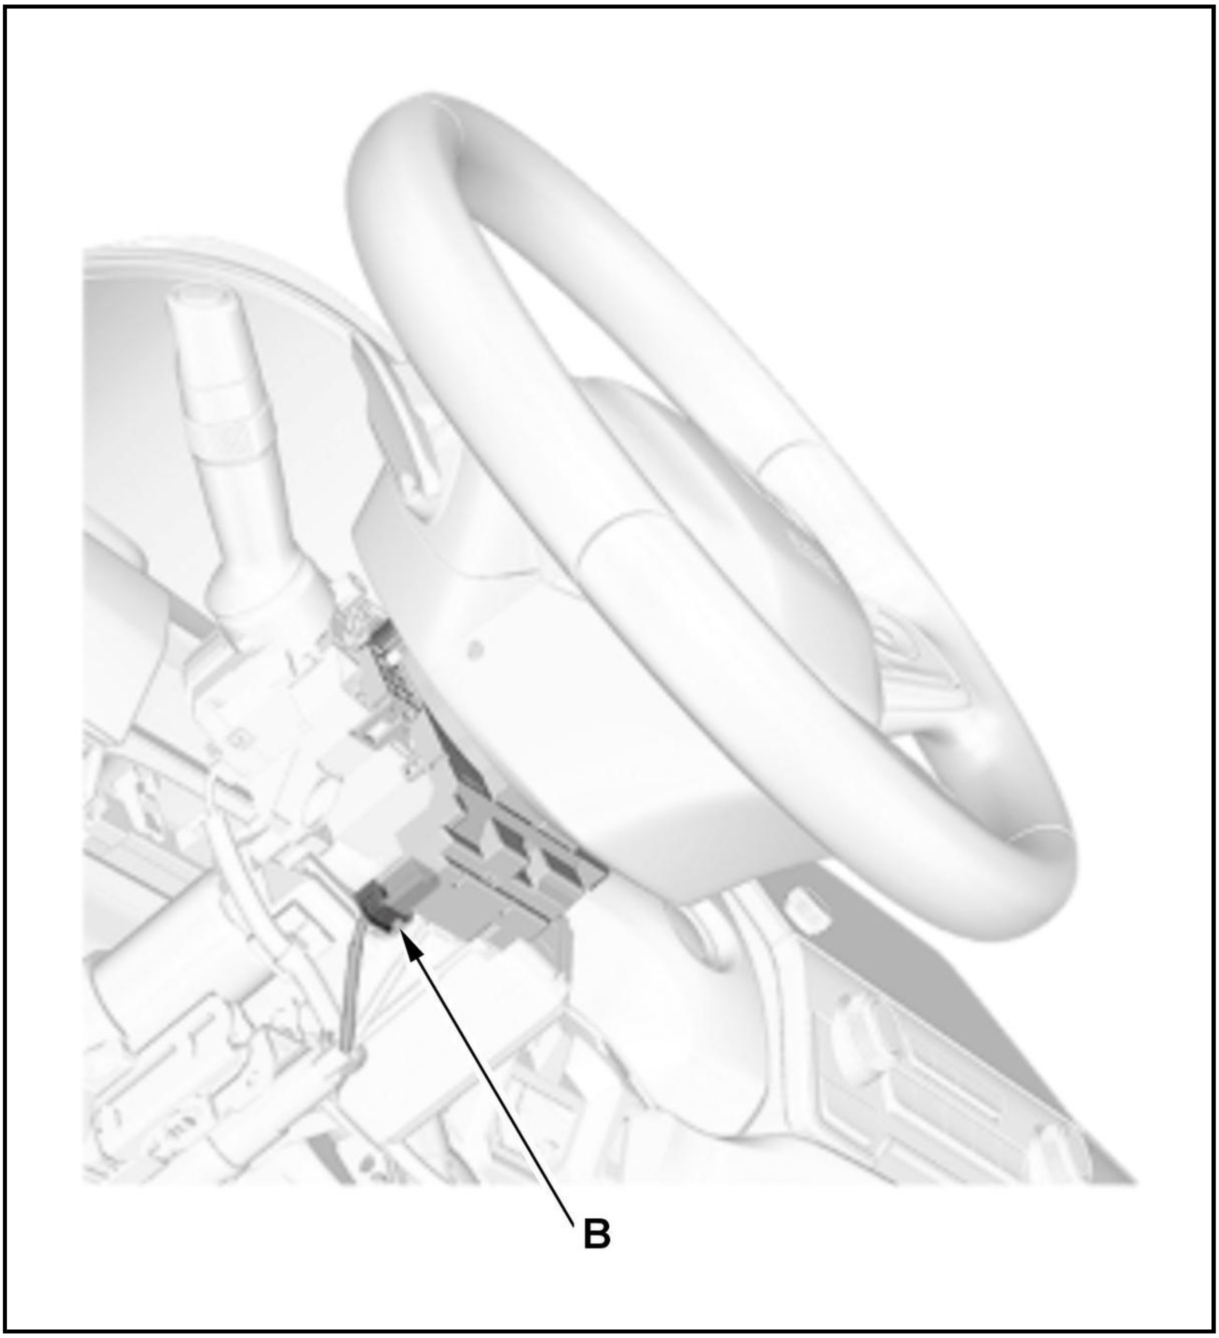
Inspection

NOTE:

- Before scrapping any front airbags, side airbags, side curtain airbags, seat belt outer lap tensioners, or front seat belt tensioners (including those in a whole vehicle to be scrapped), the part(s) must be deployed. If the vehicle is still within the warranty period, the Honda District Parts and Service Manager must give approval and/or special instruction before deploying the part(s). Only after the part(s) have been deployed (as the result of vehicle collision, for example), can they be scrapped. If the parts appear intact (not deployed), treat them with extreme caution. Follow this procedure.

- Please read the tool manual precautions and procedures for more details of the deployment tool.
- Airbag deployment is prohibited by law in some regions. Always check local laws and requirements before deploying airbags.

1. Airbag and Tensioner - Dispose



Deploying Airbags in the Vehicle

If an SRS equipped vehicle is to be entirely scrapped, its front airbags, side airbags, side curtain airbags, seat belt outer lap tensioners, and front seat belt tensioners should be deployed while still in the vehicle. These parts should not be considered as salvageable parts and should never be installed in another vehicle.

1. Turn the vehicle to the OFF (LOCK) mode. **Do the 12 volt battery terminal disconnection procedure** , then wait at least 3 minutes before starting work.

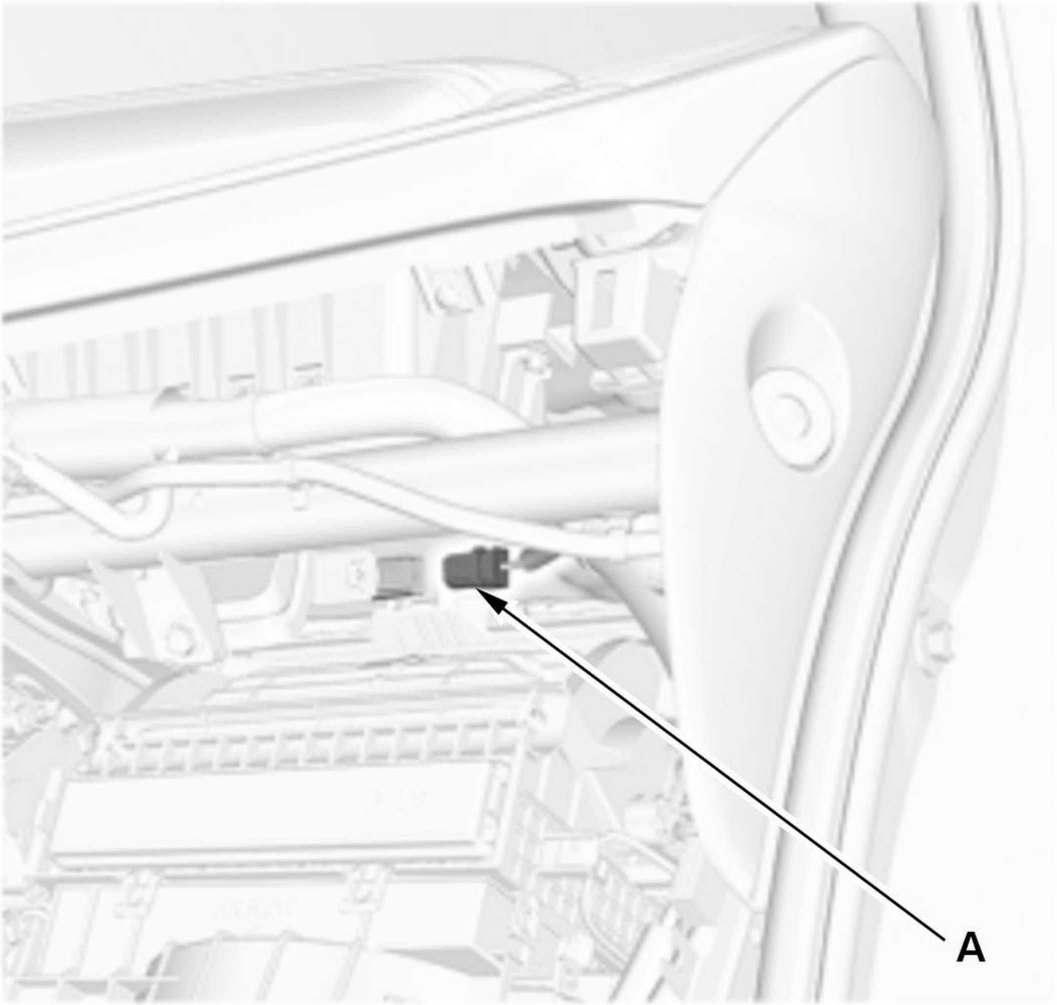
2. Confirm that each front airbag, side airbag, side curtain airbag, seat belt outer lap tensioner, or front seat belt tensioner is securely mounted.

3. Confirm that the deployment tool is functioning properly by following the check procedure on the tool label.

Driver's Airbag

4. **Remove the column covers** .

5. Locate the cable reel connector B on the dashboard wire harness. Do not disconnect the cable reel connector B.



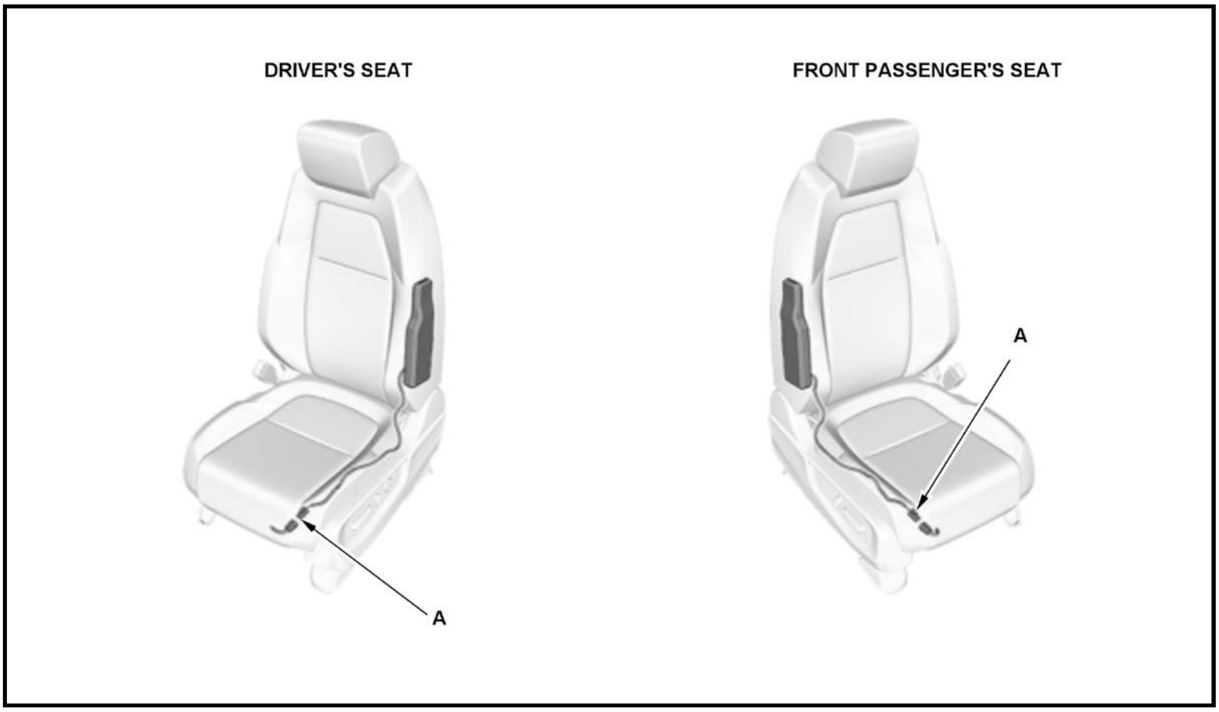
Front Passenger's Airbag

6. **Remove the glove box** .

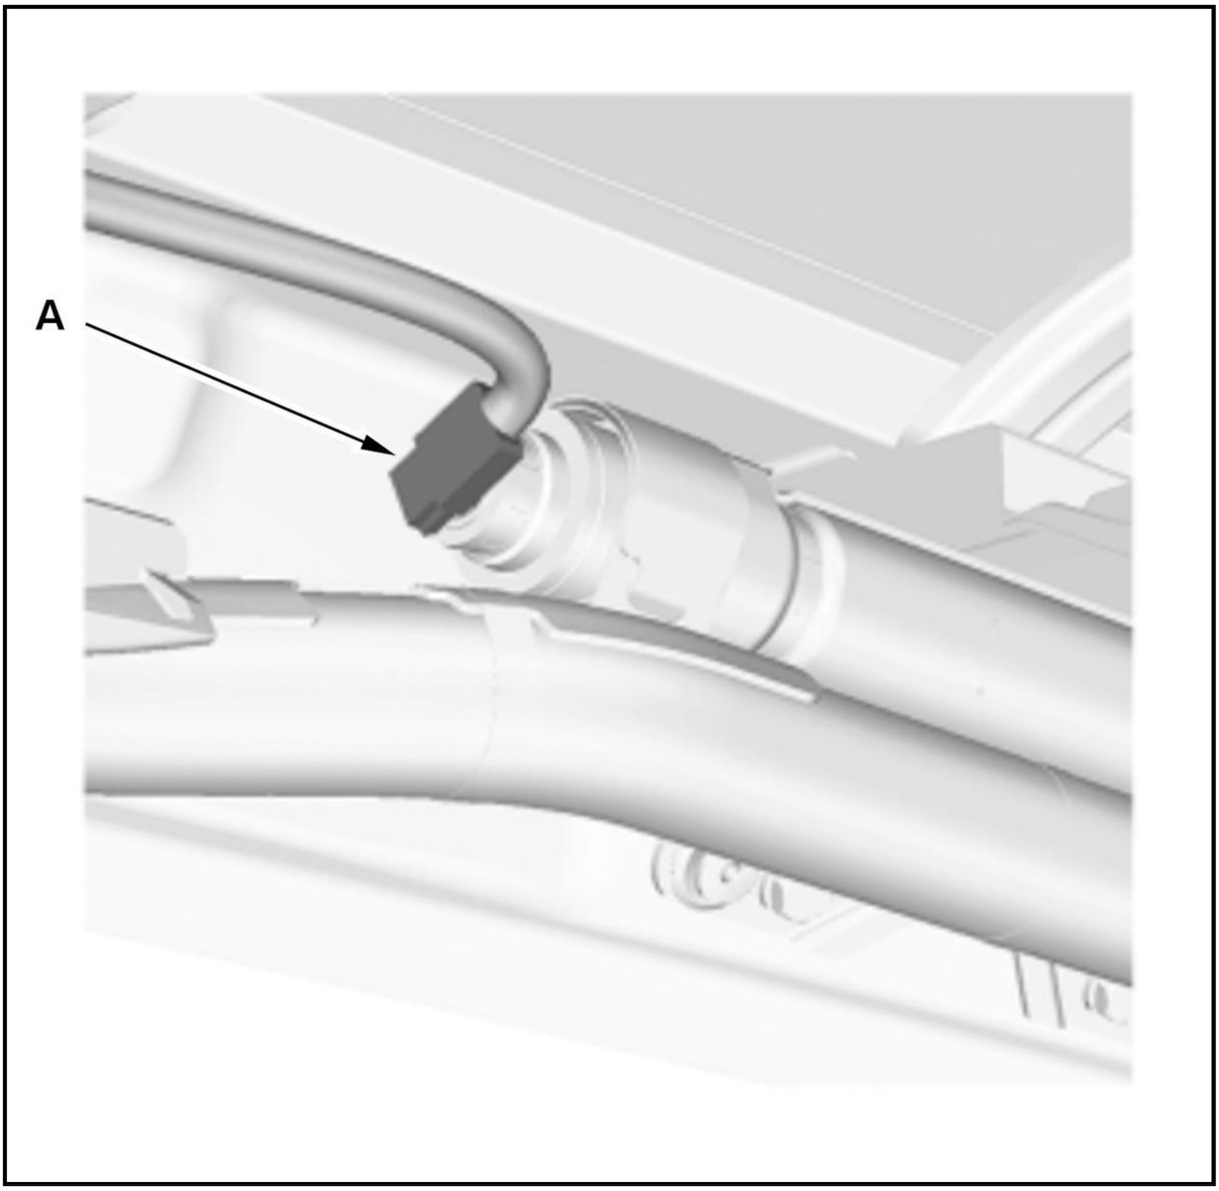
7. Disconnect the connector (A).

Side Airbag

8. **Disconnect the connector (A)** .



DRIVER'S SEAT
FRONT PASSENGER'S SEAT
A
A

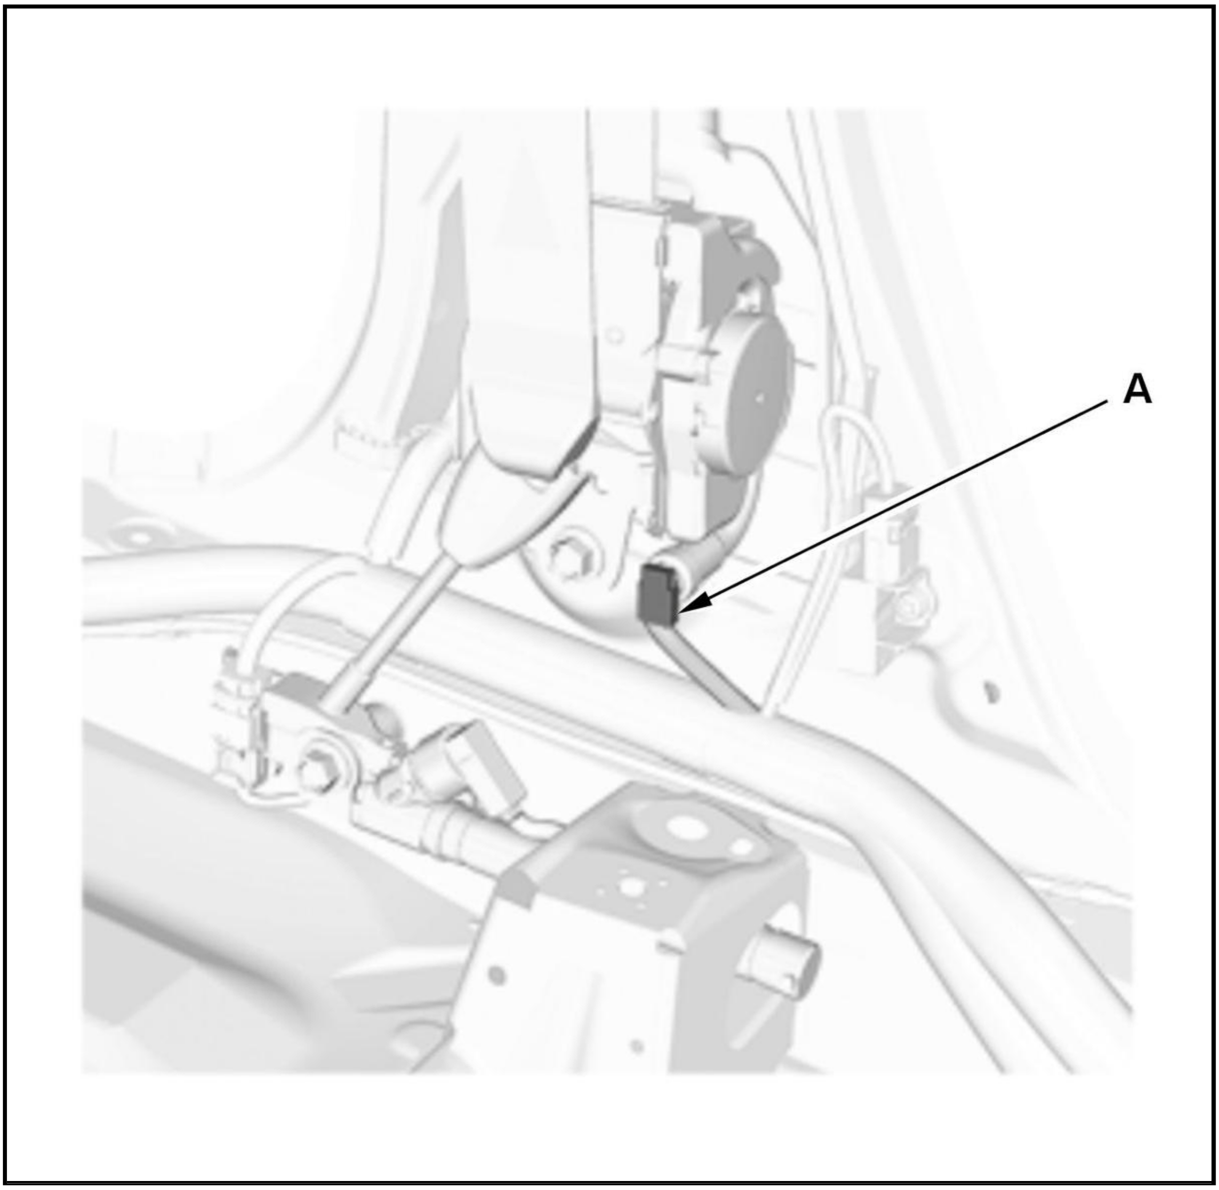


Side Curtain Airbag

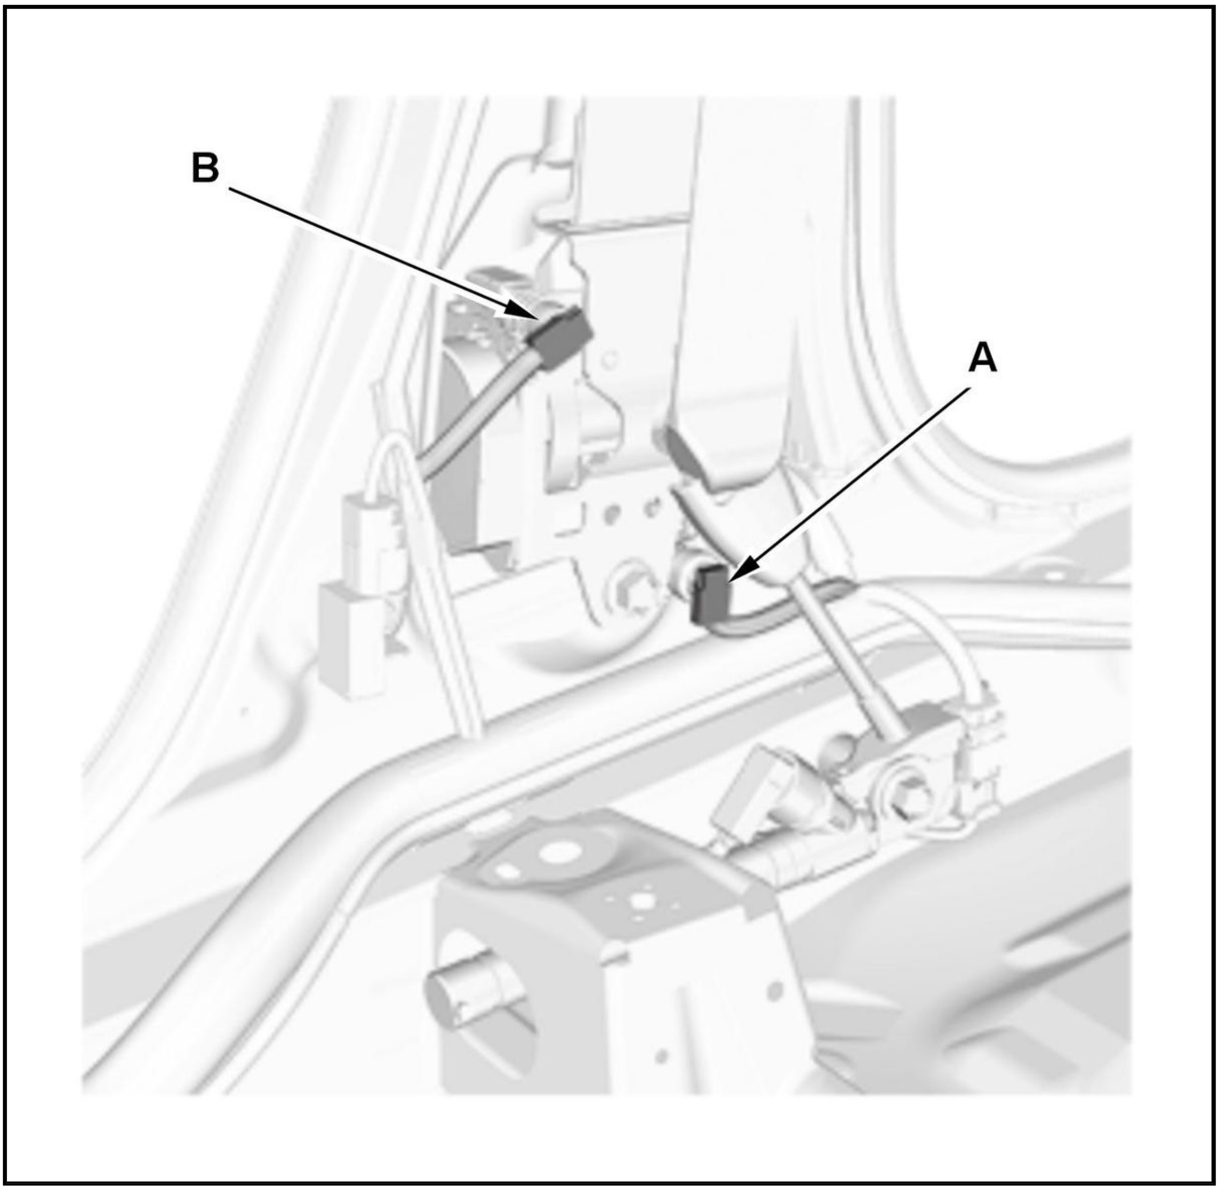
9. **Remove the headliner** .

10. Locate the right and left side curtain airbag inflator connectors (A) on the floor wire harness. Do not disconnect the side curtain airbag inflator connectors.

Driver's Side



Passenger's Side

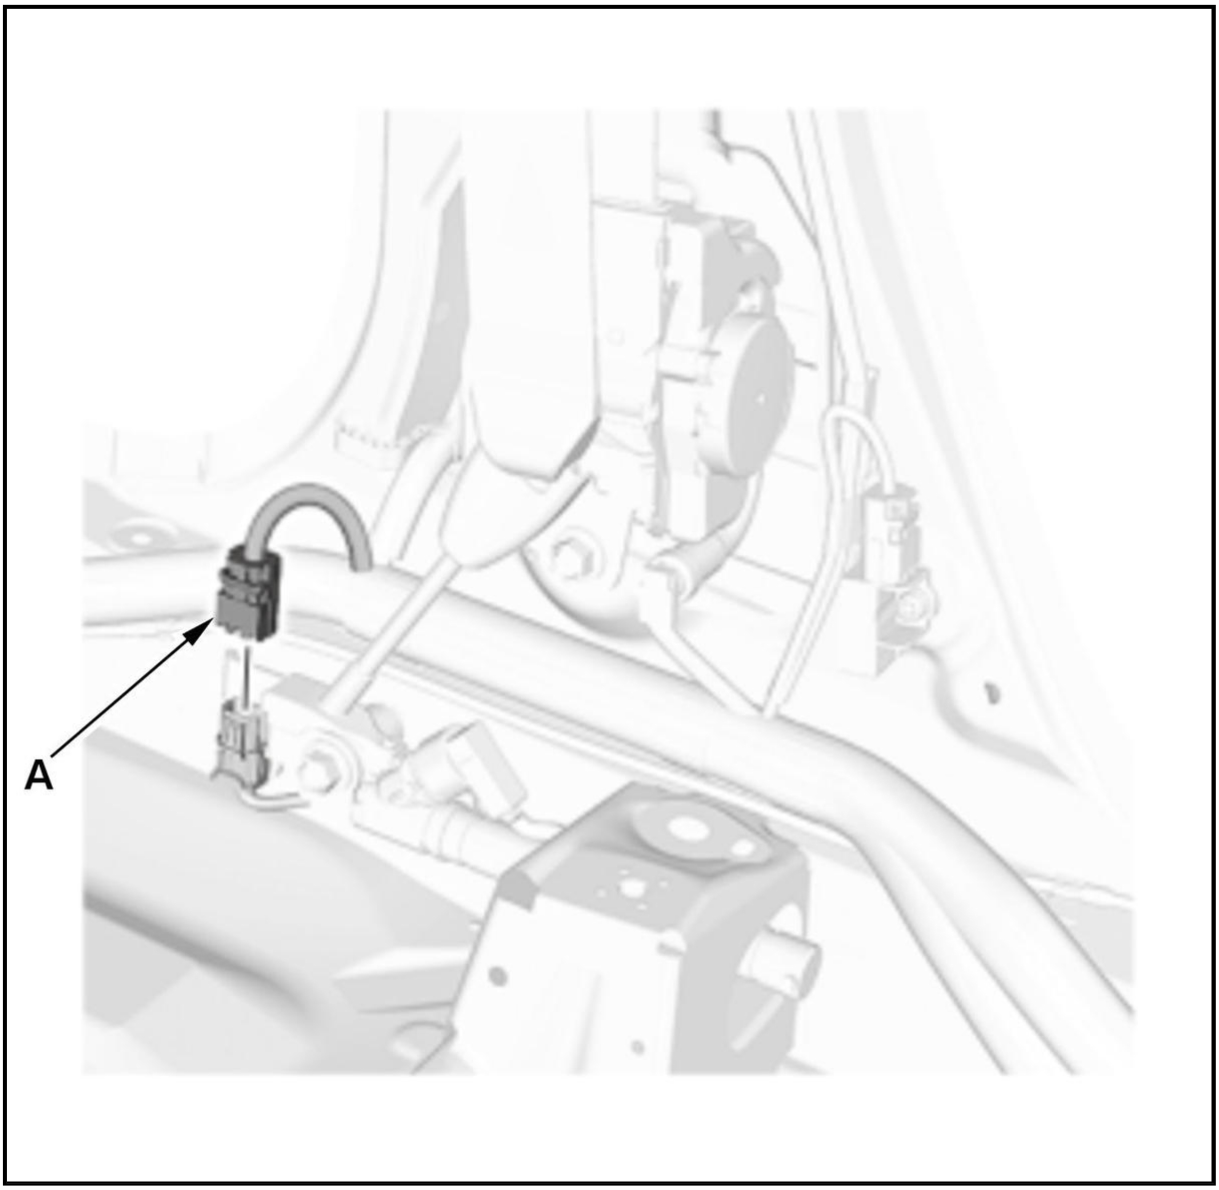


Front Seat Belt Tensioner

11. Remove the B-pillar lower trim cover

12. Locate the driver's and front passenger's seat belt tensioner connectors (A) on the floor wire harness. Do not disconnect the front seat belt tensioner connectors.

13. Front passenger's side: Locate the selectable energy absorption device connector (B) on the floor wire harness. Do not disconnect the selectable energy absorption device connector.



Seat Belt Outer Lap Tensioner

14. Remove the B-pillar lower trim cover .

15. Disconnect the connector (A).

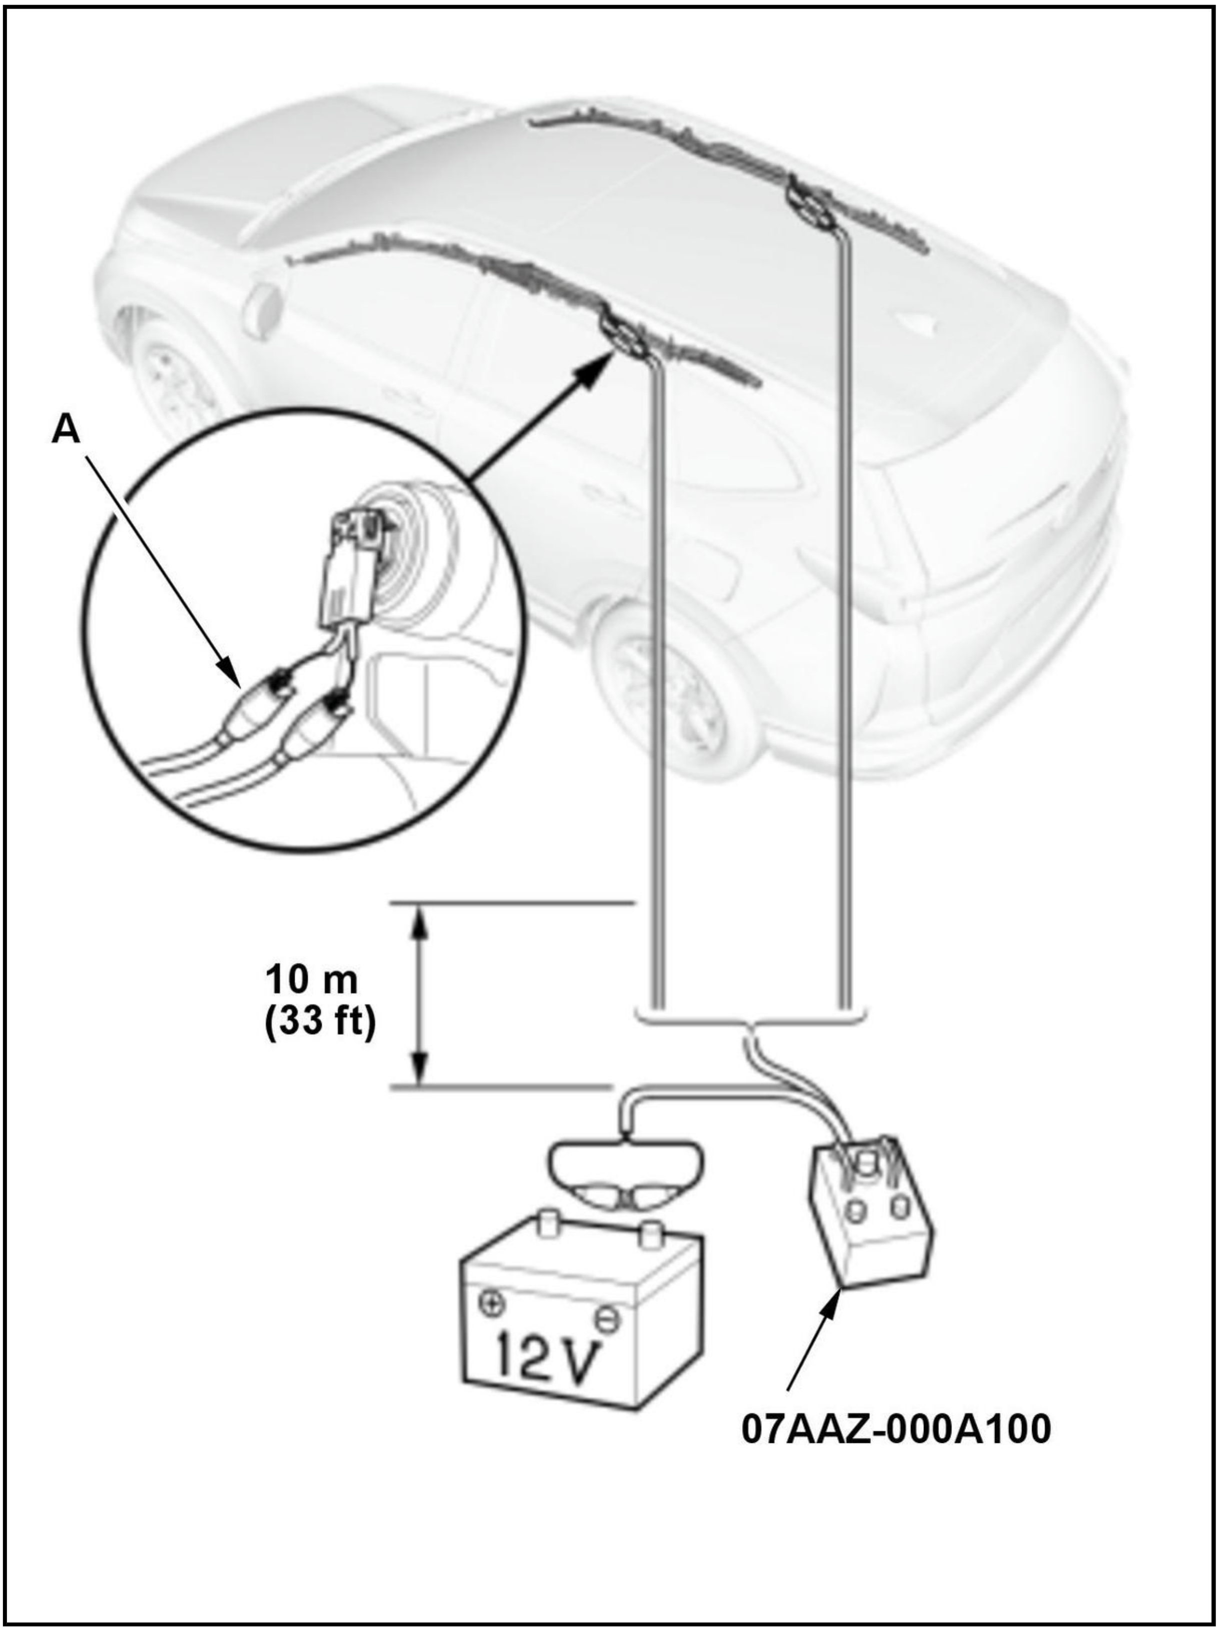
12V
07AAZ-000A100



16. Cut off each connector and strip the ends of the wires. To prevent inflators from being deployed unexpectedly, twist each pair of wires coming from each inflator to have each inflator short-circuited.

17. Select one pair of wires and untwist the wires. Clip an alligator clip (A) to each end of the wires, so that the inflator is ready to be deployed.

NOTE:

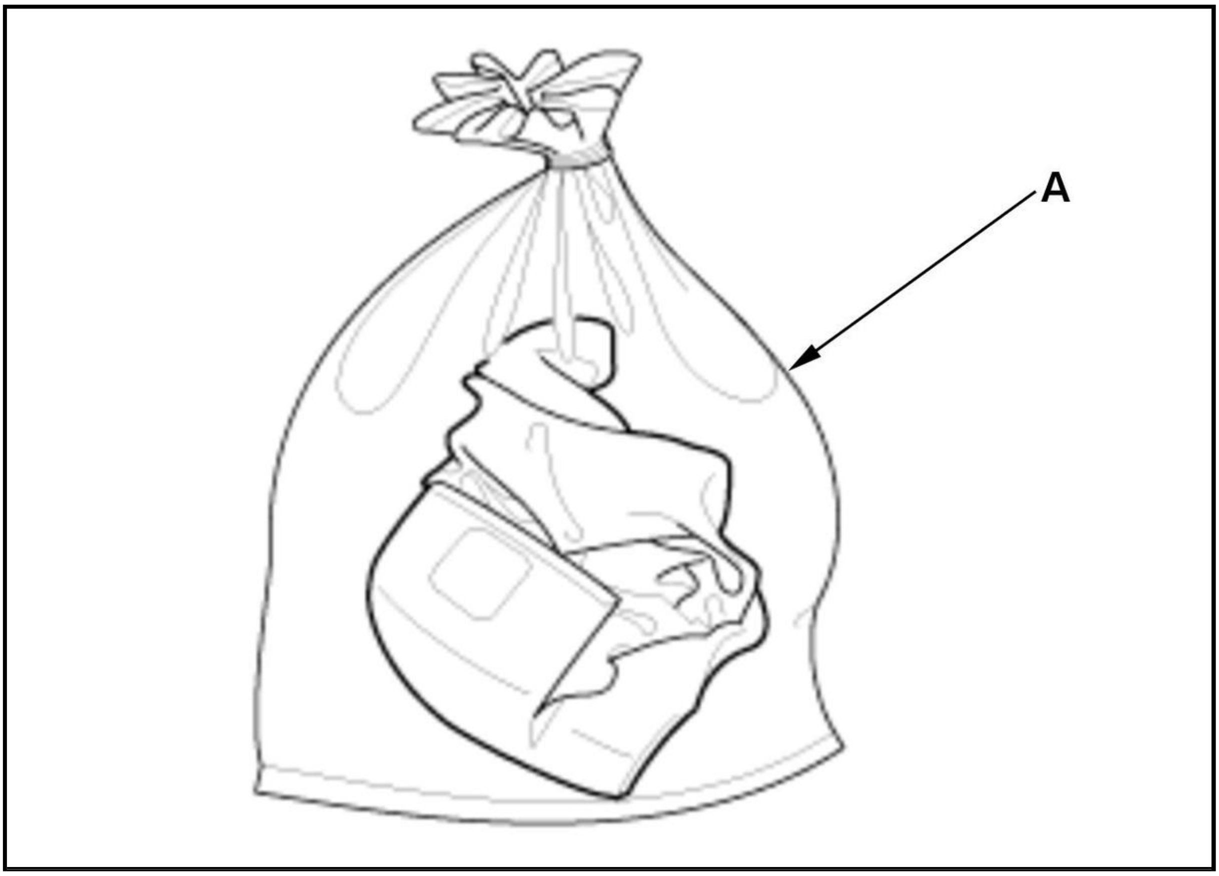
- Place the deployment tool at least 10 m (33 ft) away from the vehicle.
- Since the driver's and front passenger's airbags have dual inflators, make sure to twist the correct pair of wires to have each inflator short-circuited (with dual inflators).

18. Connect a 12 volt battery to the tool.

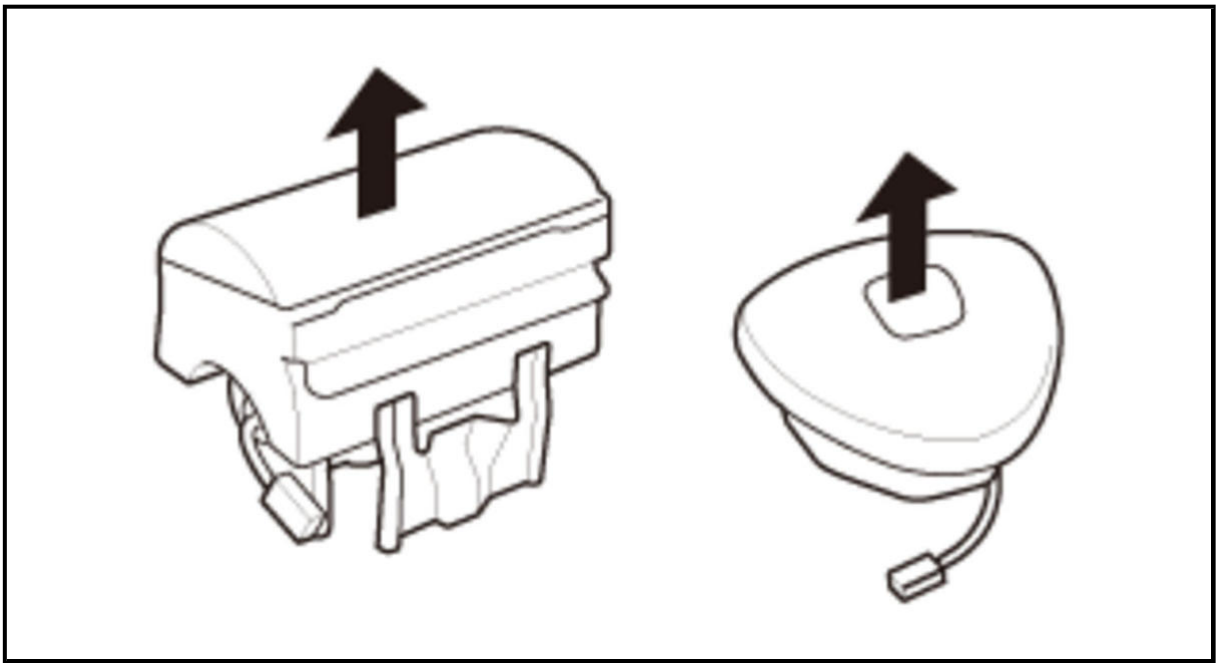
- If the green light on the tool comes on, the igniter circuit is defective and cannot deploy the component. Go to Disposal of Damaged Components.
- If the red light on the tool comes on, the component is ready to be deployed.

19. Push the tool's deployment switch. The airbags and tensioners should deploy (deployment is both highly audible and visible: A loud noise and rapid inflation of the bag, followed by slow deflation).

- If the components deploy and the green light on the tool comes on, continue with this procedure.
- If a component does not deploy, and the green light comes on, its igniter is defective. Go to Disposal of Damaged Components.
- During deployment, the airbags can become hot enough to burn you. Wait for 30 minutes after deployment before touching the airbags.

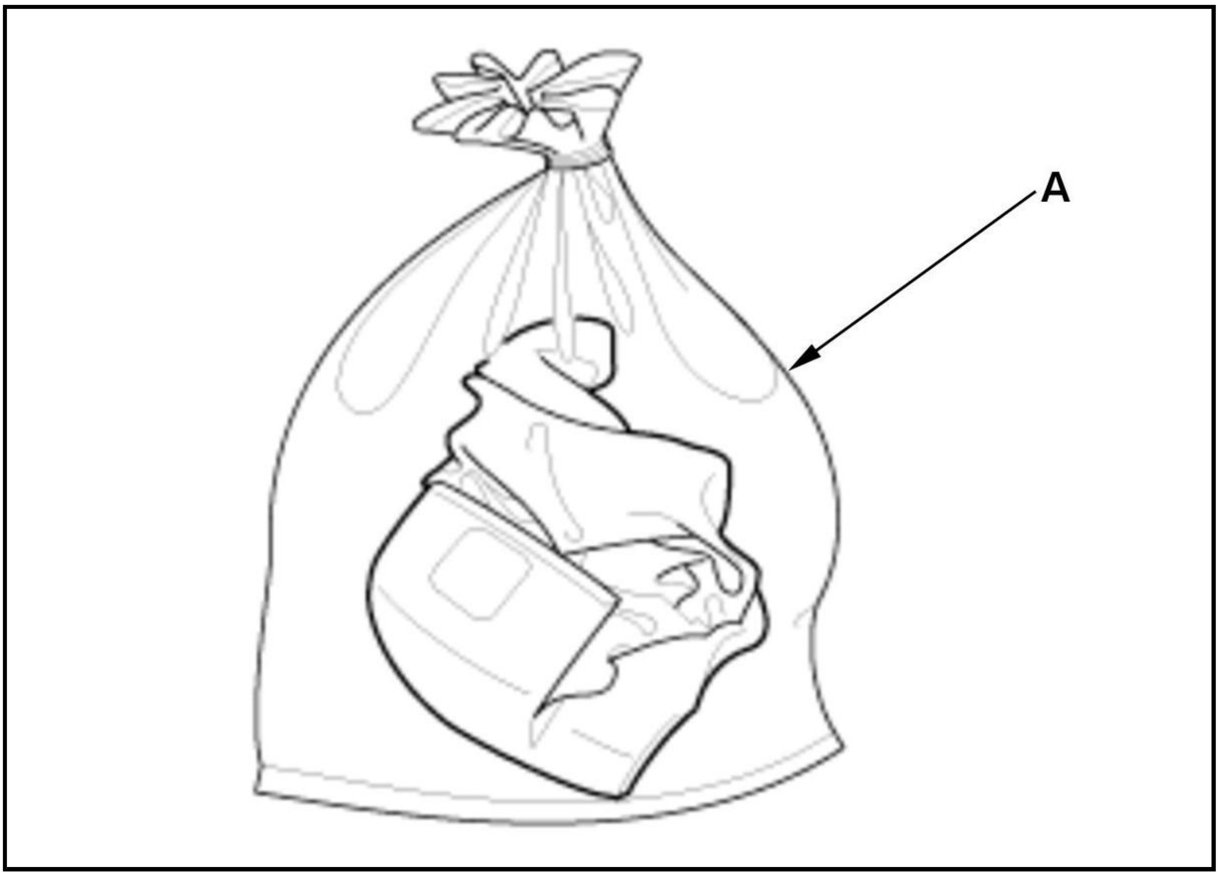


20. Dispose of the complete airbag or tensioner. No part of it can be reused. Place it in a sturdy plastic bag (A), and seal it securely. Dispose of the deployed airbag according to your local regulations.



Deploying Components Out of the Vehicle

If an intact airbag or tensioner has been removed from a scrapped vehicle, or has been found defective or damaged during transit, storage, or service, it should be deployed as follows:



1. Confirm that the deployment tool is functioning properly by following the check procedure Deploying Airbags in the Vehicle on the tool label.

2. Position the airbag face up, outdoors, on flat ground, at least 10 m (33 ft) from any obstacles or people.

3. Cut off each connector and strip the ends of the wires. To prevent inflators from being deployed unexpectedly, twist each pair of wires coming from each inflator to have each inflator short-circuited.

4. Select one pair of wires and untwist the wires. Clip an alligator clip to each end of the wires, so that the inflator is ready to be deployed.

NOTE: Since the driver's and front passenger's airbags have dual inflators, make sure to twist the correct pair of wires to have each inflator short-circuited (with dual inflators).

5. Connect a 12 volt battery to the tool.

- If the green light on the tool comes on, the igniter circuit is defective and cannot deploy the component. Go to Disposal of Damaged Components.
- If the red light on the tool comes on, the component is ready to be deployed.

6. Push the tool's deployment switch. The airbags and tensioners should deploy (deployment is both highly audible and visible: A loud noise and rapid inflation of the bag, followed by slow deflation).

- If the components deploy and the green light on the tool comes on, continue with this procedure.
- If a component does not deploy, and the green light comes on, its igniter is defective. Go to Disposal of Damaged Components.
- During deployment, the airbags can become hot enough to burn you. Wait for 30 minutes after deployment before touching the airbags.

7. Dispose of the complete airbag or tensioner. No part of it can be reused. Place it in a sturdy plastic bag (A), and seal it securely. Dispose of the deployed airbag according to your local regulations.

Disposal of Damaged Components

1. If installed in a vehicle, follow the removal procedure for **the driver's airbag** , **the front passenger's airbag** , **the side airbag** , **the side curtain airbag** , **seat belt outer lap tensioner** , and **the front seat belt tensioner** .

2. In all cases, make a short circuit by cutting, stripping, and twisting together the two inflator wires.

NOTE: Since the driver's and front passenger's airbags have dual inflators, make sure to twist the correct pair of wires to have each inflator short-circuited (with dual inflators).

3. Package the component in exactly the same packaging that the new replacement part came in.

4. Mark the outside of the box DAMAGED AIRBAG NOT DEPLOYED, DAMAGED SIDE AIRBAG NOT DEPLOYED, DAMAGED SIDE CURTAIN AIRBAG NOT DEPLOYED, DAMAGED DRIVER'S SEAT BELT OUTER LAP TENSIONER NOT DEPLOYED, or DAMAGED SEAT BELT TENSIONER NOT DEPLOYED so it does not get confused with your parts stock.

5. Contact your Honda District Parts and Service Manager for instructions on how and where to return it for disposal.

SRS PRECAUTIONS AND PROCEDURES

General Precautions

NOTE:

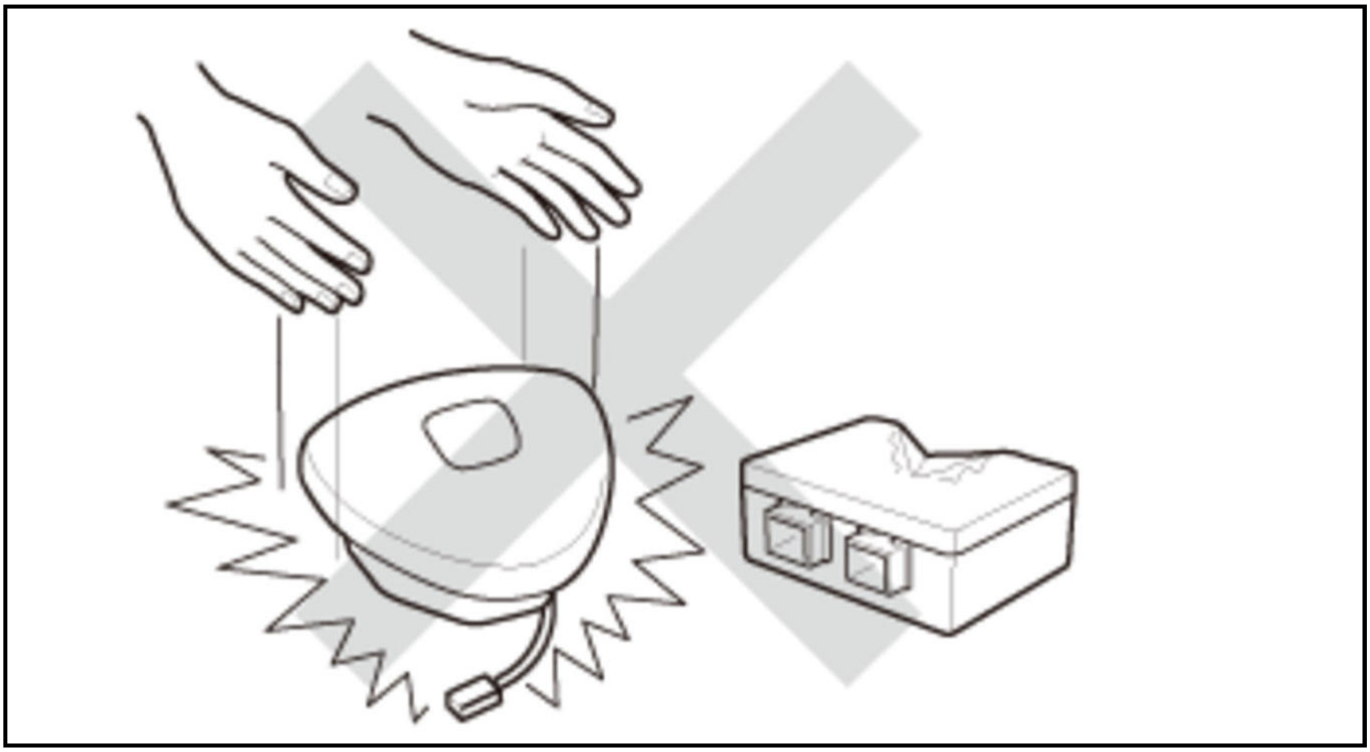
- Some systems store data in memory that is lost when the 12 volt battery is disconnected. Before disconnecting the 12 volt battery, **refer to 12 volt battery Terminal Disconnection and Reconnection** .

Please read the following precautions carefully before servicing the SRS, or the airbags could accidentally deploy and cause damage or injuries.

- Except when doing electrical inspections that require 12 volt battery power, always turn the vehicle to the OFF (LOCK) mode, disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes before starting work.

NOTE: The SRS memory is not erased even if the vehicle is turned to the OFF (LOCK) mode, or if the 12 volt battery cables are disconnected from the 12 volt battery.

- Use replacement parts which are manufactured to the same standards and quality as the original parts. Do not install used SRS parts. Use only new parts when making SRS repairs.
- Carefully inspect any SRS part before you install it. Do not install any part that shows signs of being dropped or improperly handled, such as dents, cracks or deformation.



- Before disconnecting the SRS unit connectors, always disconnect the appropriate SRS parts connectors.
- Use only a digital multimeter to check the system. If it is not a Honda multimeter, make sure its output is 10 mA (0.01 A) or less when switched to the lowest value in the ohmmeter range. A tester with a higher output could cause accidental deployment and possible injury.
- Do not put objects on the front passenger's airbag.

Steering-Related Precautions

Cable Reel Alignment

- Misalignment of the cable reel could cause an open in the wiring, making the SRS, remote steering wheel controls, or the horn inoperative. Center the cable reel whenever you do the following .
-
    - -

      Installation of the steering wheel.

    - -

      Installation of the cable reel.

    - -

      Installation of the steering column.

    - -

Other steering-related adjustment or installation.

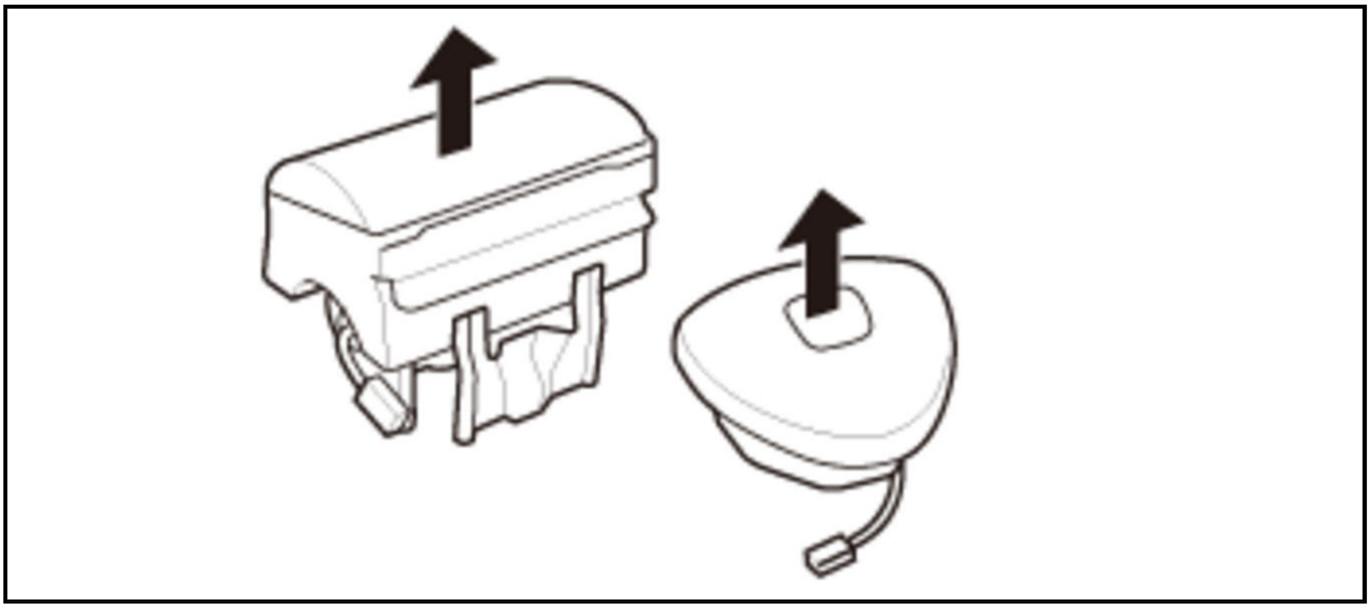
- Do not disassemble the cable reel.
- Do not apply grease to the cable reel.
- If the cable reel shows any signs of damage, replace it with a new one. For example, if the cable reel does not rotate smoothly, replace it.

Airbag Handling and Storage

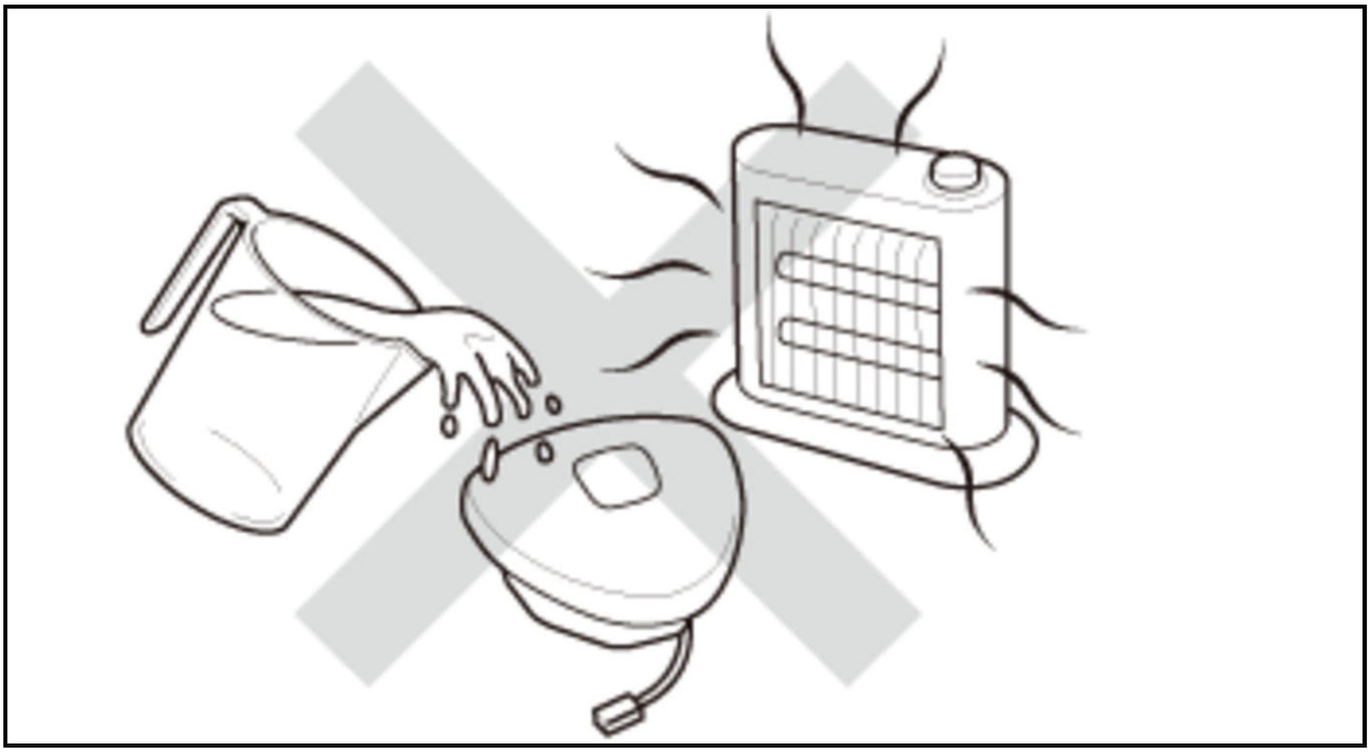
Do not disassemble an airbag. It has no serviceable parts. Once an airbag has been deployed, it cannot be repaired or reused.

For temporary storage of an airbag during service, observe the following precautions.

- Store the removed airbag with the pad surface up. Never put anything on the airbag.

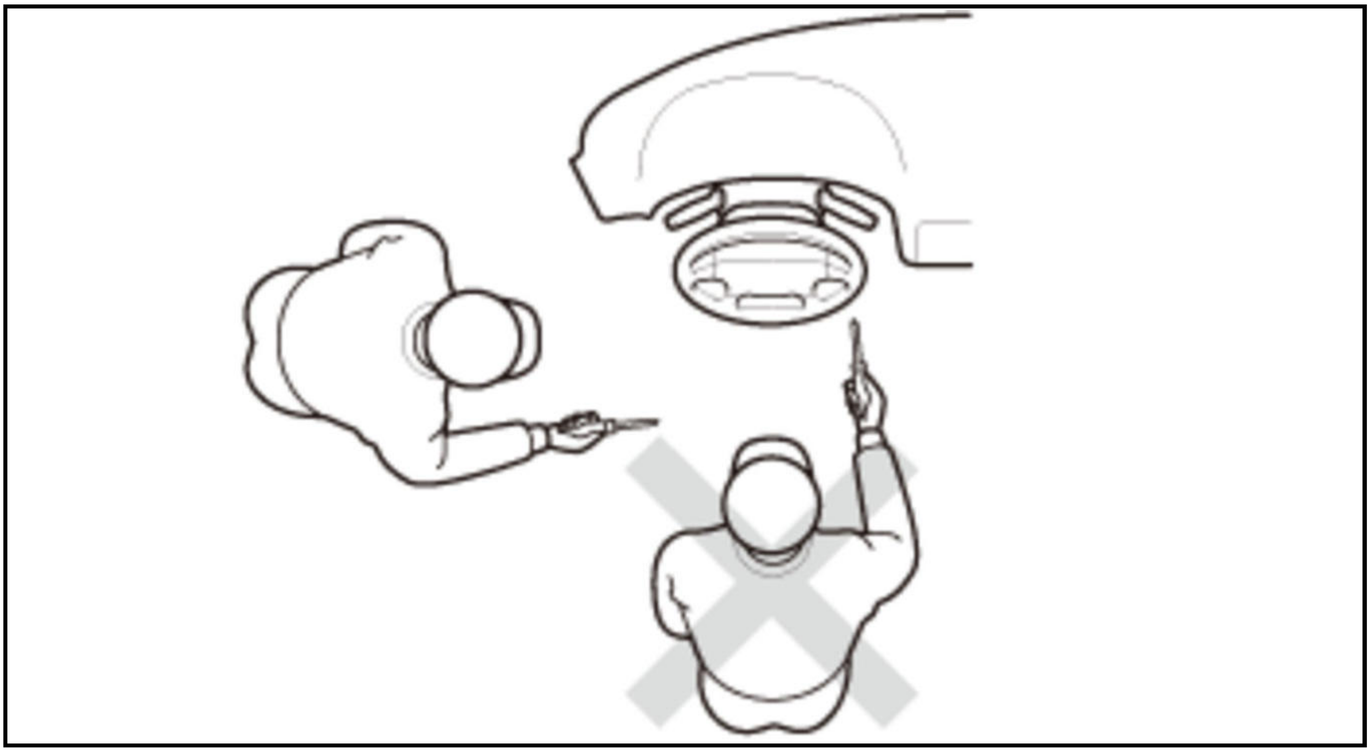


- To prevent damage to the airbag, keep it away from any oil, grease, detergent, or water.



- Store the removed airbag on a secure, flat surface away from any high heat source (exceeding 200 deg.F (93 deg.C)).

- Never do electrical tests on the airbags, such as measuring resistance.
- Do not position yourself in front of the airbag during removal, inspection, or replacement.

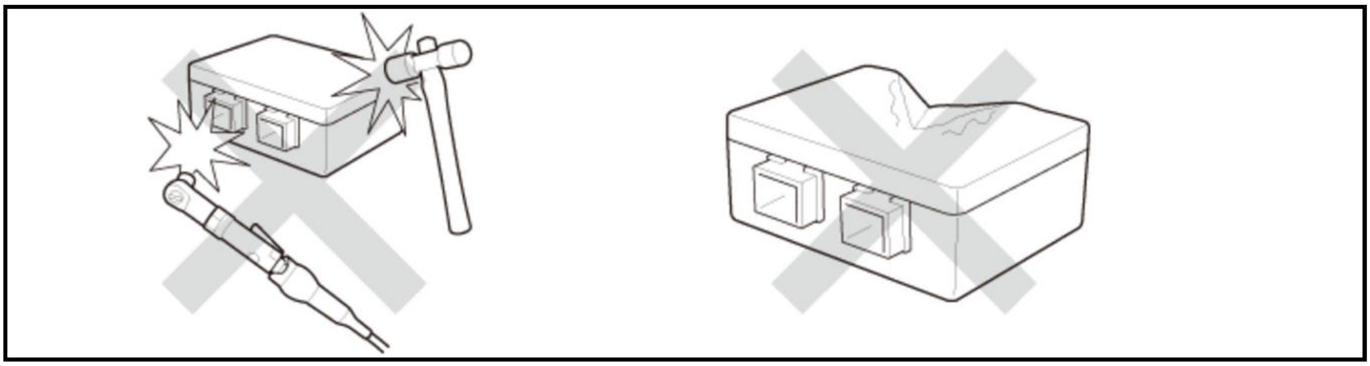


- For proper disposal of a damaged airbag or tensioner, **refer to Airbag and Tensioner Disposal**.

SRS Unit, Front and Side Impact Sensors, Driver's Seat Position Sensor, and Front Passenger's Weight Sensors

NOTE: Some systems store data in memory that is lost when the 12 volt battery is disconnected. Before disconnecting the 12 volt battery, **refer to 12 volt battery Terminal Disconnection and Reconnection** .

- Turn the vehicle to the OFF (LOCK) mode. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes before starting installation or replacement of the SRS unit, or disconnecting the connectors from the SRS unit.
- Be careful not to bump or impact the SRS unit, the front impact sensors, or the side impact sensors when the vehicle is in the ON mode, or for at least 3 minutes after the vehicle is turned to the OFF (LOCK) mode.
- Do not reconnect any connectors to the SRS unit until it is fully installed, including torquing the bolts.
- During installation or replacement, be careful not to bump (by impact wrench, hammer, etc.) the area around the SRS unit, the front impact sensors, or the side impact sensors. The airbags could accidentally deploy and cause damage or injury.



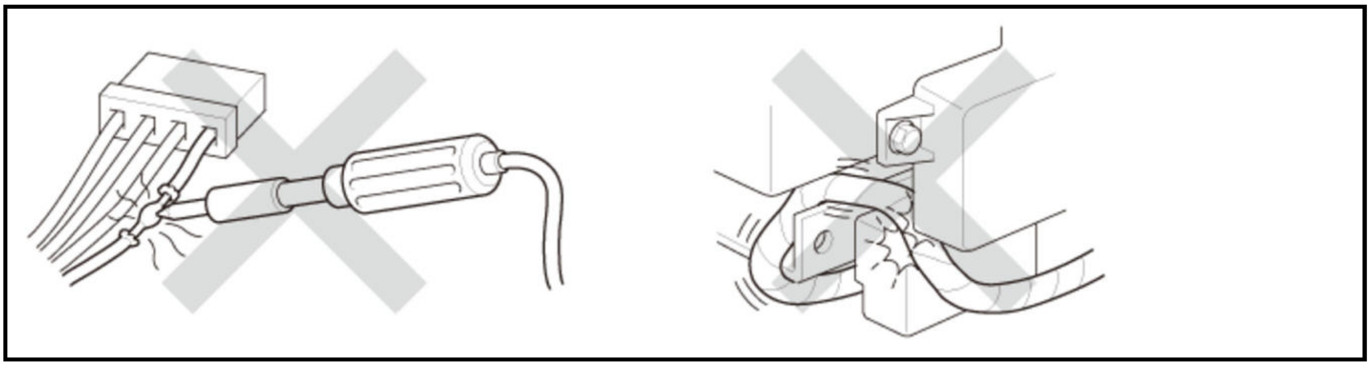
- After a collision where the front airbags, the side airbags, the side curtain airbags, the front seat belt tensioners, or the seat belt outer lap tensioner deploy, **go to Component Replacement/Inspection After Deployment**. After a collision where the airbags do not deploy, inspect for any damage or any deformation on the SRS unit, the front impact sensors, and the side impact sensors. If there is any damage, replace the SRS unit and/or the sensors. Replace all damaged parts.

- Do not disassemble the SRS unit, the front impact sensors, the side impact sensors, the driver's seat position sensor, or the front passenger's weight sensors.
- Always install the SRS unit, driver's seat position sensor, and the all impact sensors with the new bolts to the specified torque.
- Do not spill water or oil on the SRS unit or any of the sensors.

Wiring Precautions

Some of the SRS wiring can be identified by a special yellow outer covering, and the SRS connectors can be identified by their yellow color. Observe the following instructions.

- Never attempt to modify, splice, or repair SRS wiring. If there is an open or damage to the SRS wiring, replace the harness.



- Be sure to install the harness wires so they do not get pinched or interfere with other parts.
- Make sure all SRS ground locations are clean, and the grounds are securely fastened for optimum metal-to-metal contact. Poor grounds can cause intermittent problems that are difficult to diagnose.
- Do not use any silicone based cleaners or lubricants on any SRS connectors or terminals.

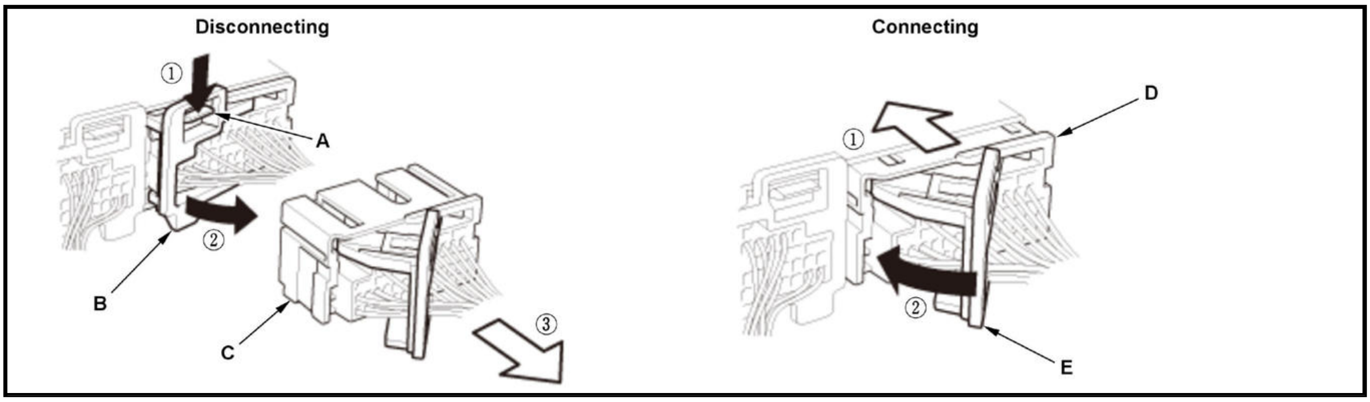
Lever-Locked Connector

The SRS unit connectors have a lever lock.

SRS Unit Connectors

Disconnecting/Connecting

- To release the lock (A), pull the lever (B) while pushing the lock on the outside of the connector, then pull out the connector (C).
- To reconnect the connector (D), push in on the connector. As the connector is pressed in, the lever (E) moves to the locked position.



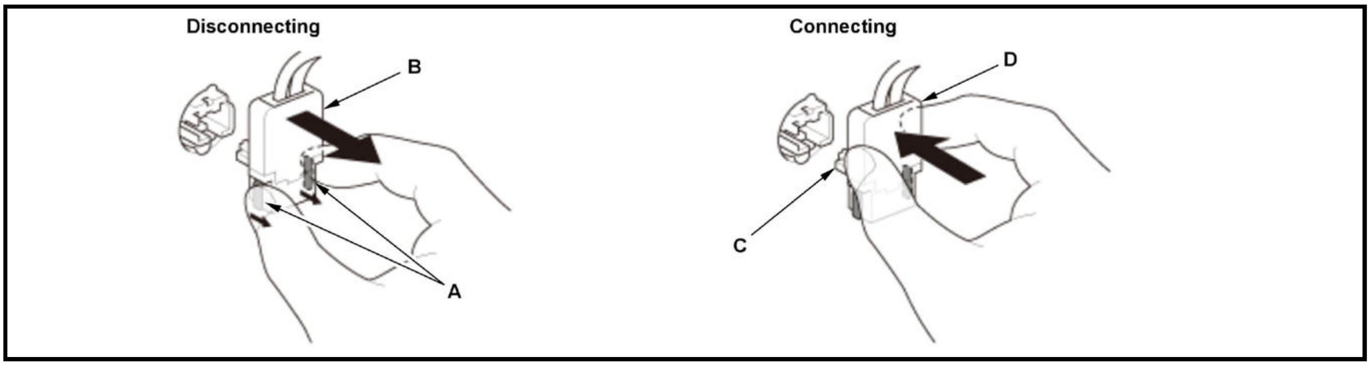
Spring-Loaded Lock Connector

Some SRS connectors have a spring-loaded lock.

Driver's Airbag Connector/Side Curtain Airbag Connector/Front Seat Belt Tensioner Connector

Disconnecting/Connecting

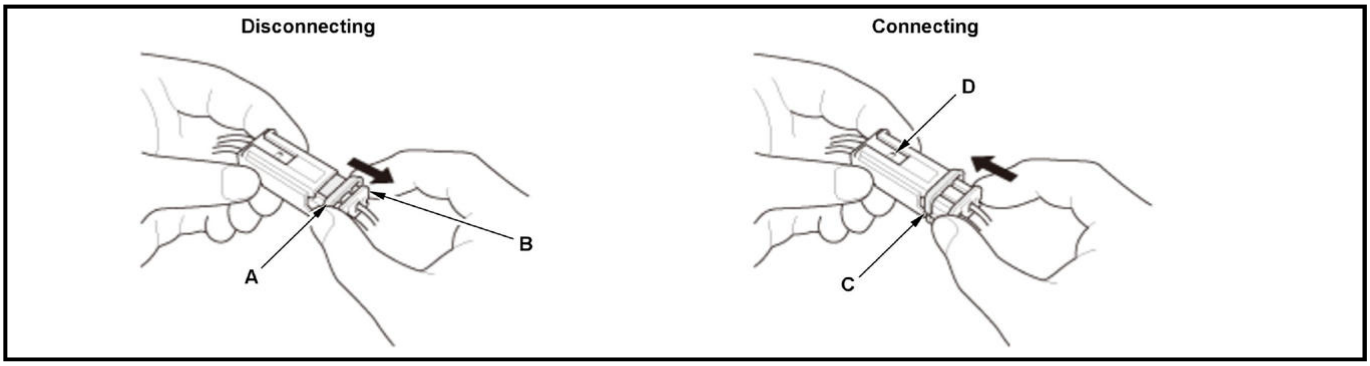
- Pull out on the locking tabs (A) to disconnect the connector (B). Be careful not to damage the connector.
- Align the guide tab (C) of the connector (D) with the ditch of the other side, and then connect the connector. Be careful not to damage the connector.



Front Passenger's Airbag Connector/Front Passenger's Side Airbag Connector

Disconnecting/Connecting

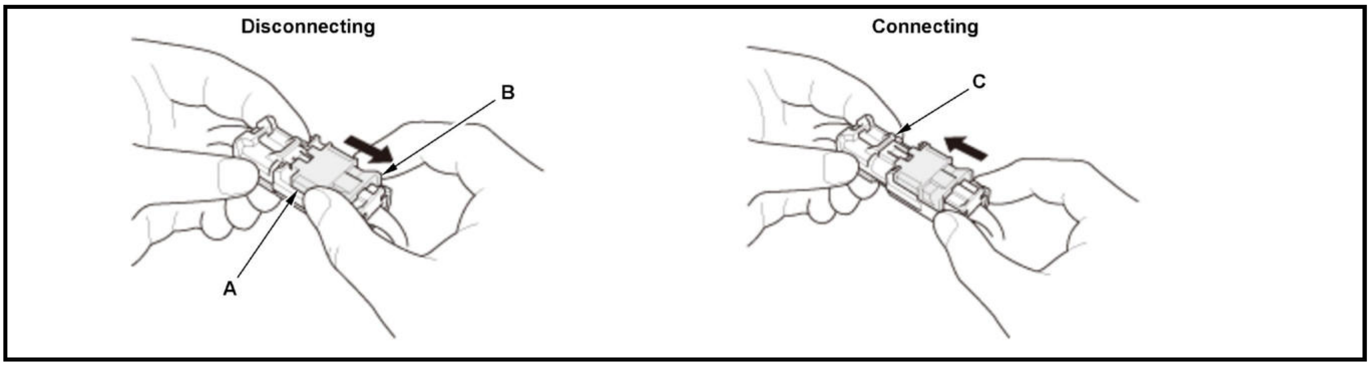
- To release the lock, pull the spring-loaded sleeve (A) toward the stop (B) while holding the opposite half of the connector, then pull the connector halves apart. Be sure to pull on the sleeve and not on the connector.
- To reconnect, hold the pawl-side connector, and press on the back of the sleeve-side connector in the direction shown. As the two connector halves are pressed together, the sleeve (C) is pushed back by the pawl (D). Do not touch the sleeve.



Driver's Side Airbag Connector/Seat Belt Outer Lap Tensioner Connector

Disconnecting/Connecting

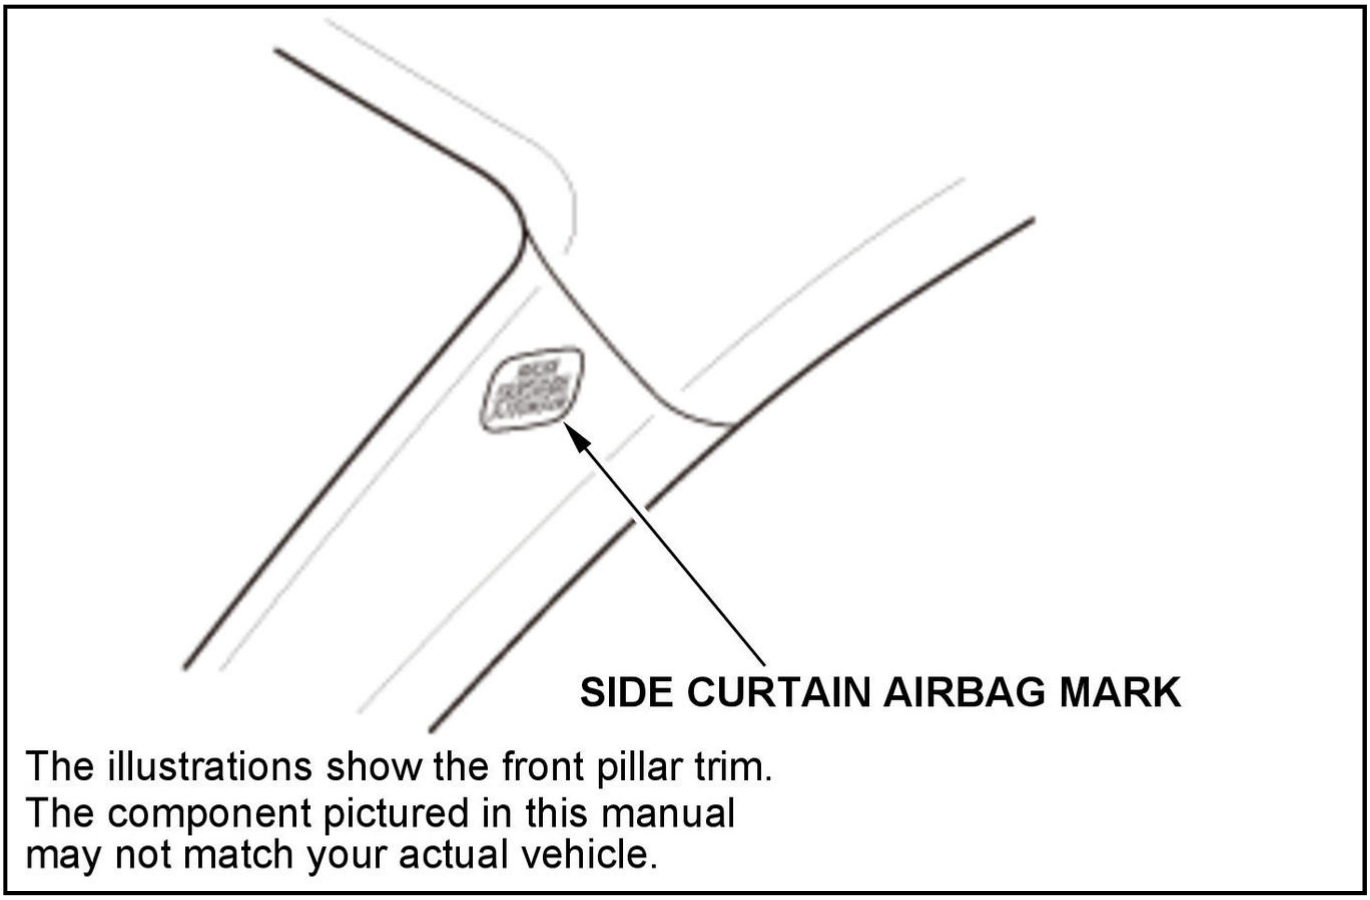
- To release the lock, pull the spring-loaded sleeve (A) toward the stop (B) while holding the opposite half of the connector, then pull the connector halves apart. Be sure to pull on the sleeve and not on the connector half.
- Hold both connector halves, and press them firmly together until the projection (C) of the sleeve-side connector clicks.



Disconnecting
B
A
Connecting
C

Side Curtain Airbags

The A-pillar trim and the quarter pillar trim with side curtain airbags have a "SIDE CURTAIN AIRBAG" mark.



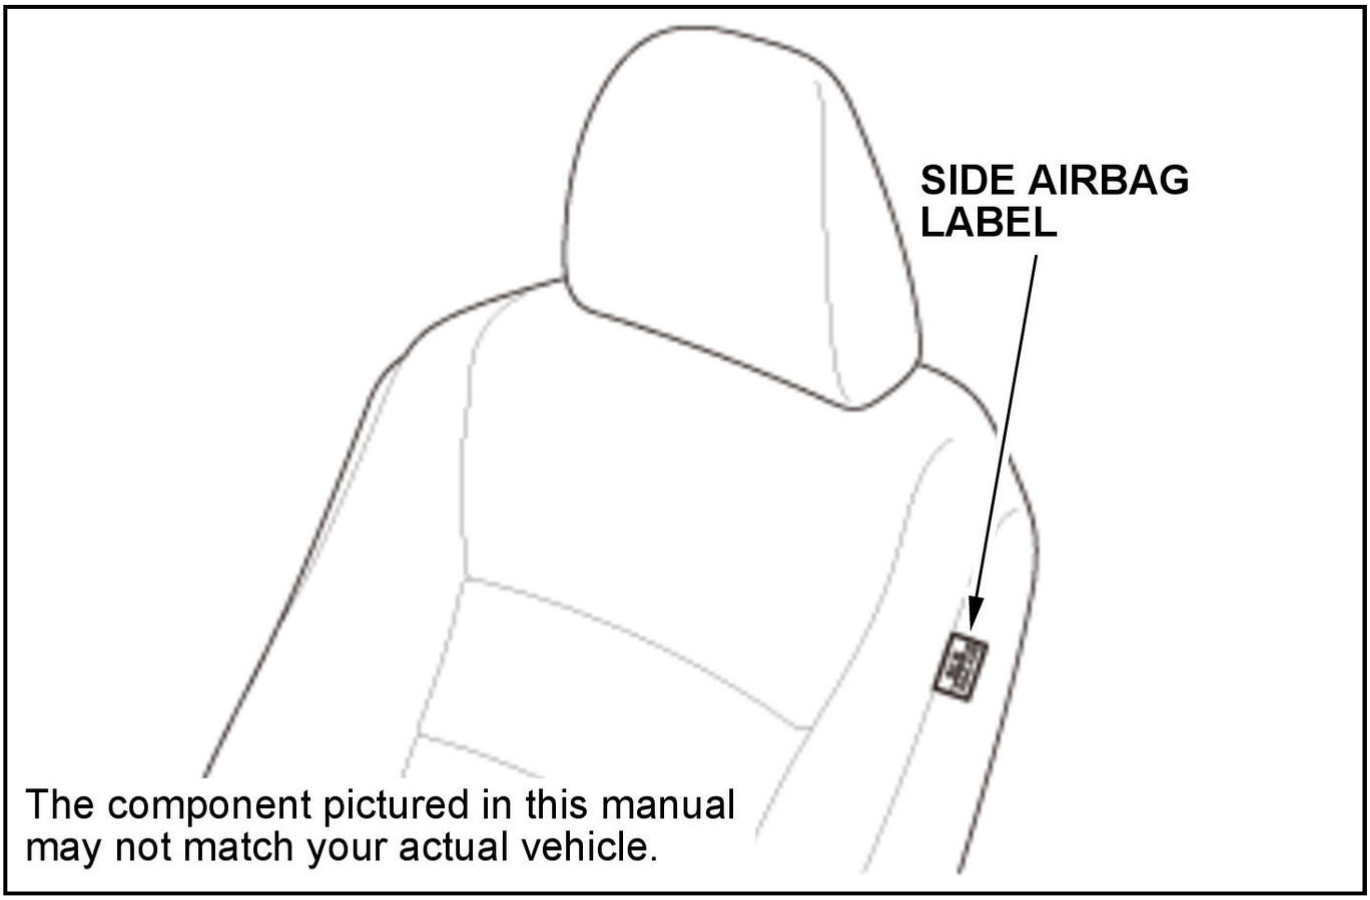
SIDE CURTAIN AIRBAG MARK
The illustrations show the front pillar trim.
The component pictured in this manual
may not match your actual vehicle.

The side curtain airbag module assembly is a long, jointed part containing an inflator, a flexible bag, and brackets. When removing or installing the side curtain airbag assembly, never:

- Handle the flexible bag.
- Drop the airbag assembly.
- Cut, tear, or unwrap the tape strips.

Front Seats With Side Airbags

Front seats with side airbags have a "SIDE AIRBAG" label on the seat-back.



SIDE AIRBAG LABEL
The component pictured in this manual may not match your actual vehicle.

- Clean the seats with a damp cloth. Do not soak the seats with liquid. Do not spray steam on the seats.
- Do not repair a torn or frayed seat-back cover/pad. Replace the seat-back cover/pad if it is damaged.
- After a collision where the side airbag was deployed, replace the side airbag and the seat frame with the new parts. If the seat-back cover is split, it must be replaced. **Refer to Component Replacement/Inspection After Deployment**.
- Never put aftermarket accessories on the seats (covers, pads, seat heaters, lights, etc.).

YAW RATE-ACCELERATION NEUTRAL POSITION MEMORIZATION

Procedure

NOTE:

- The VSA modulator-control unit receives the yaw rate and the acceleration information from the SRS unit. This information is corrected by the neutral position learning of VSA modulator-control unit, performs the VSA control. Follow the procedures of the VSA system for more details.
- When you replace or update the SRS unit, memorize the yaw rate-acceleration neutral position.

1. **VSA Sensor Neutral Position - Memorize**

DTC TROUBLESHOOTING INDEX

SRS DTC TROUBLESHOOTING INDEX(KA/KC)

DTC	Detection Item
B0001-11	Short to ground in the driver's airbag first inflator
B0001-12	Short to power in the driver's airbag first inflator
B0001-13	Open or increased resistance in the driver's airbag first inflator
B0001-1A	Decreased resistance in the driver's airbag first inflator
B0001-2B	Short to another wire harness in the driver's airbag first inflator

DTC	Detection Item
B0002-11	Short to ground in the driver's airbag second inflator
B0002-12	Short to power in the driver's airbag second inflator
B0002-13	Open or increased resistance in the driver's airbag second inflator
B0002-1A	Decreased resistance in the driver's airbag second inflator
B0002-2B	Short to another wire harness in the driver's airbag second inflator
B0010-11	Short to ground in the front passenger's airbag first inflator
B0010-12	Short to power in the front passenger's airbag first inflator
B0010-13	Open or increased resistance in the front passenger's airbag first inflator
B0010-1A	Decreased resistance in the front passenger's airbag first inflator
B0010-2B	Short to another wire harness in the front passenger's airbag first inflator
B0011-11	Short to ground in the front passenger's airbag second inflator
B0011-12	Short to power in the front passenger's airbag second inflator
B0011-13	Open or increased resistance in the front passenger's airbag second inflator
B0011-1A	Decreased resistance in the front passenger's airbag second inflator
B0011-2B	Short to another wire harness in the front passenger's airbag second inflator
B0020-11	Short to ground in the driver's side airbag inflator
B0020-12	Short to power in the driver's side airbag inflator

GENERAL INFORMATION

HOW TO READ DEPLOYED HISTORY

How to Read Deployed History

NOTE: Due to the amount of electrical current that flows within the SRS unit to deploy airbags and tensioners, the SRS unit will be severely damaged and will require replacement. Therefore, the SRS unit retains a history that indicate which airbags and tensioners that deployed in a collision. Airbags and tensioners that deployed cannot be reused and must be replaced.

1. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

2. Connect the HDS to the data link connector (DLC)

3. In the SRS MENU of the HDS, select SRS, then select Data List.

NOTE:

- A value of ON with a unit of RED indicates that the airbag(s) and or tensioner has deployed.
- A value of OFF with a unit of GREEN indicates that the airbag(s) or tensioner did not deploy.
- When any airbags or tensioners have deployed, **go to Component Replacement/Inspection After Deployment**.

Signal	**Value**	**Unit**
Left Front Airbag, Left Front/Rear Seat Belt Tensioner and/or Left Knee Airbag Deployed	OFF	•
Right Front Airbag, Right Front/Rear Seat Belt Tensioner and/or Right Knee Airbag Deployed	OFF	•
Left Side Airbag, Left Side Curtain Airbag, and/or Left Front/Rear Seat Belt Tensioner Deployed	ON	o
Right Side Airbag, Right Side Curtain Airbag, and/or Right Front/Rear Seat Belt Tensioner Deployed	OFF	•

•: Green

o: Red

4. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

5. Disconnect the HDS.

SYMPTOM TROUBLESHOOTING

SRS SYMPTOM TROUBLESHOOTING

Front seat belt reminder indicator does not come on, turn off, or flash(KA/KC)

Front seat belt reminder indicator does not come on, turn off, or flash

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed.
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures and General Troubleshooting Information.

1. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
Â	Â

Are any SRS DTCs indicated?

YES

Go to SRS DTC troubleshooting.

NO

Go to step 2.

2. Body electrical system DTC check

   -1. Check for body electrical DTCs with the HDS.

DTC Description	DTC
U0151-00 Gauge control module lost communication with SRS unit	Â

Is DTC U0151 indicated?

YES

Go to DTC U0151 troubleshooting .

NO

Go to step 3.

3. Gauge control module check

   -1. **Do the gauge control module self-diagnostic function** .

Self diagnostic function - CAN METER

Does the front seat belt reminder indicator blinkΩ

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Replace the gauge control module .

SRS indicator does not come on

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed**.
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information**.

1. Problem verification

-1. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

-2. Turn the vehicle to the ON mode, and check that the SRS indicator comes on for about 6 seconds and then go off.

Does the SRS indicator come on for about 6 seconds and then go off?

YES

Intermittent failure, the vehicle is OK at this time.

NO

The failure is duplicated. Go to step 2.

2. Gauge control module check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Connect the HDS to the data link connector (DLC)** .

   -3. Turn the vehicle to the ON mode.

   -4. **Do the gauge control module self-diagnostic function** .

   Does the SRS indicator blinkΩ

   YES

   Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

   NO

   Replace the gauge control module .

SRS indicator stays on, but no DTCs are stored, or cannot be read

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed**.
- Before doing this troubleshooting procedure, **make sure the 12 volt battery is fully charged** . If the 12 volt battery voltage is low, SRS indicator may stay on.
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures**, **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .
- SRS unit with a history that has detected the collision, turns on the SRS indicator. The internal components of the SRS unit are damaged and must be replaced.

1. HDS communication check 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Connect the HDS to the data link connector (DLC)** .

   -3. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -4. Check the HDS communication with the vehicle.

Does the HDS communication with the vehicle?

YES

Go to step 2.

NO

Go to DLC circuit troubleshooting .

2. HDS communication check 2

   -1. Check select the SRS system, in the HDS system selection menu.

   Can the SRS be selected in the System Selection Menu?

   YES

   Go to step 3.

   NO

   Go to step 5.

3. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
Â	Â

   Are any SRS DTCs indicated?

   YES

   Go to SRS DTC troubleshooting.

   NO

   Go to step 4.

4. Body electrical system DTC check

   -1. Check for body electrical DTCs with the HDS.

DTC Description	DTC
U0151-00 Gauge control module lost communication with SRS unit	Â

   Is DTC U0151 indicated?

   YES

   Go to DTC U0151 troubleshooting .

   NO

   Check the SRS indicator drive circuit by **performing self-diagnostic function of the gauge control module** . If the SRS indicator does not brink properly, **replace the gauge control module** .

5. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D35 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

Go to step 6.

NO

Replace the fuse, then turn the vehicle to the ON mode. If the fuse blows again, check for a short to ground in the under-dash fuse/relay box No. C35 (10 A) fuse circuit (dashboard wire harness); replace the dashboard wire harness, and retest. If the problem is still present, replace the under-dash fuse/relay box.

6. SRS unit power supply circuit check 1(VB Line)

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. Disconnect the following connector.

SRS unit connector A (39P)

-3. Reconnect the negative cable to the 12 volt battery.

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector A (39P): disconnected
Test point 1	**SRS unit connector A (39P) No. 39**
Test point 2	Body ground

Is there battery voltage?

YES

The VB wire is OK. Go to step 7.

NO

Open in the dashboard wire harness or faulty under-dash fuse/relay box; replace the dashboard wire harness or **the under-dash fuse/relay box** .

7. SRS unit power supply circuit check 2(GND Line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
Test point 1	**SRS unit connector A (39P) No. 36**

Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the dashboard wire harness; check for a poor ground at G305. If the ground is OK, replace the dashboard wire harness.

SYMPTOM TROUBLESHOOTING INDEX

SRS SYMPTOM TROUBLESHOOTING INDEX (KA/KC)

Symptom	Diagnostic procedure	Also check for
SRS indicator does not come on	**Symptom Troubleshooting**	-
SRS indicator stays on, but no DTCs are stored, or cannot be read	**Symptom Troubleshooting**	• **Check the deployed history**. • Charging system for under or overcharging • Communication with the HDS
Front passenger's airbag cutoff indicator flashes	Check for DTCs. If any DTC is indicated, go to the DTC troubleshooting	Front passenger's weight sensor initialization
Front passenger's airbag cutoff indicator does not come on	Check for DTCs. If any DTC is indicated, go to the DTC troubleshooting	DTC B00D5-14 troubleshooting
Front seat belt reminder indicator does not come on, turn off, or flash	**Symptom Troubleshooting**	-
HDS does not communicate with the vehicle	**DLC Circuit Troubleshooting**	• Correct HDS software • Communication with the HDS

INITIALIZATION

FRONT PASSENGER'S WEIGHT SENSOR INITIALIZATION (KA/KC)

Procedure

NOTE:

- When you replace or update the SRS unit, initialize the front passenger's weight sensor with the HDS.
- When you replace or remove the front passenger's weight sensor, the front passenger's seat frame, or the front passenger's seat rail, initialize the front passenger's weight sensor with the HDS.

1. **HDS - Connect**

2. Front Passenger's Weight Sensor - Initialize

NOTE:

- Before doing this procedure, clear the DTCs.
- Before doing this procedure, make sure the 12 volt battery is fully charged.
- Make sure the front passenger's seat and all components of the seat are correctly installed.
- Make sure nothing is on the front passenger's seat, including aftermarket seat covers or mats.
- Make sure there is nothing in the front passenger's seat-back pocket.
- Make sure the vehicle is on level ground.
- When you perform this procedure, the vehicle temperature must be between 41- 113 deg.F (5 - 45 deg.C).
- When the vehicle is exposed to intense cold or intense heat, move the vehicle inside, open the windows and moonroof (if equipped) and perform this procedure after one hour or more.
- Do not expose the front passenger's seat to sudden temperature changes.
- Do not use the A/C and the heater.
- Do not touch the front passenger's seat and keep the vehicle stationary during this procedure.
- Do not attach the seat belt tongue into the buckle.
- If possible, do all of the above procedures inside.

1. Position the front passenger's seat all the way rearward and lowermost (if equipped with the height adjuster), then adjust the seat-back to the forward most position.

NOTE: Do not move the seat from this position until the initialization is completed.

2. From SRS of the System Selection Menu, select SRS/SWS, then Adjustment. In the Adjustment, select SWS Initialization. Follow the prompts until the front passenger's weight sensor initialization has been completed.

3. From SRS of the System Selection Menu, select SRS/SWS, then Data List. In the Data List, select FRONT PASSENGER'S WEIGHT. The weight (T0) of the front passenger's seat is displayed by the HDS. Write this measurement down as "T0" on a piece of paper.

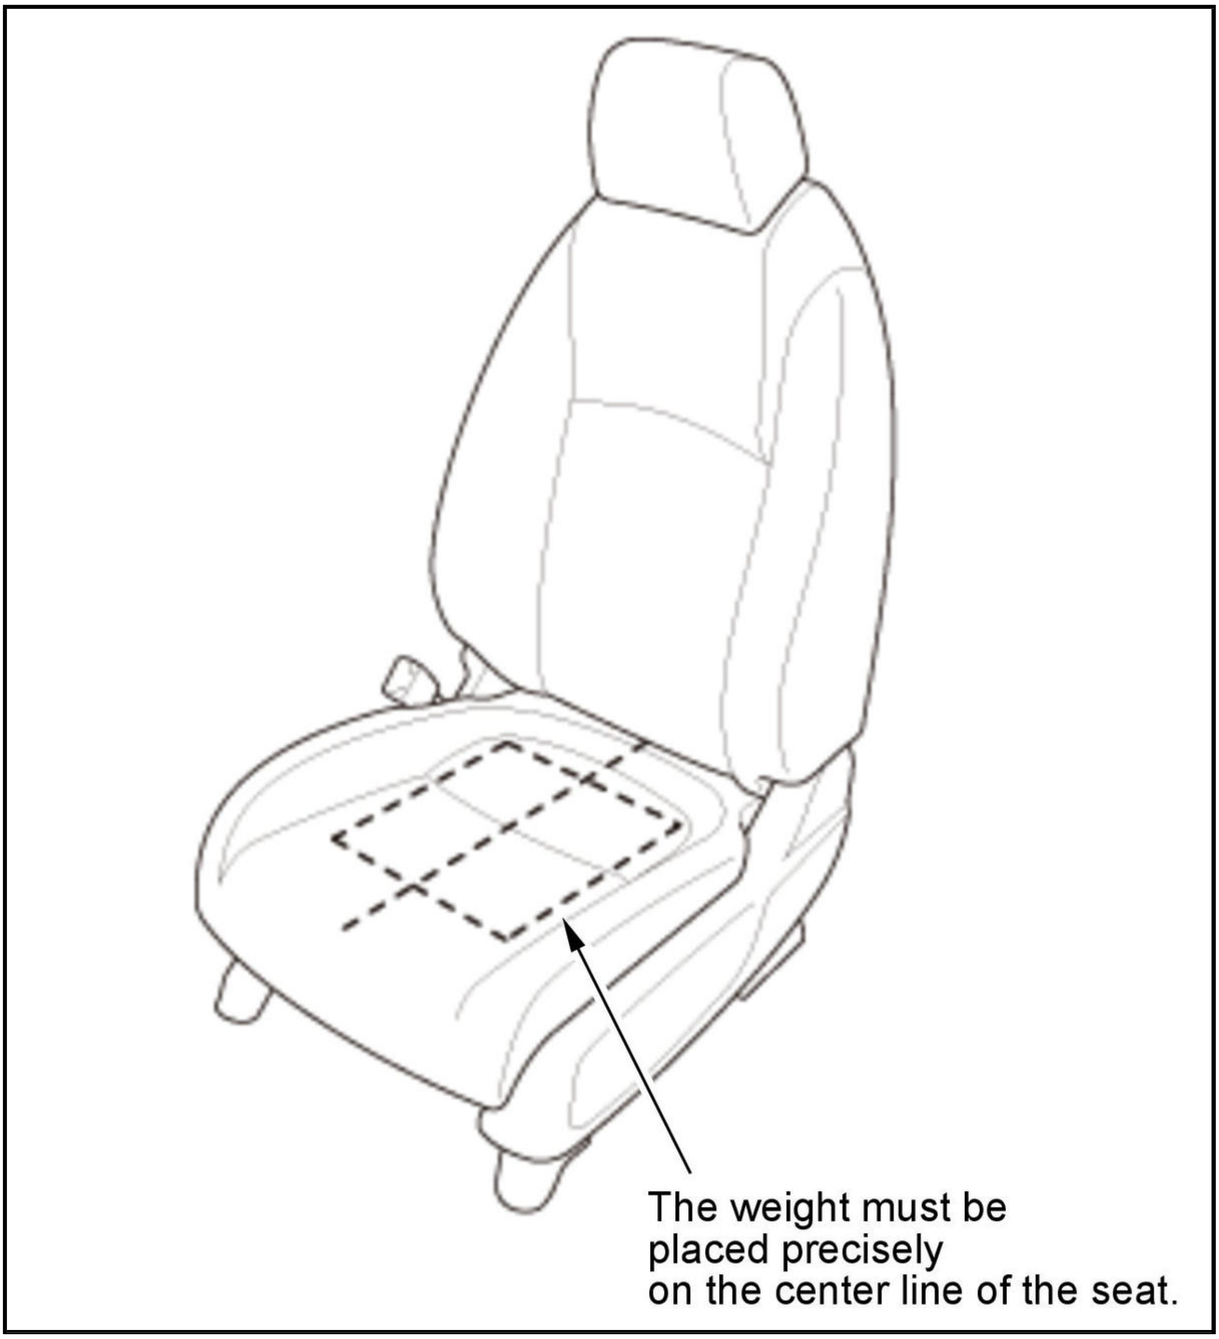
- If the reading on the HDS (T0) is within +/-0.35 kg (+/-0.77 lbs), go to step 4.
- If the reading on the HDS (T0) is at or not within +/-0.35 kg (+/-0.77 lbs), do the following and repeat the procedure from step 1.
-
    - Confirm that the seat has no interference with surrounding components.
    - **Remove the front passenger's weight sensors** (If they were not reinstalled), reinstall them, then repeat this procedure from the step 1.-
- If after reinstalling the front passenger's weight sensors, the HDS (T0) is still at or not within +/-0.35 kg (+/-0.77 lbs), replace the front passenger's weight sensors, then repeat this procedure from the beginning.

4. Prepare a weight between 10 kg (22 lbs) - 20 kg (44 lbs) then measure and note its actual weight (M) with a weight scale.

NOTE:

- The accuracy of the weight scale must be within 1 kg (2 lbs).
- The weight must be uniform in shape and size to allow precise placement on the seat.

5. Place the prepared weight precisely on the center of the front passenger's seat as shown.



6. From the Data List, select FRONT PASSENGER'S WEIGHT. The weight (T) of the front passenger's seat is displayed by the HDS. Write this measurement down as "T" on a piece of paper.

7. Divide (M) by 2. Write this calculation as "M1" on a piece of paper.

8. Calculate the variance between (M1) and the HDS (T) with the following formula.

Variance = (T)-(M1)	
Â	
T:	**Weight measured by the HDS with the weight on the seat.**
M1:	**Half of the weight measured by the weight scale.**

- If the variance is within +/-2.2 kg (+/-4.9 lbs), initialization is complete. Go to step 9.
- If the variance is at or not within +/-2.2 kg (+/-4.9 lbs), do the following and repeat the procedure from step 1.
-
    - Confirm that the seat has no interference with surrounding components.
    - Confirm that the weight was placed precisely in the center of the seat.

    - Remove the front passenger's weight sensors , reinstall them, then repeat this procedure from the step 1. If the variance is still at or not within +/-2.2 kg (+/-4.9 lbs), replace the front passenger's weight sensors (if they were not replaced), then repeat this procedure from step 1.

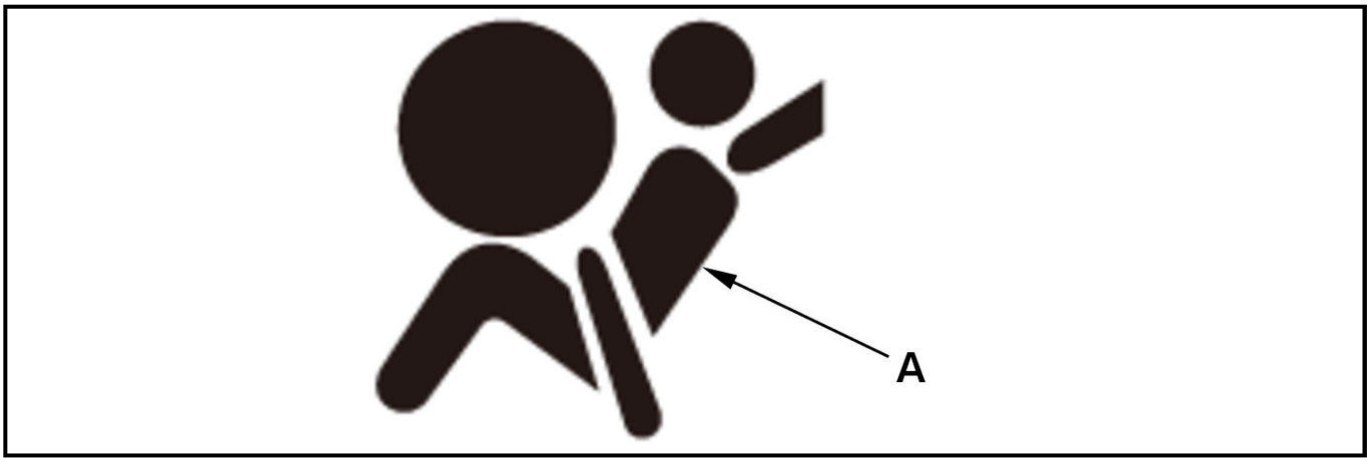
9. Turn the vehicle to the OFF (LOCK) mode.

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE SRS

SRS Indicator

The SRS indicator (A) on the gauge control module indicates problems related with SRS function.



If the system is OK, the SRS indicator should come on when you turn the vehicle to the ON mode, and then go off 6 seconds later. If it does not, there is a problem with the system.

NOTE: If the SRS indicator comes on, and SRS DTCs are not indicated, do the SRS symptom troubleshooting.

How to Troubleshoot Circuits at the Connectors Especially for Connectors with Terminal Test Ports

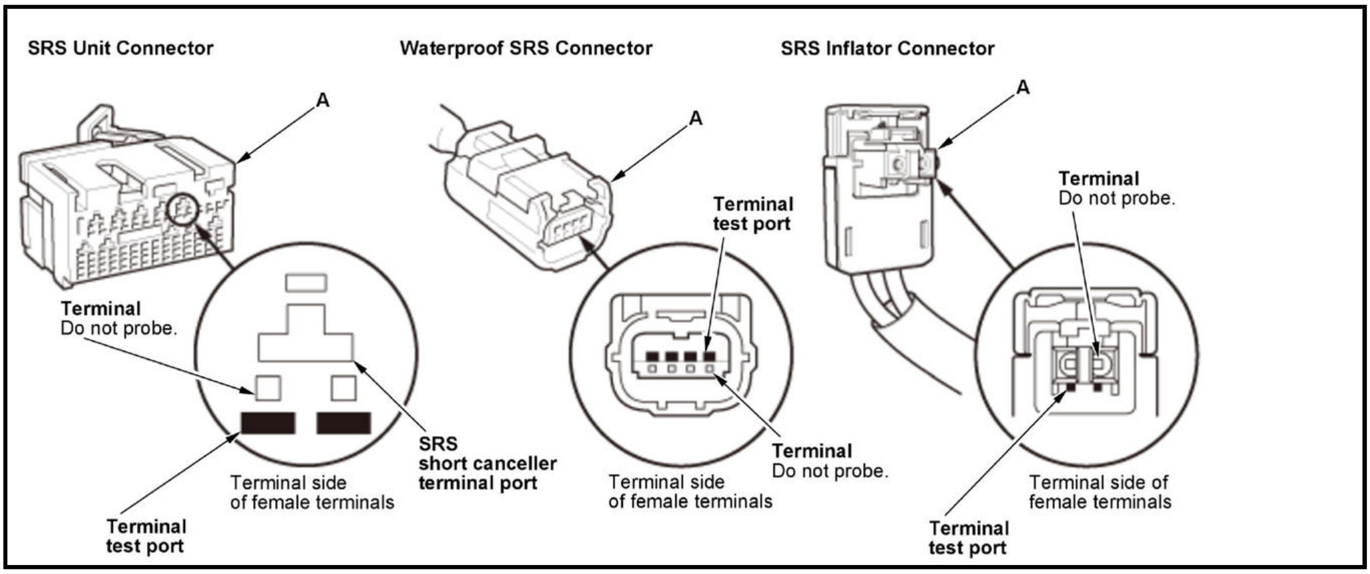
Special Tools Required

Male Pin Probe 07ZAJ-RDJA110

NOTE:

- Make sure the 12 volt battery is fully charged when doing an electrical test. If the 12 volt battery is not fully charged, the results of the tests may not be accurate.
- To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes. Damaged terminals cause a poor connection and an incorrect measurement.

1. When diagnosing or troubleshooting the circuits at the connectors (A), use the appropriate terminal test port as shown. Gently insert the pin probe of the tester or jumper wire at the terminal test port from the terminal side.



SRS Unit Connector
Waterproof SRS Connector
SRS Inflator Connector

Terminal
Do not probe.
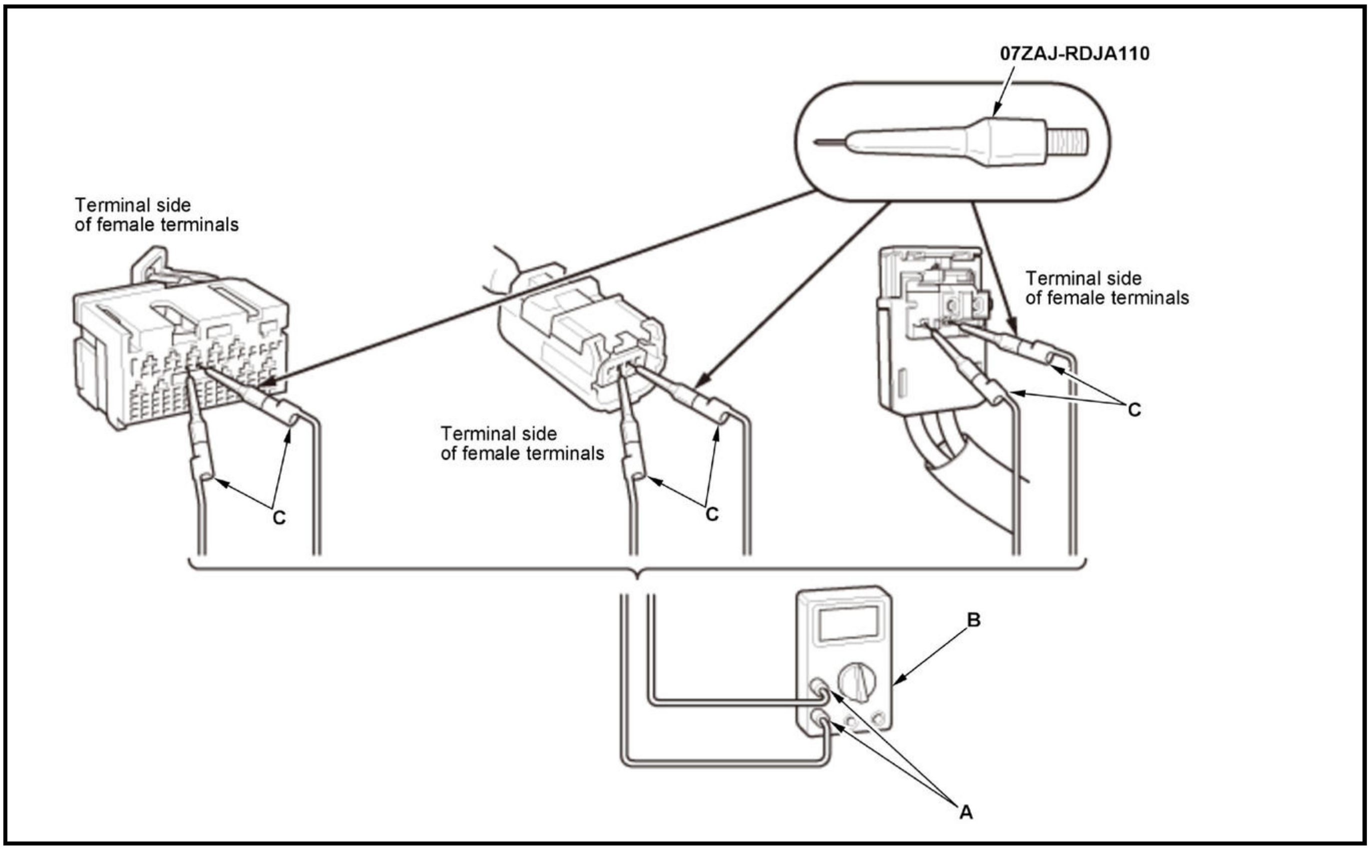
Terminal side of
female terminals
Terminal
test port

NOTE:

- Do not insert the pin probes of the tester or a jumper wire at the terminal or the SRS short canceller terminal port.
- To prevent damage to the connector terminals, do not insert the test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.

2. Connect one side of the patch cord terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminals (C) to the male pin probe.



07ZAJ-RDJA110
Terminal side
of female terminals
Terminal side
of female terminals
Terminal side
of female terminals
C
C
C
B
A

Gently contact the male pin probe at the terminal test port from the terminal side. Do not force the tips into the terminals.

NOTE:

- For accurate results, always use the male pin probe.

- To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes. Damaged terminals cause a poor connection and an incorrect measurement.
- Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.

How to Troubleshoot Circuits at the Connectors Except for Connectors with Terminal Test Ports

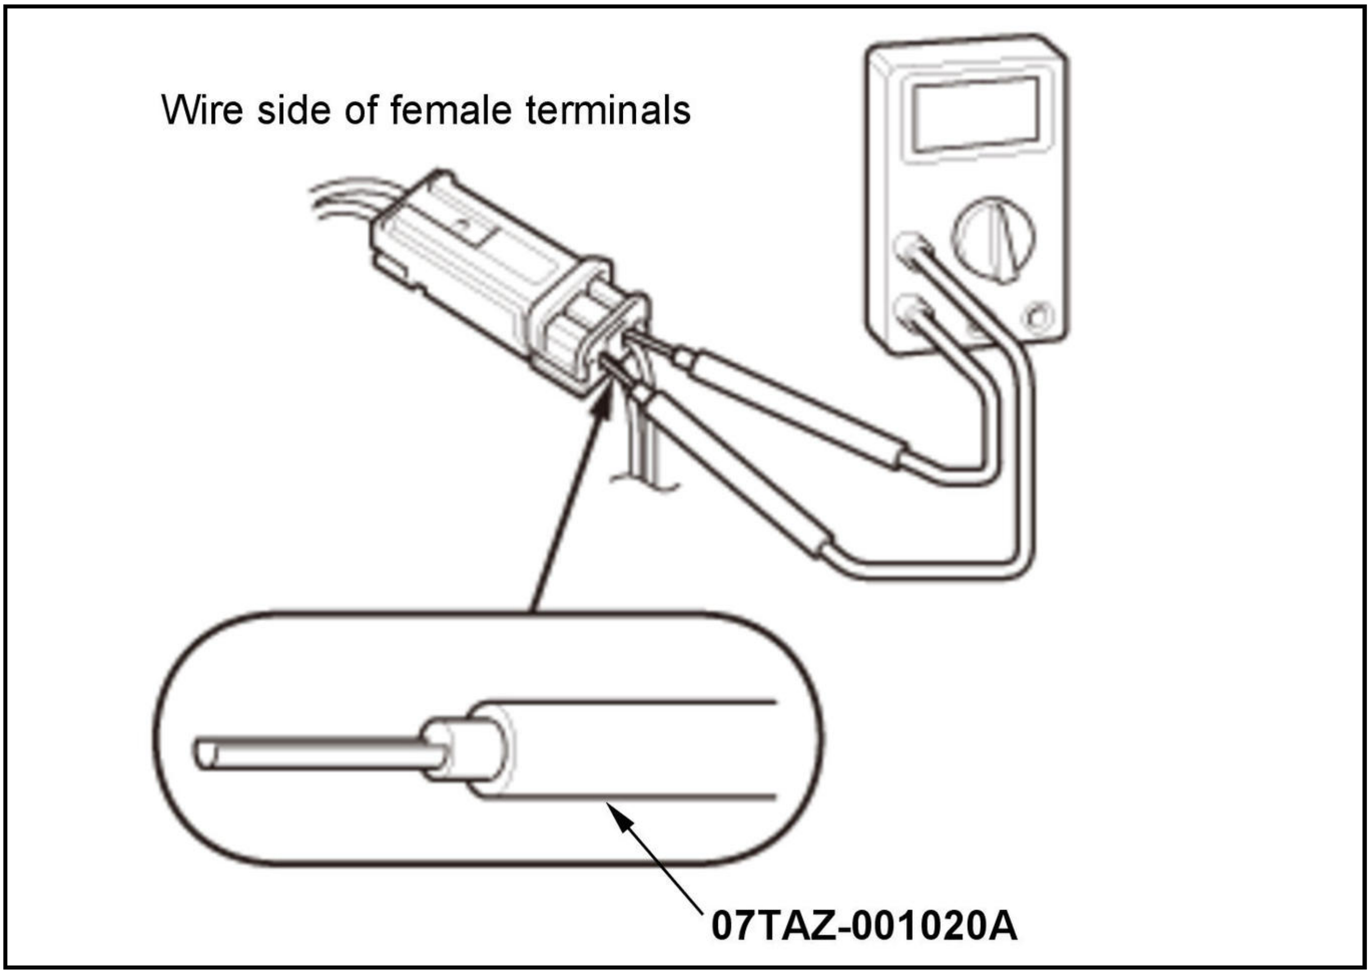
Special Tools Required

Back Probe Adapter, 17 mm 07TAZ-001020A

When using electrical test equipment, insert the back probe adapter, 17 mm of the tester into the wire side of the connector (except for connectors with terminal test ports).

NOTE:

- Make sure the 12 volt battery is fully charged when doing an electrical test. If the 12 volt battery is not fully charged, the results of the tests may not be accurate.
- Do not insert the probe of the tester into the terminal side of the connector, and do not tamper with the connector.
- To prevent damage to the connector, do not insert test equipment probes, paper clips, or other substitutes. Damaged terminals cause a poor connection and an incorrect measurement.
- Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.
- Do not insert the probe forcibly.
- Use specified service connectors in troubleshooting. Using improper tools could cause a diagnostic error due to poor metal-to-metal contact.



Opening the SRS Unit Shorting Connectors for Diagnosis

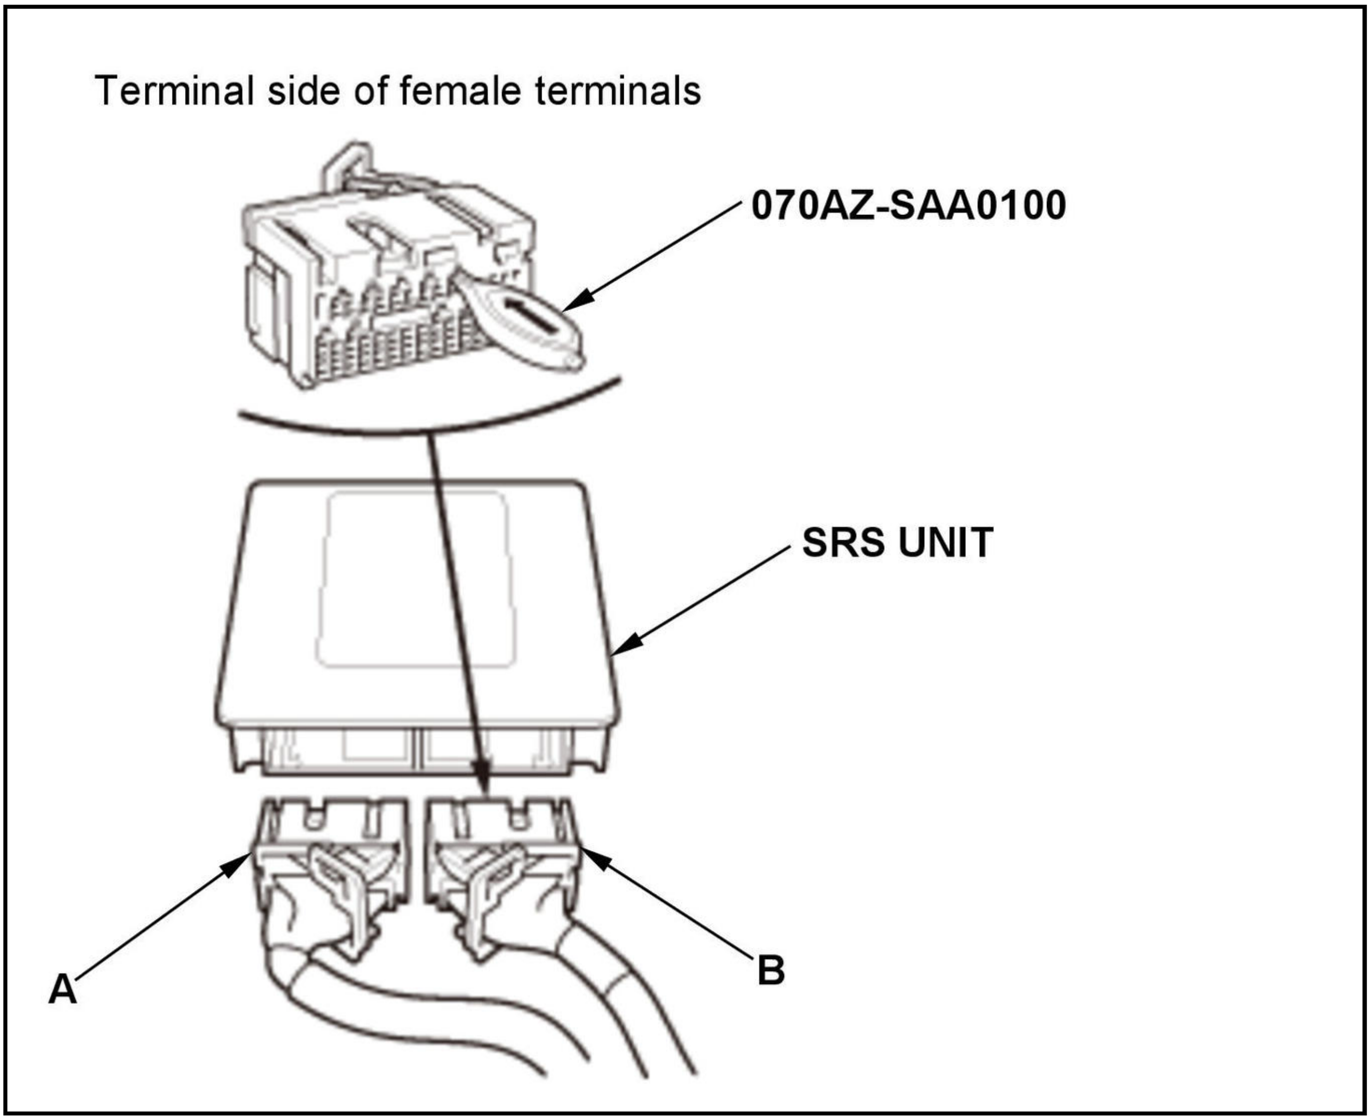
Special Tools Required

SRS Short Canceller 070AZ-SAA0100

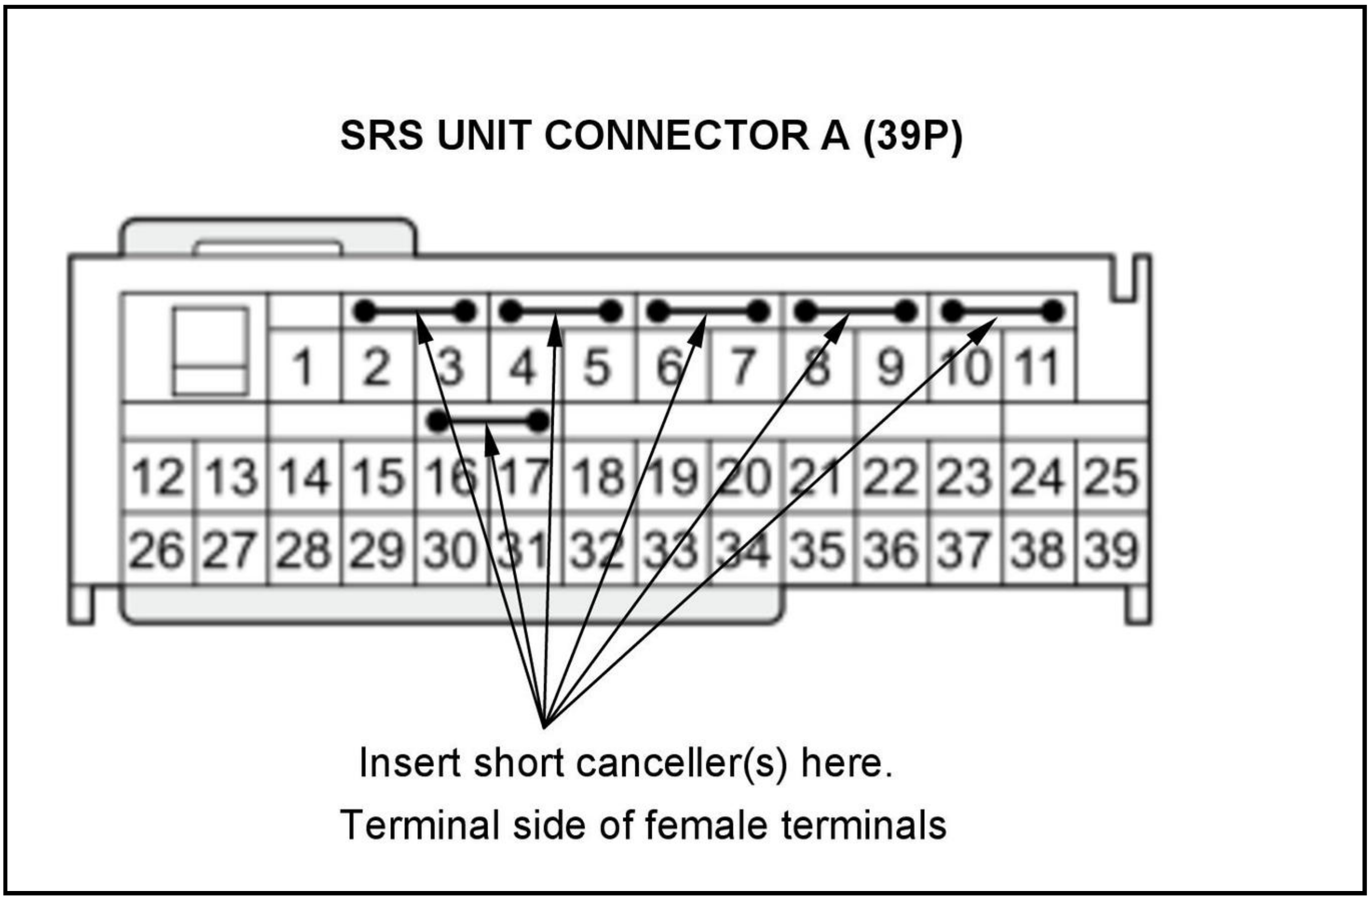
NOTE:

- To prevent damage to the connector cavity, insert an SRS short canceller straight into the cavity from the terminal side.
- Before installing an SRS short canceller, wash it with electrical contact cleaner, then dry it with compressed air.
- Do not use an SRS short canceller if it is damaged.
- Make sure to remove an SRS short canceller before reconnecting the SRS unit connector.
- Some systems store data in memory that is lost when the 12 volt battery is disconnected. Before disconnecting the 12 volt battery, **refer to 12 Volt Battery Terminal Disconnection and Reconnection** .

When SRS unit connectors A (39P) and B (39P) are disconnected, short circuits are automatically created in the connector to prevent accidental deployment of an airbag. The circuit may need to be opened sometimes when diagnosing the system. Insert an SRS short canceller in the specified cavities when necessary to keep the circuit open for diagnosis.



Terminal numbers are shown on the terminal side of the female terminals. Insert the SRS short canceller(s) into the cavities on the terminal side of the connector.

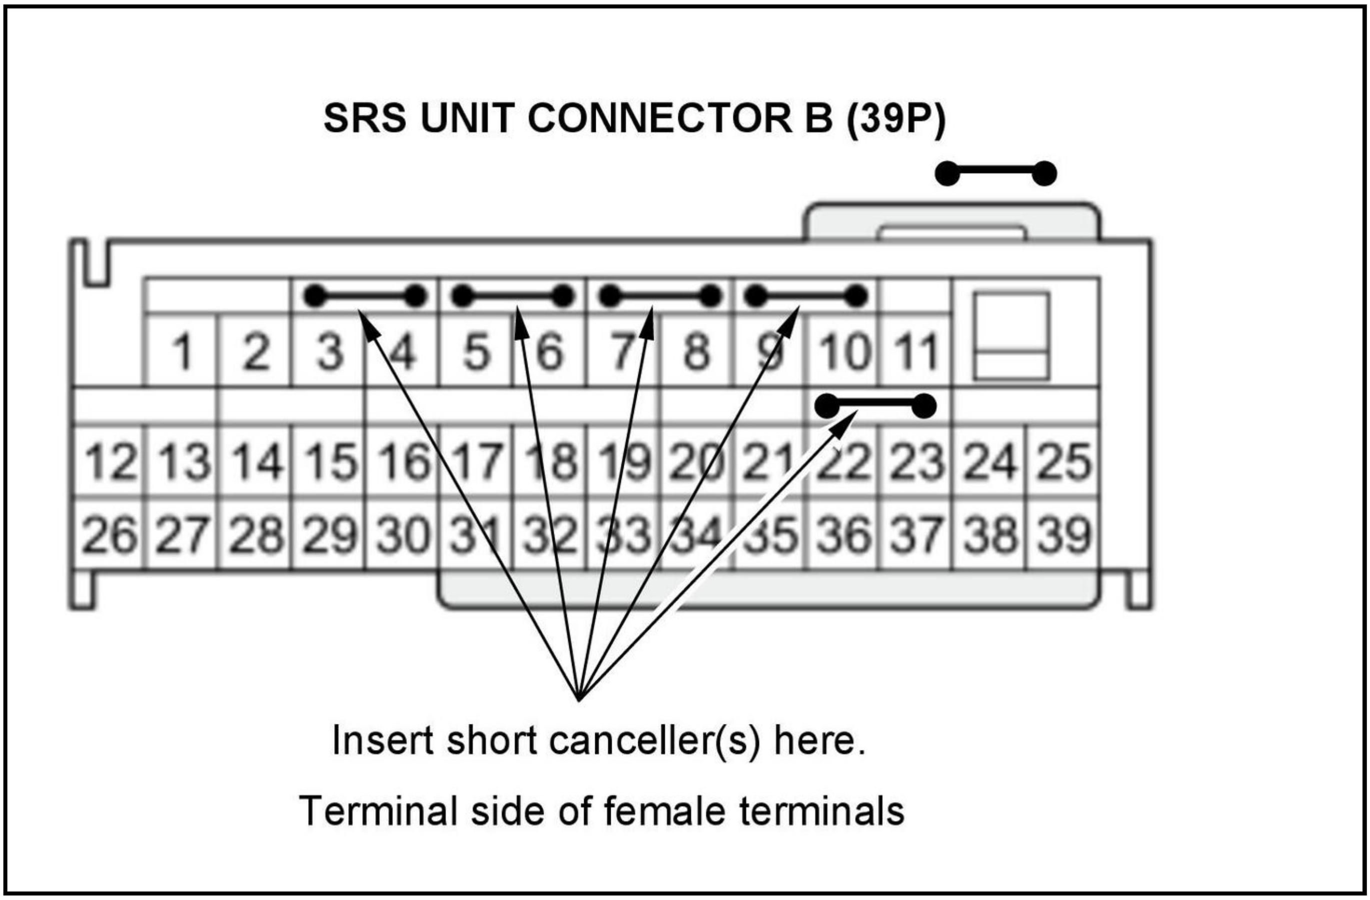


SRS UNIT CONNECTOR A (39P)

1 2 3 4 5 6 7 8 9 10 11
12 13 14 15 16 17 18 19 20 21 22 23 24 25
26 27 28 29 30 31 32 33 34 35 36 37 38 39

Insert short canceller(s) here.

Terminal side of female terminals



SRS UNIT CONNECTOR B (39P)

1 2 3 4 5 6 7 8 9 10 11
12 13 14 15 16 17 18 19 20 21 22 23 24 25
26 27 28 29 30 31 32 33 34 35 36 37 38 39

Insert short canceller(s) here.

Terminal side of female terminals

DTC (Diagnostic Trouble Codes)

The self-diagnostic function of the SRS unit allows it to locate the causes of system problems and store this information in memory. For easier troubleshooting, this data can be retrieved with the HDS via the data link circuit.

- When you turn the vehicle to the ON mode, the SRS indicator should come on. If it goes off after 6 seconds, the system is normal and is not currently detecting any problems.
- If there is a problem, the system locates and defines the problem, stores this information in the memory, and turns on the SRS indicator. The data remains in the memory even if the vehicle is turned to the OFF (LOCK) mode or the 12 volt battery is disconnected.
- The data is stored in memory as a diagnostic trouble code (DTC).
- DTCs are either latching or resetting depending on the malfunction. With resetting DTCs, the SRS indicator goes off the next time the vehicle is turned to the ON mode, and the system is normal, but the DTC is still stored. With latching DTCs, the SRS indicator does not turn off until the malfunction is repaired and the DTC is cleared.
- When you connect the HDS to the data link connector (DLC), you can retrieve a more detailed DTC in the HDS "SRS" menu.
- After reading and recording the DTC, go to the troubleshooting procedure for that code.

Precautions

- Make sure the 12 volt battery is fully charged. If the 12 volt battery is dead or low, electrical measurement values may not be correct.
- Use only a digital multimeter to check the system. Make sure its output is 10 mA (0.01 A) or less when switched to the smallest value in the ohmmeter range. A tester with a higher output could damage the airbag circuit or cause accidental airbag deployment and possible injury.
- Whenever the vehicle is turned to the ON mode, or the vehicle is in the OFF (LOCK) mode for less than 3 minutes, be careful not to bump the SRS unit; the system could falsely interpret an impact or rollover, deploying airbags in response and cause damage or injuries.
- Before removing the dashboard wire harness or floor wire harness, disconnect the driver's airbag inflator connector, the front passenger's airbag inflator connector, both side airbag inflator connectors, both side curtain airbag inflator connectors, and both front seat belt tensioner connectors.

How to Read DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

2. Connect the HDS to the data link connector (DLC)

3. Use the HDS to check for SRS DTCs.

4. Read and record the DTC.

NOTE: Do not clear the DTC until instructed by the troubleshooting procedure.

5. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

2. Connect the HDS to the data link connector (DLC)

3. Clear the DTC(s) by following the screen prompts on the HDS.

4. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

Troubleshooting Intermittent Failures

If there was a malfunction that sets a DTC, but it does not recur, a DTC will be stored in the memory, and the SRS indicator may come on depending on the malfunction detected.

NOTE:

- Check the condition of the 12 volt battery . Low battery voltage may cause some intermittent failures.
- A faulty or damaged cable reel can cause intermittent problems related to the driver's airbag inflator DTCs.

After checking the DTC, troubleshoot as follows:

1. Check for DTCs with the HDS.

2. Clear the DTCs with the HDS.

3. Set the parking brake, then start the engine, and let it idle.

4. The SRS indicator comes on for about 6 seconds and then goes off.

5. Shake the related wire harnesses and the connectors, and look for loose connections, poor pin fits, and poor grounds.

6. Take a test-drive (quick acceleration, quick braking, and cornering), turn the steering wheel fully left and right, and hold it there for 5 to 10 seconds. If the problem recurs, the SRS indicator will come on.

7. If you cannot duplicate the concern, ask the customer about the conditions when it occurred, or ask the customer to demonstrate the concern.

8. If you cannot duplicate the intermittent failure, the system is OK at this time.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

FRONT PASSENGER'S AIRBAG CUTOFF INDICATOR DOES NOT COME ON (KA/KC)

Diagnostic procedure

ADVANCED DIAGNOSTICS

DTC B0001-11

DTC B0001-11 : Short to Ground in the Driver's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the driver's airbag first inflator (LA1+, LA1- lines) • Driver's airbag internal failure (Driver's airbag first inflator) • Cable reel • SRS unit internal failure

DTC B0001-12

DTC B0001-12 : Short to Power in the Driver's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the driver's airbag first inflator (LA1+, LA1- lines) • Driver's airbag internal failure (Driver's airbag first inflator) • Cable reel • SRS unit internal failure

DTC B0001-13

DTC B0001-13 : Open or Increased Resistance in the Driver's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the driver's airbag first inflator (LA1+, LA1- lines) • Driver's airbag internal failure (Driver's airbag first inflator) • Cable reel • SRS unit internal failure

DTC B0001-1A

DTC B0001-1A : Decreased Resistance in the Driver's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line or Poor connection between the SRS unit and the driver's airbag first inflator (LA1+, LA1- lines) • Driver's airbag internal failure (Driver's airbag first inflator) • Cable reel • SRS unit internal failure

DTC B0001-2B

DTC B0001-2B : Short to Another Wire Harness in the Driver's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the driver's airbag first inflator (LA1+, LA1- lines) • Driver's airbag internal failure (Driver's airbag first inflator) • Cable reel • SRS unit internal failure

DTC B0002-11

DTC B0002-11 : Short to Ground in the Driver's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to ground between the SRS unit and the driver's airbag second inflator (LA2+, LA2- lines) - Driver's airbag internal failure (Driver's airbag second inflator) - Cable reel - SRS unit internal failure

DTC B0002-12

DTC B0002-12 : Short to Power in the Driver's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the driver's airbag second inflator (LA2+, LA2- lines) • Driver's airbag internal failure (Driver's airbag second inflator) • Cable reel • SRS unit internal failure

DTC B0002-13

DTC B0002-13 : Open or Increased Resistance in the Driver's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the driver's airbag second inflator (LA2+, LA2- lines) • Driver's airbag internal failure (Driver's airbag second inflator) • Cable reel • SRS unit internal failure

DTC B0002-1A

DTC B0002-1A : Decreased Resistance in the Driver's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line or Poor connection between the SRS unit and the driver's airbag second inflator (LA2+, LA2- lines) • Driver's airbag internal failure (Driver's airbag second inflator) • Cable reel • SRS unit internal failure

DTC B0002-2B

DTC B0002-2B : Short to Another Wire Harness in the Driver's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the driver's airbag second inflator (LA2+, LA2- lines) - Driver's airbag internal failure (Driver's airbag first inflator) - Cable reel - SRS unit internal failure

DTC B0010-11

DTC B0010-11 : Short to Ground in the Front Passenger's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to ground between the SRS unit and the front passenger's airbag first inflator (RA1+, RA1- lines) - Front passenger's airbag internal failure (Front passenger's airbag first inflator) - SRS unit internal failure

DTC B0010-12

DTC B0010-12 : Short to Power in the Front Passenger's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the front passenger's airbag first inflator (RA1+, RA1- lines) • Front passenger's airbag internal failure (Front passenger's airbag first inflator) • SRS unit internal failure

DTC B0010-13

DTC B0010-13 : Open or Increased Resistance in the Front Passenger's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds

DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Open or Poor connection between the SRS unit and the front passenger's airbag first inflator (RA1+, RA1- lines) - Front passenger's airbag internal failure (Front passenger's airbag first inflator) - SRS unit internal failure

DTC B0010-1A

DTC B0010-1A : Decreased Resistance in the Front Passenger's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line or Poor connection between the SRS unit and the front passenger's airbag first inflator (RA1+, RA1- lines) - Front passenger's airbag internal failure (Front passenger's airbag first inflator) - SRS unit internal failure

DTC B0010-2B

DTC B0010-2B : Short to Another Wire Harness in the Front Passenger's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.

- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the front passenger's airbag first inflator (RA1+, RA1- lines) • Front passenger's airbag internal failure (Front passenger's airbag first inflator) • SRS unit internal failure

DTC B0011-11

DTC B0011-11 : Short to Ground in the Front Passenger's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the front passenger's airbag second inflator (RA2+, RA2- lines) • Front passenger's airbag internal failure (Front passenger's airbag second inflator)

	- SRS unit internal failure

DTC B0011-12

DTC B0011-12 : Short to Power in the Front Passenger's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to power between the SRS unit and the front passenger's airbag second inflator (RA2+, RA2- lines) - Front passenger's airbag internal failure (Front passenger's airbag second inflator) - SRS unit internal failure

DTC B0011-13

DTC B0011-13 : Open or Increased Resistance in the Front Passenger's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition:

	• Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the front passenger's airbag second inflator (RA2+, RA2- lines) • Front passenger's airbag internal failure (Front passenger's airbag second inflator) • SRS unit internal failure

DTC B0011-1A

DTC B0011-1A : Decreased Resistance in the Front Passenger's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line or Poor connection between the SRS unit and the front passenger's airbag second inflator (RA2+, RA2- lines) • Front passenger's airbag internal failure (Front passenger's airbag second inflator) • SRS unit internal failure

DTC B0011-2B

DTC B0011-2B : Short to Another Wire Harness in the Front Passenger's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the front passenger's airbag second inflator (RA2+, RA2- lines) • Front passenger's airbag internal failure (Front passenger's airbag second inflator) • SRS unit internal failure

DTC B0020-11

DTC B0020-11 : Short to Ground in the Driver's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None

Possible Cause	- Short to ground between the SRS unit and the driver's side airbag inflator (LSA+, LSA- lines) - Driver's side airbag internal failure (Driver's side airbag inflator) - SRS unit internal failure

DTC B0020-12

DTC B0020-12 : Short to Power in the Driver's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to power between the SRS unit and the driver's side airbag inflator (LSA+, LSA- lines) - Driver's side airbag internal failure (Driver's side airbag inflator) - SRS unit internal failure

DTC B0020-13

DTC B0020-13 : Open or Increased Resistance in the Driver's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:

	- 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Open or Poor connection between the SRS unit and the driver's side airbag inflator (LSA+, LSA- lines) - Driver's side airbag internal failure (Driver's side airbag inflator) - SRS unit internal failure

DTC B0020-1A

DTC B0020-1A : Decreased Resistance in the Driver's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line or Poor connection between the SRS unit and the driver's side airbag inflator (LSA+, LSA- lines) - Driver's side airbag internal failure (Driver's side airbag inflator) - SRS unit internal failure

DTC B0020-2B

DTC B0020-2B : Short to Another Wire Harness in the Driver's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the driver's side airbag inflator (LSA+, LSA- lines) • Driver's side airbag internal failure (Driver's side airbag inflator) • SRS unit internal failure

DTC B0021-11

DTC B0021-11 : Short to Ground in the Left Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on

Fail Safe Action	- None
Possible Cause	- Short to ground between the SRS unit and the left side curtain airbag inflator (LCA+, LCA- lines) - Left side curtain airbag internal failure (Left side curtain airbag inflator) - SRS unit internal failure

DTC B0021-12

DTC B0021-12 : Short to Power in the Left Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to power between the SRS unit and the left side curtain airbag inflator (LCA+, LCA- lines) - Left side curtain airbag internal failure (Left side curtain airbag inflator) - SRS unit internal failure

DTC B0021-13

DTC B0021-13 : Open or Increased Resistance in the Left Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Open or Poor connection between the SRS unit and the left side curtain airbag inflator (LCA+, LCA- lines) - Left side curtain airbag internal failure (Left side curtain airbag inflator) - SRS unit internal failure

DTC B0021-1A

DTC B0021-1A : Decreased Resistance in the Left Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line or Poor connection between the SRS unit and the left side curtain airbag inflator (LCA+, LCA- lines) - Left side curtain airbag internal failure (Left side curtain airbag inflator) - SRS unit internal failure

DTC B0021-2B

DTC B0021-2B : Short to Another Wire Harness in the Left Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the left side curtain airbag inflator (LCA+, LCA- lines) • SRS unit internal failure

DTC B0028-11

DTC B0028-11 : Short to Ground in the Front Passenger's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the front passenger's side airbag (RSA+, RSA- lines) • Front passenger's side airbag internal failure (Front passenger's side airbag inflator) • SRS unit internal failure

DTC B0028-12

DTC B0028-12 : Short to Power in the Front Passenger's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the front passenger's side airbag inflator (RSA+, RSA- lines) • Front passenger's side airbag internal failure (Front passenger's side airbag inflator) • SRS unit internal failure

DTC B0028-13

DTC B0028-13 : Open or Increased Resistance in the Front Passenger's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the front passenger's side airbag inflator (RSA+, RSA- lines) • Front passenger's side airbag internal failure (Front passenger's side airbag inflator) • SRS unit internal failure

DTC B0028-1A

DTC B0028-1A : Decreased Resistance in the Front Passenger's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.

Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line or Poor connection between the SRS unit and the front passenger's side airbag inflator (RSA+, RSA- lines) - Front passenger's side airbag internal failure (Front passenger's side airbag inflator) - SRS unit internal failure

DTC B0028-2B

DTC B0028-2B : Short to Another Wire Harness in the Front Passenger's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the front passenger's side airbag inflator (RSA+, RSA- lines) - Front passenger's side airbag internal failure (Front passenger's side airbag inflator) - SRS unit internal failure

DTC B0029-11

DTC B0029-11 : Short to Ground in the Right Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the right side curtain airbag inflator (RCA+, RCA- lines) • Right side curtain airbag internal failure (Right side curtain airbag inflator) • SRS unit internal failure

DTC B0029-12

DTC B0029-12 : Short to Power in the Right Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None

Possible Cause	- Short to power between the SRS unit and the right side curtain airbag inflator (RCA+, RCA- lines) - Right side curtain airbag internal failure (Right side curtain airbag inflator) - SRS unit internal failure

DTC B0029-13

DTC B0029-13 : Open or Increased Resistance in the Right Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Open or Poor connection between the SRS unit and the right side curtain airbag inflator (RCA+, RCA- lines) - Right side curtain airbag internal failure (Right side curtain airbag inflator) - SRS unit internal failure

DTC B0029-1A

DTC B0029-1A : Decreased Resistance in the Right Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:

	- 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line or Poor connection between the SRS unit and the right side curtain airbag first inflator (RCA+, RCA- lines) - Right side curtain airbag internal failure (Right side curtain airbag inflator) - SRS unit internal failure

DTC B0029-2B

DTC B0029-2B : Short to Another Wire Harness in the Right Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the right side curtain airbag inflator (RCA+, RCA- lines) - SRS unit internal failure

DTC B0050-11

DTC B0050-11 : Short or Decreased Resistance in the Driver's Seat Belt Buckle Switch

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground or Short to power between the SRS unit and the driver's seat belt buckle switch (FLBC line) • Driver's seat belt buckle assembly internal failure (Driver's seat belt buckle switch)

DTC B0050-13

DTC B0050-13 : Open or Increased Resistance in the Driver's Seat Belt Buckle Switch

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on

Fail Safe Action	- None
Possible Cause	- Open or Poor connection between the SRS unit and the driver's seat belt buckle switch (FLBC line) - Open or Poor connection between the driver's seat belt buckle switch and the body ground (GND line) - Driver's seat belt buckle assembly internal failure (Driver's seat belt buckle switch) - SRS unit internal failure

DTC B0050-2B

DTC B0050-2B : Short to Another Wire Harness in the Driver's Seat Belt Buckle Switch

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the driver's seat belt buckle switch (FLBC line) - Driver's seat belt buckle assembly internal failure (Driver's seat belt buckle switch)

DTC B0052-11

DTC B0052-11 : Short or Decreased Resistance in the Front Passenger's Seat Belt Buckle Switch

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground or Short to power between the SRS unit and the front passenger's seat belt buckle switch (FRBC line) • Front passenger's seat belt buckle assembly internal failure (Front passenger's seat belt buckle switch)

DTC B0052-13

DTC B0052-13 : Open or Increased Resistance in the Front Passenger's Seat Belt Buckle Switch

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the front passenger's seat belt buckle switch (FRBC line) • Open or Poor connection between the front passenger's seat belt buckle switch and the body ground (GND line)

	- Front passenger's seat belt buckle assembly internal failure (Front passenger's seat belt buckle switch) - SRS unit internal failure

DTC B0052-2B

DTC B0052-2B : Short to Another Wire Harness in the Front Passenger's Seat Belt Buckle Switch

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the front passenger's seat belt buckle switch (FRBC line) - Front passenger's seat belt buckle assembly internal failure (Front passenger's seat belt buckle switch)

DTC B0070-11

DTC B0070-11 : Short to Ground in the Driver's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V

	Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the driver's seat belt tensioner (LRP+, LRP- lines) • Driver's seat belt internal failure (Driver's seat belt tensioner) • SRS unit internal failure

DTC B0070-12

DTC B0070-12 : Short to Power in the Driver's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the driver's seat belt tensioner (LRP+, LRP- lines) • Driver's seat belt internal failure (Driver's seat belt tensioner) • SRS unit internal failure

DTC B0070-13

DTC B0070-13 : Open or Increased Resistance in the Driver's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the driver's seat belt tensioner (LRP+, LRP- lines) • Driver's seat belt internal failure (Driver's seat belt tensioner) • SRS unit internal failure

DTC B0070-1A

DTC B0070-1A : Decreased Resistance in the Driver's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None

Possible Cause	- Short to another line or Poor connection between the SRS unit and the driver's seat belt tensioner (LRP+, LRP- lines) - Driver's seat belt internal failure (Driver's seat belt tensioner) - SRS unit internal failure

DTC B0070-2B

DTC B0070-2B : Short to Another Wire Harness in the Driver's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the driver's seat belt tensioner (LRP+, LRP- lines) - SRS unit internal failure

DTC B0072-11

DTC B0072-11 : Short to Ground in the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V

	Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the front passenger's seat belt tensioner (RRP+, RRP- lines) • Front passenger's seat belt internal failure (Front passenger's seat belt tensioner) • SRS unit internal failure

DTC B0072-12

DTC B0072-12 : Short to Power in the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the front passenger's seat belt tensioner (RRP+, RRP- lines) • Front passenger's seat belt internal failure (Front passenger's seat belt tensioner) • SRS unit internal failure

DTC B0072-13

DTC B0072-13 : Open or Increased Resistance in the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the front passenger's seat belt tensioner (RRP+, RRP- lines) • Front passenger's seat belt internal failure (Front passenger's seat belt tensioner) • SRS unit internal failure

DTC B0072-1A

DTC B0072-1A : Decreased Resistance in the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None

Possible Cause	- Short to another line or Poor connection between the SRS unit and the front passenger's seat belt tensioner (RRP+, RRP- lines) - Front passenger's seat belt internal failure (Front passenger's seat belt tensioner) - SRS unit internal failure

DTC B0072-2B

DTC B0072-2B : Short to Another Wire Harness in the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the front passenger's seat belt tensioner (RRP+, RRP- lines) - SRS unit internal failure

DTC B0079-11

DTC B0079-11 : Short to Ground in the Driver's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V

	Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to ground between the SRS unit and the driver's seat belt outer lap tensioner (LLP+, LLP- lines) - Driver's seat belt internal failure (Driver's seat belt outer lap tensioner) - SRS unit internal failure

DTC B0079-12

DTC B0079-12 : Short to Power in the Driver's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to power between the SRS unit and the driver's seat belt outer lap tensioner (LLP+, LLP- lines) - Driver's seat belt internal failure (Driver's seat belt outer lap tensioner) - SRS unit internal failure

DTC B0079-13

DTC B0079-13 : Open or Increased Resistance in the Driver's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the driver's seat belt outer lap tensioner (LLP+, LLP- lines) • Driver's seat belt internal failure (Driver's seat belt outer lap tensioner) • SRS unit internal failure

DTC B0079-1A

DTC B0079-1A : Decreased Resistance in the Driver's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None

Possible Cause	• Short to another line or Poor connection between the SRS unit and the driver's seat belt outer lap tensioner (LLP+, LLP- lines) • Driver's seat belt internal failure (Driver's seat belt outer lap tensioner) • SRS unit internal failure

DTC B0079-2B

DTC B0079-2B : Short to Another Wire Harness in the Driver's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the driver's seat belt outer lap tensioner (LLP+, LLP- lines) • Driver's seat belt internal failure (Driver's seat belt outer lap tensioner) • SRS unit internal failure

DTC B007A-11

DTC B007A-11 : Short to Ground in the Front Passenger's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:

	• 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the front passenger's seat belt outer lap tensioner (RLP+, RLP- lines) • Front passenger's seat belt internal failure (Front passenger's seat belt outer lap tensioner) • SRS unit internal failure

DTC B007A-12

DTC B007A-12 : Short to Power in the Front Passenger's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the front passenger's seat belt outer lap tensioner (RLP+, RLP- lines) • Front passenger's seat belt internal failure (Front passenger's seat belt outer lap tensioner) • SRS unit internal failure

DTC B007A-13

DTC B007A-13 : Open or Increased Resistance in the Front Passenger's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the front passenger's seat belt outer lap tensioner (RLP+, RLP- lines) • Front passenger's seat belt internal failure (Front passenger's seat belt outer lap tensioner) • SRS unit internal failure

DTC B007A-1A

DTC B007A-1A : Decreased Resistance in the Front Passenger's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.

Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line or Poor connection between the SRS unit and the front passenger's seat belt outer lap tensioner (RLP+, RLP- lines) • Front passenger's seat belt internal failure (Front passenger's seat belt outer lap tensioner) • SRS unit internal failure

DTC B007A-2B

DTC B007A-2B : Short to Another Wire Harness in the Front Passenger's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the front passenger's seat belt outer lap tensioner (RLP+, RLP- lines) • Front passenger's seat belt internal failure (Front passenger's seat belt outer lap tensioner) • SRS unit internal failure

DTC B0082-11

DTC B0082-11 : Short to Ground in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the selectable energy absorption device (RVEA+, RVEA- lines) • Front passenger's seat belt internal failure (Selectable energy absorption device) • SRS unit internal failure

DTC B0082-12

DTC B0082-12 : Short to Power in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the selectable energy absorption device (RVEA+, RVEA- lines) • Front passenger's seat belt internal failure (Selectable energy absorption device) • SRS unit internal failure

DTC B0082-13

DTC B0082-13 : Open or Increased Resistance in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the selectable energy absorption device (RVEA+, RVEA- lines) • Front passenger's seat belt internal failure (Selectable energy absorption device) • SRS unit internal failure

DTC B0082-1A

DTC B0082-1A : Decreased Resistance in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line or Poor connection between the SRS unit and the selectable energy absorption device (RVEA+, RVEA- lines) • Front passenger's seat belt internal failure (Selectable energy absorption device) • SRS unit internal failure

DTC B0082-2B

DTC B0082-2B : Short to Another Wire Harness in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line or Poor connection between the SRS unit and the selectable energy absorption device (RVEA+, RVEA- lines) • SRS unit internal failure

DTC B0090-4A

DTC B0090-4A : Internal Failure of the Left Front Impact Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Incorrect left front impact sensor installed • Incorrect SRS unit installed • Left front impact sensor internal failure • SRS unit internal failure

DTC B0090-87

DTC B0090-87 : No Signal From the Left Front Impact Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open, Short to another line, Short to ground, Short to power, or Poor connection between the SRS unit and the left front impact sensor (LFS+, LFS- lines) • Left front impact sensor internal failure • SRS unit internal failure

DTC B0090-92

DTC B0090-92 : Internal Failure of the Left Front Impact Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle

	- SRS indicator on
Fail Safe Action	- None
Possible Cause	- Left front impact sensor internal failure - SRS unit internal failure

DTC B0091-4A

DTC B0091-4A : Internal Failure of the Left Side Impact Sensor (first)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Incorrect left side impact sensor (first) installed - Incorrect SRS unit installed - Left side impact sensor (first) internal failure - SRS unit internal failure

DTC B0091-87

DTC B0091-87 : No Signal From the Left Side Impact Sensor (first)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open, Short to another line, Short to ground, Short to power, or Poor connection between the SRS unit and the left side impact sensor (first) (LS1+, LS1- lines) • Left side impact sensor (first) internal failure • SRS unit internal failure

DTC B0091-92

DTC B0091-92 : Internal Failure of the Left Side Impact Sensor (first)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Left side impact sensor (first) internal failure • SRS unit internal failure

DTC B0092-4A

DTC B0092-4A : Internal Failure of the Left Side Impact Sensor (second)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Incorrect left side impact sensor (second) installed • Incorrect SRS unit installed • Left side impact sensor (second) internal failure • SRS unit internal failure

DTC B0092-87

DTC B0092-87 : No Signal From the Left Side Impact Sensor (second)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on

Fail Safe Action	- None
Possible Cause	- Open, Short to another line, Short to ground, Short to power, or Poor connection between the SRS unit and the left side impact sensor (second) (LS2+, LS2- lines) - Left side impact sensor (second) internal failure - SRS unit internal failure

DTC B0092-92

DTC B0092-92 : Internal Failure of the Left Side Impact Sensor (second)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Left side impact sensor (second) internal failure - SRS unit internal failure

DTC B0095-4A

DTC B0095-4A : Internal Failure of the Right Front Impact Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:

	- 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Incorrect right front impact sensor installed - Incorrect SRS unit installed - Right front impact sensor internal failure - SRS unit internal failure

DTC B0095-87

DTC B0095-87 : No Signal From the Right Front Impact Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Open, Short to another line, Short to ground, Short to power, or Poor connection between the SRS unit and the right front impact sensor (RFS+, RFS- lines) - Right front impact sensor internal failure - SRS unit internal failure

DTC B0095-92

DTC B0095-92 : Internal Failure of the Right Front Impact Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Right front impact sensor internal failure • SRS unit internal failure

DTC B0096-4A

DTC B0096-4A : Internal Failure of the Right Side Impact Sensor (first)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on

Fail Safe Action	- None
Possible Cause	- Incorrect right side impact sensor (first) installed - Incorrect SRS unit installed - Right side impact sensor (first) internal failure - SRS unit internal failure

DTC B0096-87

DTC B0096-87 : No Signal From the Right Side Impact Sensor (first)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Open, Short to another line, Short to ground, Short to power, or Poor connection between the SRS unit and the right side impact sensor (first) (RS1+, RS1- lines) - Right side impact sensor (first) internal failure - SRS unit internal failure

DTC B0096-92

DTC B0096-92 : Internal Failure of the Right Side Impact Sensor (first)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Right side impact sensor (first) internal failure - SRS unit internal failure

DTC B0097-4A

DTC B0097-4A : Internal Failure of the Right Side Impact Sensor (second)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Incorrect right side impact sensor (second) installed - Incorrect SRS unit installed - Right side impact sensor (second) internal failure - SRS unit internal failure

DTC B0097-87

DTC B0097-87 : No Signal From the Right Side Impact Sensor (second)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open, Short to another line, Short to ground, Short to power, or Poor connection between the SRS unit and the right side impact sensor (second) (RS2+, RS2- lines) • Right side impact sensor (second) internal failure • SRS unit internal failure

DTC B0097-92

DTC B0097-92 : Internal Failure of the Right Side Impact Sensor (second)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Right side impact sensor (second) internal failure • SRS unit internal failure

DTC B00A0-54

DTC B00A0-54 : Front Passenger's Weight Sensor not Calibrated

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Front passenger's weight sensor not initialized

DTC B00B5-11

DTC B00B5-11 : Short or Decreased Resistance in the Driver's Seat Position Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the driver's seat position sensor (SS+ line) • Driver's seat position sensor internal failure • SRS unit internal failure

DTC B00B5-13

DTC B00B5-13 : Open or Increased Resistance in the Driver's Seat Position Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None

Possible Cause	- Open or Poor connection between the SRS unit and the driver's seat position sensor (SS+ line) - Open or Poor connection between the driver's seat position sensor and the body ground (GND line) - Driver's seat position sensor internal failure - SRS unit internal failure

DTC B00B5-2B

DTC B00B5-2B : Short to Another Wire Harness in the Driver's Seat Position Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - Battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the driver's seat position sensor (SS+ line) - Driver's seat position sensor internal failure - SRS unit internal failure

DTC B00C0-16

DTC B00C0-16 : Internal Failure of the Front Passenger's Weight Sensor (front inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	Front passenger's weight sensor internal failure (front inner side)

DTC B00C0-4A

DTC B00C0-4A : Different Supplier ID/Function ID of the Front Passenger's Weight Sensor (front inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Front passenger's weight sensor internal failure (front inner side) • SRS unit internal failure

DTC B00C0-54

DTC B00C0-54 : Different Serial ID of the Front Passenger's Weight Sensor (front inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.

- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	SRS unit internal failure

DTC B00C0-87

DTC B00C0-87 : No Signal From the Front Passenger's Weight Sensor (front inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or poor connection between the SRS unit and the front passenger's weight sensor (front inner side) (SWS+, SWSS, SWS- lines) • Short to power or short to ground between the SRS unit and the front passenger's weight sensor (front inner side) (SWSS line) • Short to another line or poor connection between the SRS unit and the front passenger's weight sensor (front inner side) (SWSS to SWS+ lines, SWSS to

	SWS- lines) - SRS unit internal failure - Front passenger's weight sensor internal failure (front inner side)

DTC B00C0-96

DTC B00C0-96 : Internal Failure of the Front Passenger's Weight Sensor (front inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - Battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	Front passenger's weight sensor internal failure (front inner side)

DTC B00C2-16

DTC B00C2-16 : Internal Failure of the Front Passenger's Weight Sensor (rear inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - Battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.

Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	Front passenger's weight sensor internal failure (rear inner side)

DTC B00C2-4A

DTC B00C2-4A : Different Supplier ID/Function ID of the Front Passenger's Weight Sensor (rear inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - Battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Front passenger's weight sensor internal failure (rear inner side) - SRS unit internal failure

DTC B00C2-54

DTC B00C2-54 : Different Serial ID of the Front Passenger's Weight Sensor (rear inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:

	• Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	SRS unit internal failure

DTC B00C2-87

DTC B00C2-87 : No Signal From the Front Passenger's Weight Sensor (rear inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or poor connection between the SRS unit and the front passenger's weight sensor (rear inner side) (SWS+, SWS-, SWSS lines) • SRS unit internal failure • Front passenger's weight sensor internal failure (rear inner side)

DTC B00C2-96

DTC B00C2-96 : Internal Failure of the Front Passenger's Weight Sensor (rear inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.

- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	Front passenger's seat rail internal failure (Front passenger's weight sensor (rear inner side))

DTC B00D5-14

DTC B00D5-14 : Open or Short to Ground in the Front Passenger's Airbag Cutoff Indicator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 9 seconds.
Duration	About 9 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Short to ground between the SRS unit and the front passenger's airbag cutoff indicator (OFF_PTT line) • Open or Short to ground between the 12 volt battery and the front passenger's airbag cutoff indicator • Front passenger's airbag cutoff indicator internal failure

	- SRS unit internal failure

DTC B00D5-17

DTC B00D5-17 : Short to Power in the Front Passenger's Airbag Cutoff Indicator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 9 seconds.
Duration	About 9 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the front passenger's airbag cutoff indicator (OFF_PTT line) • Front passenger's airbag cutoff indicator internal failure • SRS unit internal failure

DTC B2800-49

DTC B2800-49 : Internal Failure of the SRS Unit

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition:

	• Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• SRS unit internal failure

DTC B2801-49

DTC B2801-49 : Internal Failure of the SRS Unit

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• SRS unit internal failure

DTC B2802-49

DTC B2802-49 : Internal Failure of the SRS Unit

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• SRS unit internal failure

DTC B2840-13

DTC B2840-13 : SRS Unit Connector A Not Properly Installed

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Poor connection between the SRS unit and connector A • SRS unit internal failure

DTC B2841-13

DTC B2841-13 : SRS Unit Connector B Not Properly Installed

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Poor connection between the SRS unit and connector B • SRS unit internal failure

DTC C0061-96 (SRS UNIT)

DTC C0061-96 : Internal Failure of the SRS Unit

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- SRS unit internal failure

DTC C0063-96 (SRS UNIT)

DTC C0063-96 : Internal Failure of the SRS Unit

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- SRS unit internal failure

DTC U0122-00 (SRS UNIT)

DTC U0122-00 : Lost Communication With the VSA Modulator-Control Unit (wheel speed sensor signal error)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the CAN gateway and the SRS unit (F-CAN C_H, F-CAN C_L lines) • Open or Poor connection between the CAN gateway and the VSA modulator-control unit (F-CAN B_H, F-CAN B_L, F-CAN C_H, F-CAN C_L lines) • VSA modulator-control unit internal failure • SRS unit internal failure

DTC U3000-49 (SRS UNIT)

DTC U3000-49 : Internal Failure of the SRS Unit

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on

Fail Safe Action	- None
Possible Cause	- Short to ground or short to power between the SRS unit and the front passenger's weight sensor (front inner side) (SWS+ line) - Short to another line between the SRS unit and the front passenger's weight sensor (front inner side) (SWS+ line to SWS- line) - Short to ground or short to power between the SRS unit and the front passenger's weight sensor (rear inner side) (SWS+ line) - Short to another line between the SRS unit and the front passenger's weight sensor (rear inner side) (SWS+ line to SWS- line) - SRS unit internal failure - Front passenger's weight sensor internal failure

DTC U3000-51 (SRS UNIT)

DTC U3000-51 : SRS Unit Programming Error

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- SRS unit update is not completed properly - SRS unit internal failure

DTC ADVANCED DIAGNOSTICS

DTC B0001-11

DTC B0001-11 : Short to Ground in the Driver's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the driver's airbag first inflator (LA1+, LA1- lines) • Driver's airbag internal failure (Driver's airbag first inflator) • SRS unit internal failure

DTC B0001-12

DTC B0001-12 : Short to Power in the Driver's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V

	Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the driver's airbag first inflator (LA1+, LA1- lines) • Driver's airbag internal failure (Driver's airbag first inflator) • SRS unit internal failure

DTC B0001-13

DTC B0001-13 : Open or Increased Resistance in the Driver's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

DTC B0001-13: Open or Increased Resistance in the Driver's Airbag First Inflator

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the driver's airbag first inflator (LA1+, LA1- lines) • Driver's airbag internal failure (Driver's airbag first inflator) • SRS unit internal failure

DTC B0001-1A

DTC B0001-1A : Decreased Resistance in the Driver's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line or Poor connection between the SRS unit and the driver's airbag first inflator (LA1+, LA1-) • Driver's airbag internal failure (Driver's airbag first inflator) • SRS unit internal failure

DTC B0001-2B

DTC B0001-2B : Short to Another Wire Harness in the Driver's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle

	- SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the driver's airbag first inflator (LA1+, LA1- line) - Driver's airbag internal failure (Driver's airbag first inflator) - SRS unit internal failure

DTC B0002-11 (KA/KC) (2019 2020 2021)

DTC B0002-11 : Short to Ground in the Driver's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to ground between the SRS unit and the driver's airbag second inflator (LA2+, LA2- lines) - Driver's airbag internal failure (Driver's airbag second inflator) - Cable reel - SRS unit internal failure

DTC B0002-12 (KA/KC) (2019 2020 2021)

DTC B0002-12 : Short to Power in the Driver's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the driver's airbag second inflator (LA2+, LA2- lines) • Driver's airbag internal failure (Driver's airbag second inflator) • Cable reel • SRS unit internal failure

DTC B0002-13 (KA/KC) (2019 2020 2021)

DTC B0002-13 : Open or Increased Resistance in the Driver's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the driver's airbag second inflator (LA2+, LA2- lines) • Driver's airbag internal failure (Driver's airbag second inflator)

	• Cable reel • SRS unit internal failure

DTC B0002-1A (KA/KC) (2019 2020 2021)

DTC B0002-1A : Decreased Resistance in the Driver's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line or Poor connection between the SRS unit and the driver's airbag second inflator (LA2+, LA2 - lines) • Driver's airbag internal failure (Driver's airbag second inflator) • Cable reel • SRS unit internal failure

DTC B0002-2B (KA/KC) (2019 2020 2021)

DTC B0002-2B : Short to Another Wire Harness in the Driver's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V

	Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the driver's airbag second inflator (LA2 line) • Cable reel • SRS unit internal failure

DTC B0010-11

DTC B0010-11 : Short to Ground in the Front Passenger's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the front passenger's airbag first inflator (RA1+, RA1- lines) • Front passenger's airbag internal failure (Front passenger's airbag first inflator) • SRS unit internal failure

DTC B0010-12

DTC B0010-12 : Short to Power in the Front Passenger's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the front passenger's airbag first inflator (RA1+, RA1- lines) • SRS unit internal failure

DTC B0010-13

DTC B0010-13 : Open or Increased Resistance in the Front Passenger's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None

Possible Cause	- Open or Poor connection between the SRS unit and the front passenger's airbag first inflator (RA1+, RA1- lines) - Front passenger's airbag internal failure (Front passenger's airbag first inflator) - SRS unit internal failure

DTC B0010-1A

DTC B0010-1A : Decreased Resistance in the Front Passenger's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line or Poor connection between the SRS unit and the front passenger's airbag first inflator (RA1+, RA1- lines) - Front passenger's airbag internal failure (Front passenger's airbag first inflator) - SRS unit internal failure

DTC B0010-2B

DTC B0010-2B : Short to Another Wire Harness in the Front Passenger's Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:

	• 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the front passenger's airbag first inflator (RA1+, RA1- lines) • SRS unit internal failure

DTC B0011-11

DTC B0011-11 : Short to Ground in the Front Passenger's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the front passenger's airbag second inflator (RA2+, RA2- lines) • Front passenger's airbag internal failure (Front passenger's airbag second inflator) • SRS unit internal failure

DTC B0011-12

DTC B0011-12 : Short to Power in the Front Passenger's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the front passenger's airbag second inflator (RA2+, RA2- lines) • SRS unit internal failure

DTC B0011-13

DTC B0011-13 : Open or Increased Resistance in the Front Passenger's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on

Fail Safe Action	- None
Possible Cause	- Open or Poor connection between the SRS unit and the front passenger's airbag second inflator (RA2+, RA2- lines) - Front passenger's airbag internal failure (Front passenger's airbag second inflator) - SRS unit internal failure

DTC B0011-1A

DTC B0011-1A : Decreased Resistance in the Front Passenger's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line or Poor connection between the SRS unit and the front passenger's airbag second inflator (RA2+, RA2- lines) - Front passenger's airbag internal failure (Front passenger's airbag second inflator) - SRS unit internal failure

DTC B0011-2B

DTC B0011-2B : Short to Another Wire Harness in the Front Passenger's Airbag Second Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the front passenger's airbag second inflator (RA2+, RA2- lines) • SRS unit internal failure

DTC B0020-11

DTC B0020-11 : Short to Ground in the Driver's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the driver's side airbag inflator (LSA+, LSA- lines) • Driver's side airbag internal failure (Driver's side airbag inflator) • SRS unit internal failure

DTC B0020-12

DTC B0020-12 : Short to Power in the Driver's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the driver's side airbag inflator (LSA+, LSA- lines) • SRS unit internal failure

DTC B0020-13

DTC B0020-13 : Open or Increased Resistance in the Driver's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on

Fail Safe Action	- None
Possible Cause	- Open or Poor connection between the SRS unit and the driver's side airbag inflator (LSA+, LSA- lines) - Driver's side airbag internal failure (Driver's side airbag inflator) - SRS unit internal failure

DTC B0020-1A

DTC B0020-1A : Decreased Resistance in the Driver's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line or Poor connection between the SRS unit and the driver's side airbag inflator (LSA+, LSA- lines) - Driver's side airbag internal failure (Driver's side airbag inflator) - SRS unit internal failure

DTC B0020-2B

DTC B0020-2B : Short to Another Wire Harness in the Driver's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the driver's side airbag inflator (LSA+, LSA- lines) • SRS unit internal failure

DTC B0021-11

DTC B0021-11 : Short to Ground in the Left Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the left side curtain airbag inflator (LCA+, LCA- lines) • Left side curtain airbag internal failure (Left side curtain airbag inflator) • SRS unit internal failure

DTC B0021-12

DTC B0021-12 : Short to Power in the Left Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the left side curtain airbag inflator (LCA+, LCA- lines) • SRS unit internal failure

DTC B0021-13

DTC B0021-13 : Open or Increased Resistance in the Left Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on

Fail Safe Action	- None
Possible Cause	- Open or Poor connection between the SRS unit and the left side curtain airbag inflator (LCA+, LCA- lines) - Left side curtain airbag internal failure (Left side curtain airbag inflator) - SRS unit internal failure

DTC B0021-1A

DTC B0021-1A : Decreased Resistance in the Left Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line or Poor connection between the SRS unit and the left side curtain airbag inflator (LCA+, LCA- lines) - Left side curtain airbag internal failure (Left side curtain airbag inflator) - SRS unit internal failure

DTC B0021-2B

DTC B0021-2B : Short to Another Wire Harness in the Left Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the left side curtain airbag inflator (LCA+, LCA- lines) • SRS unit internal failure

DTC B0028-11

DTC B0028-11 : Short to Ground in the Front Passenger's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the front passenger's side airbag (RSA+, RSA- lines) • Front passenger's side airbag internal failure (Front passenger's side airbag inflator) • SRS unit internal failure

DTC B0028-12

DTC B0028-12 : Short to Power in the Front Passenger's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the front passenger's side airbag inflator (RSA+, RSA- lines) • SRS unit internal failure

DTC B0028-13

DTC B0028-13 : Open or Increased Resistance in the Front Passenger's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the front passenger's side airbag inflator (RSA+, RSA- lines) • Front passenger's side airbag internal failure (Front passenger's side airbag inflator) • SRS unit internal failure

DTC B0028-1A

DTC B0028-1A : Decreased Resistance in the Front Passenger's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line or Poor connection between the SRS unit and the front passenger's side airbag inflator (RSA+, RSA- lines) • Front passenger's side airbag internal failure (Front passenger's side airbag inflator) • SRS unit internal failure

DTC B0028-2B

DTC B0028-2B : Short to Another Wire Harness in the Front Passenger's Side Airbag Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the front passenger's side airbag inflator (RSA+, RSA- lines) • SRS unit internal failure

DTC B0029-11

DTC B0029-11 : Short to Ground in the Right Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle

	- SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to ground between the SRS unit and the right side curtain airbag inflator (RCA+, RCA- lines) - Right side curtain airbag internal failure (Right side curtain airbag inflator) - SRS unit internal failure

DTC B0029-12

DTC B0029-12 : Short to Power in the Right Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to power between the SRS unit and the right side curtain airbag inflator (RCA+, RCA- lines) - SRS unit internal failure

DTC B0029-13

DTC B0029-13 : Open or Increased Resistance in the Right Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the right side curtain airbag inflator (RCA+, RCA- lines) • Right side curtain airbag internal failure (Right side curtain airbag inflator) • SRS unit internal failure

DTC B0029-1A

DTC B0029-1A : Decreased Resistance in the Right Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line or Poor connection between the SRS unit and the right side curtain airbag first inflator (RCA+, RCA- lines) • Right side curtain airbag internal failure (Right side curtain airbag first inflator) • SRS unit internal failure

DTC B0029-2B

DTC B0029-2B : Short to Another Wire Harness in the Right Side Curtain Airbag First Inflator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the right side curtain airbag first inflator (RCA+, RCA- lines) • SRS unit internal failure

DTC B0050-11

DTC B0050-11 : Short or Decreased Resistance in the Driver's Seat Belt Buckle Switch

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground or Short to power between the SRS unit and the driver's seat belt buckle switch (FLBC line) • Driver's seat belt buckle assembly internal failure (Driver's seat belt buckle switch) • SRS unit internal failure

DTC B0050-13

DTC B0050-13 : Open or Increased Resistance in the Driver's Seat Belt Buckle Switch

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the driver's seat belt buckle switch (FLBC line) • Open or Poor connection between the driver's seat belt buckle switch and the body ground (GND line) • Driver's seat belt buckle assembly internal failure (Driver's seat belt buckle switch)

	- SRS unit internal failure

DTC B0050-2B

DTC B0050-2B : Short to Another Wire Harness in the Driver's Seat Belt Buckle Switch

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the driver's seat belt buckle switch (FLBC line) • Driver's seat belt buckle assembly internal failure (Driver's seat belt buckle switch)

DTC B0052-11

DTC B0052-11 : Short or Decreased Resistance in the Front Passenger's Seat Belt Buckle Switch

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition:

	- Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to ground or Short to power between the SRS unit and the front passenger's seat belt buckle switch (FRBC line) - Front passenger's seat belt buckle assembly internal failure (Front passenger's seat belt buckle switch) - SRS unit internal failure

DTC B0052-13

DTC B0052-13 : Open or Increased Resistance in the Front Passenger's Seat Belt Buckle Switch

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Open or Poor connection between the SRS unit and the front passenger's seat belt buckle switch (FRBC line) - Open or Poor connection between the front passenger's seat belt buckle switch and the body ground (GND line) - Front passenger's seat belt buckle assembly internal failure (Front passenger's seat belt buckle switch) - SRS unit internal failure

DTC B0052-2B

DTC B0052-2B : Short to Another Wire Harness in the Front Passenger's Seat Belt Buckle Switch

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line between the SRS unit and the front passenger's seat belt buckle switch (FRBC line) • Front passenger's seat belt buckle assembly internal failure (Front passenger's seat belt buckle switch)

DTC B0070-11

DTC B0070-11 : Short to Ground in the Driver's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the driver's seat belt tensioner (LRP+, LRP- lines) • Driver's seat belt internal failure (Driver's seat belt tensioner) • SRS unit internal failure

DTC B0070-12

DTC B0070-12 : Short to Power in the Driver's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the driver's seat belt tensioner (LRP+, LRP- lines) • SRS unit internal failure

DTC B0070-13

DTC B0070-13 : Open or Increased Resistance in the Driver's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the driver's seat belt tensioner (LRP+, LRP- lines) • Driver's seat belt internal failure (Driver's seat belt tensioner) • SRS unit internal failure

DTC B0070-1A

DTC B0070-1A : Decreased Resistance in the Driver's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle

	- SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line or Poor connection between the SRS unit and the driver's seat belt tensioner (LRP+, LRP- lines) - Driver's seat belt internal failure (Driver's seat belt tensioner) - SRS unit internal failure

DTC B0070-2B

DTC B0070-2B : Short to Another Wire Harness in the Driver's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the driver's seat belt tensioner (LRP+, LRP- lines) - SRS unit internal failure

DTC B0072-11

DTC B0072-11 : Short to Ground in the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to ground between the SRS unit and the front passenger's seat belt tensioner (RRP+, RRP- lines) - Front passenger's seat belt internal failure (Front passenger's seat belt tensioner) - SRS unit internal failure

DTC B0072-12

DTC B0072-12 : Short to Power in the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to power between the SRS unit and the front passenger's seat belt tensioner (RRP+, RRP- lines) - SRS unit internal failure

DTC B0072-13

DTC B0072-13 : Open or Increased Resistance in the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the front passenger's seat belt tensioner (RRP+, RRP- lines) • Front passenger's seat belt internal failure (Front passenger's seat belt tensioner) • SRS unit internal failure

DTC B0072-1A

DTC B0072-1A : Decreased Resistance in the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle

	- SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line or Poor connection between the SRS unit and the front passenger's seat belt tensioner (RRP+, RRP- lines) - Front passenger's seat belt internal failure (Front passenger's seat belt tensioner) - SRS unit internal failure

DTC B0072-2B

DTC B0072-2B : Short to Another Wire Harness in the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the front passenger's seat belt tensioner (RRP+, RRP- lines) - SRS unit internal failure

DTC B0079-11

DTC B0079-11 : Short to Ground in the Driver's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the driver's seat belt outer lap tensioner (LLP+, LLP- lines) • Driver's seat belt internal failure (Driver's seat belt outer lap tensioner) • SRS unit internal failure

DTC B0079-12

DTC B0079-12 : Short to Power in the Driver's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the driver's seat belt outer lap tensioner (LLP+, LLP- lines) • Driver's seat belt internal failure (Driver's seat belt outer lap tensioner) • SRS unit internal failure

DTC B0079-13

DTC B0079-13 : Open or Increased Resistance in the Driver's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the driver's seat belt outer lap tensioner (LLP+, LLP- lines) • Driver's seat belt internal failure (Driver's seat belt outer lap tensioner) • SRS unit internal failure

DTC B0079-1A

DTC B0079-1A : Decreased Resistance in the Driver's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle

	- SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line or Poor connection between the SRS unit and the driver's seat belt outer lap tensioner (LLP+, LLP- lines) - Driver's seat belt internal failure (Driver's seat belt outer lap tensioner) - SRS unit internal failure

DTC B0079-2B

DTC B0079-2B : Short to Another Wire Harness in the Driver's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - Battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the driver's seat belt outer lap tensioner (LLP+, LLP- lines) - Driver's seat belt outer lap tensioner internal failure - SRS unit internal failure

DTC B007A-11

DTC B007A-11 : Short to Ground in the Front Passenger's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the front passenger's seat belt outer lap tensioner (RLP+, RLP- lines) • Front passenger's seat belt internal failure (Front passenger's seat belt outer lap tensioner) • SRS unit internal failure

DTC B007A-12

DTC B007A-12 : Short to Power in the Front Passenger's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the front passenger's seat belt outer lap tensioner (RLP+, RLP- lines)

	• Front passenger's seat belt internal failure (Front passenger's seat belt outer lap tensioner) • SRS unit internal failure

DTC B007A-13

DTC B007A-13 : Open or Increased Resistance in the Front Passenger's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the SRS unit and the front passenger's seat belt outer lap tensioner (RLP+, RLP- lines) • Front passenger's seat belt internal failure (Front passenger's seat belt outer lap tensioner) • SRS unit internal failure

DTC B007A-1A

DTC B007A-1A : Decreased Resistance in the Front Passenger's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V

	Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line or Poor connection between the SRS unit and the front passenger's seat belt outer lap tensioner (RLP+, RLP- lines) - Front passenger's seat belt internal failure (Front passenger's seat belt outer lap tensioner) - SRS unit internal failure

DTC B007A-2B

DTC B007A-2B : Short to Another Wire Harness in the Front Passenger's Seat Belt Outer Lap Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - Battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the r front passenger's seat belt outer lap tensioner (RLP+, RLP- lines) - Front passenger's seat belt outer lap tensioner internal failure - SRS unit internal failure

DTC B0082-11

DTC B0082-11 : Short to Ground in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the selectable energy absorption device (RVEA+, RVEA- lines) • Front passenger's seat belt internal failure (Selectable energy absorption device) • SRS unit internal failure

DTC B0082-12

DTC B0082-12 : Short to Power in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds

DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to power between the SRS unit and the selectable energy absorption device (RVEA+, RVEA- lines) - Front passenger's seat belt internal failure (Selectable energy absorption device) - SRS unit internal failure

DTC B0082-13

DTC B0082-13 : Open or Increased Resistance in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Open or Poor connection between the SRS unit and the selectable energy absorption device (RVEA+, RVEA- lines) - Front passenger's seat belt internal failure (Selectable energy absorption device) - SRS unit internal failure

DTC B0082-1A

DTC B0082-1A : Decreased Resistance in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.

- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to another line or Poor connection between the SRS unit and the selectable energy absorption device (RVEA+, RVEA- lines) • Front passenger's seat belt internal failure (Selectable energy absorption device) • SRS unit internal failure

DTC B0082-2B

DTC B0082-2B : Short to Another Wire Harness in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None

Possible Cause	- Short to another line or Poor connection between the SRS unit and the selectable energy absorption device (RVEA+, RVEA- lines) - Front passenger's seat belt internal failure (Selectable energy absorption device) - SRS unit internal failure

DTC B0090-4A

DTC B0090-4A : Internal Failure of the Left Front Impact Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Incorrect left front impact sensor installed - Incorrect SRS unit installed - Left front impact sensor internal failure - SRS unit internal failure

DTC B0090-87

DTC B0090-87 : No Signal From the Left Front Impact Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:

	- 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Open, Short to another line, Short to ground, Short to power, or Poor connection between the SRS unit and the left front impact sensor (LFS+, LFS- lines) - Left front impact sensor internal failure - SRS unit internal failure

DTC B0090-92

DTC B0090-92 : Internal Failure of the Left Front Impact Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Left front impact sensor internal failure - SRS unit internal failure

DTC B0091-4A

DTC B0091-4A : Internal Failure of the Left Side Impact Sensor (first)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Incorrect left side impact sensor (first) installed • Incorrect SRS unit installed • Left side impact sensor (first) internal failure • SRS unit internal failure

DTC B0091-87

DTC B0091-87 : No Signal From the Left Side Impact Sensor (first)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open, Short to another line, Short to ground, Short to power, or Poor connection between the SRS unit and the left side impact sensor (first) (LS1+, LS1- lines) • Left side impact sensor (first) internal failure • SRS unit internal failure

DTC B0091-92

DTC B0091-92 : Internal Failure of the Left Side Impact Sensor (first)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Left side impact sensor (first) internal failure • SRS unit internal failure

DTC B0092-4A

DTC B0092-4A : Internal Failure of the Left Side Impact Sensor (second)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Incorrect left side impact sensor (second) installed • Incorrect SRS unit installed • Left side impact sensor (second) internal failure • SRS unit internal failure

DTC B0092-87

DTC B0092-87 : No Signal From the Left Side Impact Sensor (second)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on

Fail Safe Action	- None
Possible Cause	- Open, Short to another line, Short to ground, Short to power, or Poor connection between the SRS unit and the left side impact sensor (second) (LS2+, LS2- lines) - Left side impact sensor (second) internal failure - SRS unit internal failure

DTC B0092-92

DTC B0092-92 : Internal Failure of the Left Side Impact Sensor (second)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Left side impact sensor (second) internal failure - SRS unit internal failure

DTC B0095-4A

DTC B0095-4A : Internal Failure of the Right Front Impact Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:

	- 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Incorrect right front impact sensor installed - Incorrect SRS unit installed - Right front impact sensor internal failure - SRS unit internal failure

DTC B0095-87

DTC B0095-87 : No Signal From the Right Front Impact Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Open, Short to another line, Short to ground, Short to power, or Poor connection between the SRS unit and the right front impact sensor (RFS+, RFS- lines) - Right front impact sensor internal failure - SRS unit internal failure

DTC B0095-92

DTC B0095-92 : Internal Failure of the Right Front Impact Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Right front impact sensor internal failure • SRS unit internal failure

DTC B0096-4A

DTC B0096-4A : Internal Failure of the Right Side Impact Sensor (first)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on

Fail Safe Action	- None
Possible Cause	- Incorrect right side impact sensor (first) installed - Incorrect SRS unit installed - Right side impact sensor (first) internal failure - SRS unit internal failure

DTC B0096-87

DTC B0096-87 : No Signal From the Right Side Impact Sensor (first)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Open, Short to another line, Short to ground, Short to power, or Poor connection between the SRS unit and the right side impact sensor (first) (RS1+, RS1- lines) - Right side impact sensor (first) internal failure - SRS unit internal failure

DTC B0096-92

DTC B0096-92 : Internal Failure of the Right Side Impact Sensor (first)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Right side impact sensor (first) internal failure • SRS unit internal failure

DTC B0097-4A

DTC B0097-4A : Internal Failure of the Right Side Impact Sensor (second)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Incorrect right side impact sensor (second) installed • Incorrect SRS unit installed • Right side impact sensor (second) internal failure • SRS unit internal failure

DTC B0097-87

DTC B0097-87 : No Signal From the Right Side Impact Sensor (second)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open, Short to another line, Short to ground, Short to power, or Poor connection between the SRS unit and the right side impact sensor (second) (RS2+, RS2- lines) • Right side impact sensor (second) internal failure • SRS unit internal failure

DTC B0097-92

DTC B0097-92 : Internal Failure of the Right Side Impact Sensor (second)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Right side impact sensor (second) internal failure • SRS unit internal failure

DTC B00A0-54

DTC B00A0-54 : Front Passenger's Weight Sensor not Calibrated

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Front passenger's weight sensor not initialized

DTC B00B5-11

DTC B00B5-11 : Short or Decreased Resistance in the Driver's Seat Position Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground between the SRS unit and the driver's seat position sensor (SS+ line) • Driver's seat position sensor internal failure • SRS unit internal failure

DTC B00B5-13

DTC B00B5-13 : Open or Increased Resistance in the Driver's Seat Position Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None

Possible Cause	- Open or Poor connection between the SRS unit and the driver's seat position sensor (SS+ line) - Open or Poor connection between the driver's seat position sensor and the body ground (GND line) - Driver's seat position sensor internal failure - SRS unit internal failure

DTC B00B5-2B

DTC B00B5-2B : Short to Another Wire Harness in the Driver's Seat Position Sensor

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - Battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Short to another line between the SRS unit and the driver's seat position sensor (SS+ lines) - Driver's seat position sensor internal failure - SRS unit internal failure

DTC B00C0-16

DTC B00C0-16 : Internal Failure of the Front Passenger's Weight Sensor (front inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	Front passenger's seat rail internal failure (Front passenger's weight sensor (front inner side))

DTC B00C0-4A

DTC B00C0-4A : Different Supplier ID/Function ID of the Front Passenger's Weight Sensor (front inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Front passenger's weight sensor internal failure (front inner side) • SRS unit internal failure

DTC B00C0-54

DTC B00C0-54 : Different Serial ID of the Front Passenger's Weight Sensor (front inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	SRS unit internal failure

DTC B00C0-87

DTC B00C0-87 : No Signal From the Front Passenger's Weight Sensor (front inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or poor connection between the SRS unit and the front passenger's weight sensor (front inner side) (SWS+, SWSS, SWS- lines) • Short to power or short to ground between the SRS unit and the front passenger's weight sensor (front inner side) (SWSS line)

	• Short to another line or poor connection between the SRS unit and the front passenger's weight sensor (front inner side) (SWSS to SWS+ lines, SWSS to SWS- lines) • SRS unit internal failure • Front passenger's weight sensor internal failure (front inner side)

DTC B00C0-96

DTC B00C0-96 : Internal Failure of the Front Passenger's Weight Sensor (front inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	Front passenger's seat rail internal failure (Front passenger's weight sensor (front inner side))

DTC B00C2-16

DTC B00C2-16 : Internal Failure of the Front Passenger's Weight Sensor (rear inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition:

	- Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	Front passenger's seat rail internal failure (Front passenger's weight sensor (rear inner side))

DTC B00C2-4A

DTC B00C2-4A : Different Supplier ID/Function ID of the Front Passenger's Weight Sensor (rear inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - Battery voltage 10 - 16 V Operating Condition: - Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- Front passenger's weight sensor internal failure (rear inner side) - SRS unit internal failure

DTC B00C2-54

DTC B00C2-54 : Different Serial ID of the Front Passenger's Weight Sensor (rear inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	SRS unit internal failure

DTC B00C2-87

DTC B00C2-87 : No Signal From the Front Passenger's Weight Sensor (rear inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or poor connection between the SRS unit and the front passenger's weight sensor (rear inner side) (SWS+, SWS-, SWSS lines) • SRS unit internal failure • Front passenger's weight sensor internal failure (rear inner side)

DTC B00C2-96

DTC B00C2-96 : Internal Failure of the Front Passenger's Weight Sensor (rear inner side)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	Front passenger's seat rail internal failure (Front passenger's weight sensor (rear inner side))

DTC B00D5-14 (KA/KC)

DTC B00D5-14 : Open or Short to Ground in the Front Passenger's Airbag Cutoff Indicator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 9 seconds.
Duration	About 9 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Short to ground between the SRS unit and the front passenger's airbag cutoff indicator (OFF PTT line)

	• Open or Short to ground between the 12 volt battery and the front passenger's airbag cutoff indicator • Front passenger's airbag cutoff indicator internal failure • SRS unit internal failure

DTC B00D5-17 (KA/KC)

DTC B00D5-17 : Short to Power in the Front Passenger's Airbag Cutoff Indicator

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 9 seconds.
Duration	About 9 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to power between the SRS unit and the front passenger's airbag cutoff indicator (OFF PTT line) • Front passenger's airbag cutoff indicator internal failure • SRS unit internal failure

DTC B2800-49

DTC B2800-49 : Internal Failure of the SRS Unit

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V

	Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• SRS unit internal failure

DTC B2801-49

DTC B2801-49 : Internal Failure of the SRS Unit

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• SRS unit internal failure

DTC B2802-49

DTC B2802-49 : Internal Failure of the SRS Unit

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• SRS unit internal failure

DTC B2840-13

DTC B2840-13 : SRS Unit Connector A Not Properly Installed

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Poor connection between the SRS unit and connector A • SRS unit internal failure

DTC B2841-13

DTC B2841-13 : SRS Unit Connector B Not Properly Installed

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Poor connection between the SRS unit and connector B • SRS unit internal failure

DTC C0061-96 (SRS UNIT)

DTC C0061-96 : Internal Failure of the SRS Unit

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None

Possible Cause	- SRS unit internal failure

DTC C0063-96 (SRS UNIT)

DTC C0063-96 : Internal Failure of the SRS Unit

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• SRS unit internal failure

DTC U0122-00 (SRS UNIT (WITH CAN GATEWAY))

DTC U0122-00 : Lost Communication With the VSA Modulator-Control Unit (wheel speed sensor signal error)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.

Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the CAN gateway and the SRS unit (F-CAN B_H, F-CAN B_L lines) • Open or Poor connection between the CAN gateway and the VSA modulator-control unit (F-CAN A_H, F-CAN A_L, F-CAN B_H, F-CAN B_L lines) • VSA modulator-control unit internal failure • SRS unit internal failure

DTC U0122-00 (SRS UNIT (WITHOUT CAN GATEWAY))

DTC U0122-00 : Lost Communication With the VSA Modulator-Control Unit (wheel speed sensor signal error)

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Open or Poor connection between the VSA modulator-control unit and the SRS unit (F-CAN_H, F-CAN_L lines) • VSA modulator-control unit internal failure

DTC U3000-49 (SRS UNIT (KA/KC))

DTC U3000-49 : Internal Failure of the SRS Unit

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.
Duration	About 6 seconds
DTC Type	• 1 drive cycle • SRS indicator on
Fail Safe Action	• None
Possible Cause	• Short to ground or short to power between the SRS unit and the front passenger's weight sensor (front inner side) (SWS+ line) • Short to another line between the SRS unit and the front passenger's weight sensor (front inner side) (SWS+ line to SWS- line) • Short to ground or short to power between the SRS unit and the front passenger's weight sensor (rear inner side) (SWS+ line) • Short to another line between the SRS unit and the front passenger's weight sensor (rear inner side) (SWS+ line to SWS- line) • SRS unit internal failure • Front passenger's weight sensor internal failure

DTC U3000-51 (SRS UNIT)

DTC U3000-51 : SRS Unit Programming Error

NOTE

- Always check "How to troubleshoot the SRS system" and proceed along each "DTC Troubleshooting" procedure.
- Make sure the 12 volt battery is fully charged. If not, the results of tests may not be accurate.
- The SRS indicator will turn on when the 12 volt battery voltage becomes below 10 volts.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V Operating Condition: • Turn the vehicle to the ON mode, and wait 6 seconds.

Duration	About 6 seconds
DTC Type	- 1 drive cycle - SRS indicator on
Fail Safe Action	- None
Possible Cause	- SRS unit update is not completed properly - SRS unit internal failure

Supplemental Restraint System (SRS) - DTC Diagnostics (Except Hybrid) (1 Of 2) - CR-V

DTC TROUBLESHOOTING

DTC B0001-11 (KA/KC) (2019 2020 2021)

DTC B0001-11 : Short to Ground in the Driver's Airbag First Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0001-11 Short to ground in the driver's airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-11 Short to ground in the driver's airbag first inflator	B

   Is DTC B0001-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

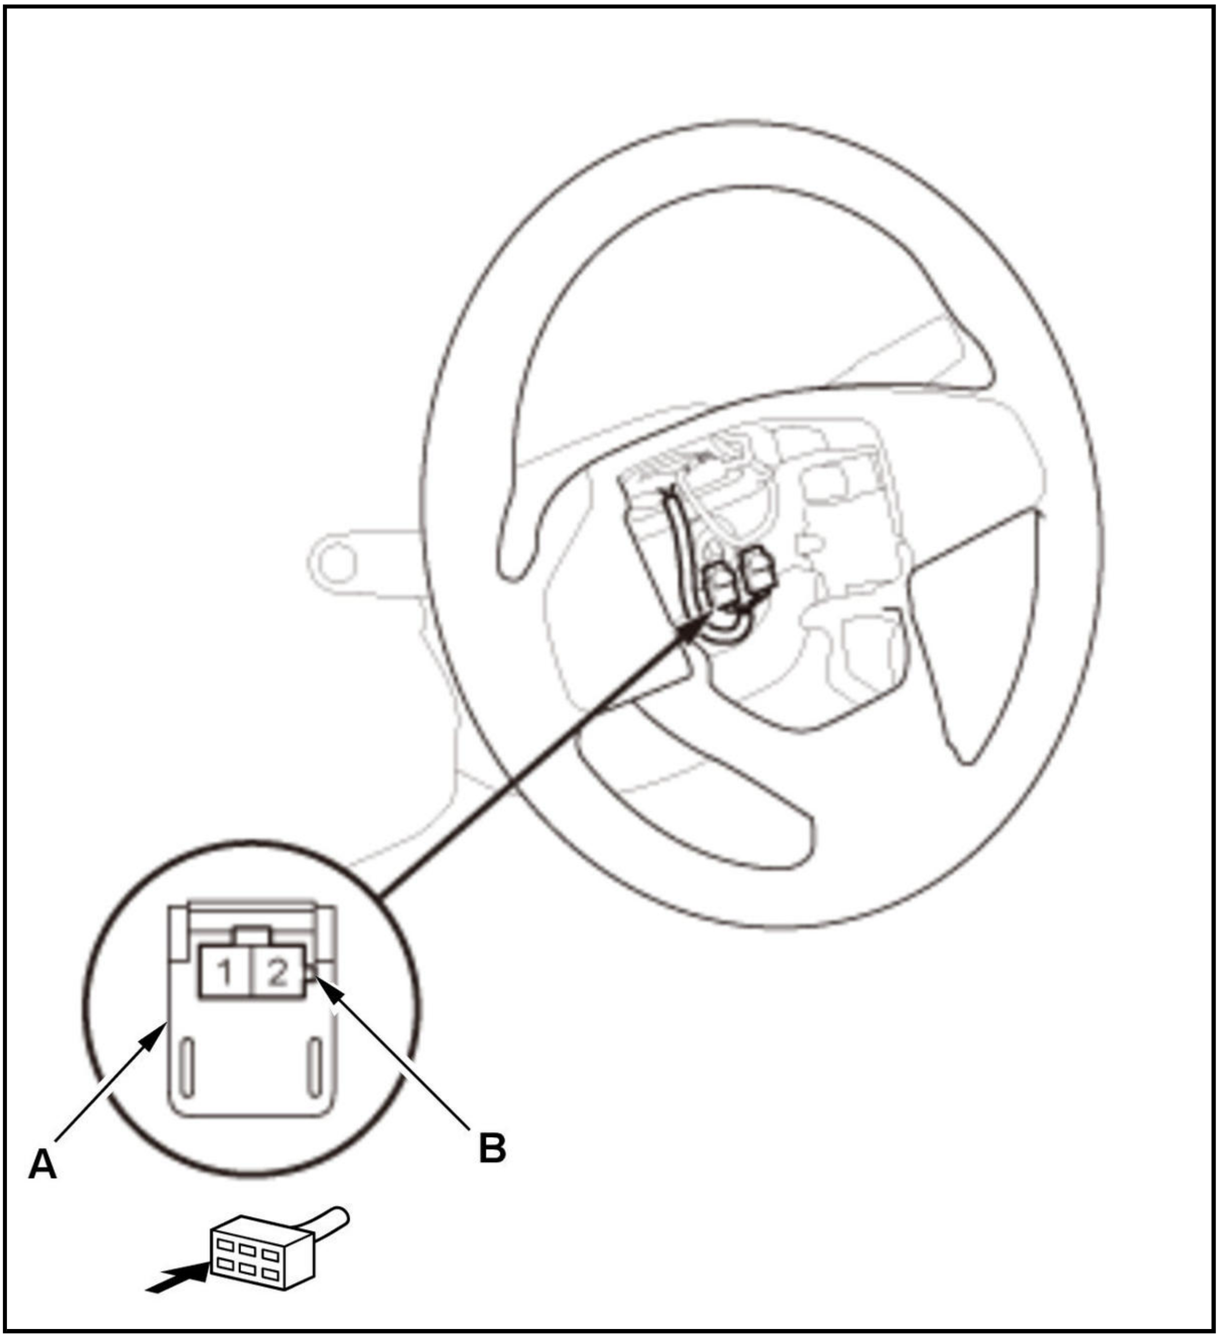
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

-4. Disconnect the following connector.

Driver's airbag first inflator 2P connector (on the cable reel harness)

NOTE: Make sure to work with the driver's airbag first inflator 2P connector (A) that has a guide tab (B) on the right side of the No. 2 terminal as shown.



-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0001-11 Short to ground in the driver's airbag first inflator	B

Is DTC B0001-11 indicated?

YES

Go to step 3.

NO

Short to ground in the driver's airbag first inflator; **replace the driver's airbag** , then clear the DTC.

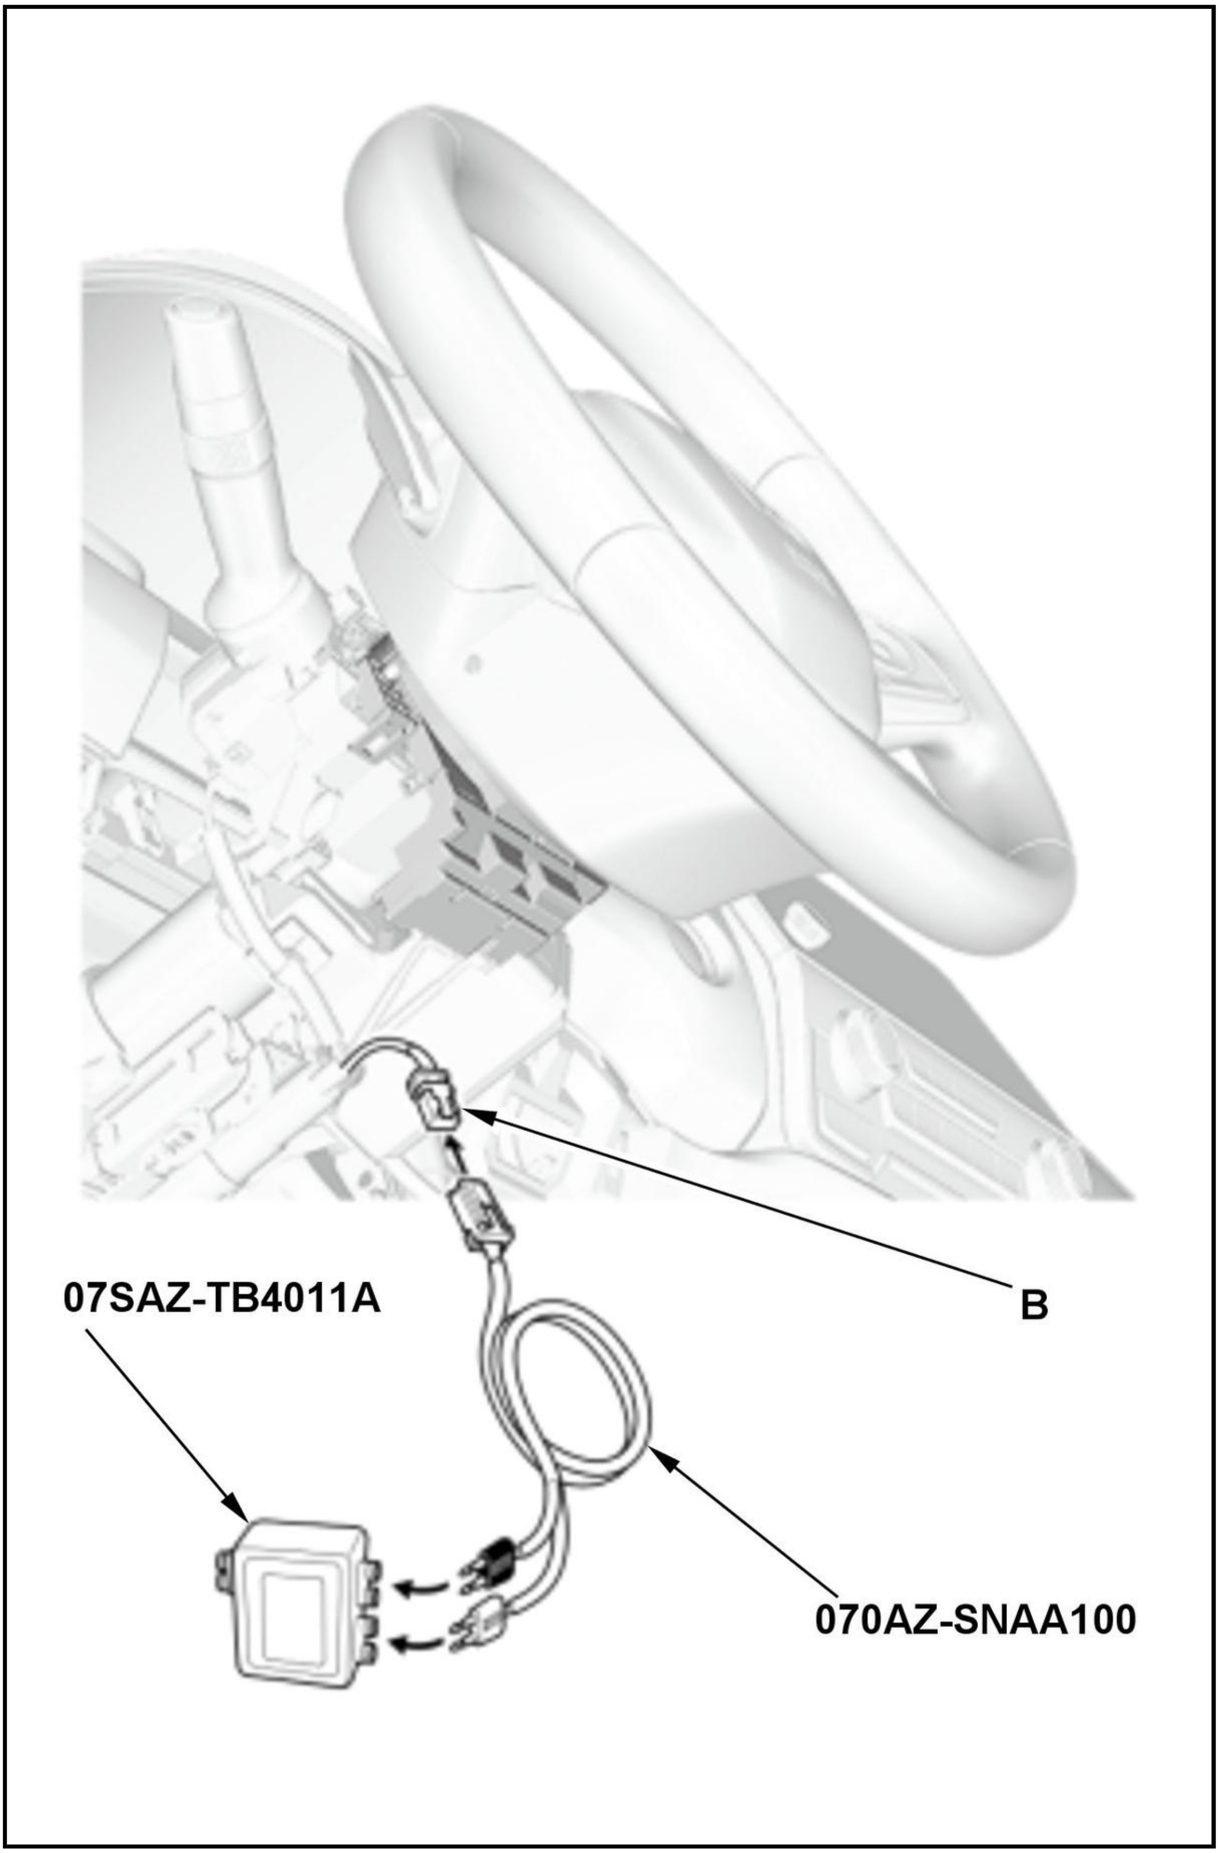
3. Cable reel check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the column covers** .

-4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0001-11 Short to ground in the driver's airbag first inflator	B

Is DTC B0001-11 indicated?

YES

Go to step 4.

NO

Short to ground in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA1+, LA1- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

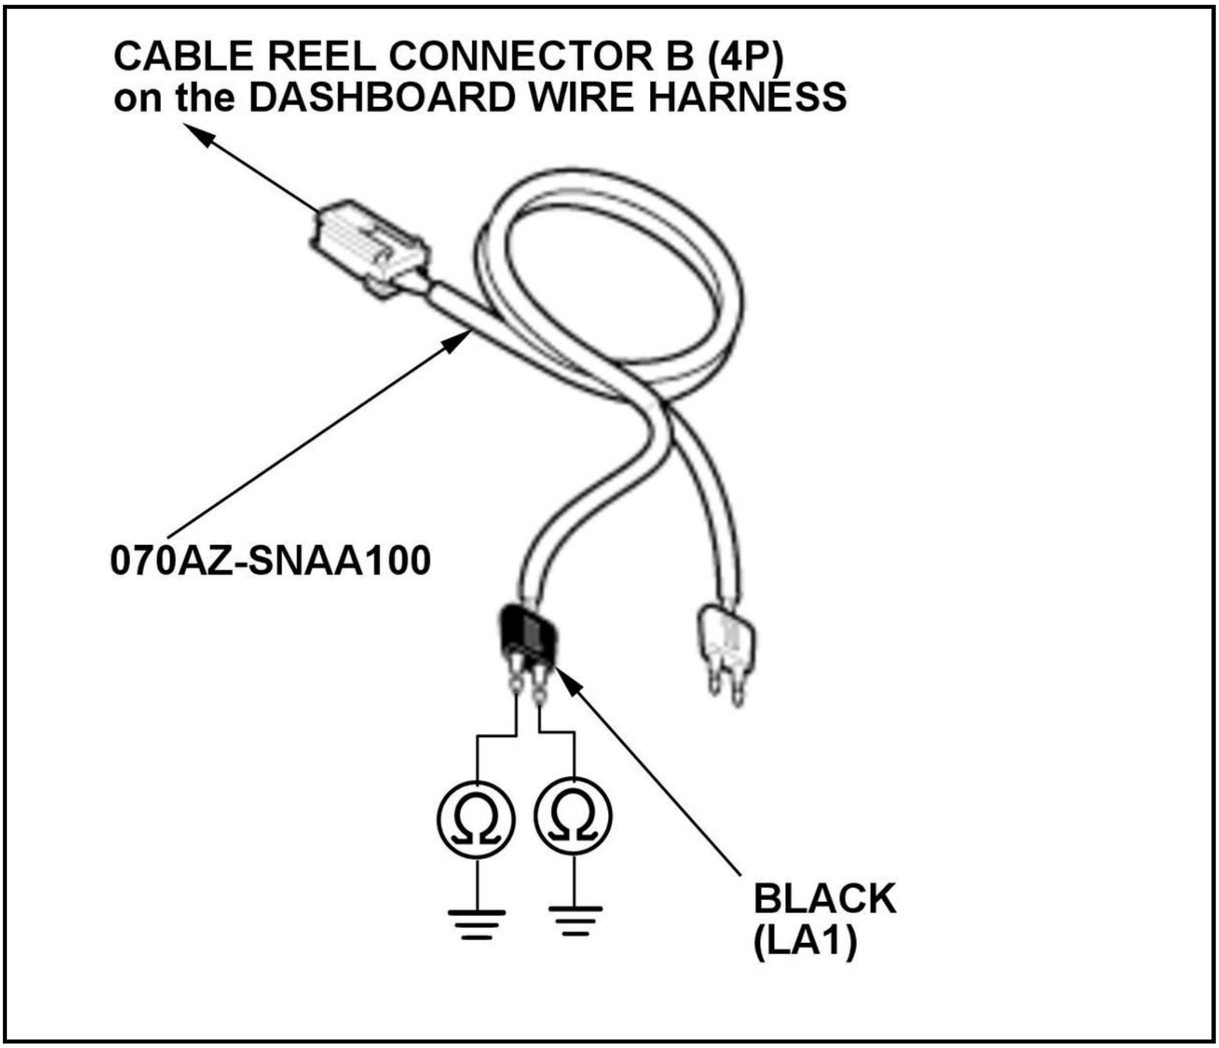
-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
Test point 1	SRS simulator lead J black terminal
Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The LA1+ and LA1-wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to ground in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0001-11, B0001-2B

DTC B0001-11 : Short to Ground in the Driver's Airbag First Inflator

DTC B0001-2B : Short to Another Wire Harness in the Driver's Airbag First Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead K 070AZ-SNAA200

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number

and were properly installed .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0001-11 Short to ground in the driver's airbag first inflator	B
B0001-2B Short to another wire harness in the driver's airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-11 Short to ground in the driver's airbag first inflator	B
B0001-2B Short to another wire harness in the driver's airbag first inflator	B

   Is DTC B0001-11 or B0001-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

Driver's airbag first inflator 2P connector (on the cable reel harness)

   -5. Reconnect the negative cable to the 12 volt battery.

   -6. Clear the DTCs with the HDS.

   -7. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -8. Check for DTCs with the HDS.

DTC Description	DTC
B0001-11 Short to ground in the driver's airbag first inflator	B
B0001-2B Short to another wire harness in the driver's airbag first inflator	B

   Is DTC B0001-11 or B0001-2B indicated?

YES

Go to step 3.

NO

Short to ground in the driver's airbag first inflator; **replace the driver's airbag** , then clear the DTC.

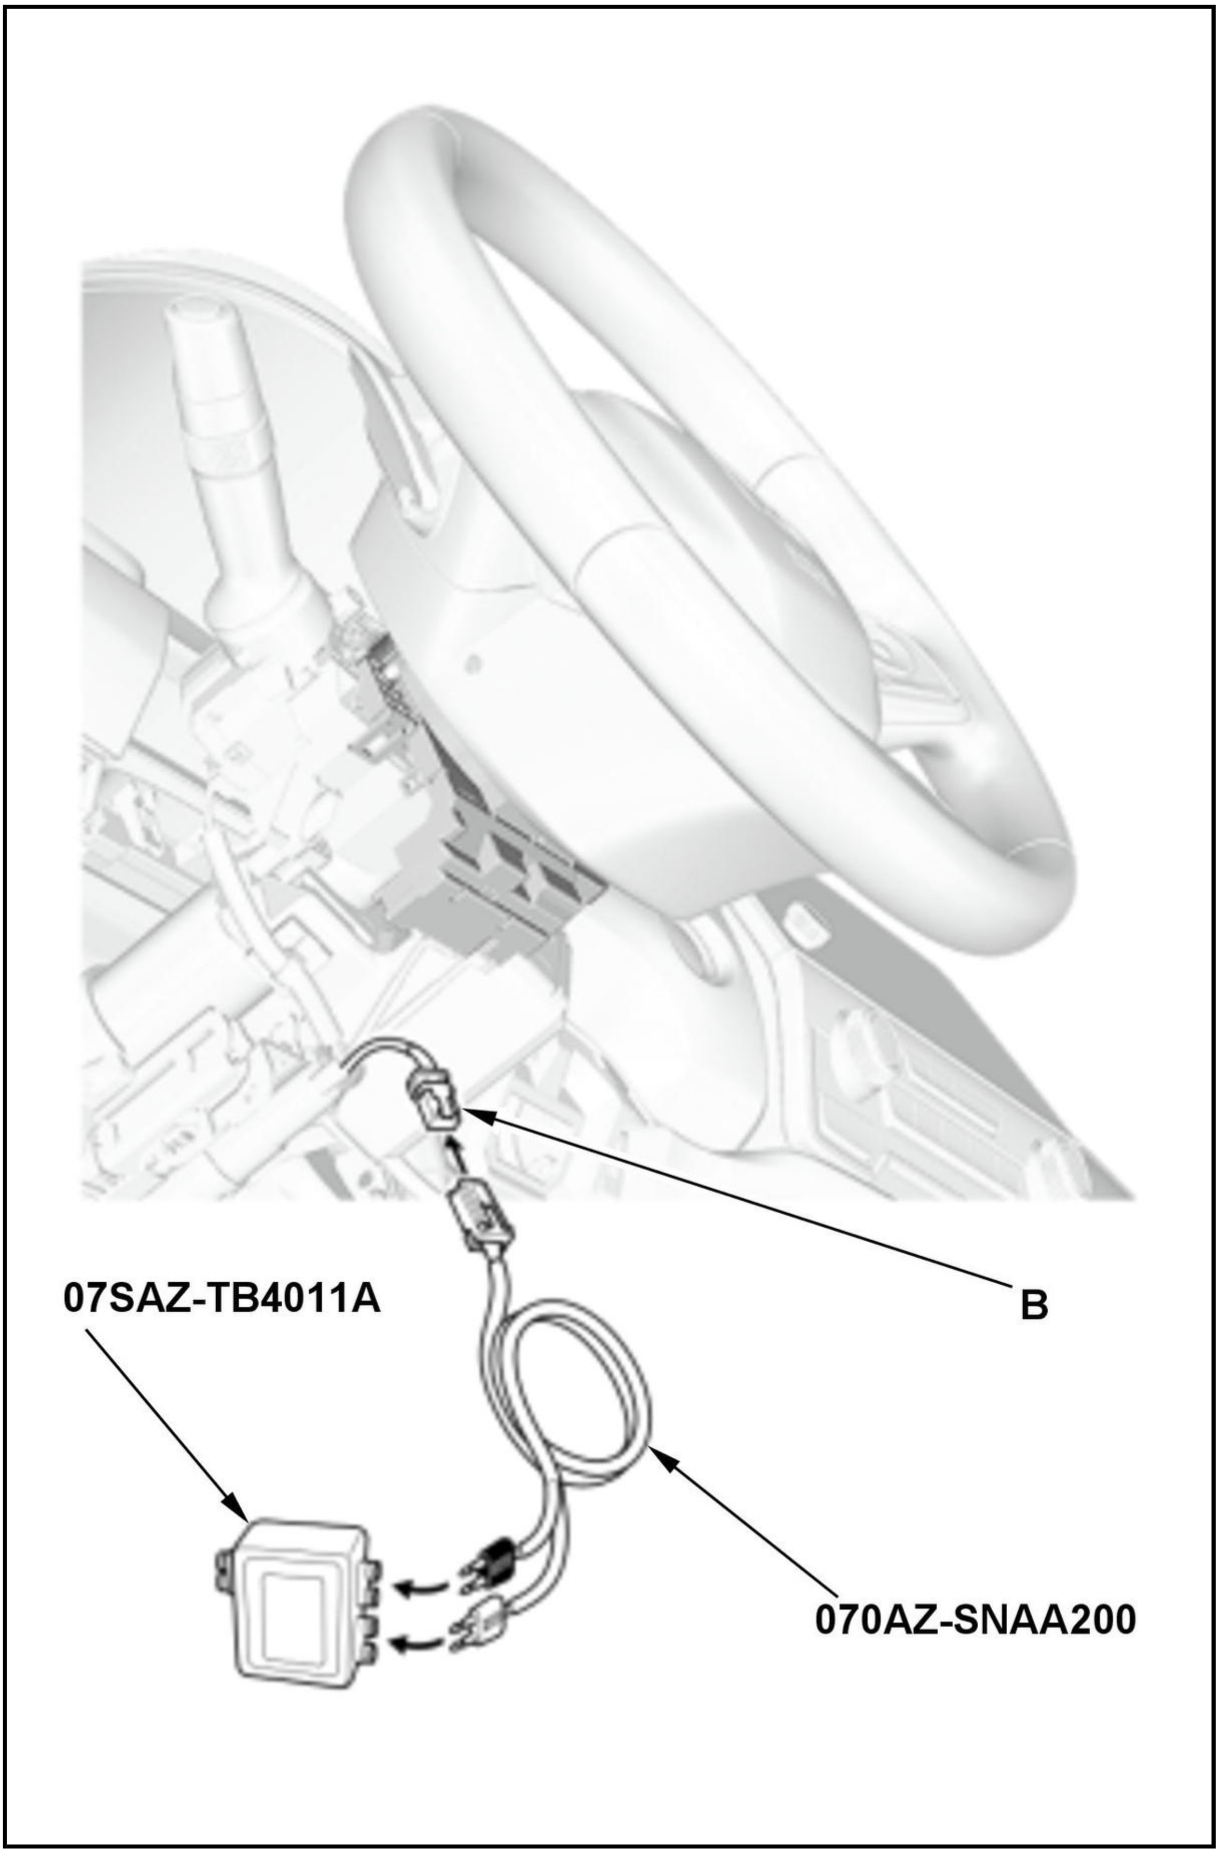
3. Cable reel check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the column covers** .

   -4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA200

-5. Connect the terminals of SRS simulator lead K to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead K to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0001-11 Short to ground in the driver's airbag first inflator	B
B0001-2B Short to another wire harness in the driver's airbag first inflator	B

Is DTC B0001-11 or B0001-2B indicated?

YES

Go to step 4.

NO

Short to ground in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA1+, LA1- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

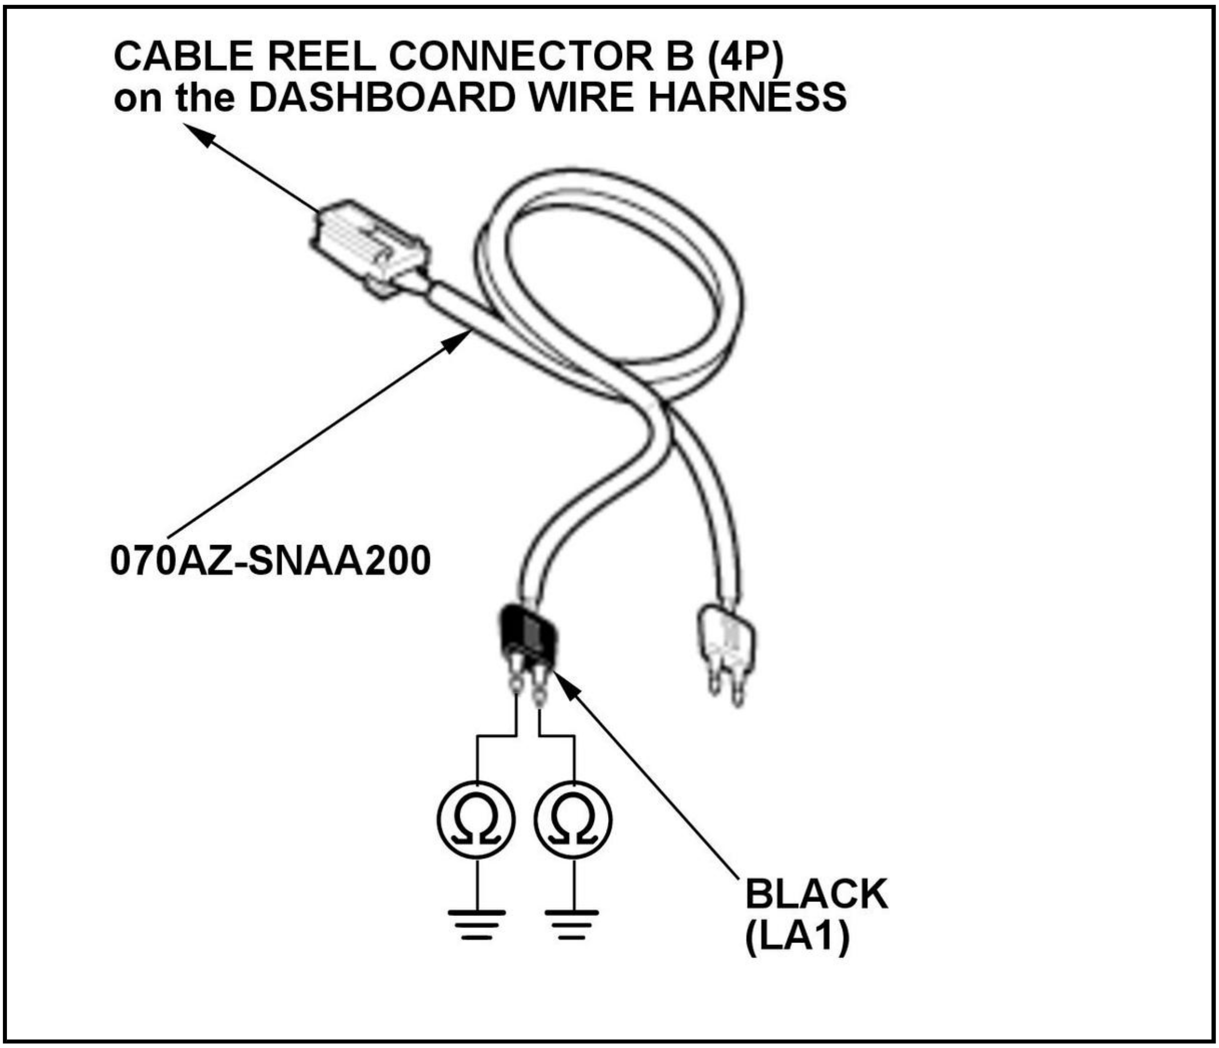
-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead K. Do not disconnect SRS simulator lead K from cable reel connector B (4P) on the dashboard wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead K
Test point 1	SRS simulator lead K black terminal
Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The LA1+ and LA1-wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to ground in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0001-12

DTC B0001-12 : Short to Power in the Driver's Airbag First Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead K 070AZ-SNAA200

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0001-12 Short to power in the driver's airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-12 Short to power in the driver's airbag first inflator	B

   Is DTC B0001-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

Driver's airbag first inflator 2P connector (on the cable reel harness)

   -5. Reconnect the negative cable to the 12 volt battery.

   -6. Clear the DTCs with the HDS.

   -7. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -8. Check for DTCs with the HDS.

DTC Description	DTC
B0001-12 Short to power in the driver's airbag first inflator	B

   Is DTC B0001-12 indicated?

   YES

   Go to step 3.

NO

Short to power in the driver's airbag first inflator; **replace the driver's airbag** , then clear the DTC.

3. Cable reel check

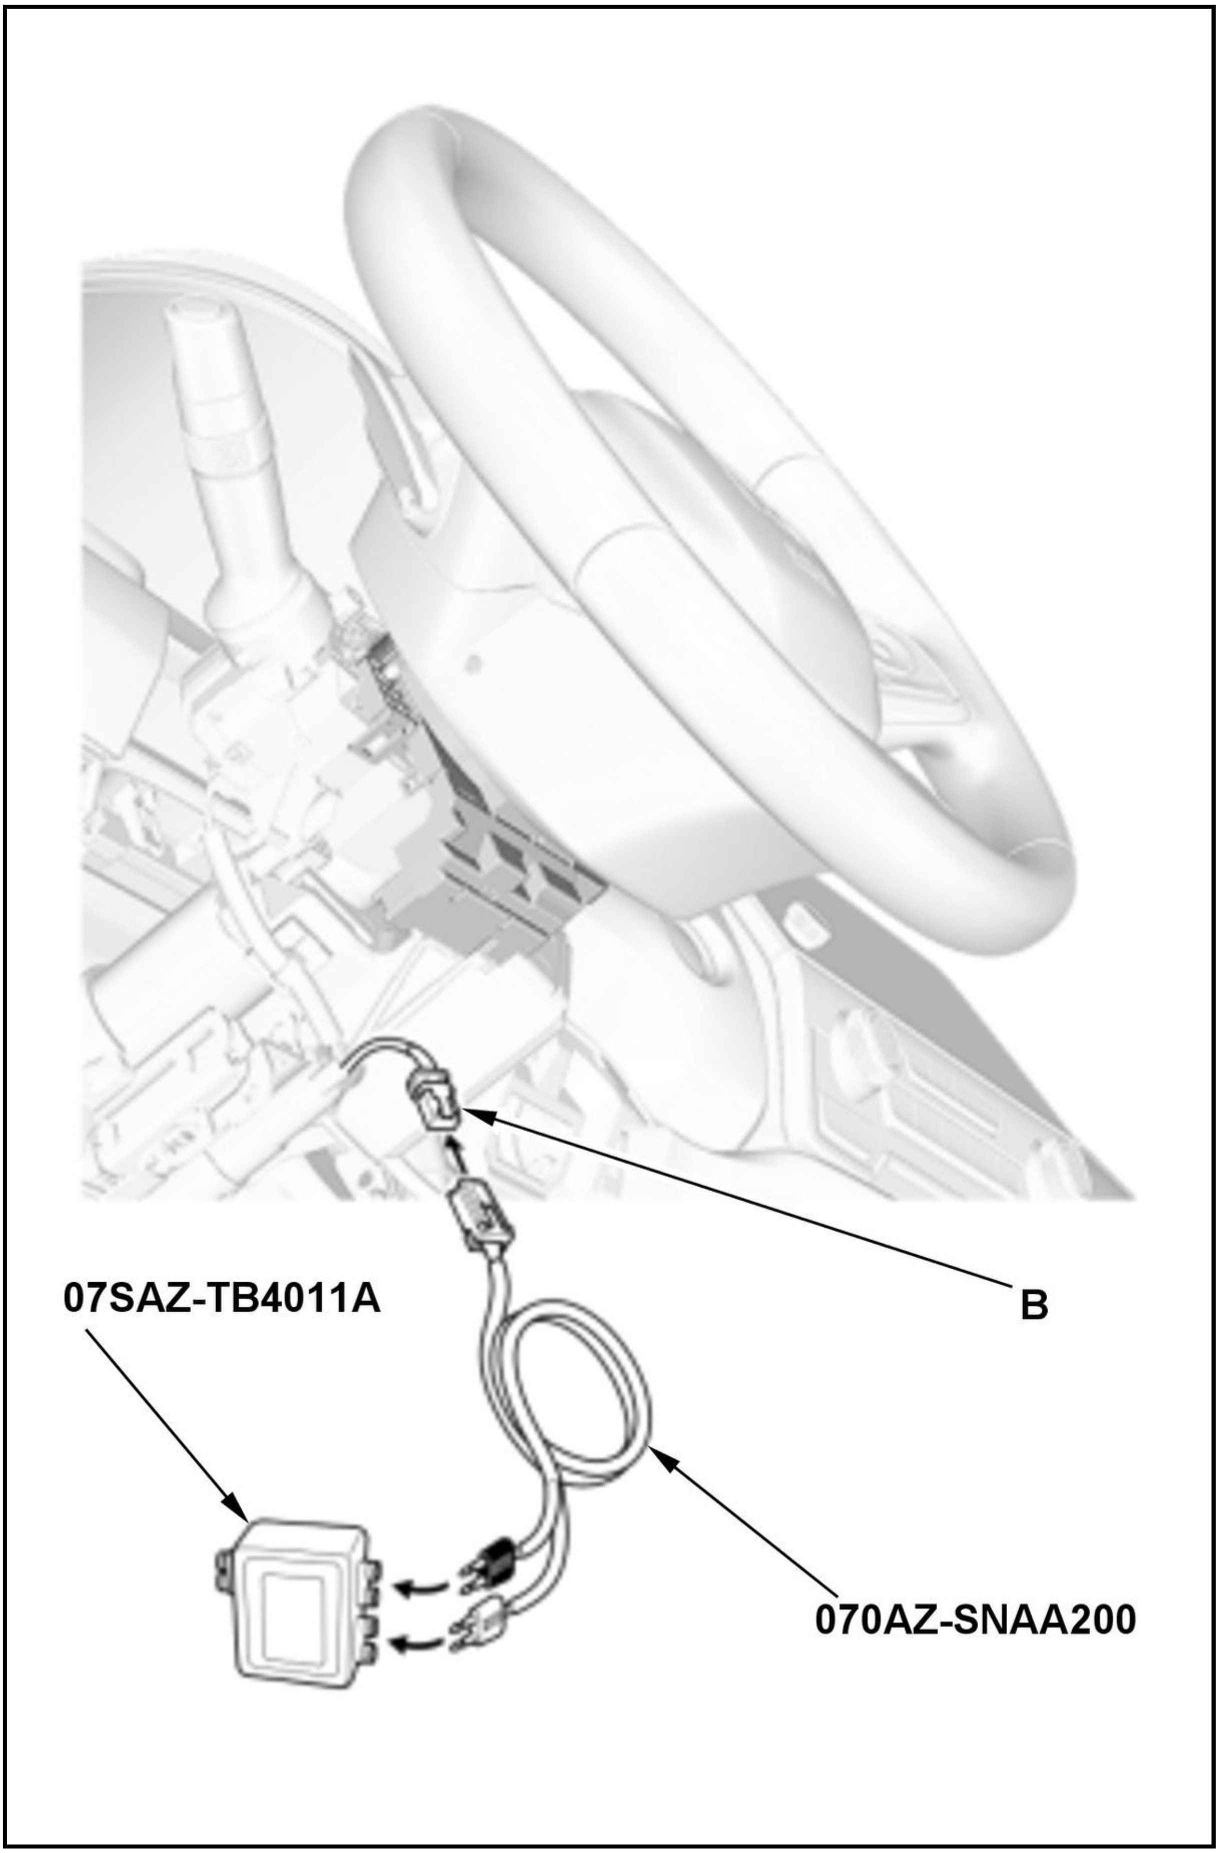
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Remove the jumper wire from the driver's airbag first inflator 2P connector on the cable reel harness.

   -4. **Remove the column covers** .

   -5. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA200

-6. Connect the terminals of SRS simulator lead K to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead K to cable reel connector B (4P) on the dashboard wire harness.

-7. Reconnect the negative cable to the 12 volt battery.

-8. Clear the DTCs with the HDS.

-9. Turn the vehicle to the ON mode, then wait for 10 seconds.

-10.

Check for DTCs with the HDS.

DTC Description	DTC
B0001-12 Short to power in the driver's airbag first inflator	B

Is DTC B0001-12 indicated?

YES

Go to step 4.

NO

Short to power in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA1+, LA1- lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector A (39P)

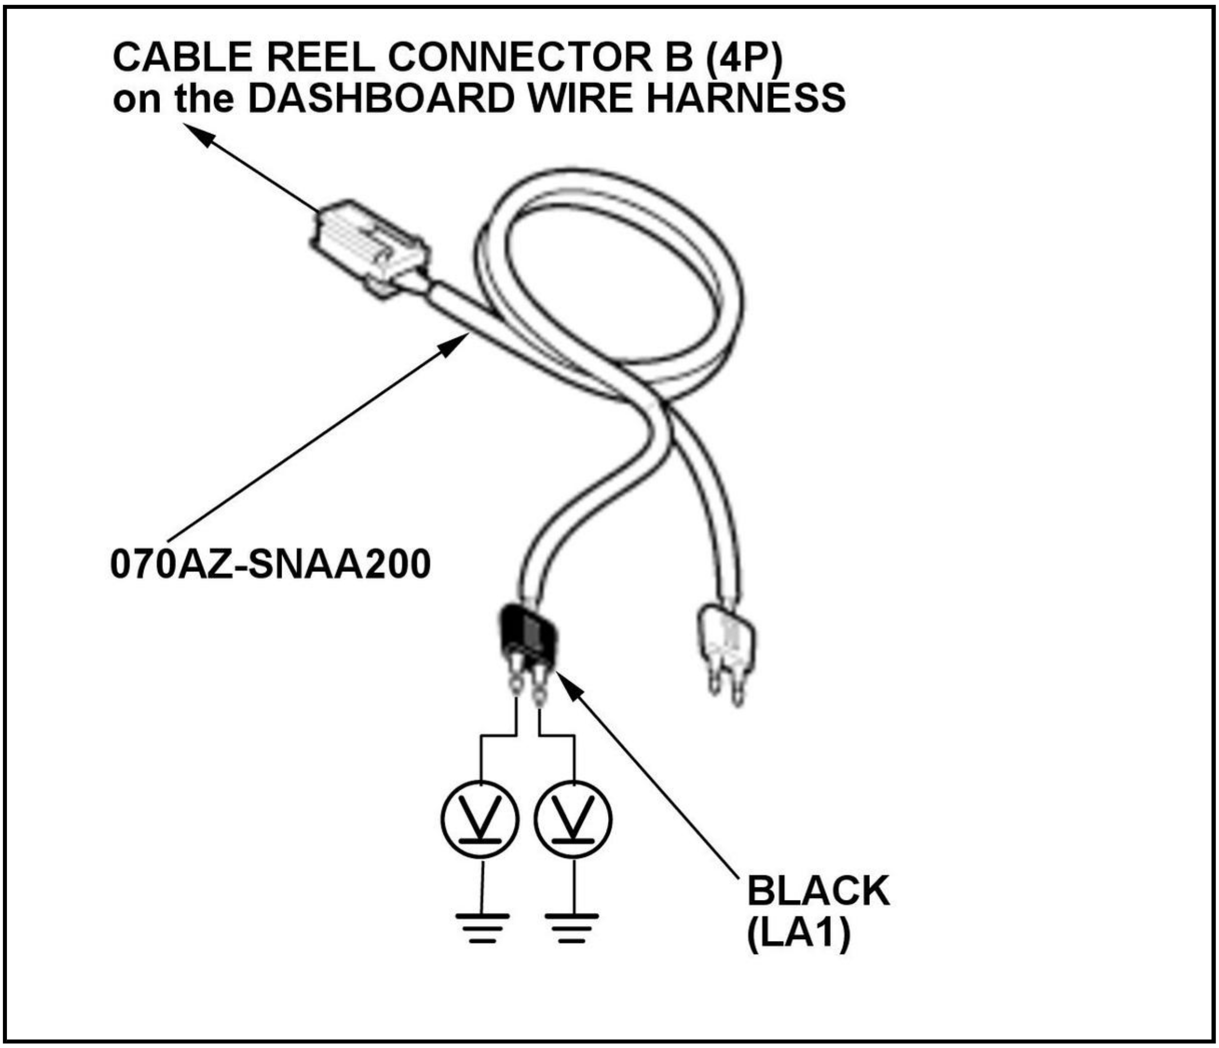
-4. Disconnect the SRS inflator simulator from SRS simulator lead K. Do not disconnect SRS simulator lead K from cable reel connector B (4P) on the dashboard wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead K
Test point 1	SRS simulator lead K black terminal
Test point 2	Body ground



Is there 0.2 V or less?

YES

The LA1+ and LA1-wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to power in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0001-12 (KA/KC) (2019 2020 2021)

DTC B0001-12 : Short to Power in the Driver's Airbag First Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0001-12 Short to power in the driver's airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-12 Short to power in the driver's airbag first inflator	B

   Is DTC B0001-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

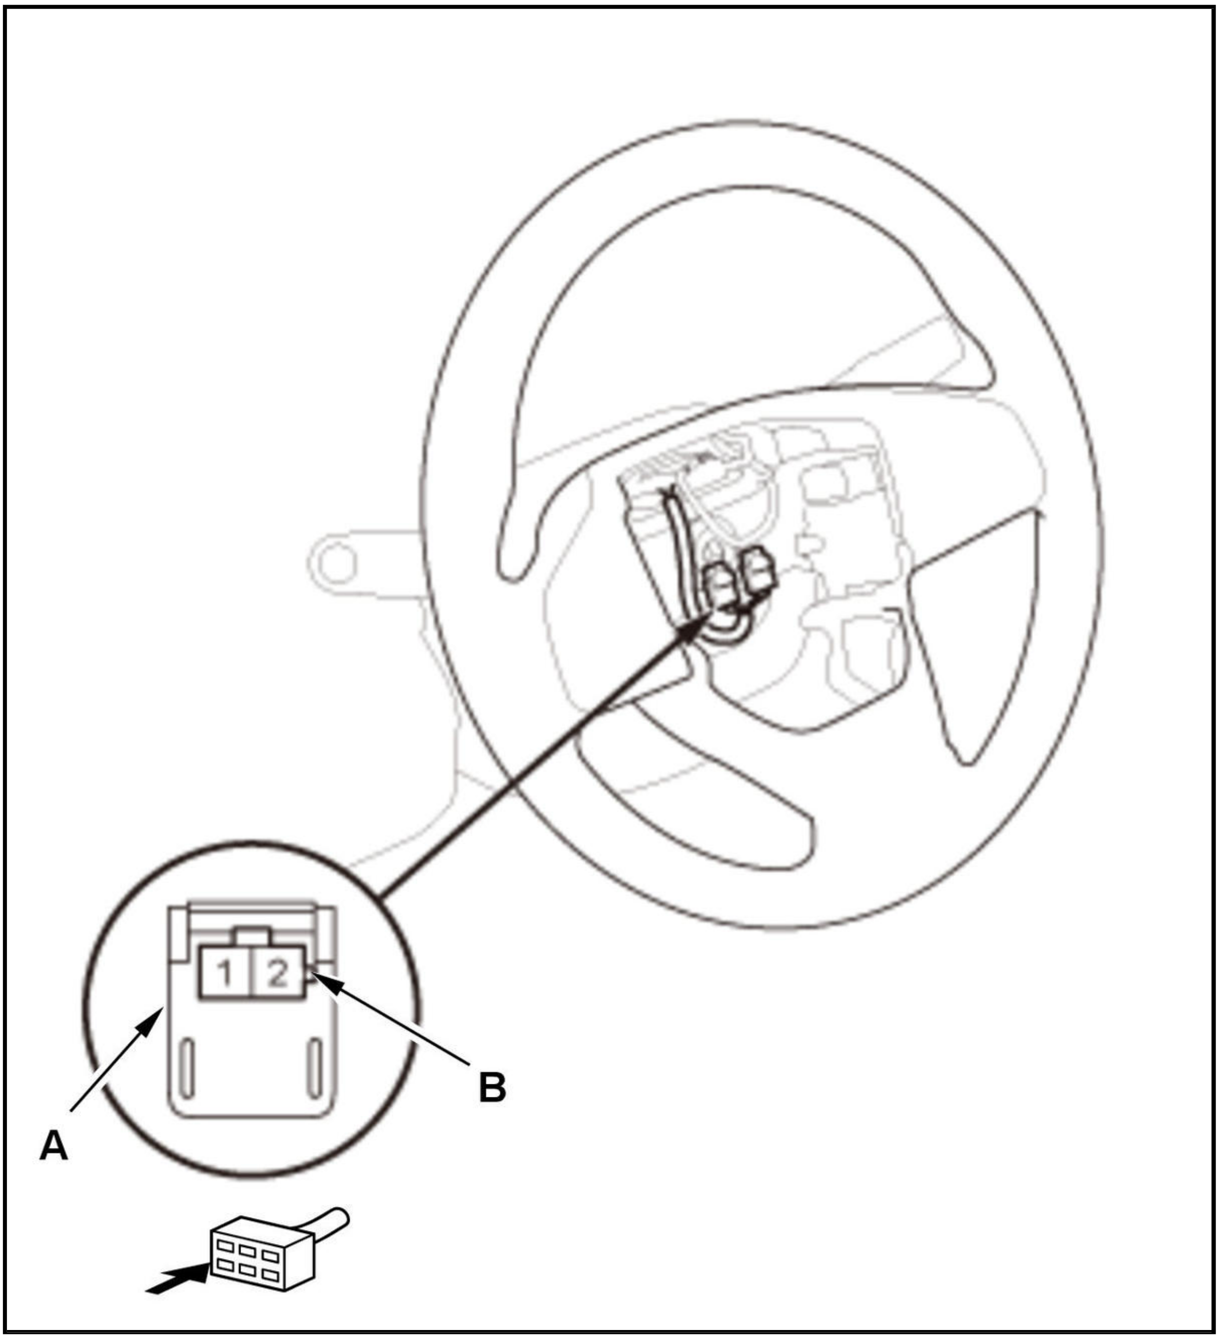
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

Driver's airbag first inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag first inflator 2P connector (A) that has a guide tab (B) on the right side of the No. 2 terminal as shown.



-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0001-12 Short to power in the driver's airbag first inflator	B

Is DTC B0001-12 indicated?

YES

Go to step 3.

NO

Short to power in the driver's airbag first inflator; **replace the driver's airbag** , then clear the DTC.

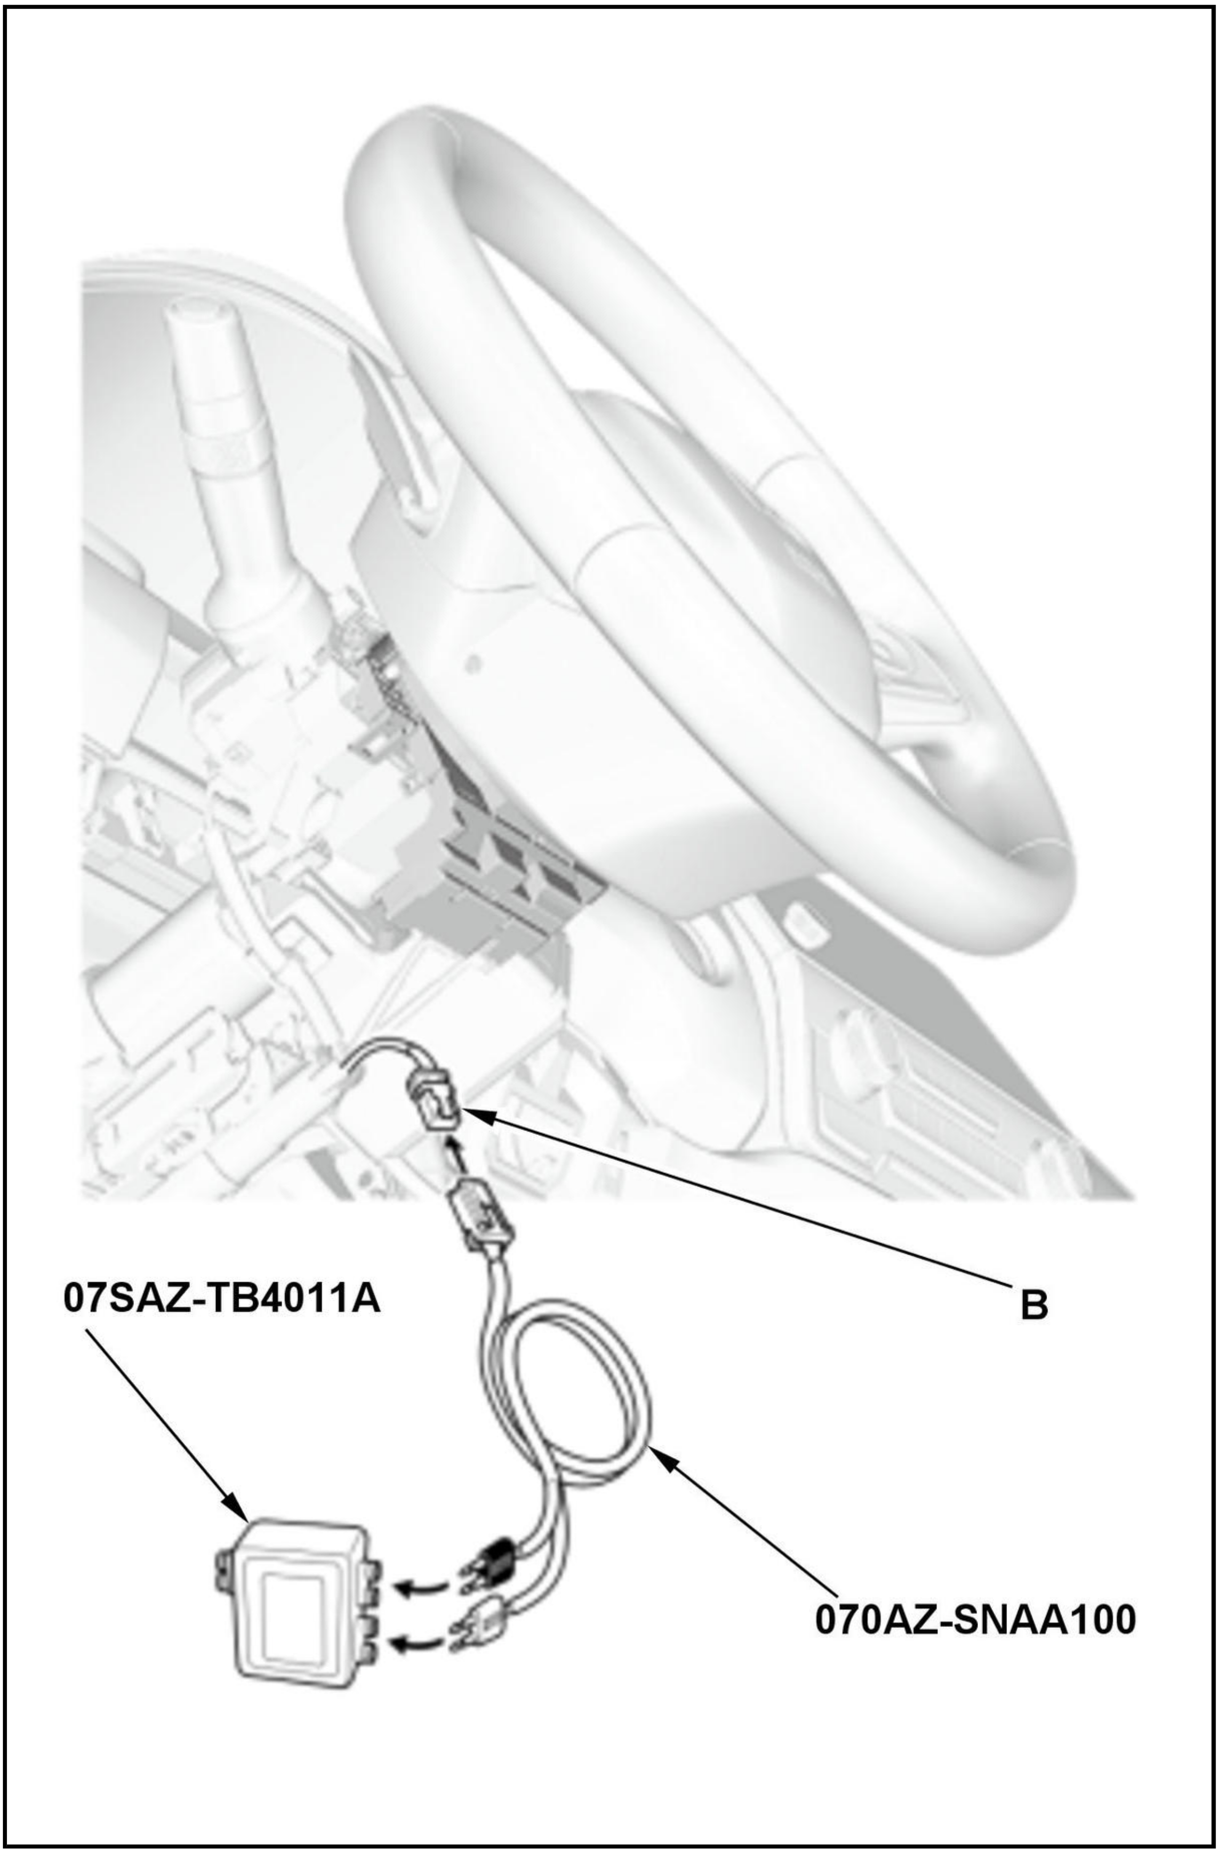
3. Cable reel check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the column covers** .

-4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0001-12 Short to power in the driver's airbag first inflator	B

Is DTC B0001-12 indicated?

YES

Go to step 4.

NO

Short to power in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA1+, LA1- lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector A (39P)

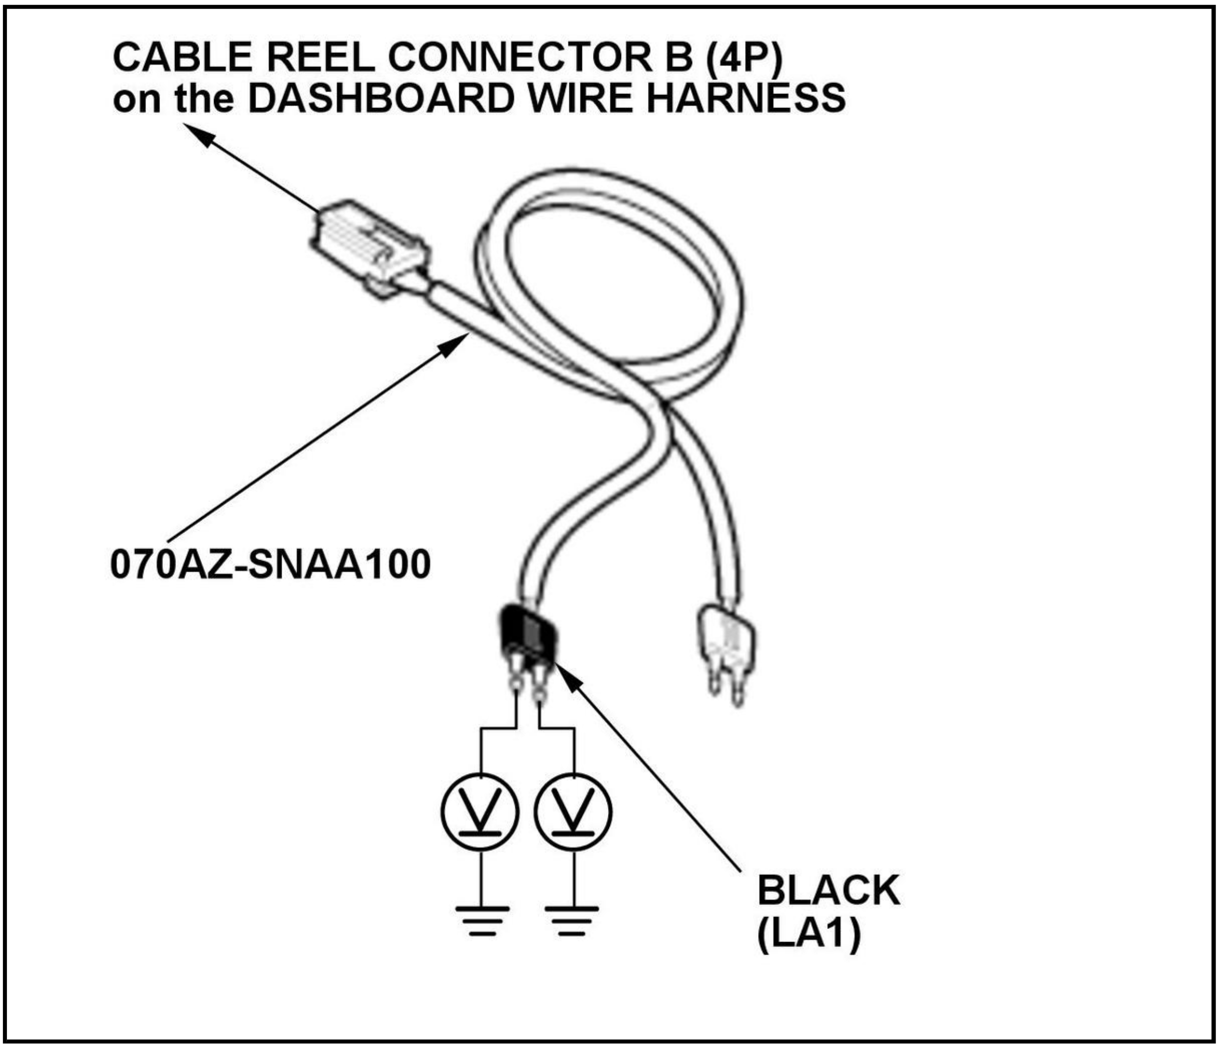
-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
Test point 1	SRS simulator lead J black terminal
Test point 2	Body ground



Is there 0.2 V or less?

YES

The LA1+ and LA1-wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to power in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0001-13

DTC B0001-13 : Open or Increased Resistance in the Driver's Airbag First Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead K 070AZ-SNAA200

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0001-13 Open or increased resistance in the driver's airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-13 Open or increased resistance in the driver's airbag first inflator	B

   Is DTC B0001-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

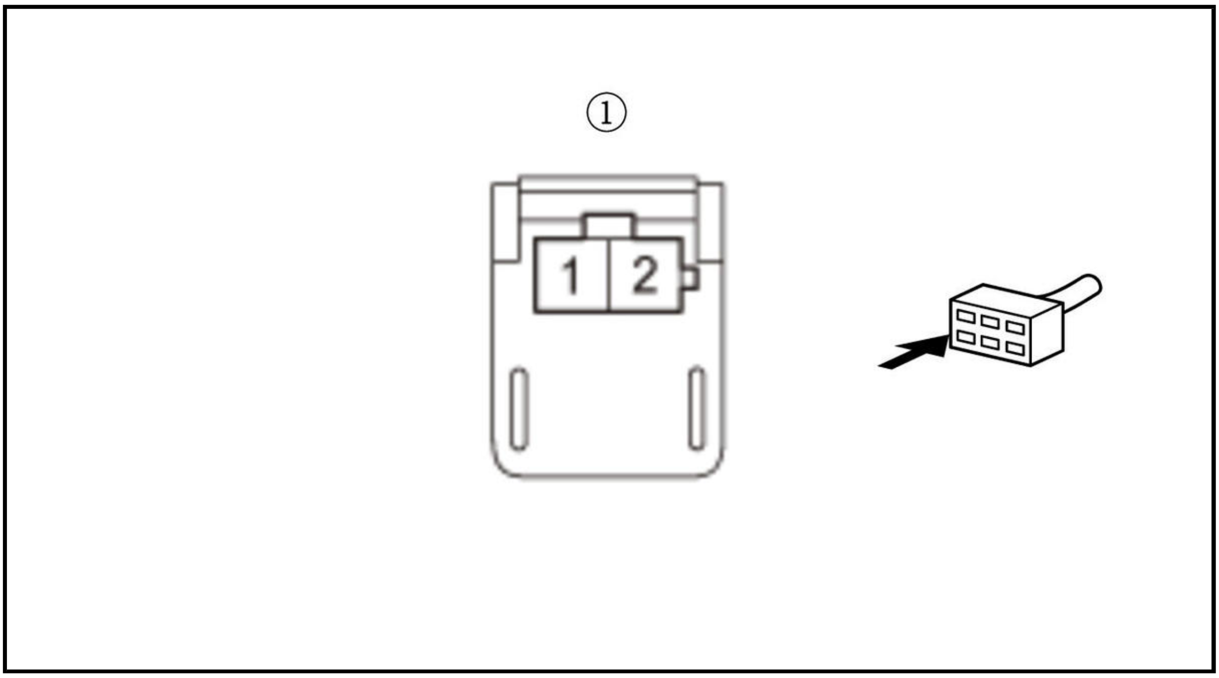
   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

Driver's airbag first inflator 2P connector (on the cable reel harness)

   -5. Connect terminals A and B with a jumper wire.

Terminal A	Driver's airbag first inflator 2P connector (female terminals) No. 1 (on the cable reel harness): ①
Terminal B	Driver's airbag first inflator 2P connector (female terminals) No. 2 (on the cable reel harness): ①



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0001-13 Open or increased resistance in the driver's airbag first inflator	B

Is DTC B0001-13 indicated?

YES

Go to step 3.

NO

Open in the driver's airbag first inflator; **replace the driver's airbag** , then clear the DTC.

3. Cable reel check

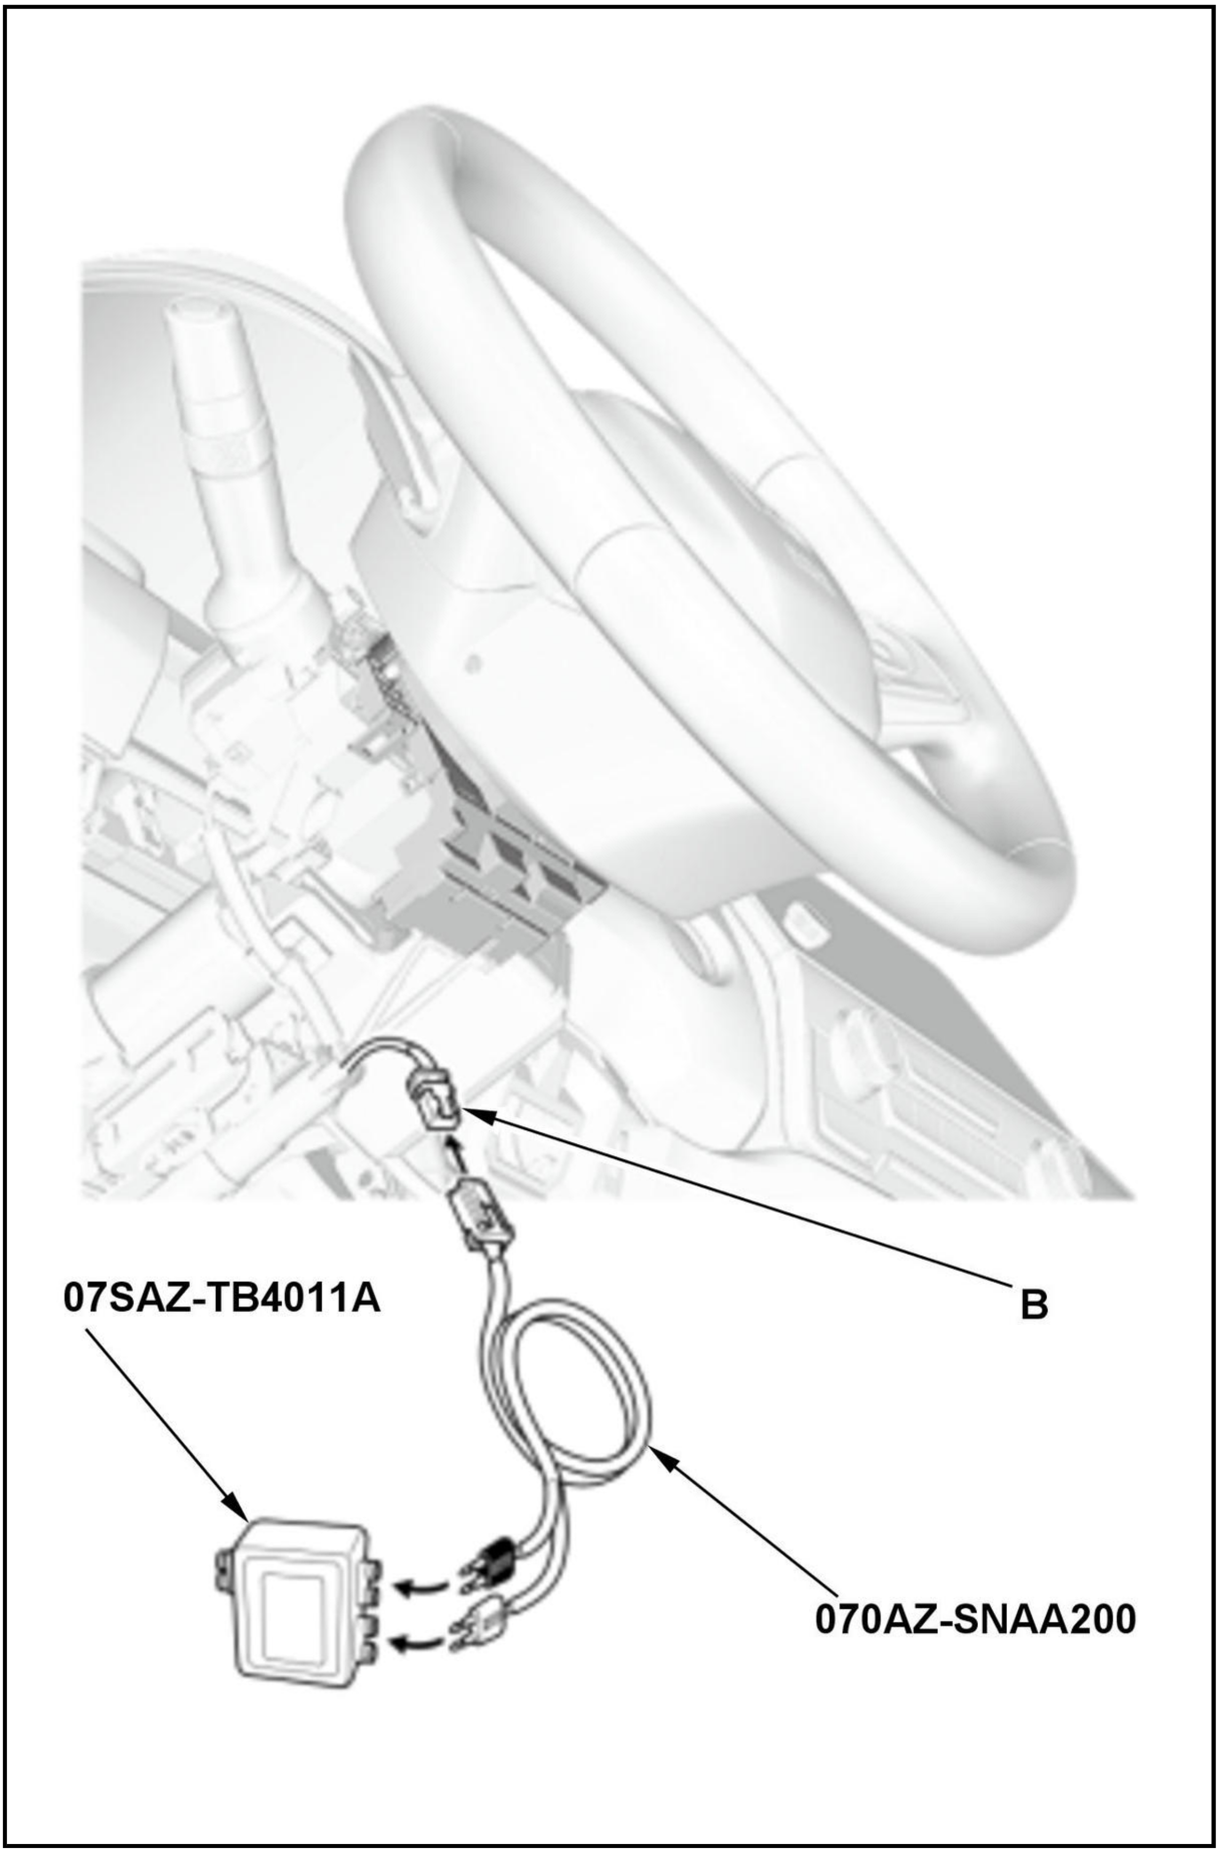
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the driver's airbag first inflator 2P connector on the cable reel harness.

-4. **Remove the column covers** .

-5. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA200

-6. Connect the terminals of SRS simulator lead K to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead K to cable reel connector B (4P) on the dashboard wire harness.

-7. Reconnect the negative cable to the 12 volt battery.

-8. Clear the DTCs with the HDS.

-9. Turn the vehicle to the ON mode, then wait for 10 seconds.

-10.

Check for DTCs with the HDS.

DTC Description	DTC
B0001-13 Open or increased resistance in the driver's airbag first inflator	B

Is DTC B0001-13 indicated?

YES

Go to step 4.

NO

Open in the cable reel; **replace the cable reel** , then clear the DTC.

4. Open wire check (LA1+, LA1- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

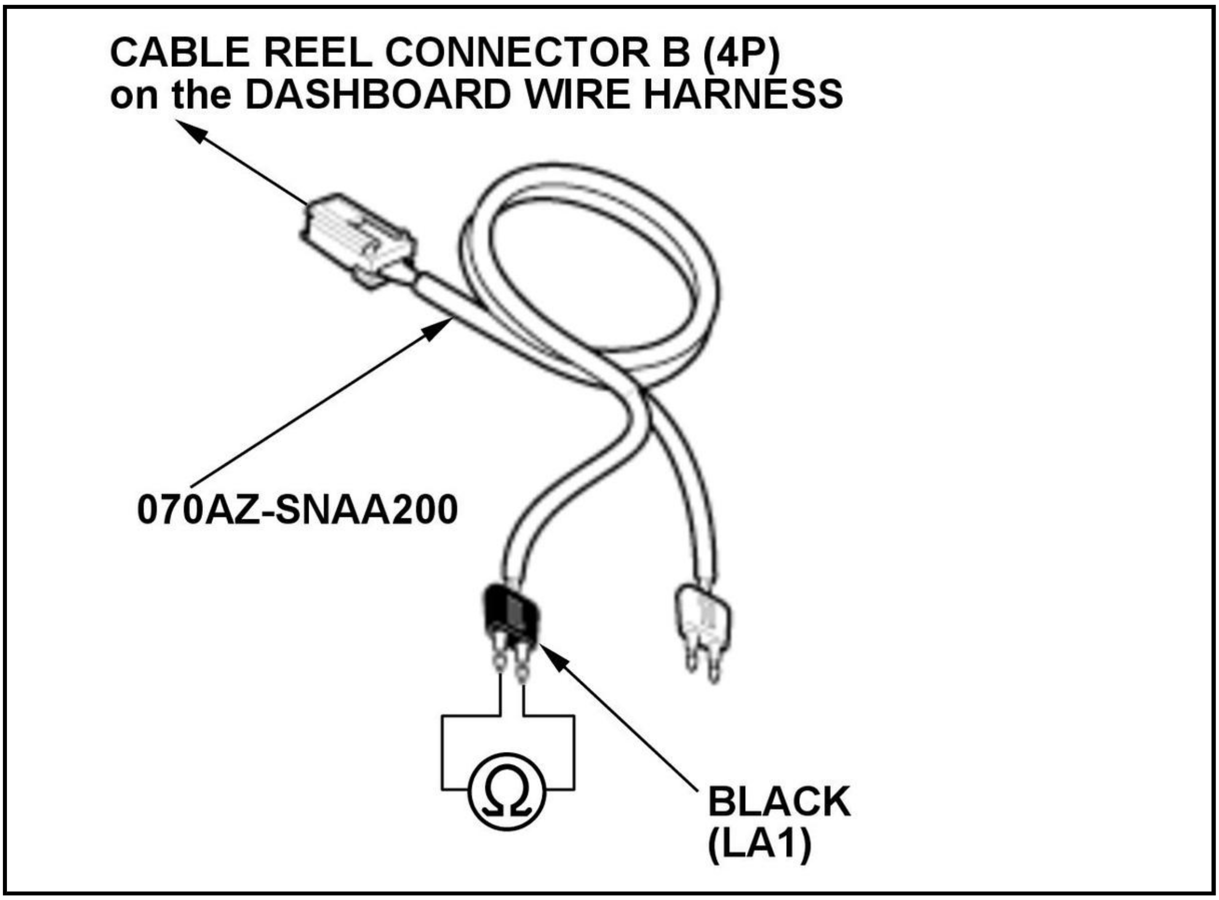
-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead K. Do not disconnect SRS simulator lead K from cable reel connector B (4P) on the dashboard wire harness.

-5. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead K
Test point	SRS simulator lead K black terminal



Is there 1.0 Ω or less?

YES

The LA1+ and LA1-wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

NO

Open in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0001-13 (KA/KC) (2019 2020 2021)

DTC B0001-13 : Open or Increased Resistance in the Driver's Airbag First Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0001-13 Open or increased resistance in the driver's airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-13 Open or increased resistance in the driver's airbag first inflator	B

   Is DTC B0001-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

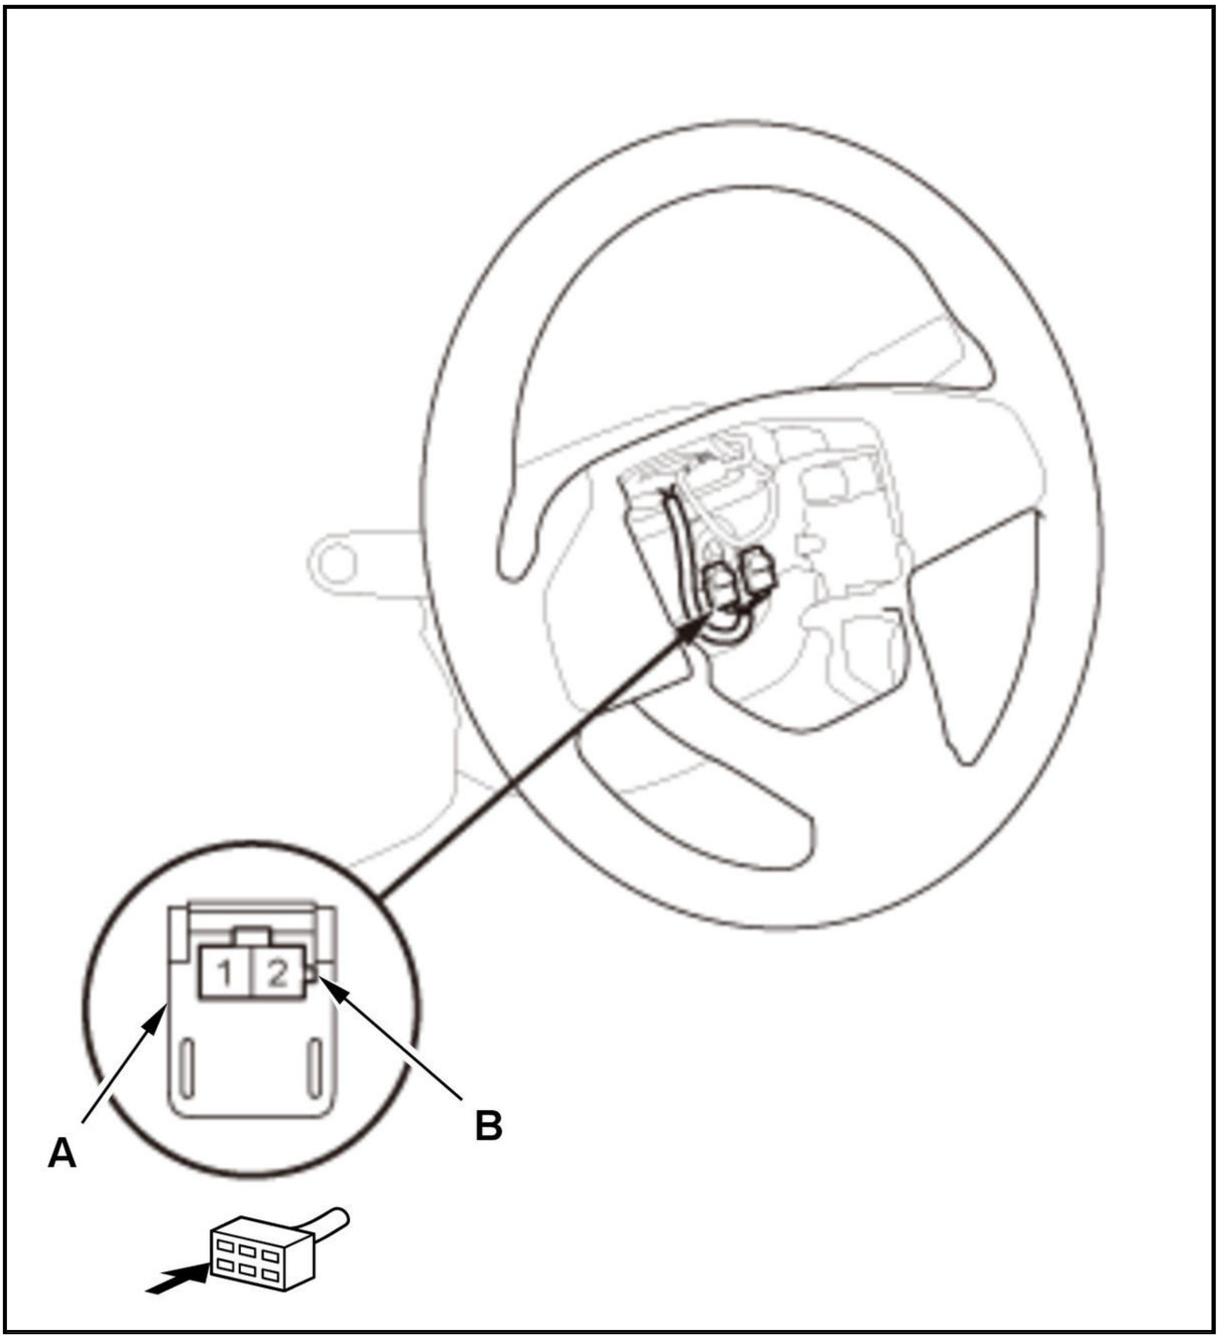
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

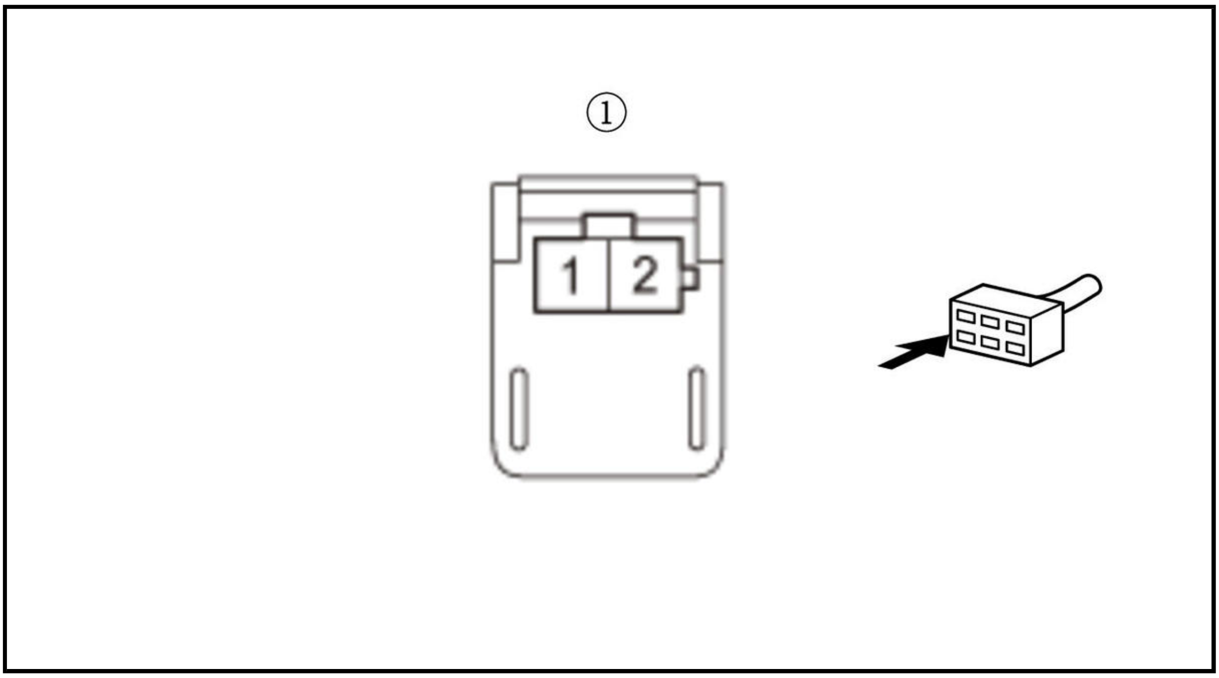
Driver's airbag first inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag first inflator 2P connector (A) that has a guide tab (B) on the right side of the No. 2 terminal as shown.



-5. Connect terminals A and B with a jumper wire.

Terminal A	Driver's airbag first inflator 2P connector (female terminals) No. 1 (on the cable reel harness): ①
Terminal B	Driver's airbag first inflator 2P connector (female terminals) No. 2 (on the cable reel harness): ①



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0001-13 Open or increased resistance in the driver's airbag first inflator	B

Is DTC B0001-13 indicated?

YES

Go to step 3.

NO

Open in the driver's airbag first inflator; **replace the driver's airbag** , then clear the DTC.

3. Cable reel check

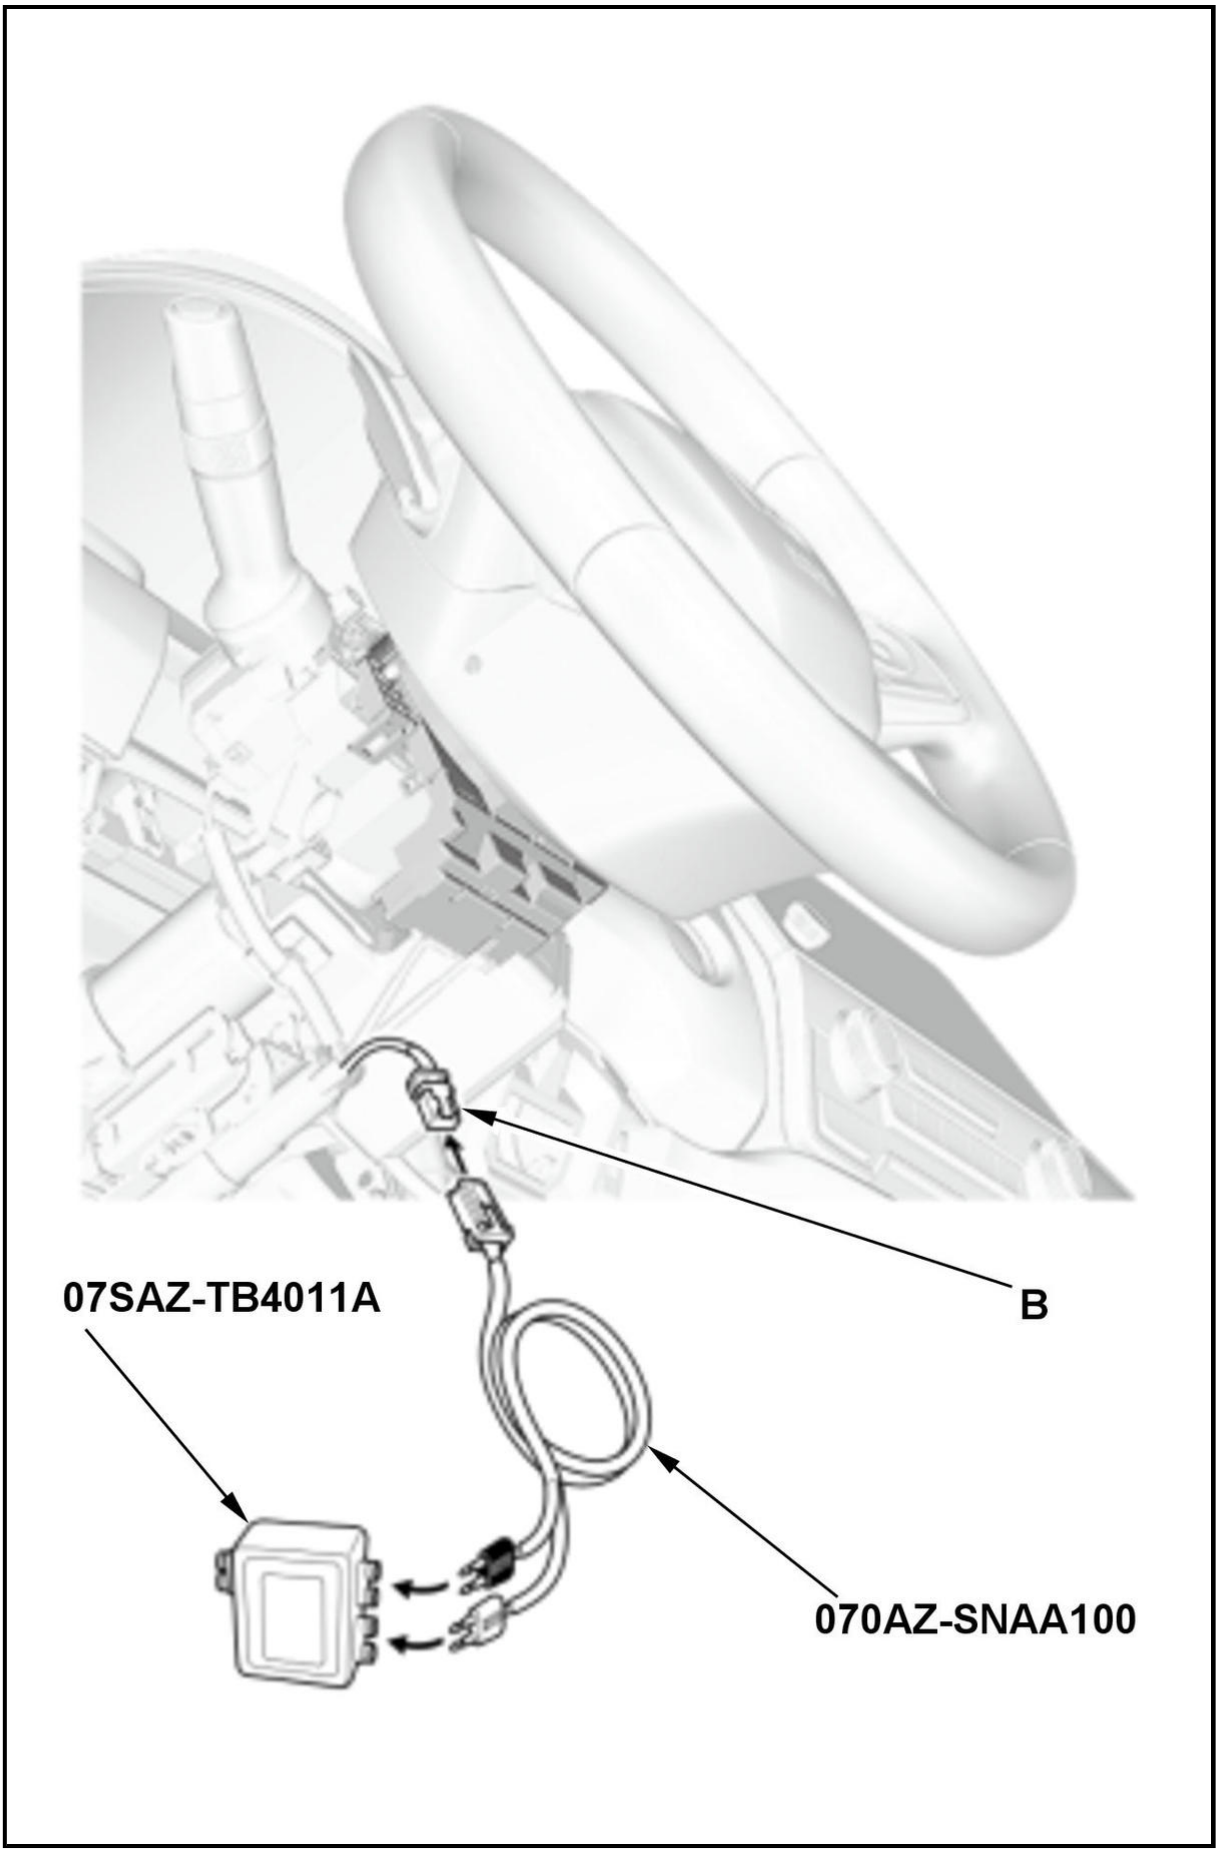
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the driver's airbag first inflator 2P connector on the cable reel harness.

-4. **Remove the column covers** .

-5. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-6. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-7. Reconnect the negative cable to the 12 volt battery.

-8. Clear the DTCs with the HDS.

-9. Turn the vehicle to the ON mode, then wait for 10 seconds.

-10.

Check for DTCs with the HDS.

DTC Description	DTC
B0001-13 Open or increased resistance in the driver's airbag first inflator	B

Is DTC B0001-13 indicated?

YES

Go to step 4.

NO

Open in the cable reel; **replace the cable reel** , then clear the DTC.

4. Open wire check (LA1+, LA1- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

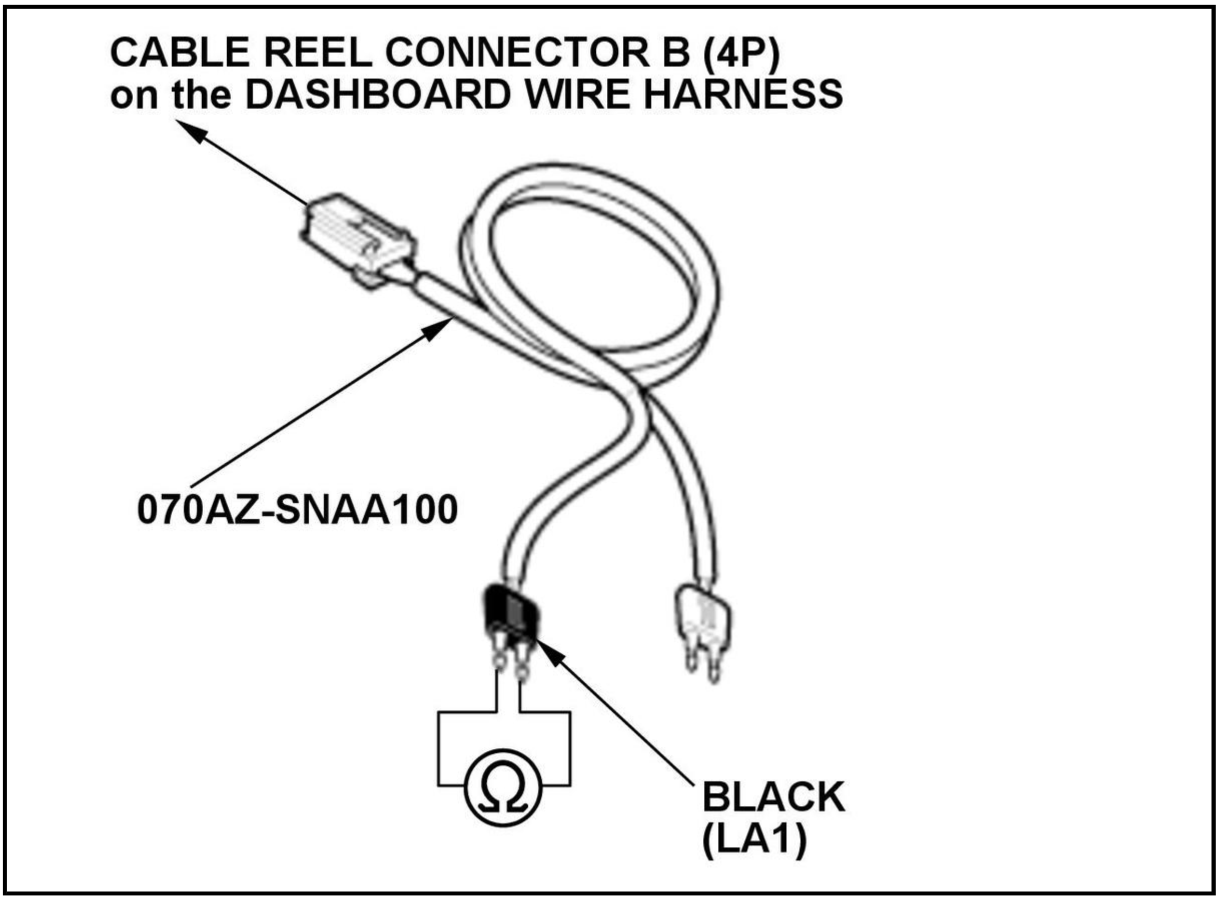
-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
Test point	SRS simulator lead J black terminal



Is there 1.0 Ω or less?

YES

The LA1+ and LA1-wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

NO

Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0001-1A

DTC B0001-1A : Decreased Resistance in the Driver's Airbag First Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead K 070AZ-SNAA200

-SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0001-1A Decreased resistance in the driver's airbag first inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-1A Decreased resistance in the driver's airbag first inflator	B

Is DTC B0001-1A indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the driver's airbag** .

-4. Disconnect the following connector.

Driver's airbag first inflator 2P connector (on the cable reel harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0001-1A Decreased resistance in the driver's airbag first inflator	B

Is DTC B0001-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the driver's airbag first inflator; **replace the driver's airbag** , then clear the DTC.

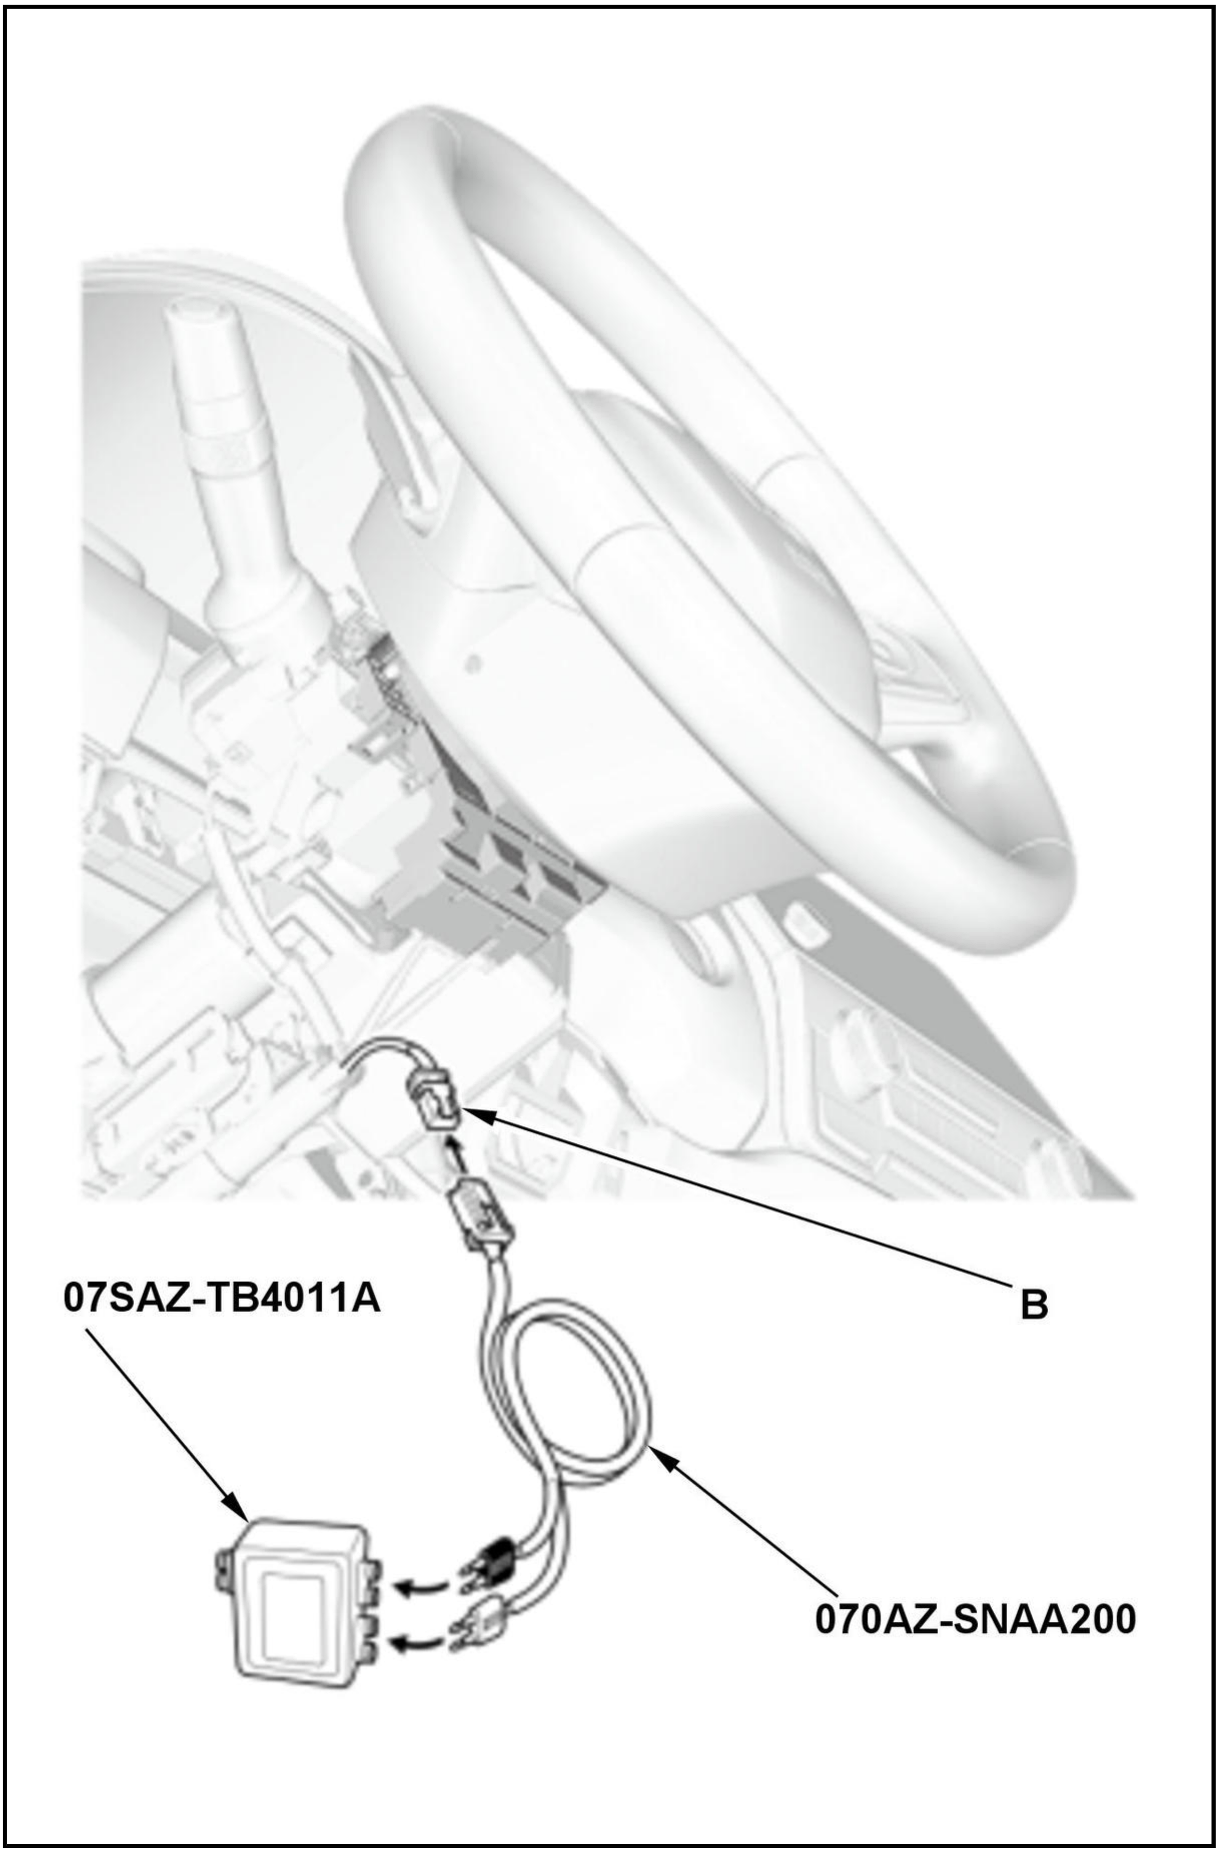
3. Cable reel check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the column covers** .

   -4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA200

-5. Connect the terminals of SRS simulator lead K to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead K to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0001-1A Decreased resistance in the driver's airbag first inflator	B

Is DTC B0001-1A indicated?

YES

Go to step 4.

NO

Short to another wire in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA1+ line to LA1- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

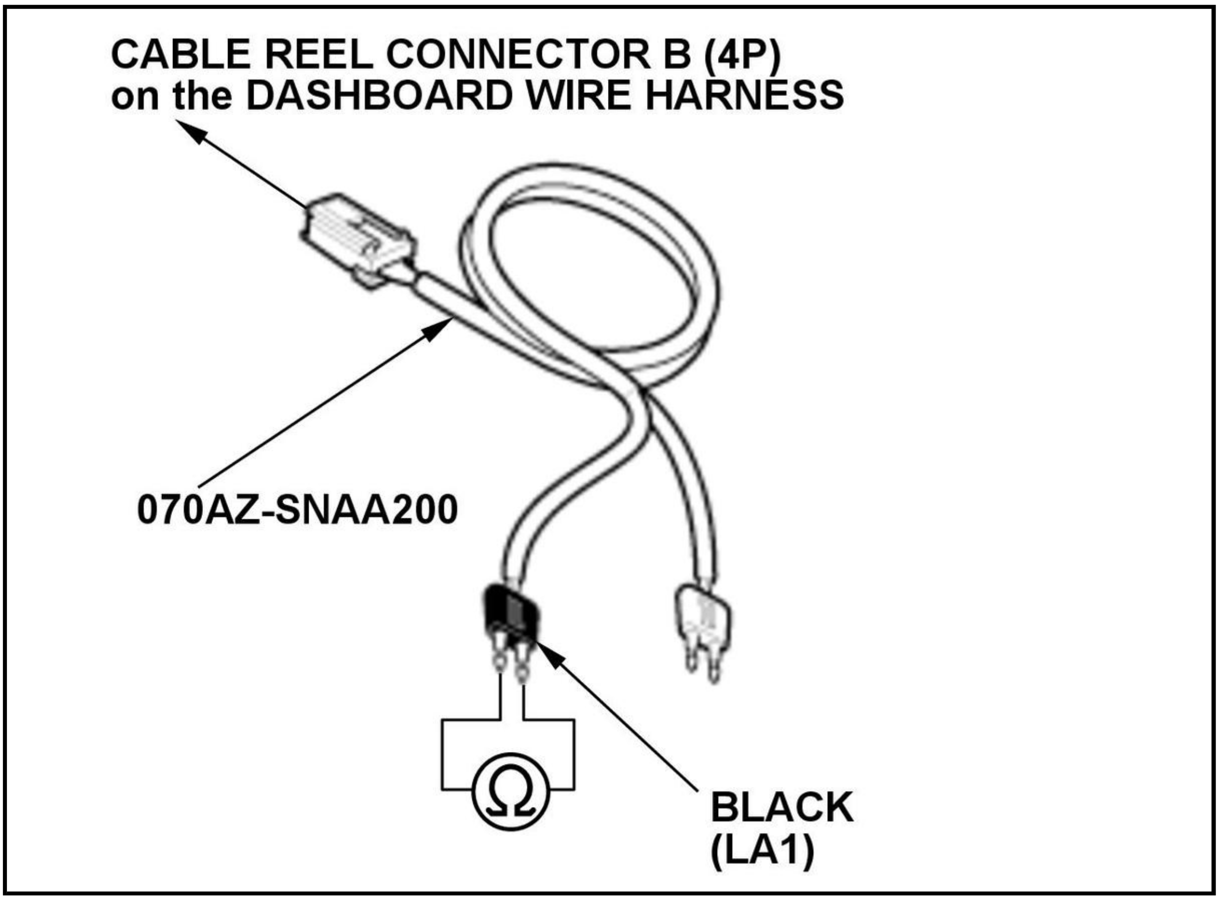
SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead K. Do not disconnect SRS simulator lead K from cable reel connector B (4P) on the dashboard wire harness.

-5. **Connect the SRS short canceller to SRS unit connector A (39P) terminals No. 8 and No. 9** .

-6. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead K
	SRS unit connector A (39P) No. 8 and No. 9: connected to SRS short canceller
Test point	SRS simulator lead K black terminal



Is there an open circuit, or at least 1 MΩ?

YES

The LA1+ and LA1-wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to another wire in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0001-1A (KA/KC) (2019 2020 2021)

DTC B0001-1A : Decreased Resistance in the Driver's Airbag First Inflator

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-1A Decreased resistance in the driver's airbag first inflator	B

   Is DTC B0001-1A indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

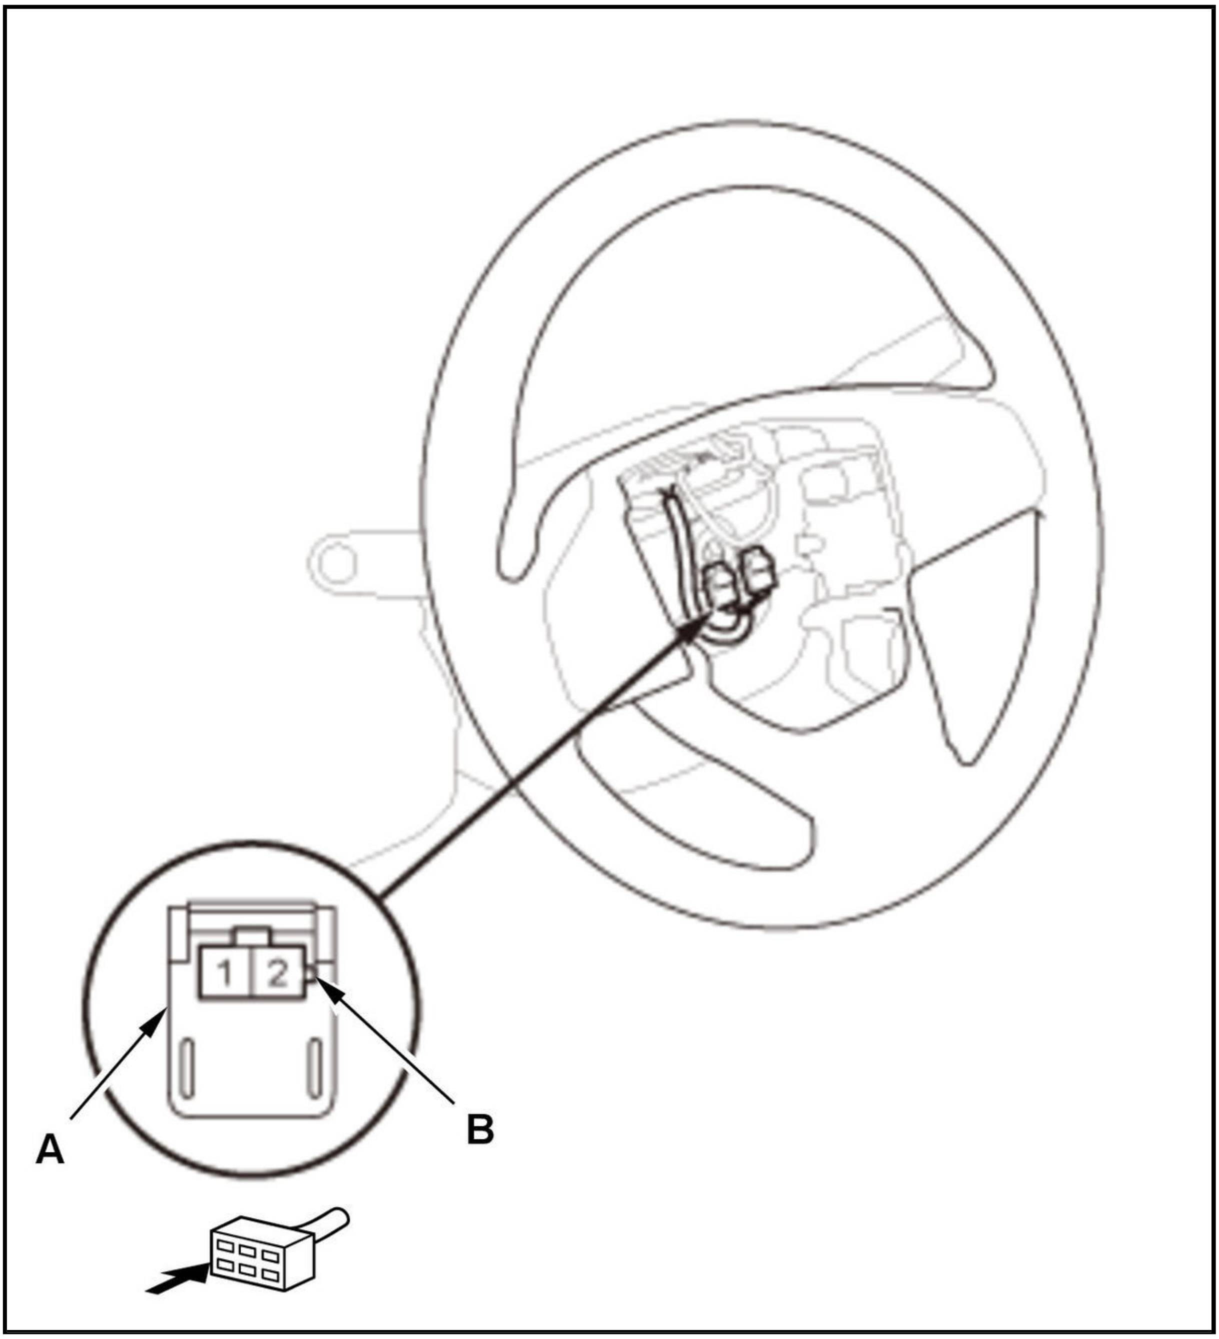
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

Driver's airbag first inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag first inflator 2P connector (A) that has a guide tab (B) on the right side of the No. 2 terminal as shown.



-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0001-1A Decreased resistance in the driver's airbag first inflator	B

Is DTC B0001-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the driver's airbag first inflator; **replace the driver's airbag** , then clear the DTC.

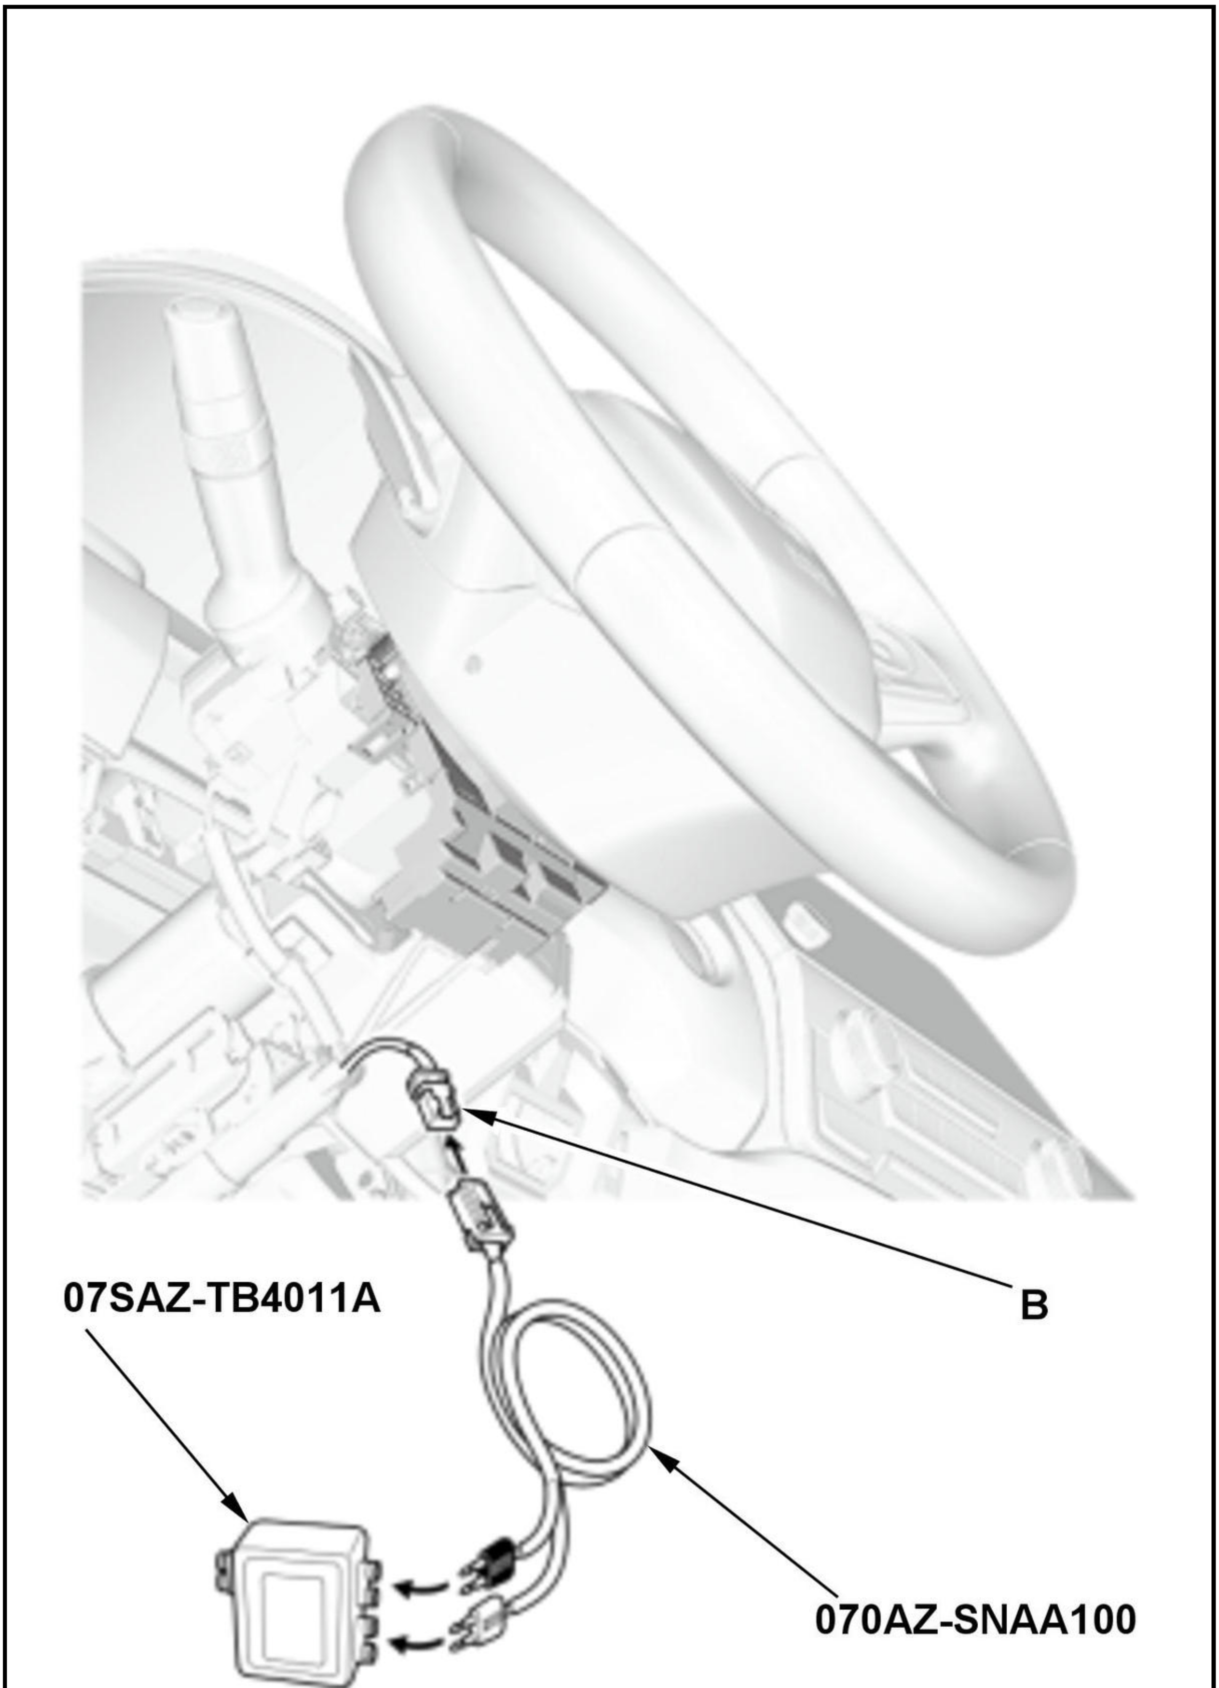
3. Cable reel check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the column covers** .

   -4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0001-1A Decreased resistance in the driver's airbag first inflator	B

Is DTC B0001-1A indicated?

YES

Go to step 4.

NO

Short to another wire in the cable reel; replace the cable reel , then clear the DTC.

4. Shorted wire check (LA1+ line to LA1- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

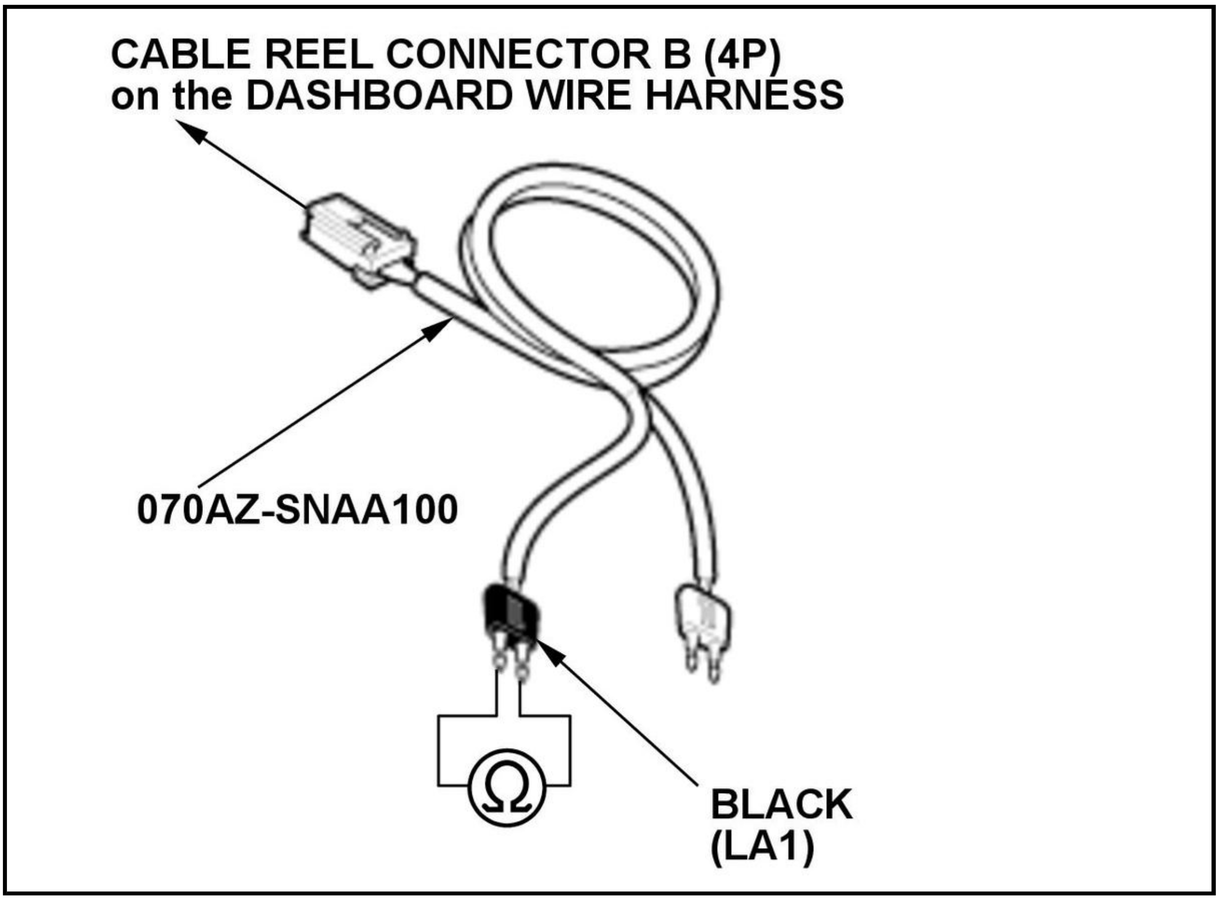
SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. **Connect the SRS short canceller to SRS unit connector A (39P) terminals No. 8 and No. 9** .

-6. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
	SRS unit connector A (39P) No. 8 and No. 9: connected to SRS short canceller
Test point	SRS simulator lead J black terminal



Is there an open circuit, or at least 1 MΩ?

YES

The LA1+ and LA1-wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to another wire in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0001-2B (KA/KC) (2019 2020 2021)

DTC B0001-2B : Short to Another Wire Harness in the Driver's Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B

Is DTC B0001-2B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the left side airbag inflator	B
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the right side airbag inflator	B
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B

DTC Description	DTC
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0002-2B, B0010-2B, B0011-2B, B0020-2B, B0021-2B, B0028-2B, B0029-2B, B0070-2B, B0072-2B, B0079-2B, B007A-2B or B0082-2B indicated with DTC B0001-2B?

YES

Go to step 3.

NO

Go to step 4.

3. Shorted wire check (LA1 lines to another line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

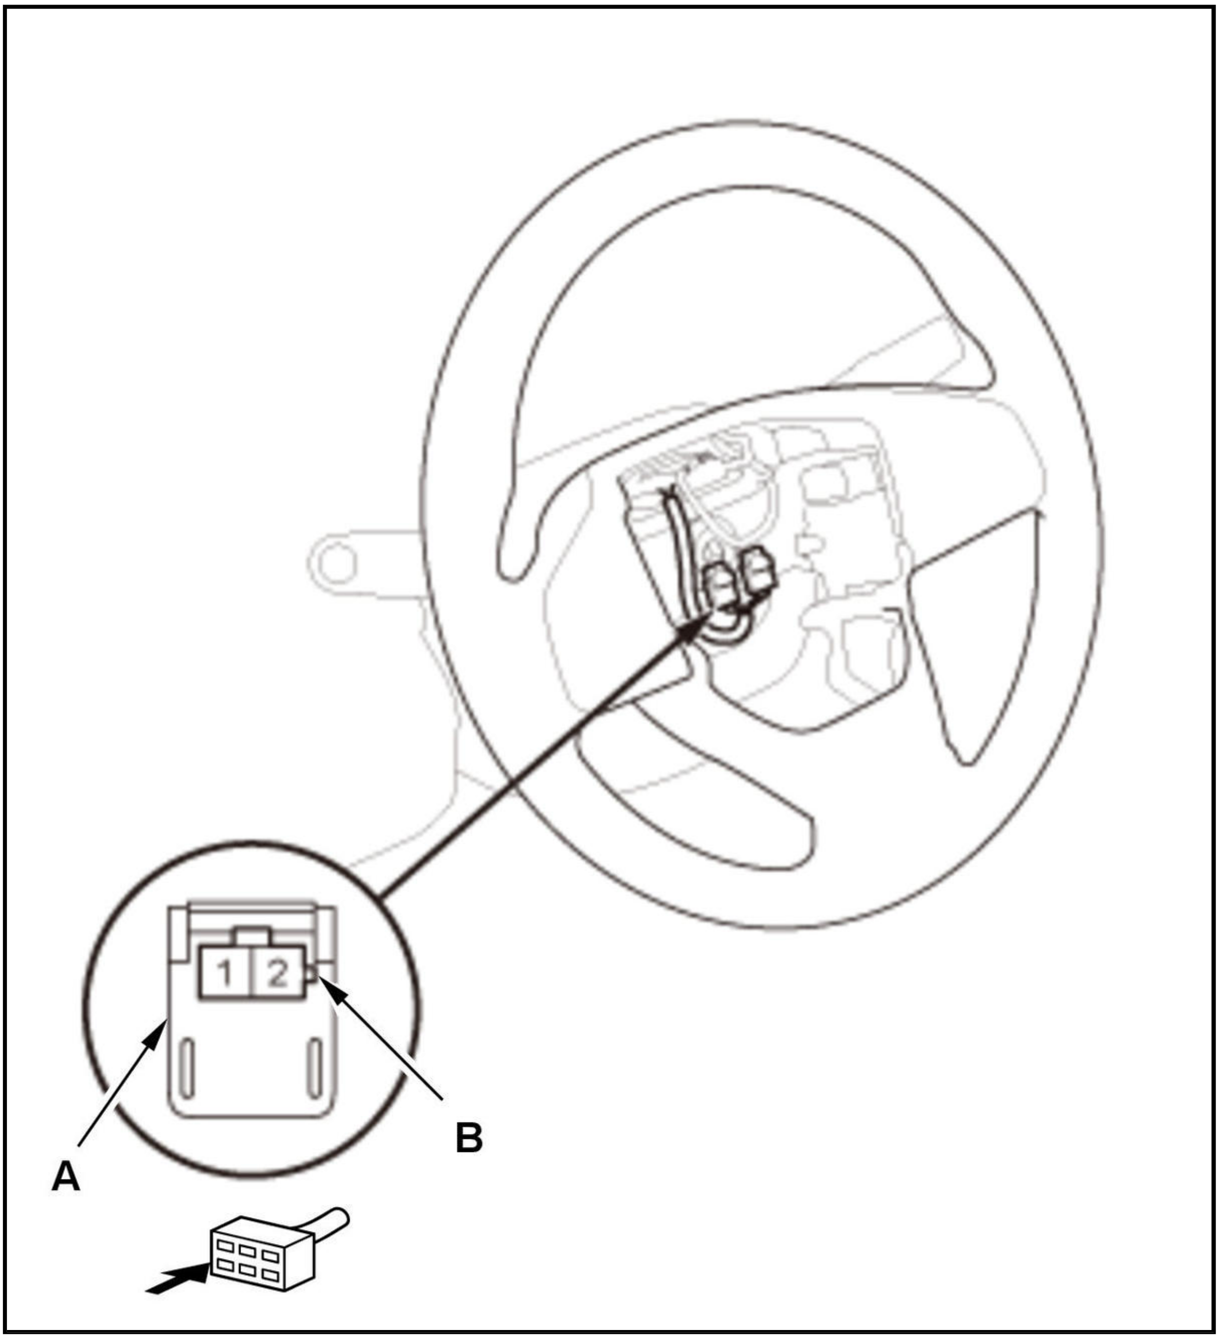
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connectors.

SRS unit connector A (39P)
SRS unit connector B (39P)
Driver's airbag second inflator 2P connector (on the cable reel harness)
Inflator connectors which are assigned to 2B codes listed on HDS

NOTE: Make sure to work with the driver's airbag first inflator 2P connector (A) that has a guide tab (B) on the right side of the No. 2 terminal as shown.



-5. Check for continuity between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	SRS unit connector B (39P): disconnected
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

Is there continuity?

YES

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

NO

The LA1 wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

4. Shorted wire check (LA1+ line to LA2+ line, LA1- line to LA2- line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the driver's airbag** .

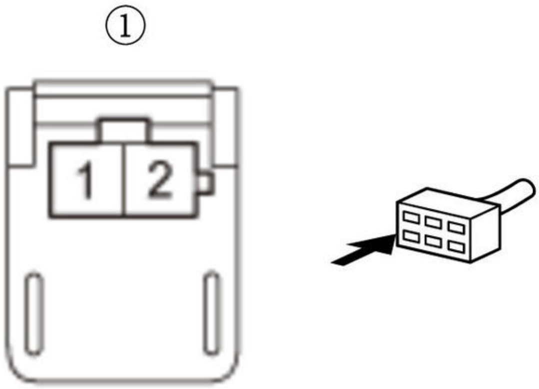
-4. Disconnect the following connector.

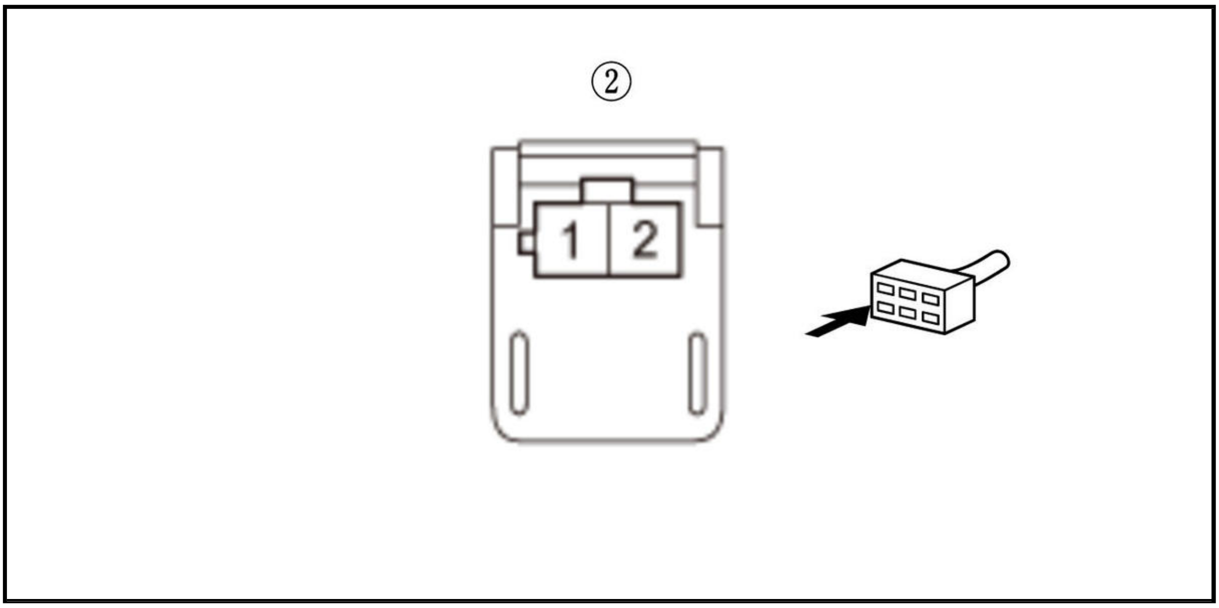
Driver's airbag first inflator 2P connector (on the cable reel harness)
Driver's airbag second inflator 2P connector (on the cable reel harness)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
Test point 1	Driver's airbag first inflator 2P connector No. 2 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 2 (on the cable reel harness) ②

Test point 1	Driver's airbag first inflator 2P connector No. 1 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 1 (on the cable reel harness) ②





Is there continuity?

YES

Go to step 5.

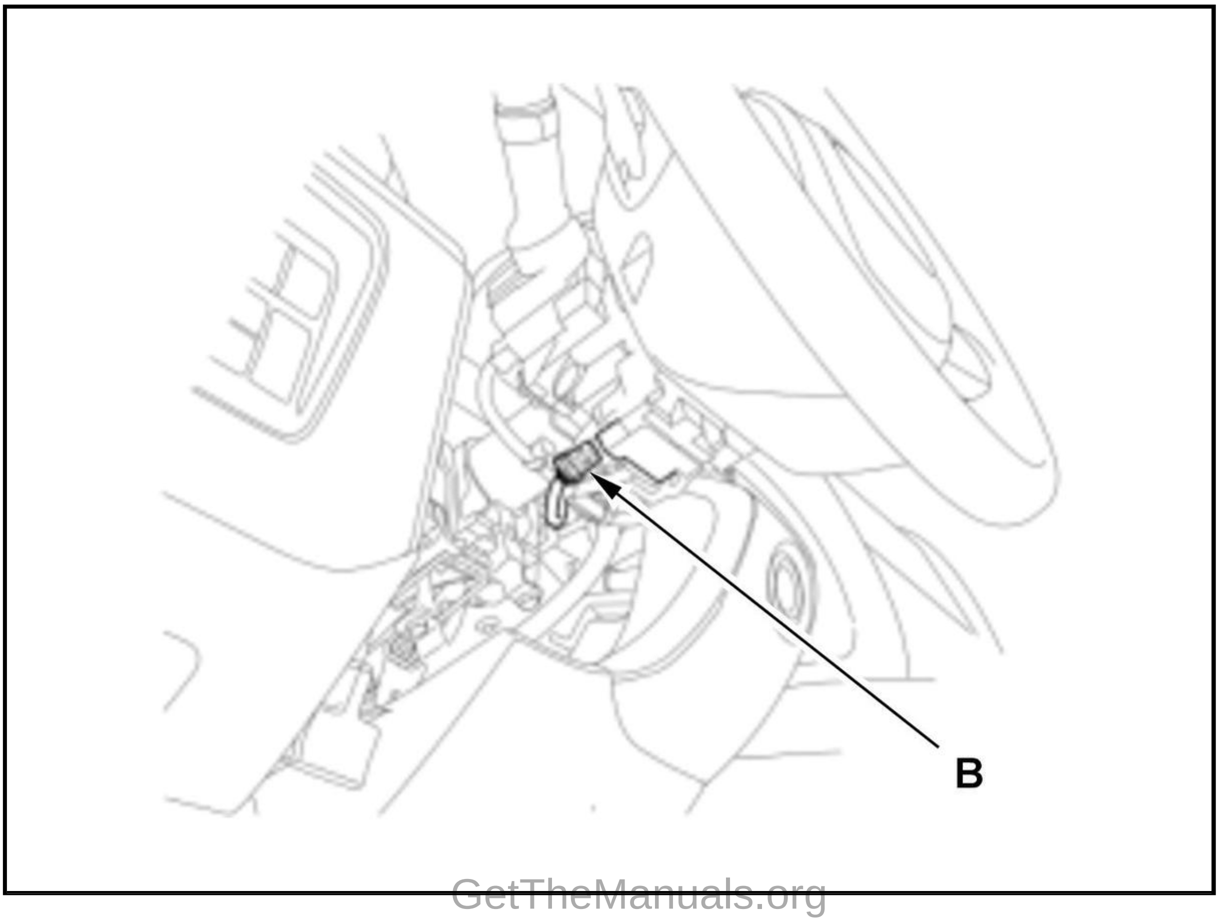
NO

The LA1+, LA1-, LA2+, and LA2- wires are OK. Faulty driver's airbag second inflator; **replace the driver's airbag** , then clear the DTC.

5. Shorted wire check (LA1+ line to LA2+ line, LA1- line to LA2- line) 2

   -1. **Remove the column covers** .

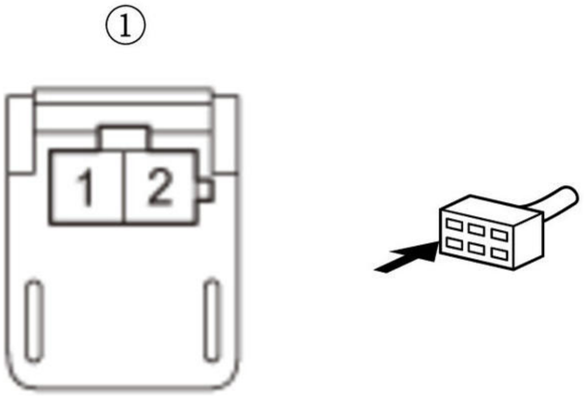
   -2. Disconnect cable reel connector B (4P) on the dashboard wire harness.

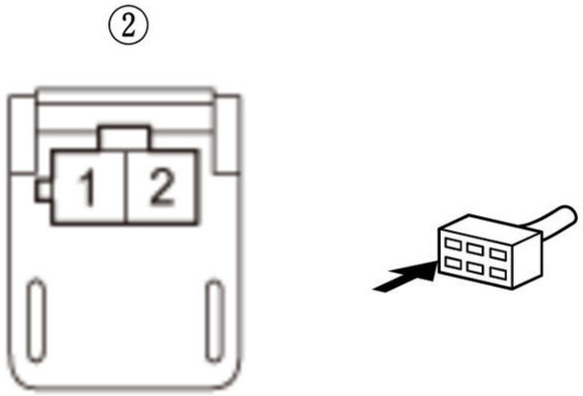


-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
Test point 1	Driver's airbag first inflator 2P connector No. 2 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 2 (on the cable reel harness) ②

Test point 1	Driver's airbag first inflator 2P connector No. 1 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 1 (on the cable reel harness) ②





Is there continuity?

YES

Short to another wire in the cable reel; **replace the cable reel** , then clear the DTC.

NO

Go to step 6.

6. Shorted wire check (LA1+ line to LA2+ line, LA1- line to LA2- line) 3

-1. Disconnect the following connectors.

SRS unit connector A (39P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 9**
Test point 2	**SRS unit connector A (39P) No. 10**

Test point 1	**SRS unit connector A (39P) No. 8**
Test point 2	**SRS unit connector A (39P) No. 11**

Is there continuity?

YES

Short to another wire in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

NO

The LA1+, LA1-, LA2+, and LA2- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

DTC B0002-11 (KA/KC) (2019 2020 2021)

DTC B0002-11 : Short to Ground in the Driver's Airbag Second Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0002-11 Short to ground in the driver's airbag second inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0002-11 Short to ground in the driver's airbag second inflator	B

   Is DTC B0002-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

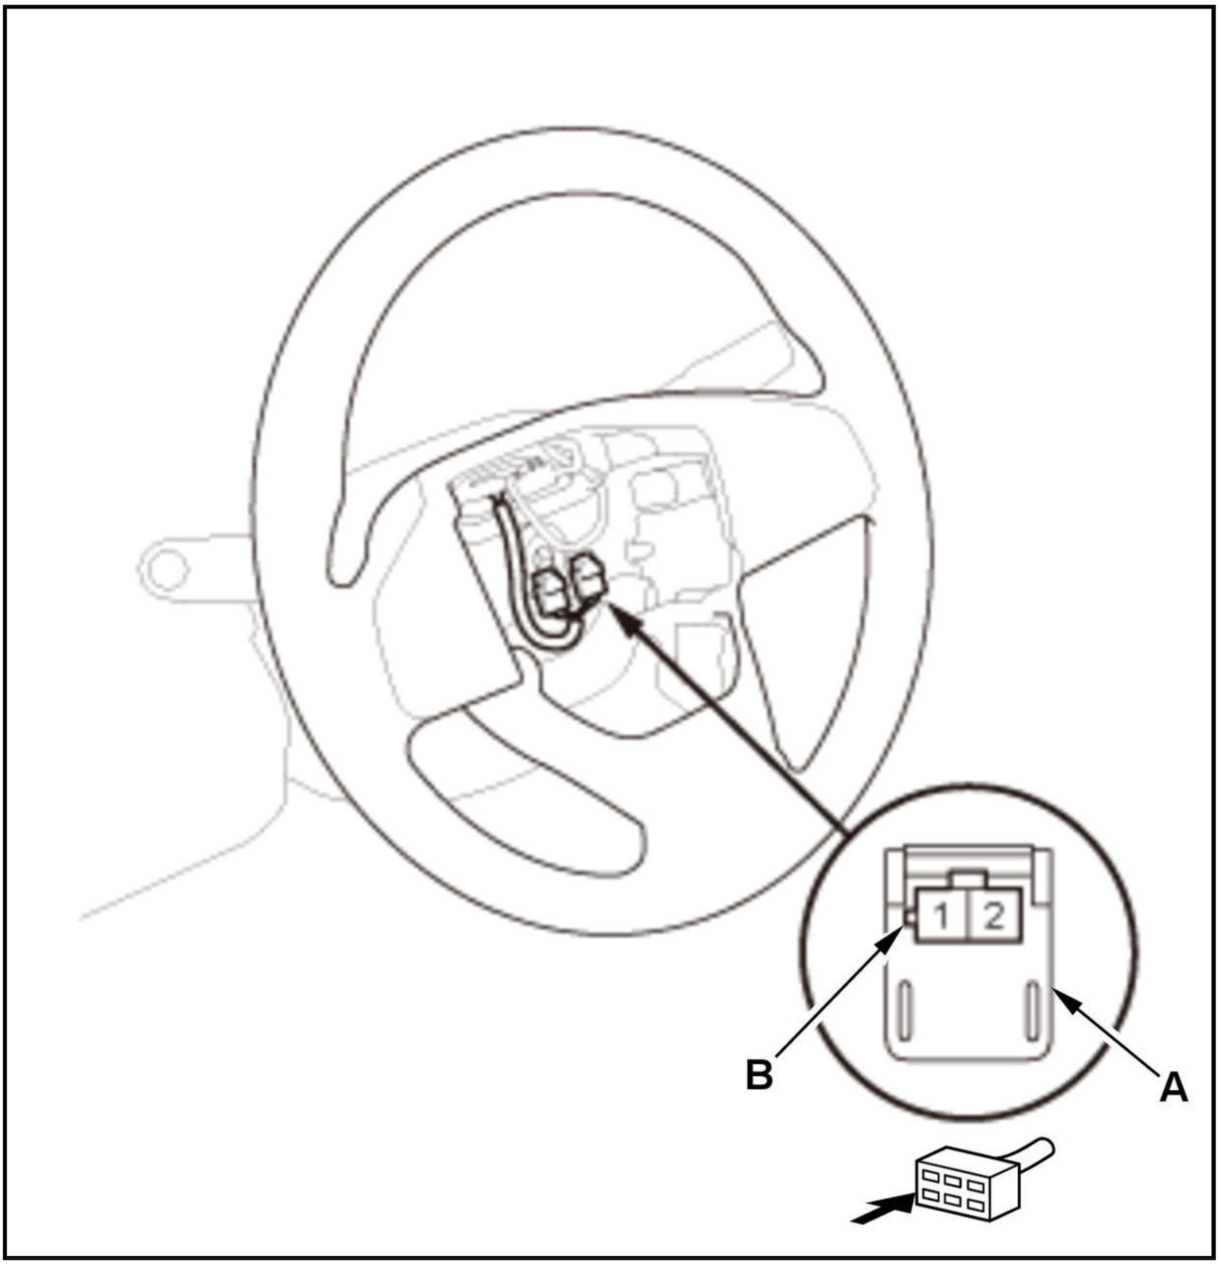
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

Driver's airbag second inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag second inflator 2P connector (A) that has a guide tab (B) on the left side of the No. 1 terminal as shown.



-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0002-11 Short to ground in the driver's airbag second inflator	B

Is DTC B0002-11 indicated?

YES

Go to step 3.

NO

Short to ground in the driver's airbag second inflator; **replace the driver's airbag** , then clear the DTC.

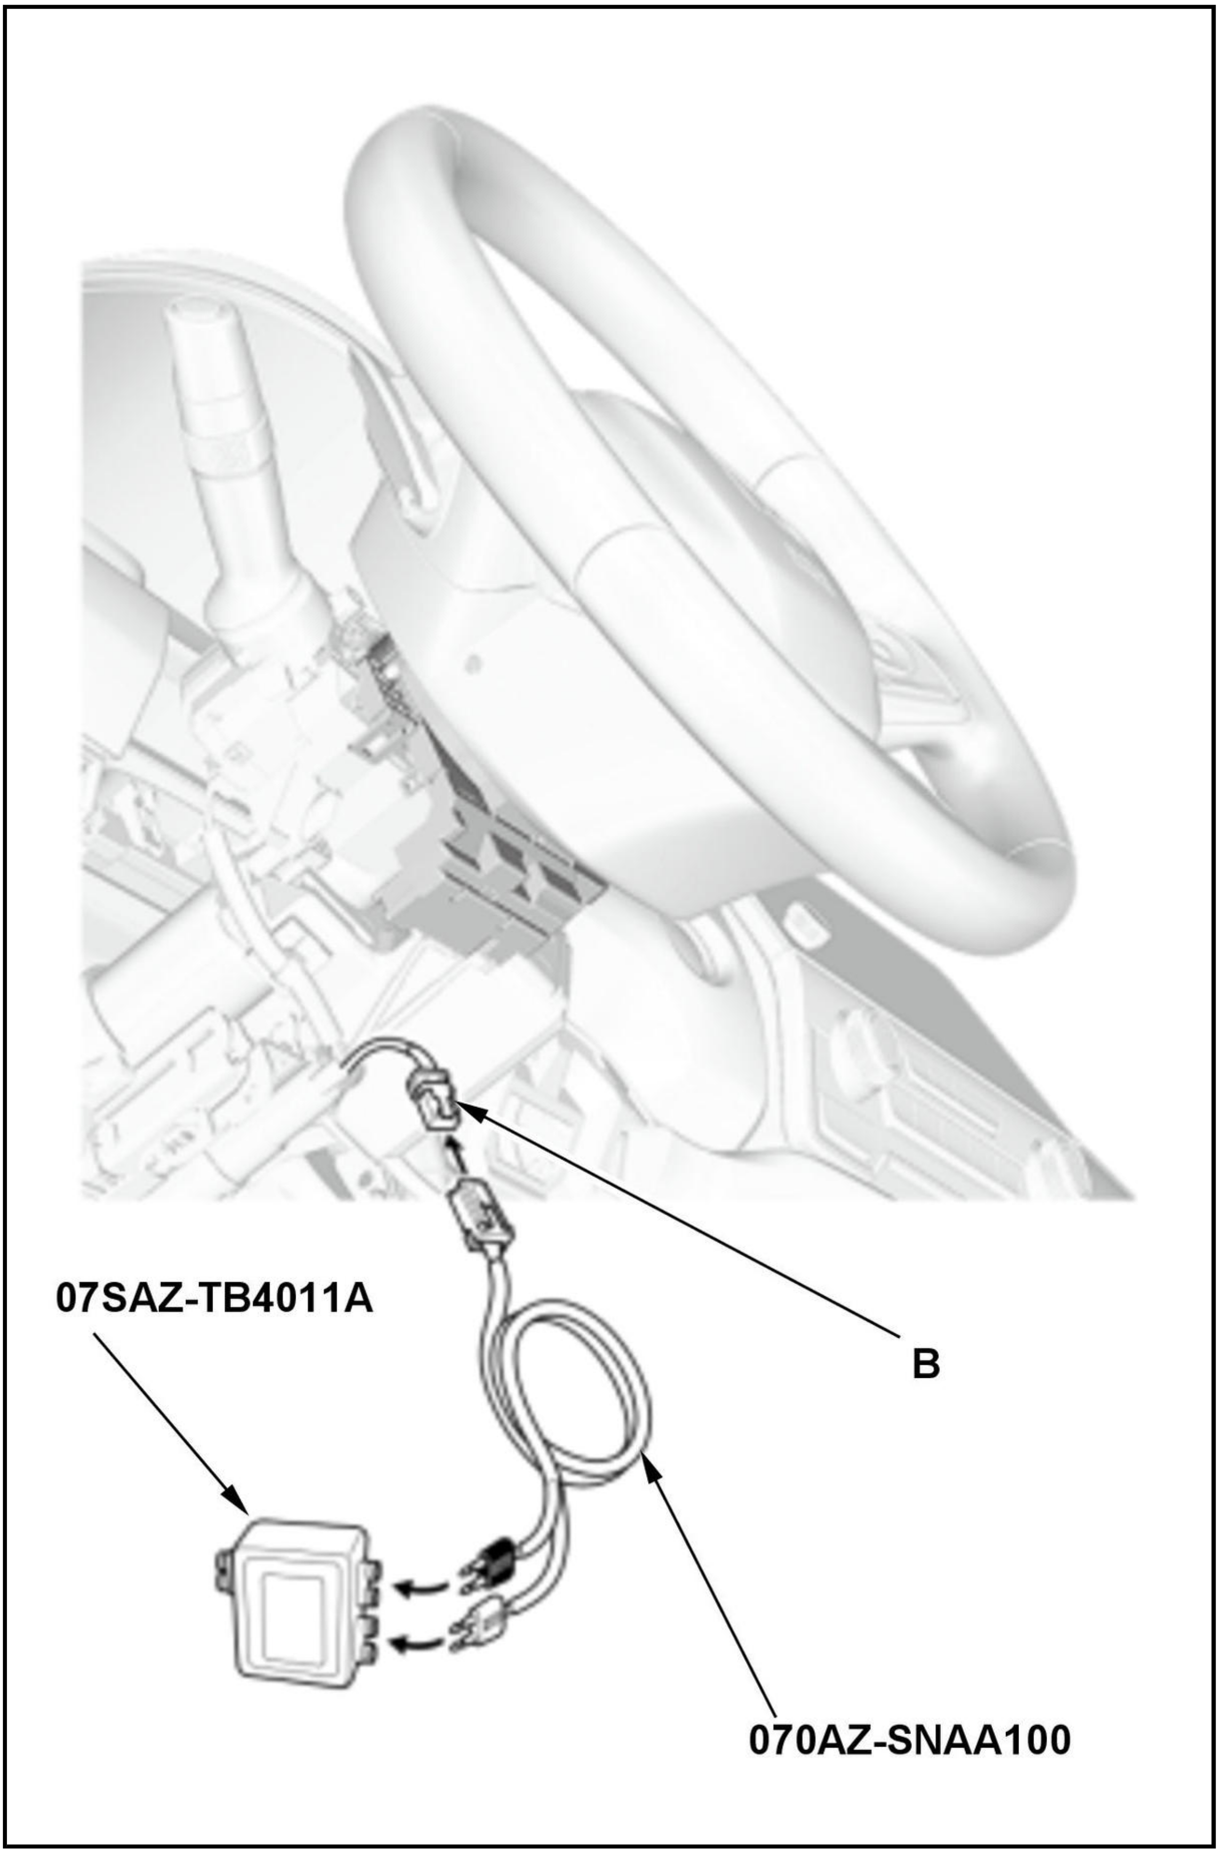
3. Cable reel check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the column covers** .

-4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0002-11 Short to ground in the driver's airbag second inflator	B

Is DTC B0002-11 indicated?

YES

Go to step 4.

NO

Short to ground in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA2+, LA2-lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

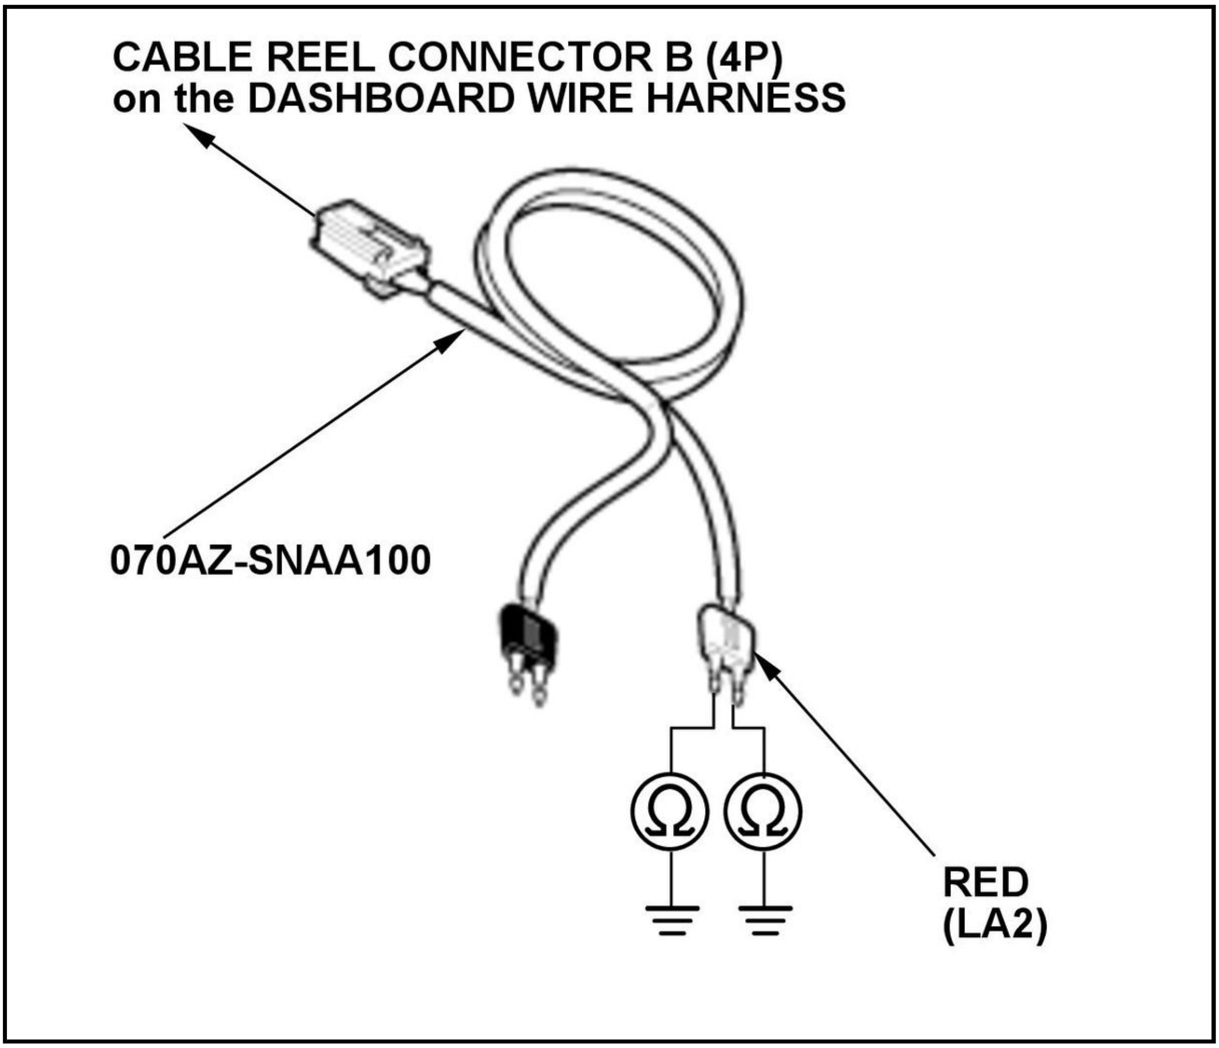
-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
Test point 1	SRS simulator lead J red terminal
Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The LA2+ and LA2-wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to ground in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0002-12 (KA/KC) (2019 2020 2021)

DTC B0002-12 : Short to Power in the Driver's Airbag Second Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0002-12 Short to power in the driver's airbag second inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0002-12 Short to power in the driver's airbag second inflator	B

   Is DTC B0002-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

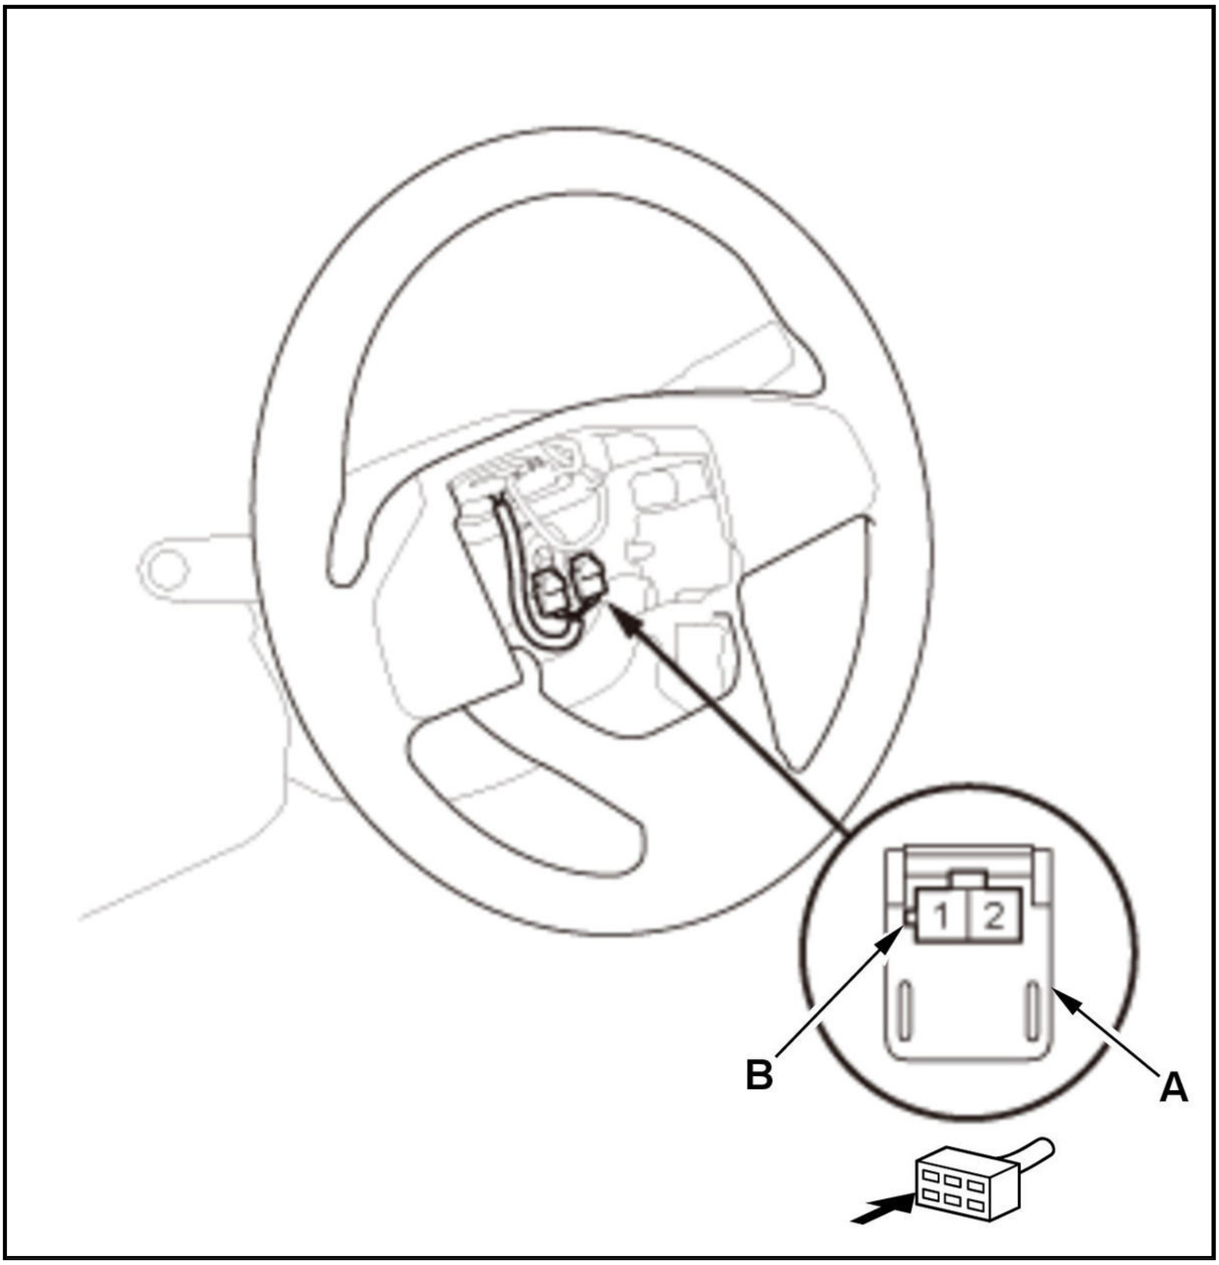
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

Driver's airbag second inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag second inflator 2P connector (A) that has a guide tab (B) on the left side of the No. 1 terminal as shown.



-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0002-12 Short to power in the driver's airbag second inflator	B

Is DTC B0002-12 indicated?

YES

Go to step 3.

NO

Short to power in the driver's airbag second inflator; **replace the driver's airbag** , then clear the DTC.

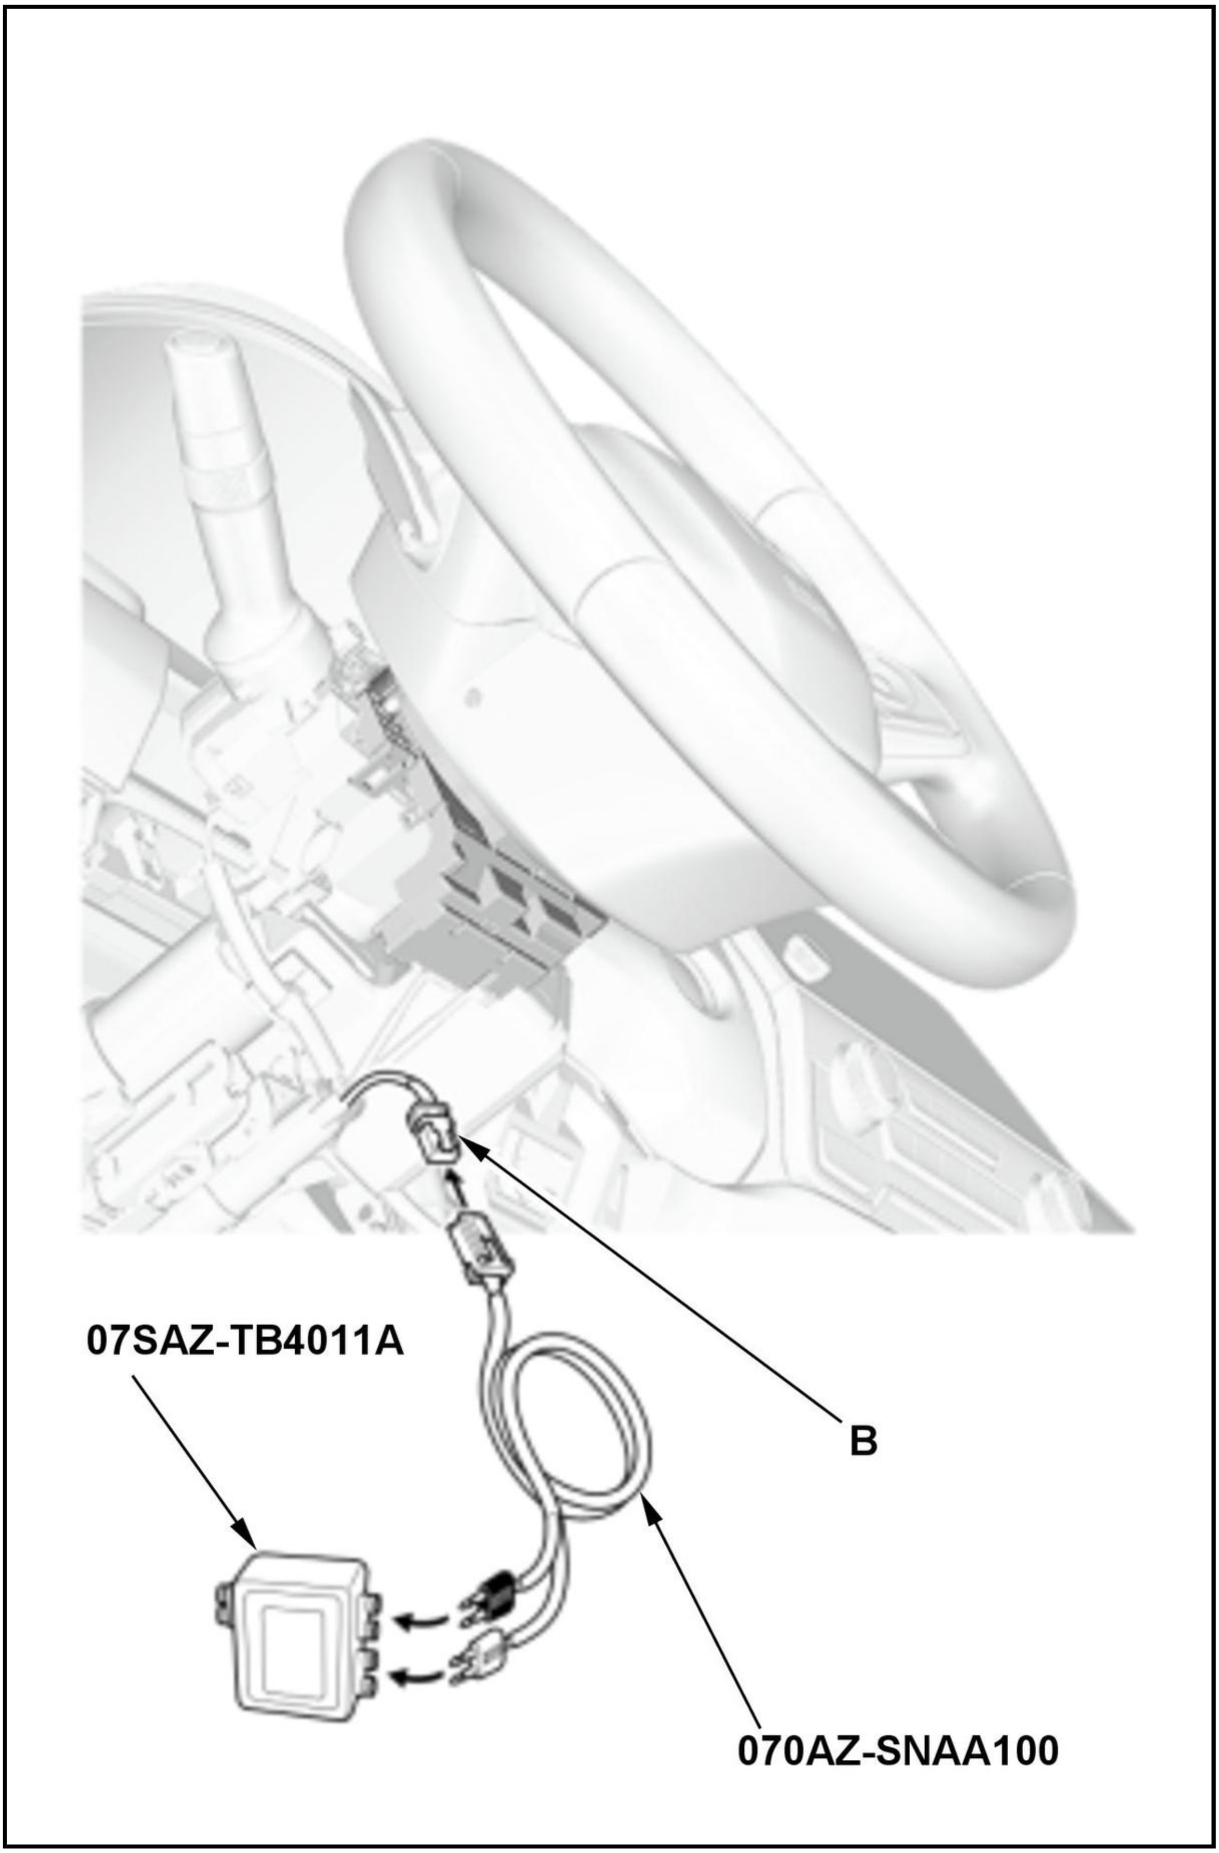
3. Cable reel check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the column covers** .

-4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0002-12 Short to power in the driver's airbag second inflator	B

Is DTC B0002-12 indicated?

YES

Go to step 4.

NO

Short to power in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA2+, LA2- lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector A (39P)

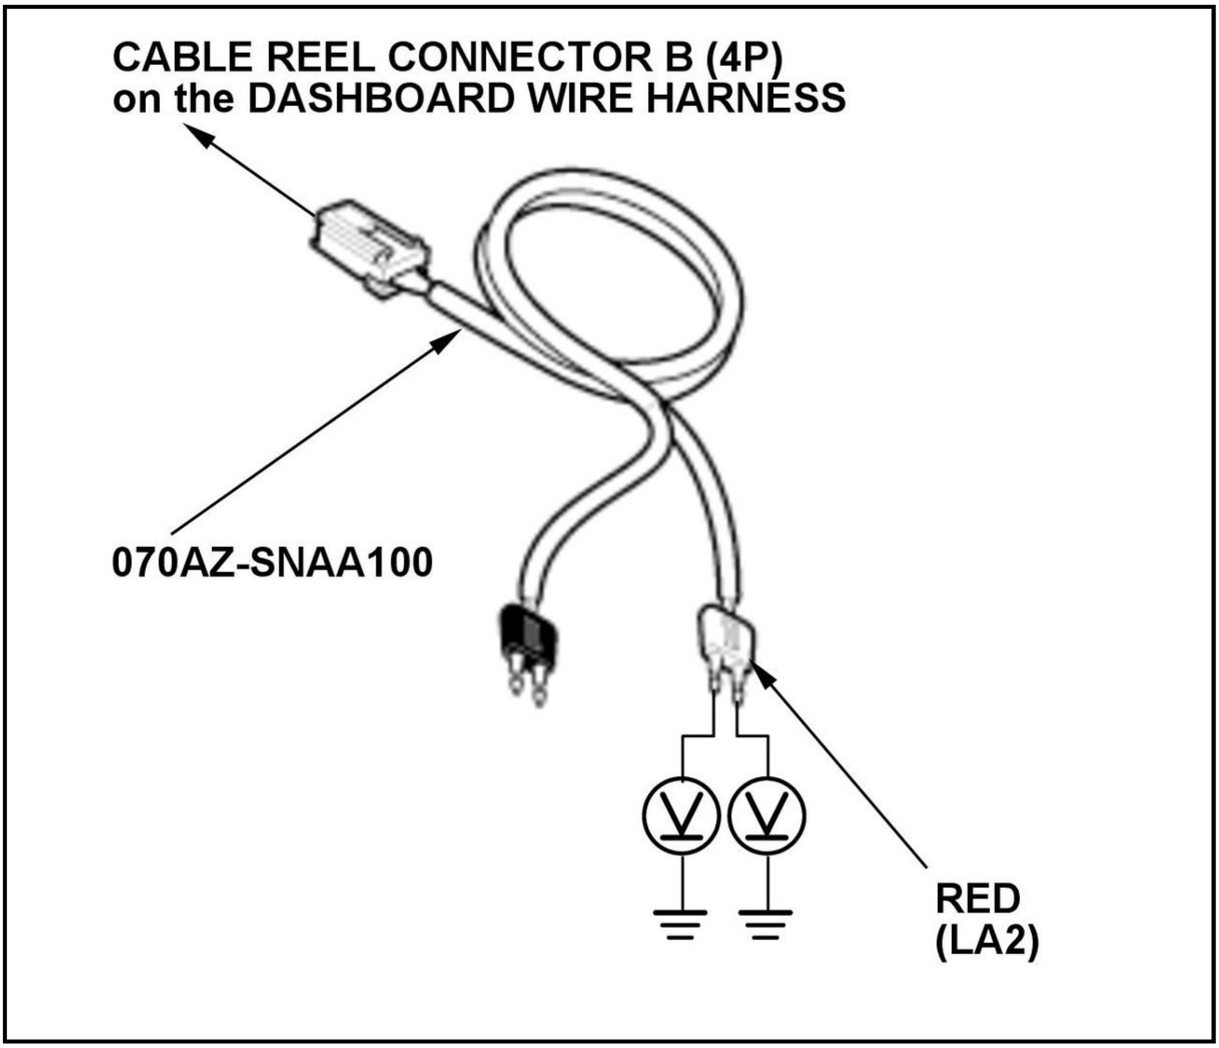
-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
Test point 1	SRS simulator lead J red terminal
Test point 2	Body ground



Is there 0.2 V or less?

YES

The LA2+ and LA2-wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to power in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0002-13 (KA/KC) (2019 2020 2021)

DTC B0002-13 : Open or Increased Resistance in the Driver's Airbag Second Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0002-13 Open or increased resistance in the driver's airbag second inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0002-13 Open or increased resistance in the driver's airbag second inflator	B

   Is DTC B0002-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

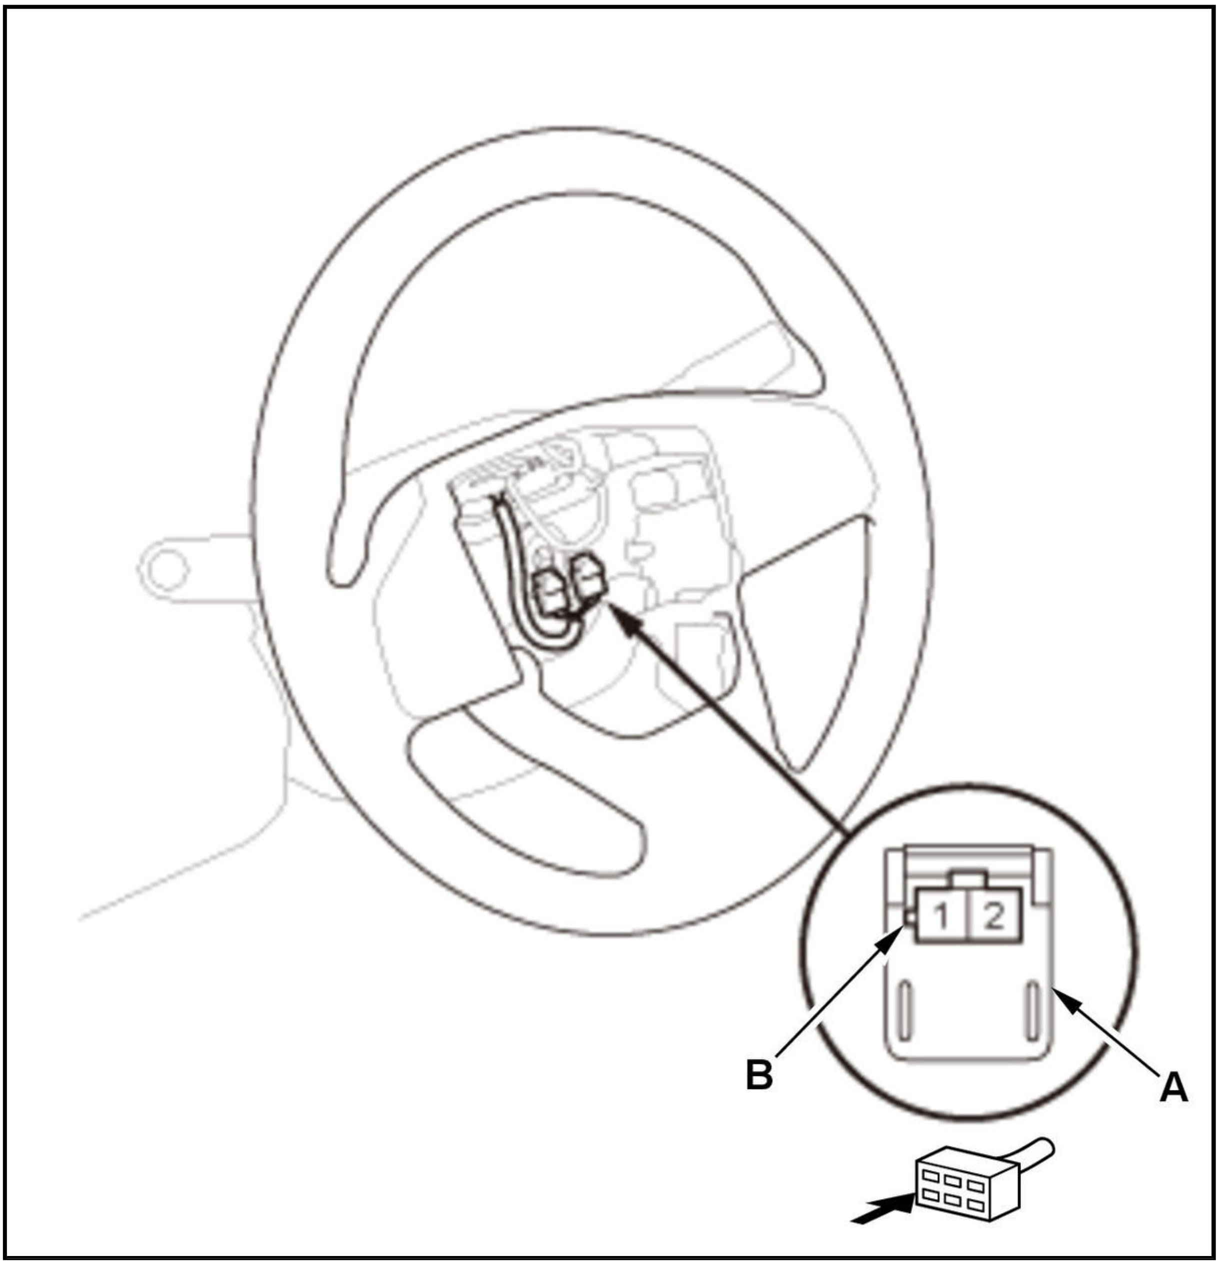
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

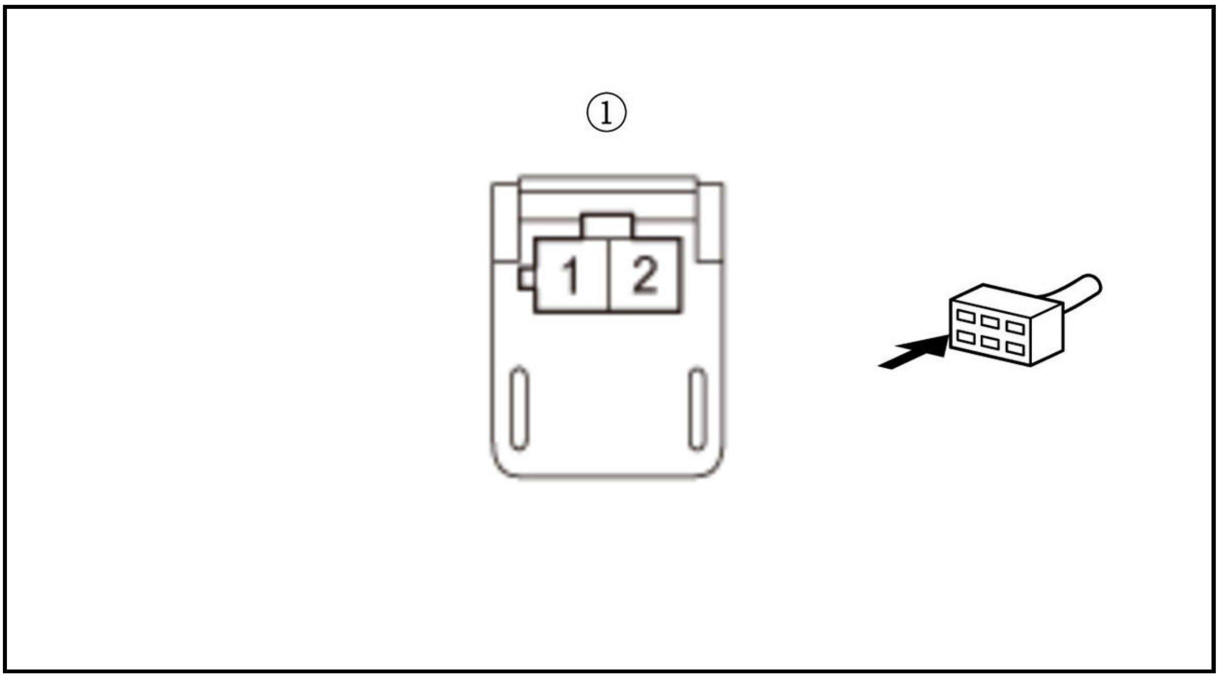
Driver's airbag second inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag second inflator 2P connector (A) that has a guide tab (B) on the left side of the No. 1 terminal as shown.



-5. Connect terminals A and B with a jumper wire.

Terminal A	Driver's airbag second inflator 2P connector (female terminals) No. 1 (on the cable reel harness): ①
Terminal B	Driver's airbag second inflator 2P connector (female terminals) No. 2 (on the cable reel harness): ①



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0002-13 Open or increased resistance in the driver's airbag second inflator	B

Is DTC B0002-13 indicated?

YES

Go to step 3.

NO

Open in the driver's airbag second inflator; **replace the driver's airbag** , then clear the DTC.

3. Cable reel check

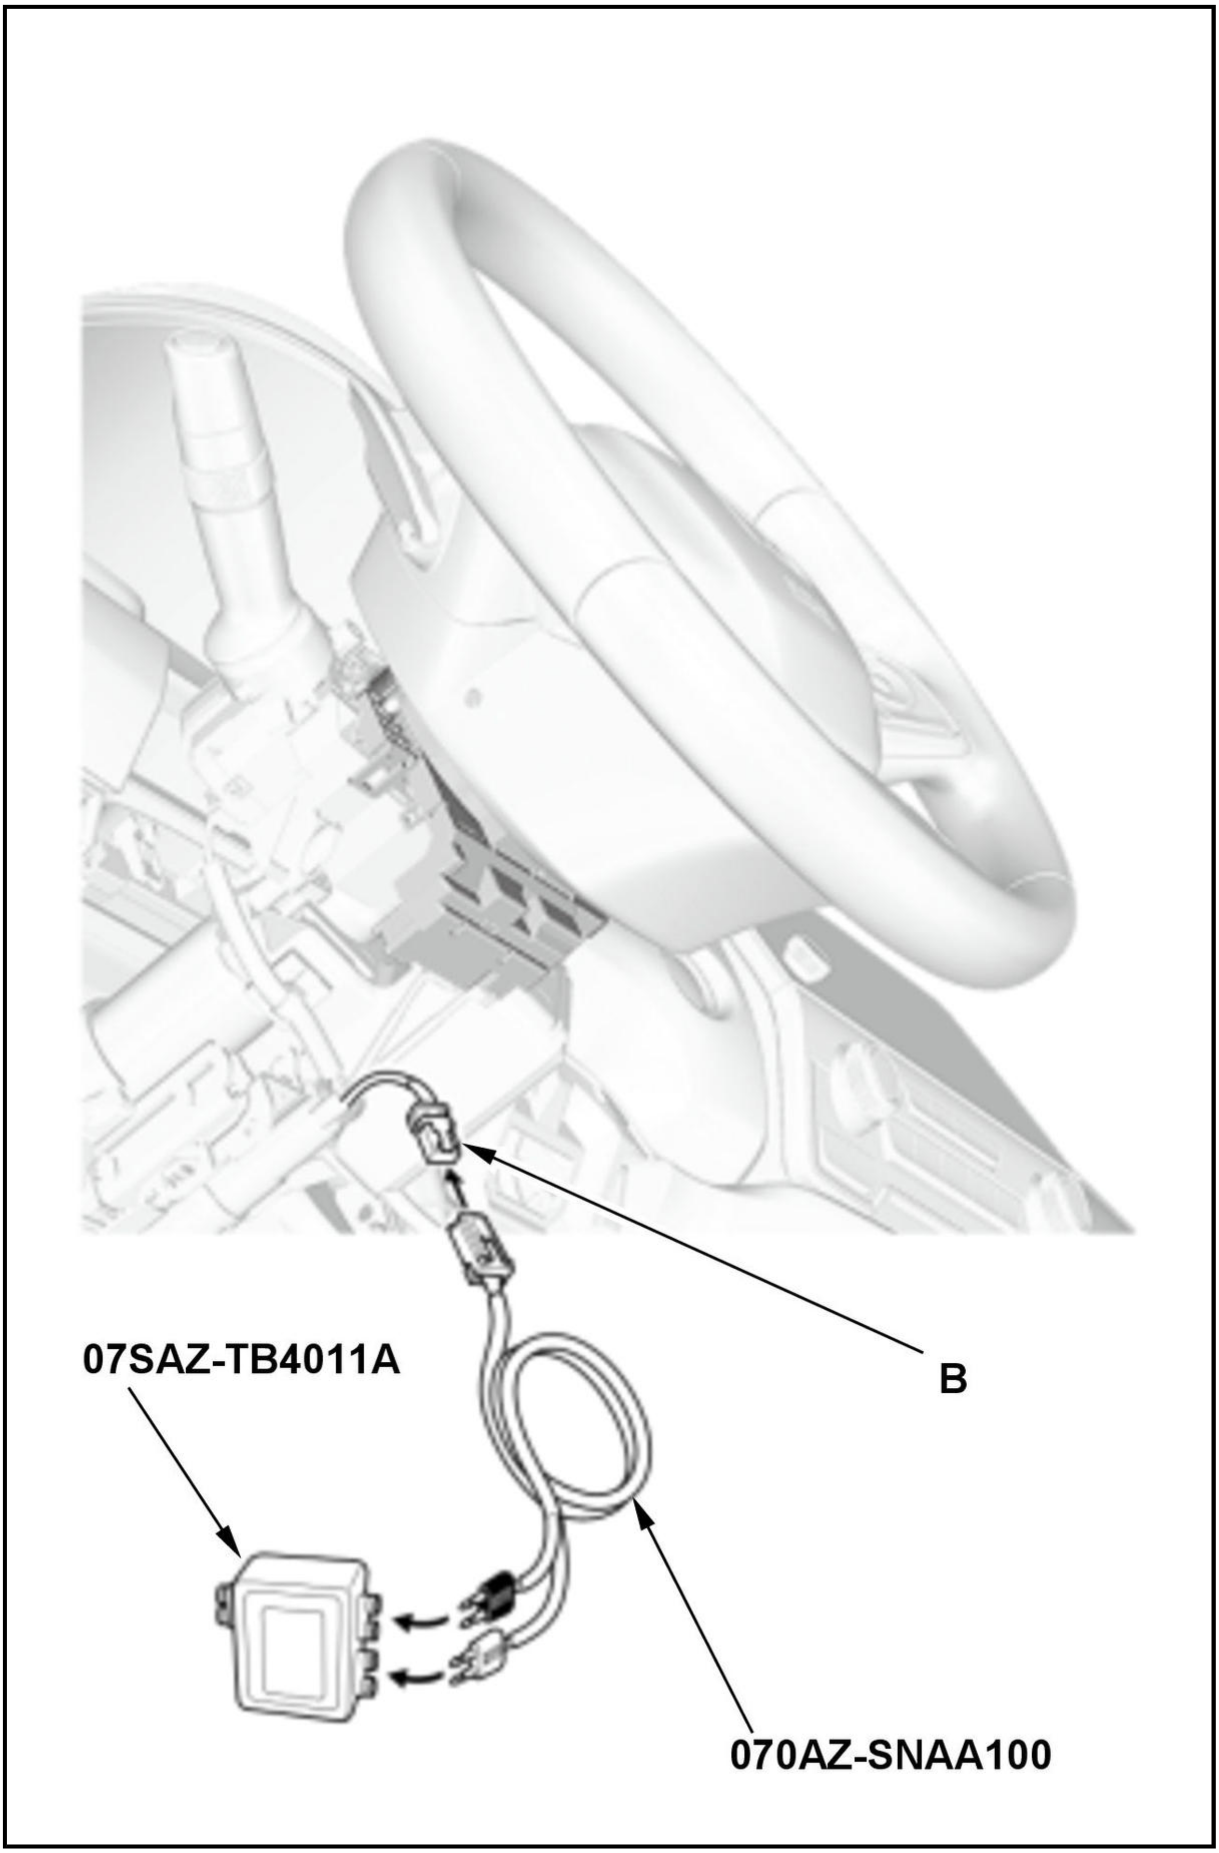
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the driver's airbag second inflator 2P connector on the cable reel harness.

-4. **Remove the column covers** .

-5. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-6. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-7. Reconnect the negative cable to the 12 volt battery.

-8. Clear the DTCs with the HDS.

-9. Turn the vehicle to the ON mode, then wait for 10 seconds.

-10.

Check for DTCs with the HDS.

DTC Description	DTC
B0002-13 Open or increased resistance in the driver's airbag second inflator	B

Is DTC B0002-13 indicated?

YES

Go to step 4.

NO

Open in the cable reel; **replace the cable reel** , then clear the DTC.

4. Open wire check (LA2+, LA2- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

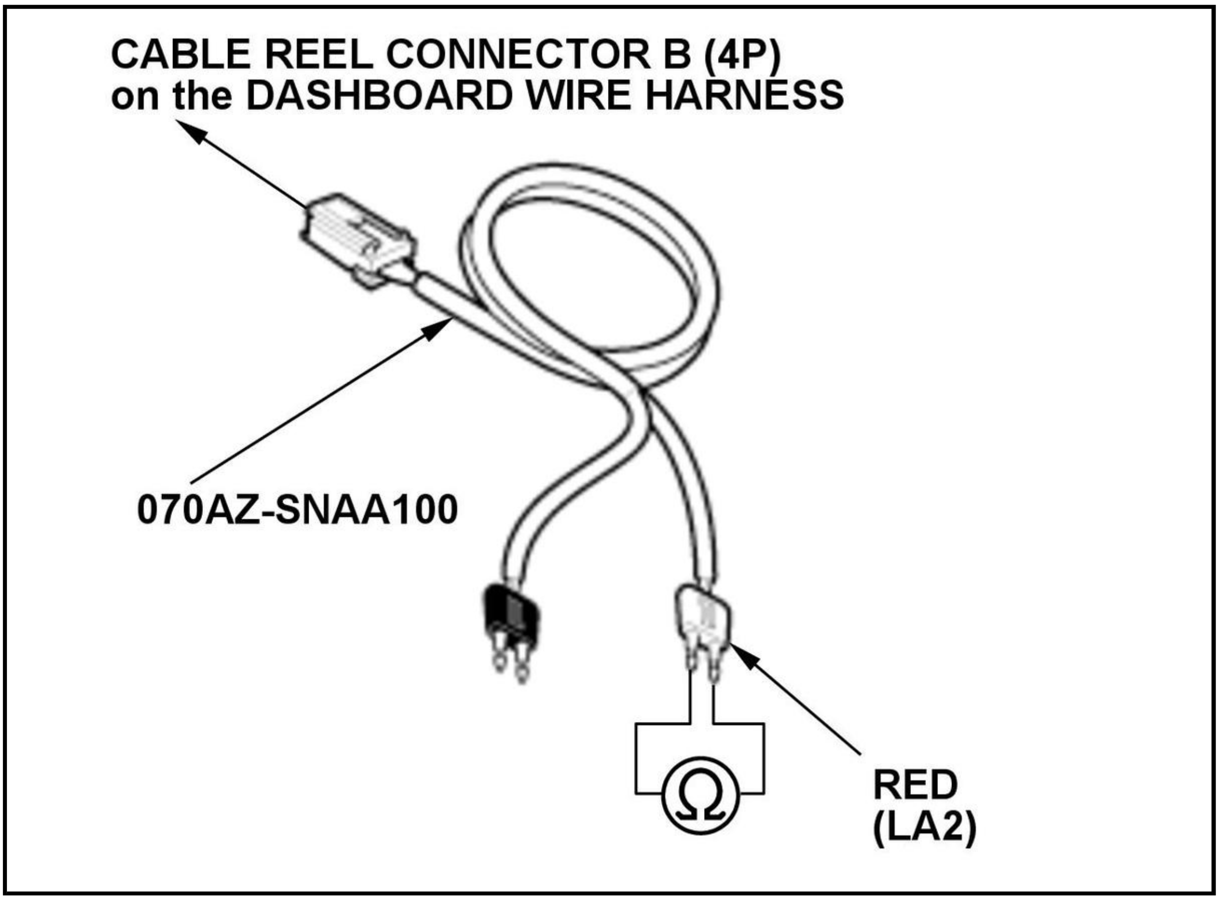
-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
Test point	SRS simulator lead J red terminal



Is there 1.0 Ω or less?

YES

The LA2+ and LA2-wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

NO

Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0002-1A (KA/KC) (2019 2020 2021)

DTC B0002-1A : Decreased Resistance in the Driver's Airbag Second Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead J 070AZ-SNAA100

-SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0002-1A Decreased resistance in the driver's airbag second inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0002-1A Decreased resistance in the driver's airbag second inflator	B

   Is DTC B0002-1A indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

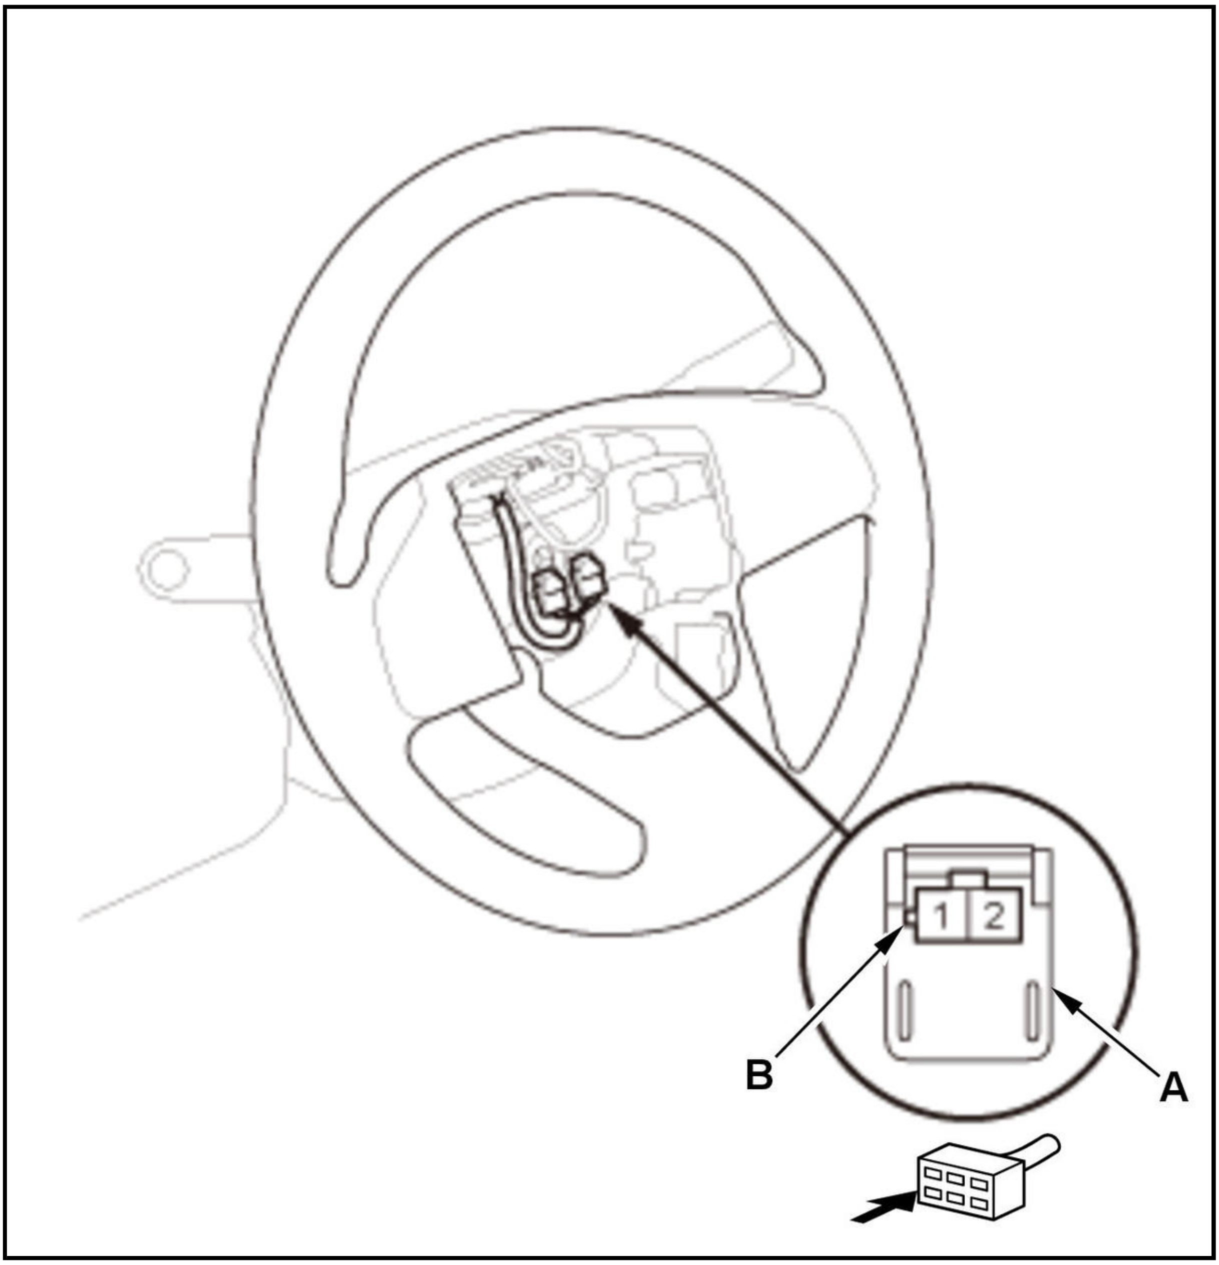
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

Driver's airbag second inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag second inflator 2P connector (A) that has a guide tab (B) on the left side of the No. 1 terminal as shown.



-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0002-1A Decreased resistance in the driver's airbag second inflator	B

Is DTC B0002-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the driver's airbag second inflator; **replace the driver's airbag** , then clear the DTC.

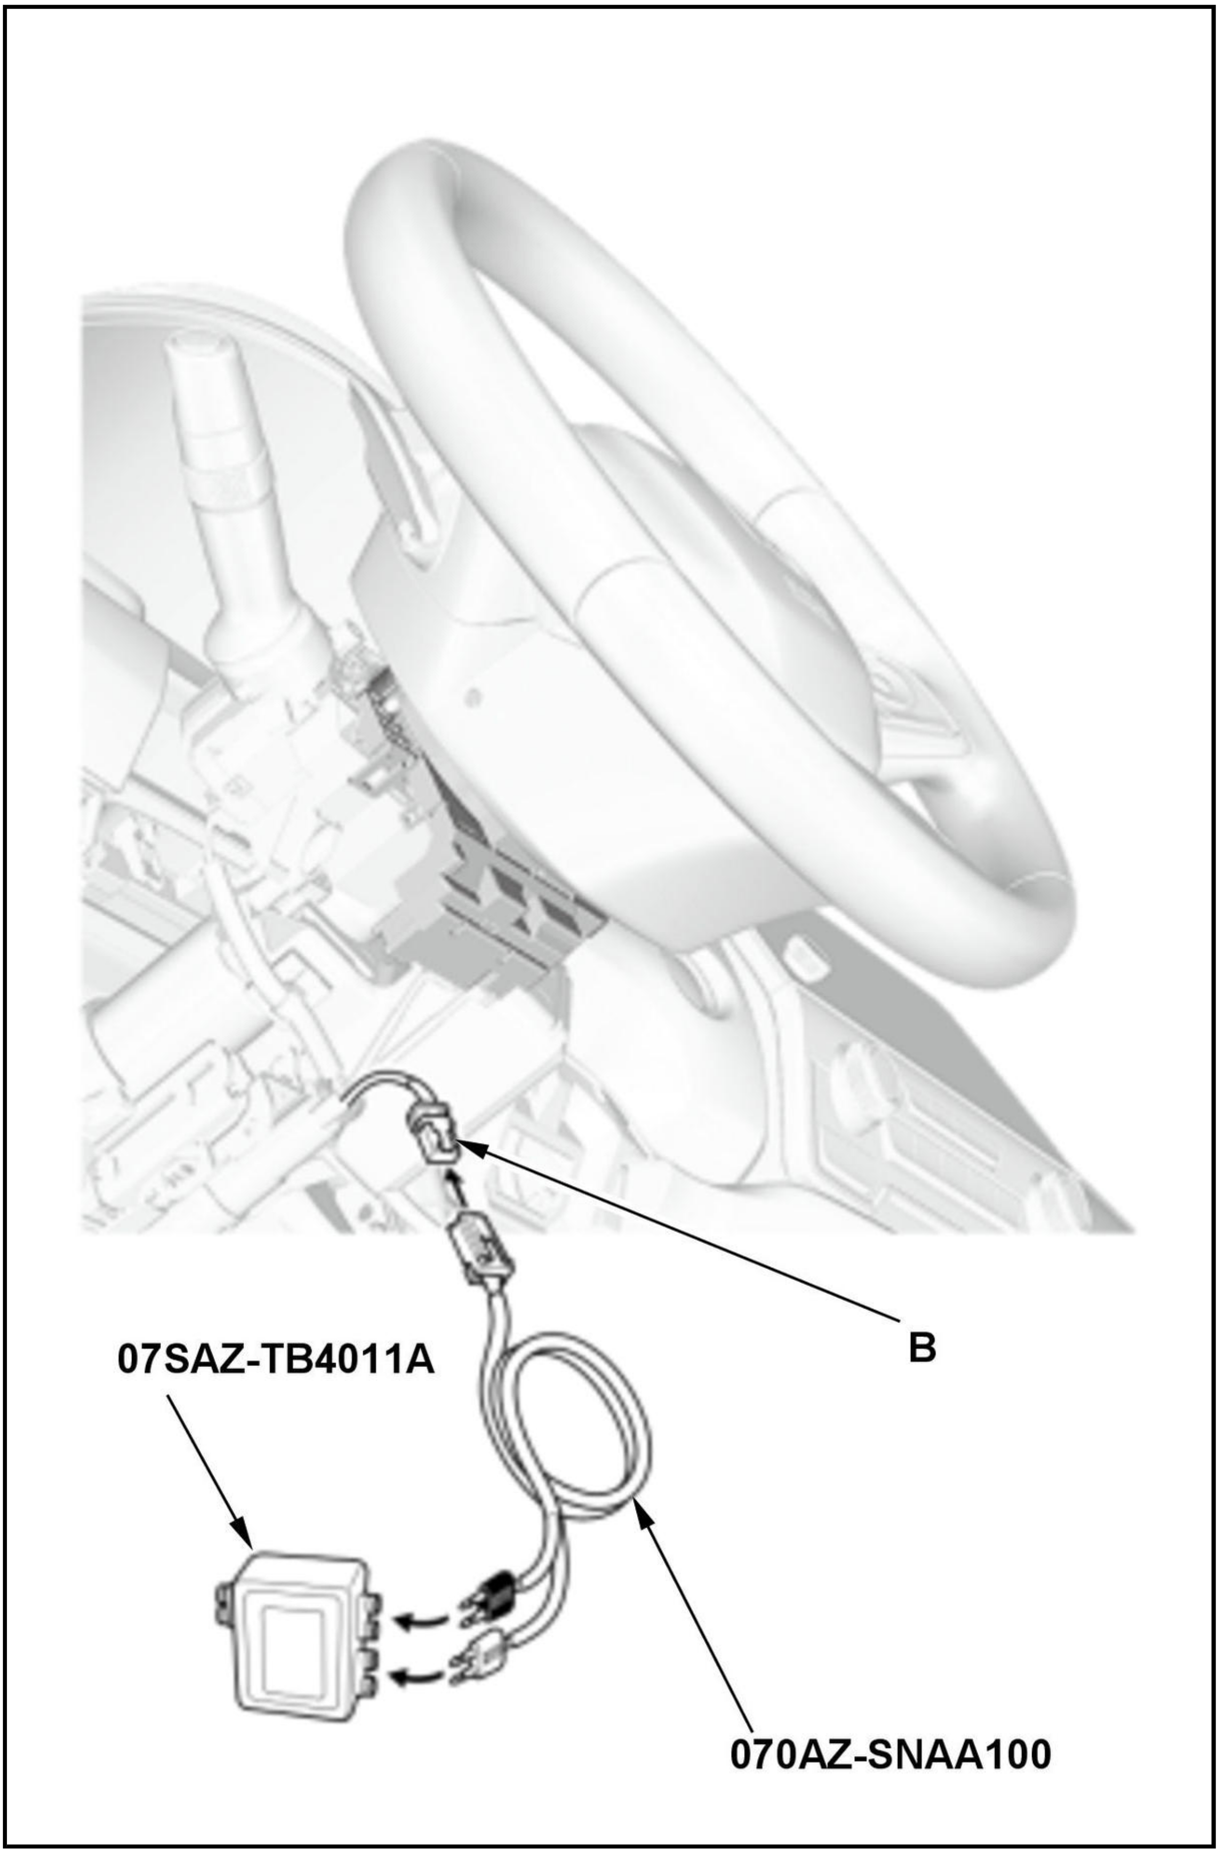
3. Cable reel check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the column covers** .

-4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0002-1A Decreased resistance in the driver's airbag second inflator	B

Is DTC B0002-1A indicated?

YES

Go to step 4.

NO

Short to another wire in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA2+ line to LA2- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

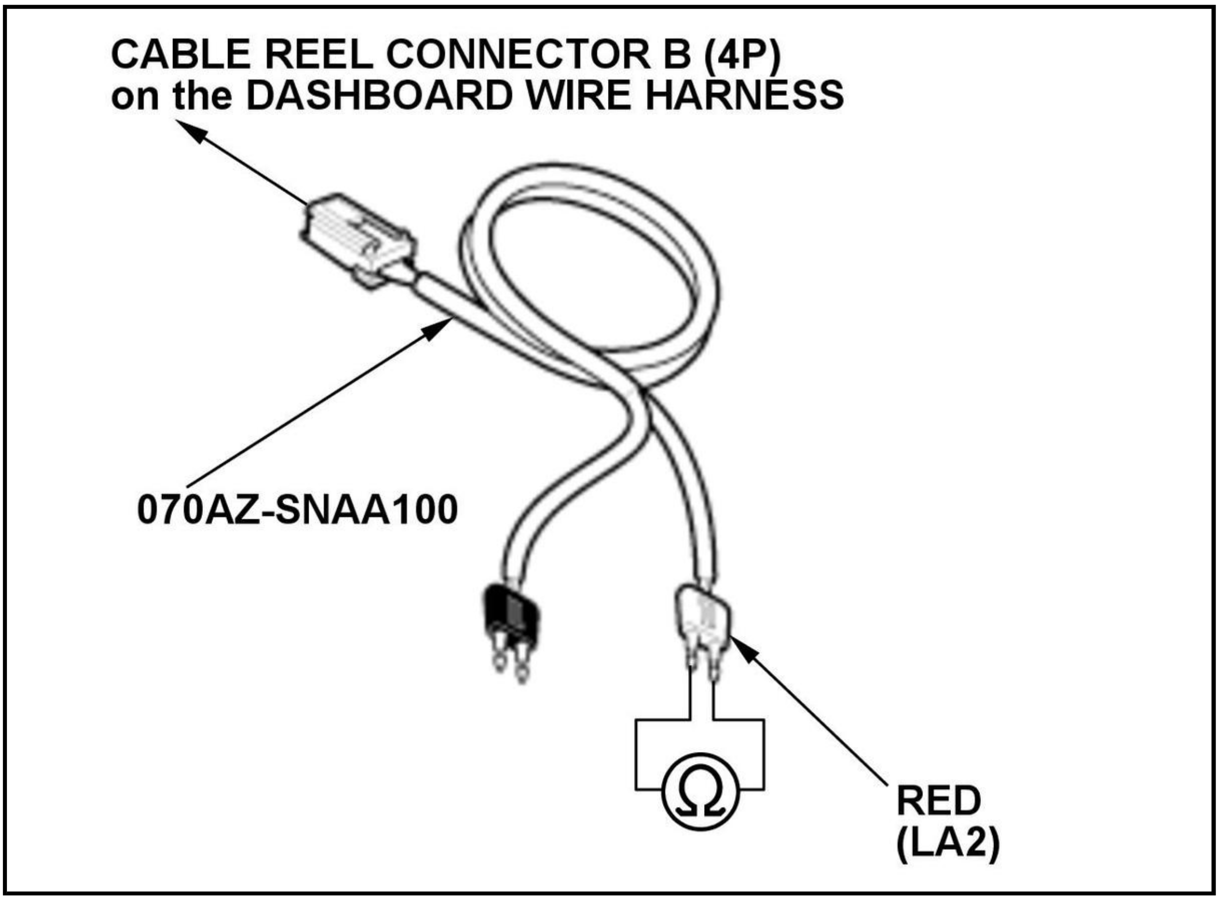
SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. **Connect the SRS short canceller to SRS unit connector A (39P) terminals No. 10 and No. 11** .

-6. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
	SRS unit connector A (39P) No. 10 and No. 11: connected to SRS short canceller
Test point	SRS simulator lead J red terminal



Is there an open circuit, or at least 1 MΩ?

YES

The LA2+ and LA2-wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to another wire in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0002-2B (KA/KC) (2019 2020 2021)

DTC B0002-2B : Short to Another Wire Harness in the Driver's Airbag Second Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0002-2B Short to another wire harness in the driver's airbag second inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0002-2B Short to another wire harness in the driver's airbag second inflator	B

Is DTC B0002-2B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the left side airbag inflator	B
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the right side airbag inflator	B
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B

DTC Description	DTC
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0001-2B, B0010-2B, B0011-2B, B0020-2B, B0021-2B, B0028-2B, B0029-2B, B0070-2B, B0072-2B, B0079-2B, B007A-2B or B0082-2B indicated with DTC B0002-2B?

YES

Go to step 3.

NO

Go to step 4.

3. Shorted wire check (LA2 lines to another line)

-1. Turn the vehicle to the OFF (LOCK) mode.

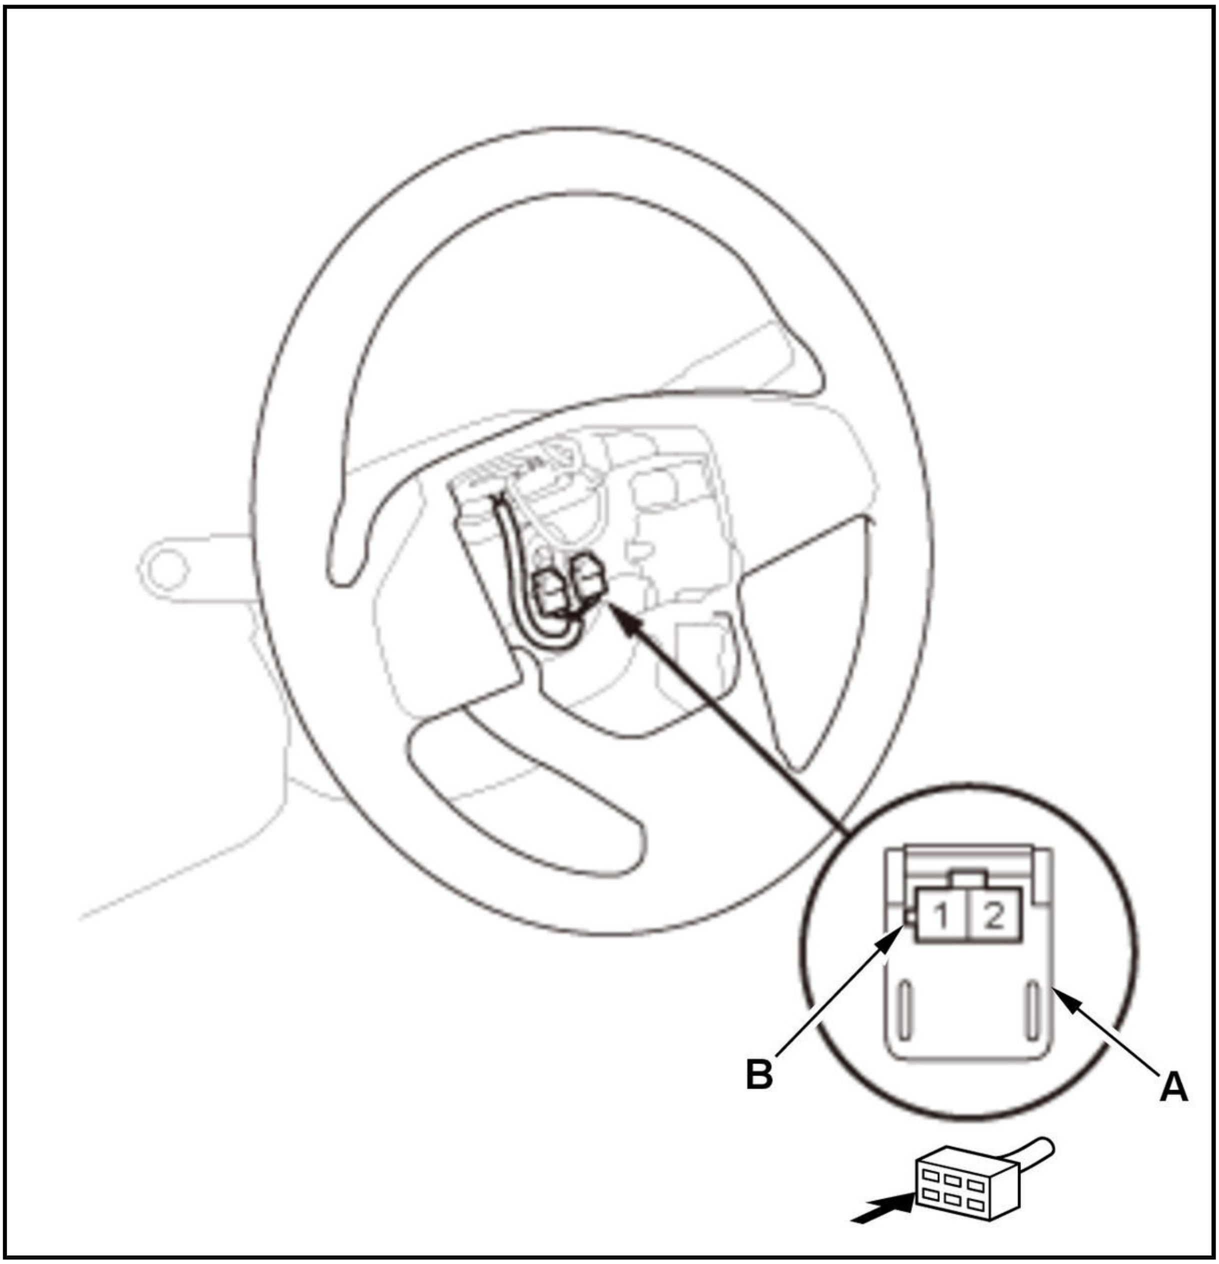
-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the driver's airbag** .

-4. Disconnect the following connectors.

SRS unit connector A (39P)
SRS unit connector B (39P)
Driver's airbag second inflator 2P connector (on the cable reel harness)
Inflator connectors which are assigned to 2B codes listed on HDS

NOTE: Make sure to work with the driver's airbag second inflator 2P connector (A) that has a guide tab (B) on the left side of the No. 1 terminal as shown.



-5. Check for continuity between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode SRS unit connector A (39P): disconnected SRS unit connector B (39P): disconnected Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

DTC	Test point 1	Test point 2

	SRS unit connector A (39P) No. 11	SRS unit connector A (39P) No. 3

Is there continuity?

YES

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

NO

The LA2 wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

4. Shorted wire check (LA1+ line to LA2+ line, LA1- line to LA2- line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the driver's airbag** .

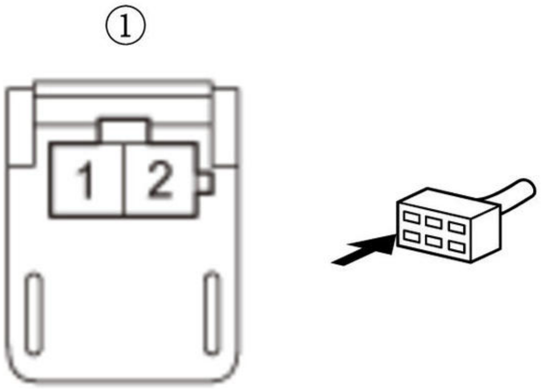
-4. Disconnect the following connector.

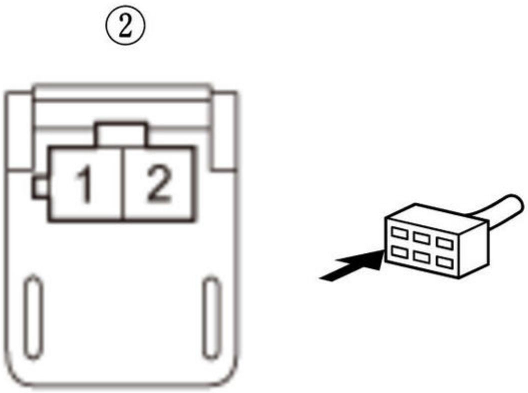
Driver's airbag first inflator 2P connector (on the cable reel harness)
Driver's airbag second inflator 2P connector (on the cable reel harness)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
Test point 1	Driver's airbag first inflator 2P connector No. 2 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 2 (on the cable reel harness) ②

Test point 1	Driver's airbag first inflator 2P connector No. 1 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 1 (on the cable reel harness) ②





Is there continuity?

YES

Go to step 5.

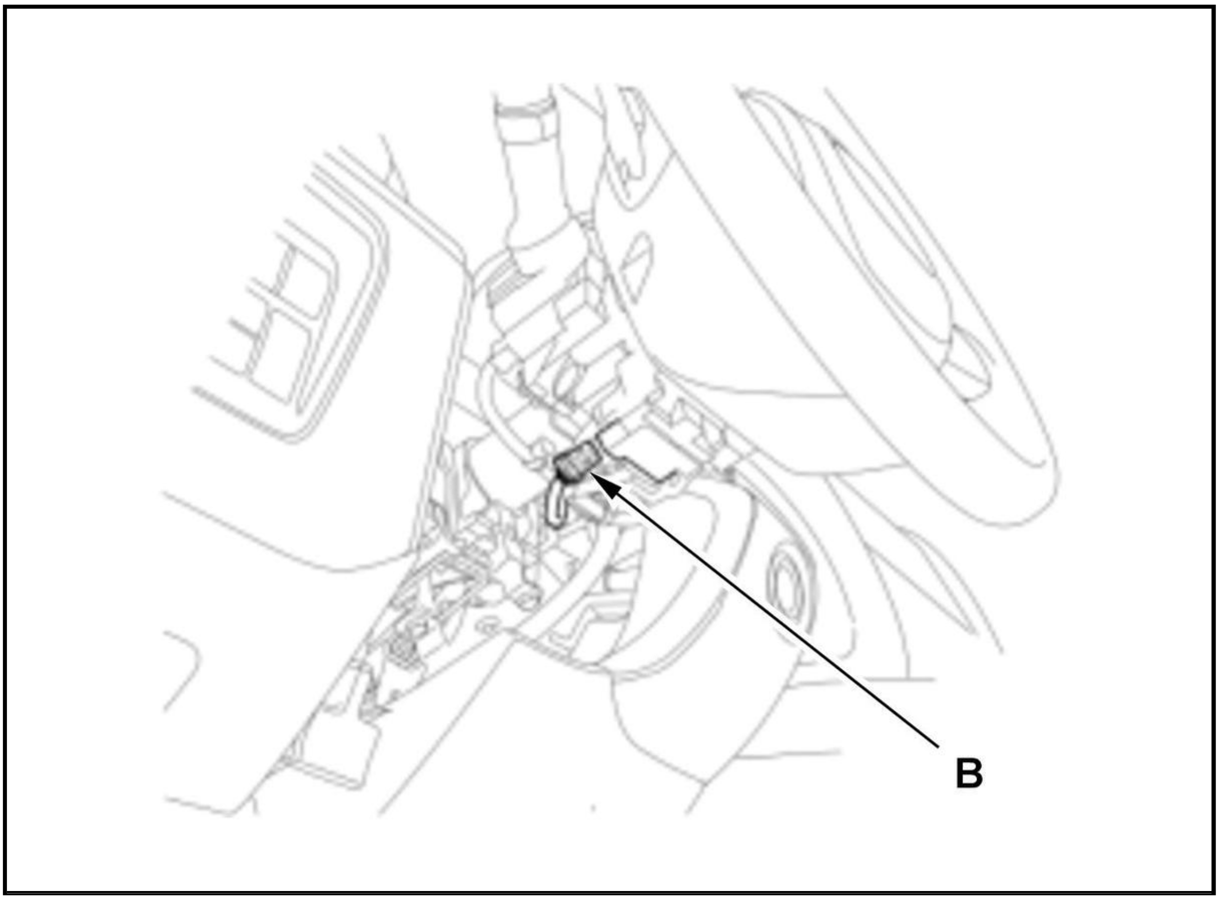
NO

The LA1+, LA1-, LA2+, and LA2- wires are OK. Faulty driver's airbag second inflator; **replace the driver's airbag** , then clear the DTC.

5. Shorted wire check (LA1+ line to LA2+ line, LA1- line to LA2- line) 2

-1. **Remove the column covers** .

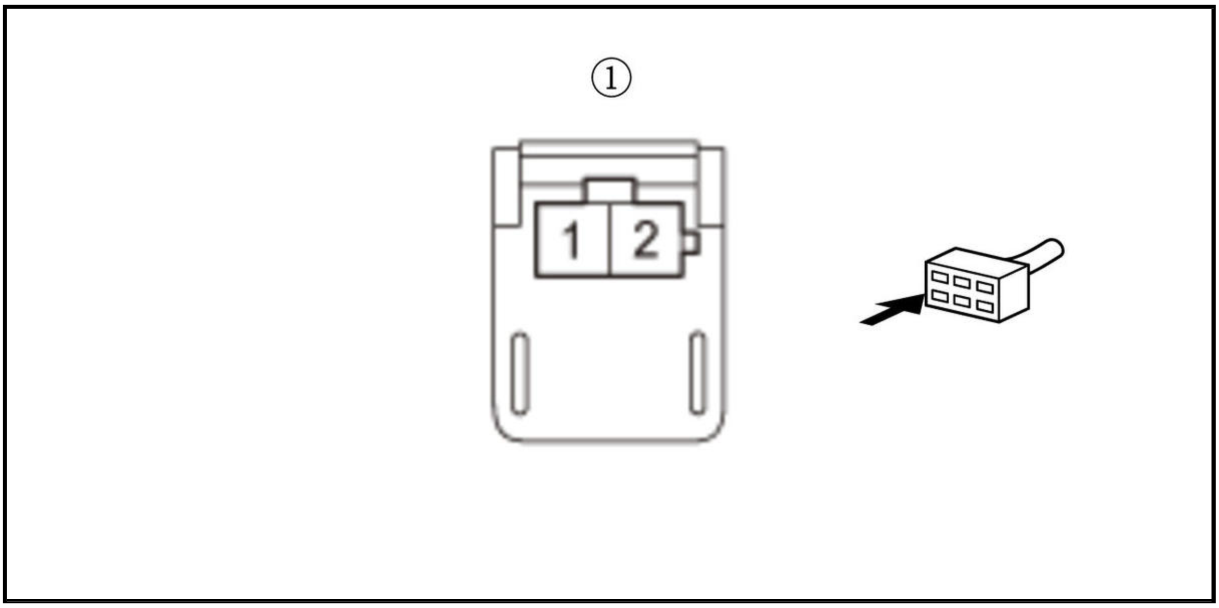
-2. Disconnect cable reel connector B (4P) on the dashboard wire harness.

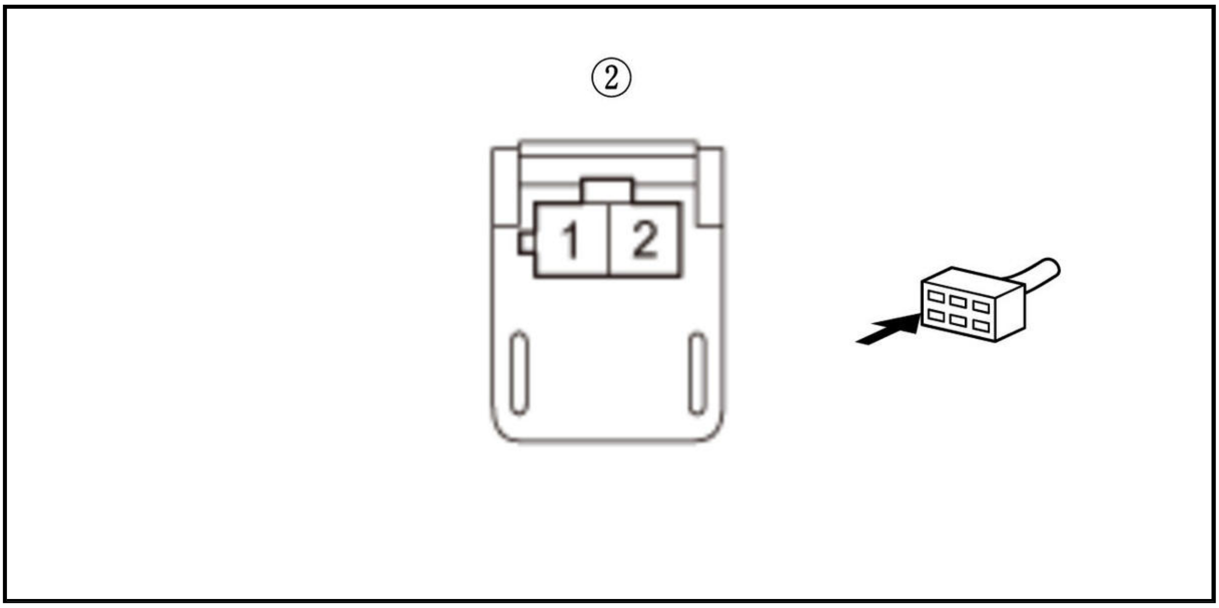


-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
Test point 1	Driver's airbag first inflator 2P connector No. 2 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 2 (on the cable reel harness) ②

Test point 1	Driver's airbag first inflator 2P connector No. 1 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 1 (on the cable reel harness) ②





Is there continuity?

YES

Short to another wire in the cable reel; replace the cable reel , then clear the DTC.

NO

Go to step 6.

6. Shorted wire check (LA1+ line to LA2+ line, LA1- line to LA2- line) 3

-1. Disconnect the following connectors.

SRS unit connector A (39P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected

Test point 1	**SRS unit connector A (39P) No. 9**
Test point 2	**SRS unit connector A (39P) No. 10**

Test point 1	**SRS unit connector A (39P) No. 8**
Test point 2	**SRS unit connector A (39P) No. 11**

Is there continuity?

YES

Short to another wire in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

NO

The LA1+, LA1-, LA2+, and LA2- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

DTC B0010-11, B0011-11 (KA/KC)

DTC B0010-11 : Short to Ground in the Front Passenger's Airbag First Inflator

DTC B0011-11 : Short to Ground in the Front Passenger's Airbag Second Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0010-11 Short to ground in the front passenger's airbag first inflator	B
B0011-11 Short to ground in the front passenger's airbag second inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0010-11 Short to ground in the front passenger's airbag first inflator	B

DTC Description	DTC
B0011-11 Short to ground in the front passenger's airbag second inflator	B

Is DTC B0010-11 or B0011-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

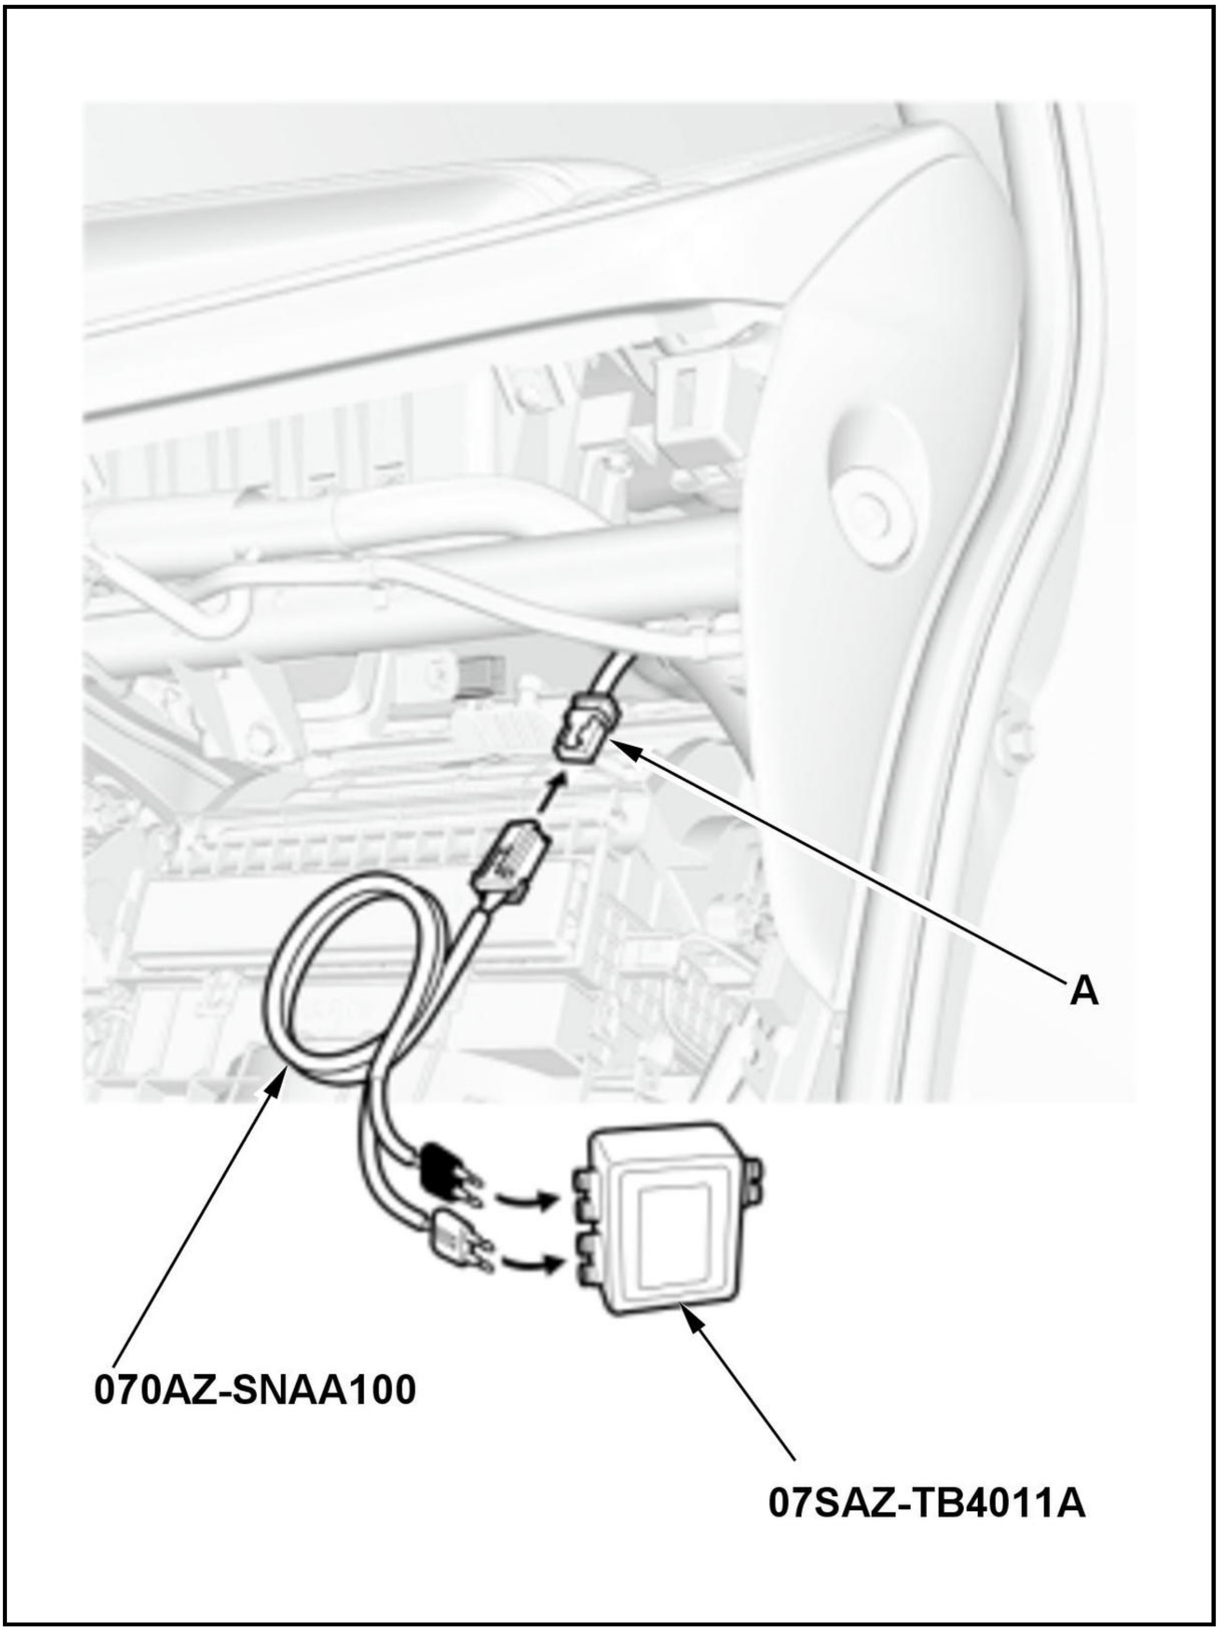
2. Front passenger's airbag inflator check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the glove box** .

-4. Disconnect the front passenger's airbag inflator 4P connector (A) on the dashboard wire harness.



-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to the front passenger's airbag inflator 4P connector on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0010-11 Short to ground in the front passenger's airbag first inflator	B
B0011-11 Short to ground in the front passenger's airbag second inflator	B

Is DTC B0010-11 or B0011-11 indicated?

YES

Go to step 3.

NO

Short to ground in the front passenger's airbag first or second inflator; **replace the front passenger's airbag** , then clear the DTC.

3. Shorted wire check (RA1+, RA1-, RA2+, RA2- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from the front passenger's airbag inflator 4P connector on the dashboard wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's airbag inflator 4P connector (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Front passenger's airbag inflator 4P connector (on the dashboard wire harness): connected to SRS simulator lead J
Test point 1	SRS simulator lead J black terminal
Test point 2	Body ground

Test point 1	SRS simulator lead J red terminal
Test point 2	Body ground

070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the driver's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0020-11 Short to ground in the driver's side airbag inflator	B

Is DTC B0020-11 indicated?

YES

Go to step 3.

NO

Short to ground in the driver's side airbag inflator; **replace the driver's side airbag** , then clear the DTC.

3. Shorted wire check (LSA+, LSA- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

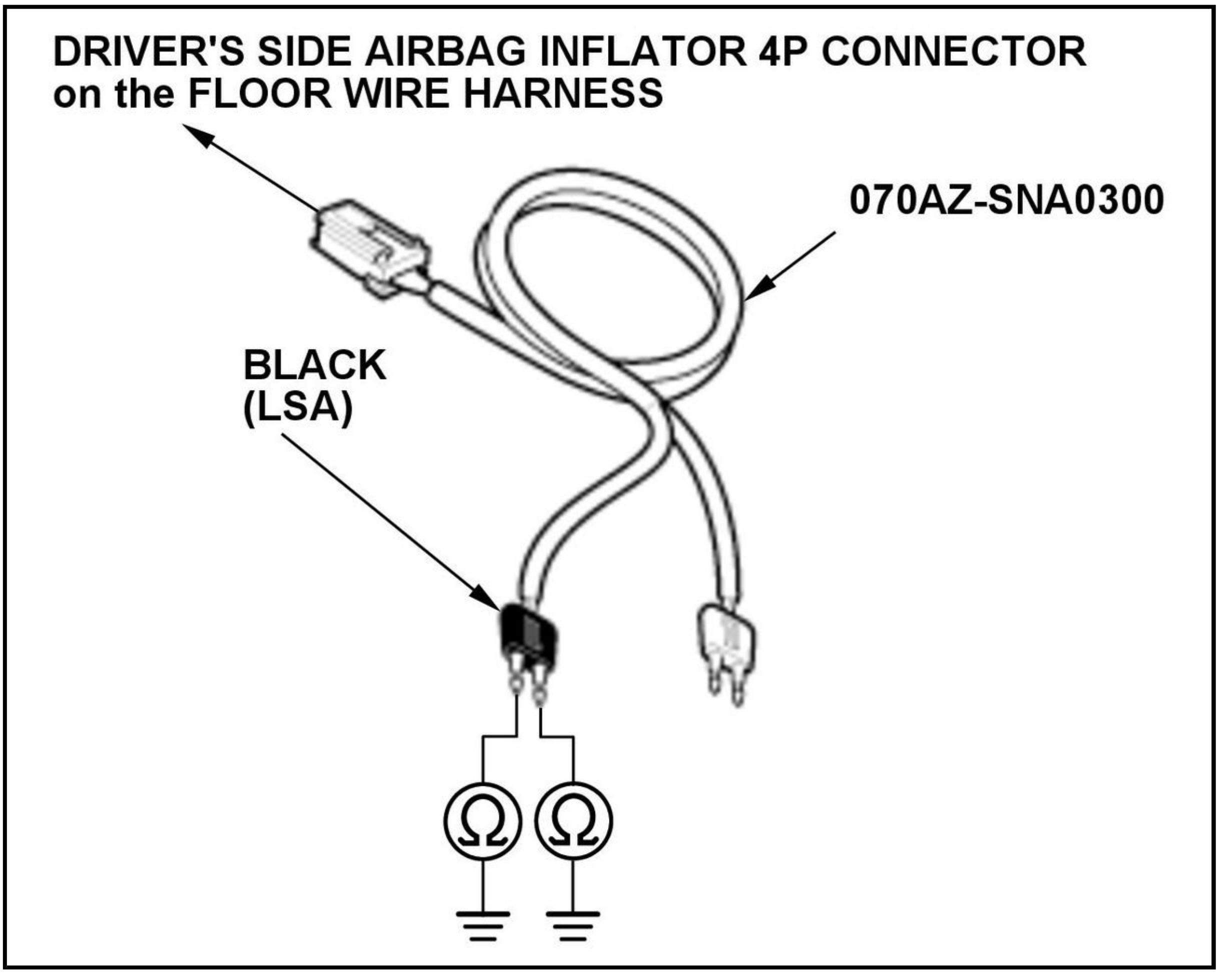
-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the driver's side airbag inflator 2P connector on the floor wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Driver's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
Test point 1	SRS simulator lead L black terminal
Test point 2	Body ground



DRIVER'S SIDE AIRBAG INFLATOR 4P CONNECTOR on the FLOOR WIRE HARNESS
070AZ-SNA0300
BLACK (LSA)
Ω
Ω

Is there an open circuit, or at least 1 MΩ?

YES

The LSA+ and LSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the floor wire harness.

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0020-12

DTC B0020-12 : Short to Power in the Driver's Side Airbag Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead L 070AZ-SNA0300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0020-12 Short to power in the driver's side airbag inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0020-12 Short to power in the driver's side airbag inflator	B

   Is DTC B0020-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

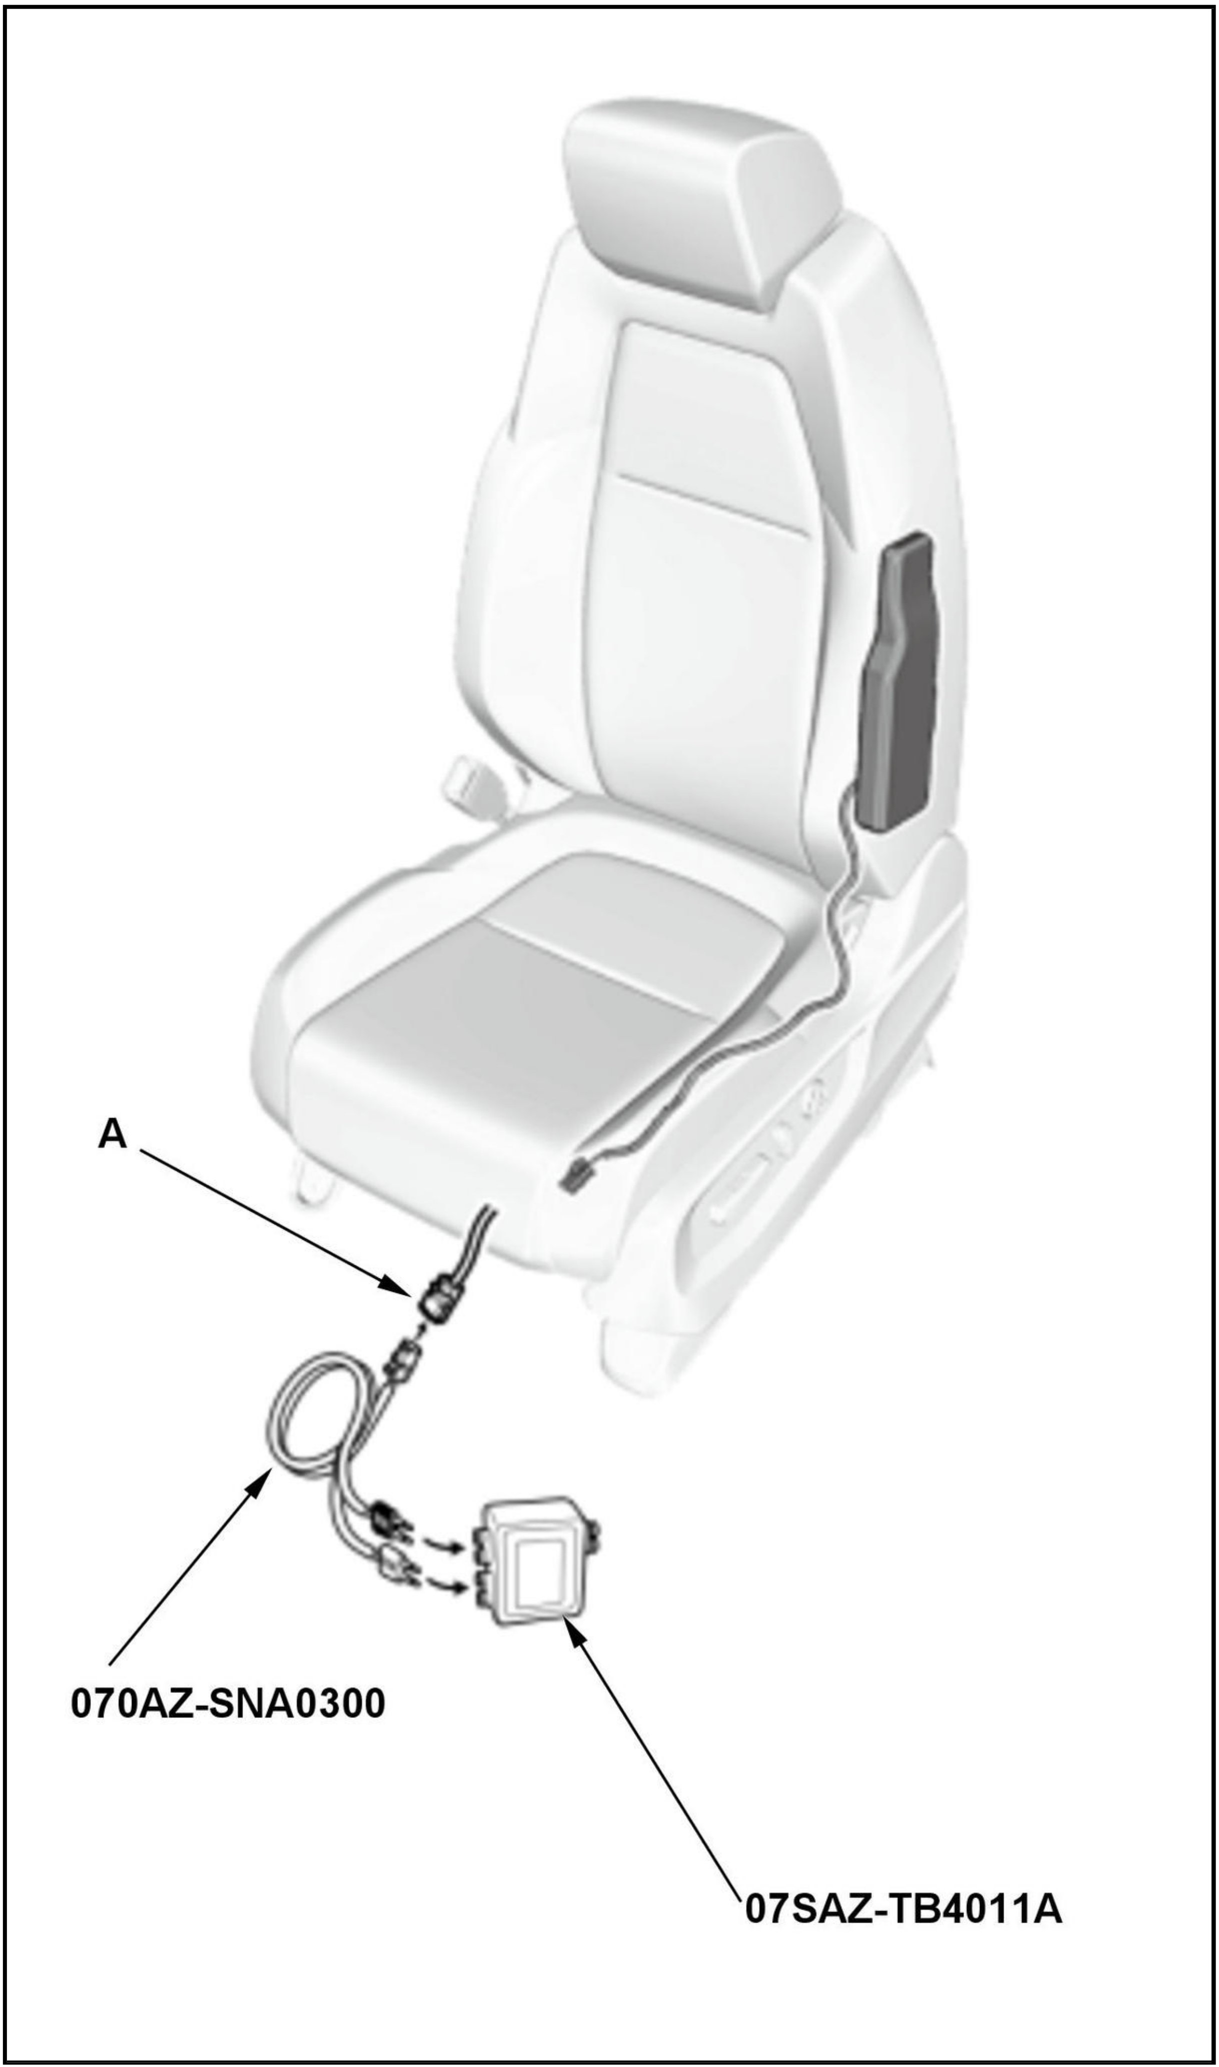
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's side airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the driver's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the driver's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0020-12 Short to power in the driver's side airbag inflator	B

Is DTC B0020-12 indicated?

YES

Go to step 3.

NO

Short to power in the driver's side airbag inflator; **replace the driver's side airbag** , then clear the DTC.

3. Shorted wire check (LSA+, LSA- lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

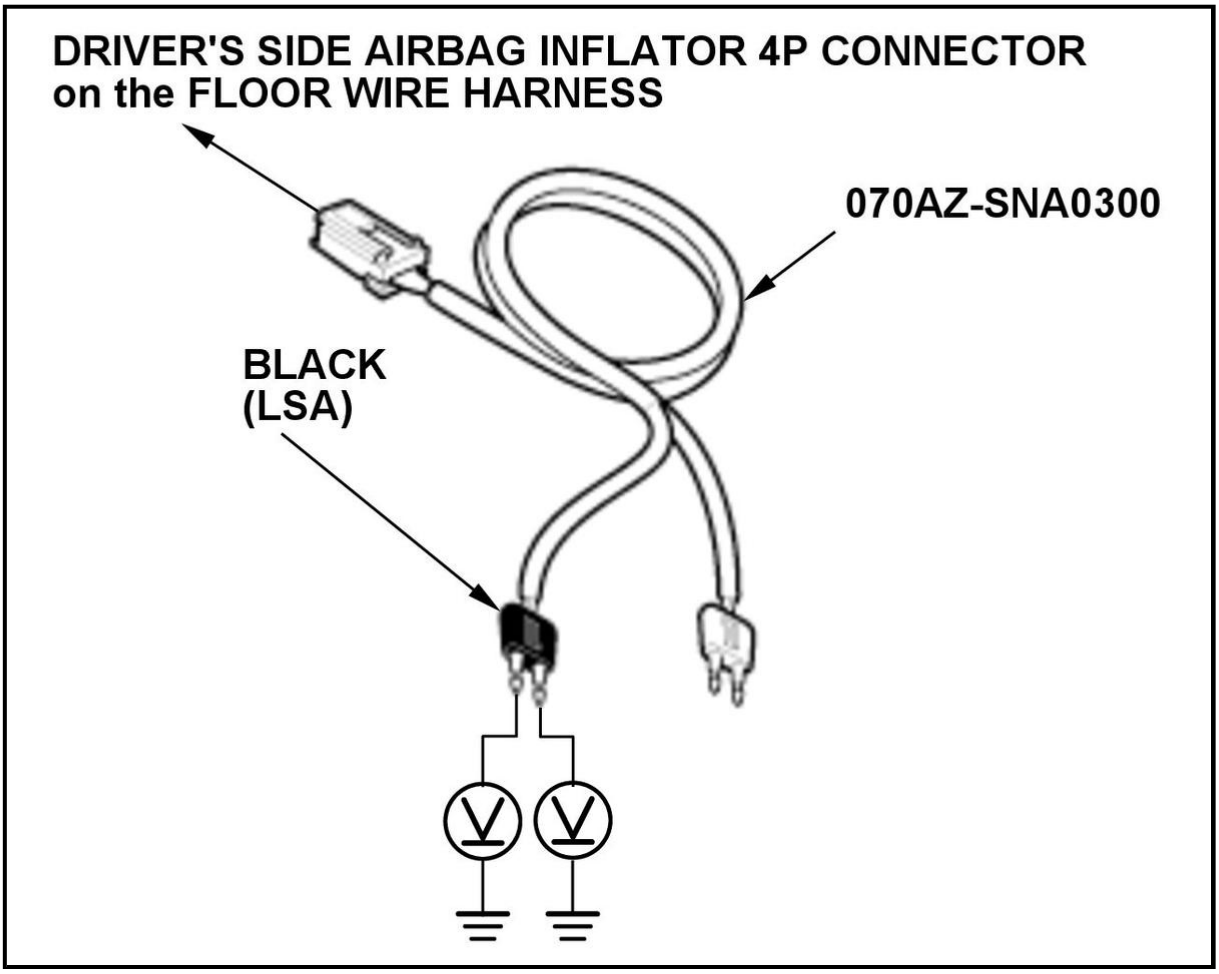
-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the driver's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Driver's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Driver's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
Test point 1	SRS simulator lead L black terminal
Test point 2	Body ground



DRIVER'S SIDE AIRBAG INFLATOR 4P CONNECTOR on the FLOOR WIRE HARNESS
070AZ-SNA0300
BLACK (LSA)

Is there 0.2 V or less?

YES

The LSA+ and LSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the floor wire harness.

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0020-13

DTC B0020-13 : Open or Increased Resistance in the Driver's Side Airbag Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead L 070AZ-SNA0300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and 12 Volt Battery Terminal Disconnection and Reconnection .

DTC Description	DTC
B0020-13 Open or increased resistance in the driver's side airbag inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0020-13 Open or increased resistance in the driver's side airbag inflator	B

   Is DTC B0020-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

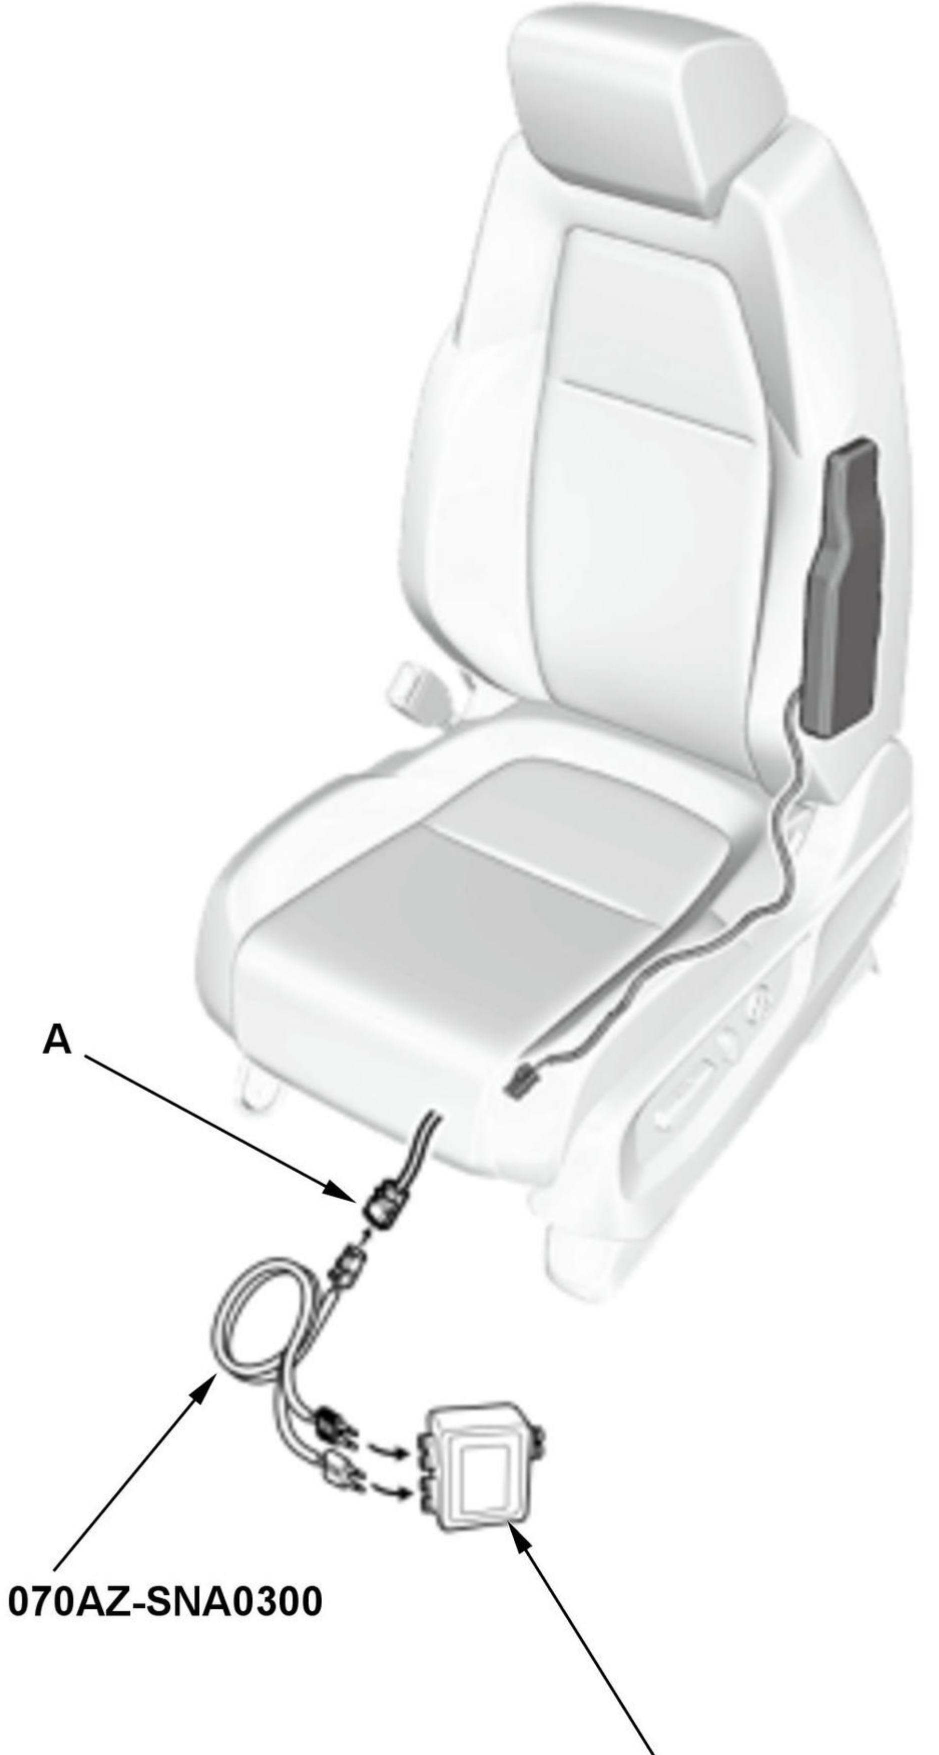
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's side airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the driver's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the driver's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0020-13 Open or increased resistance in the driver's side airbag inflator	B

Is DTC B0020-13 indicated?

YES

Go to step 3.

NO

Open in the driver's side airbag inflator; **replace the driver's side airbag** , then clear the DTC.

3. Open wire check (LSA+, LSA- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

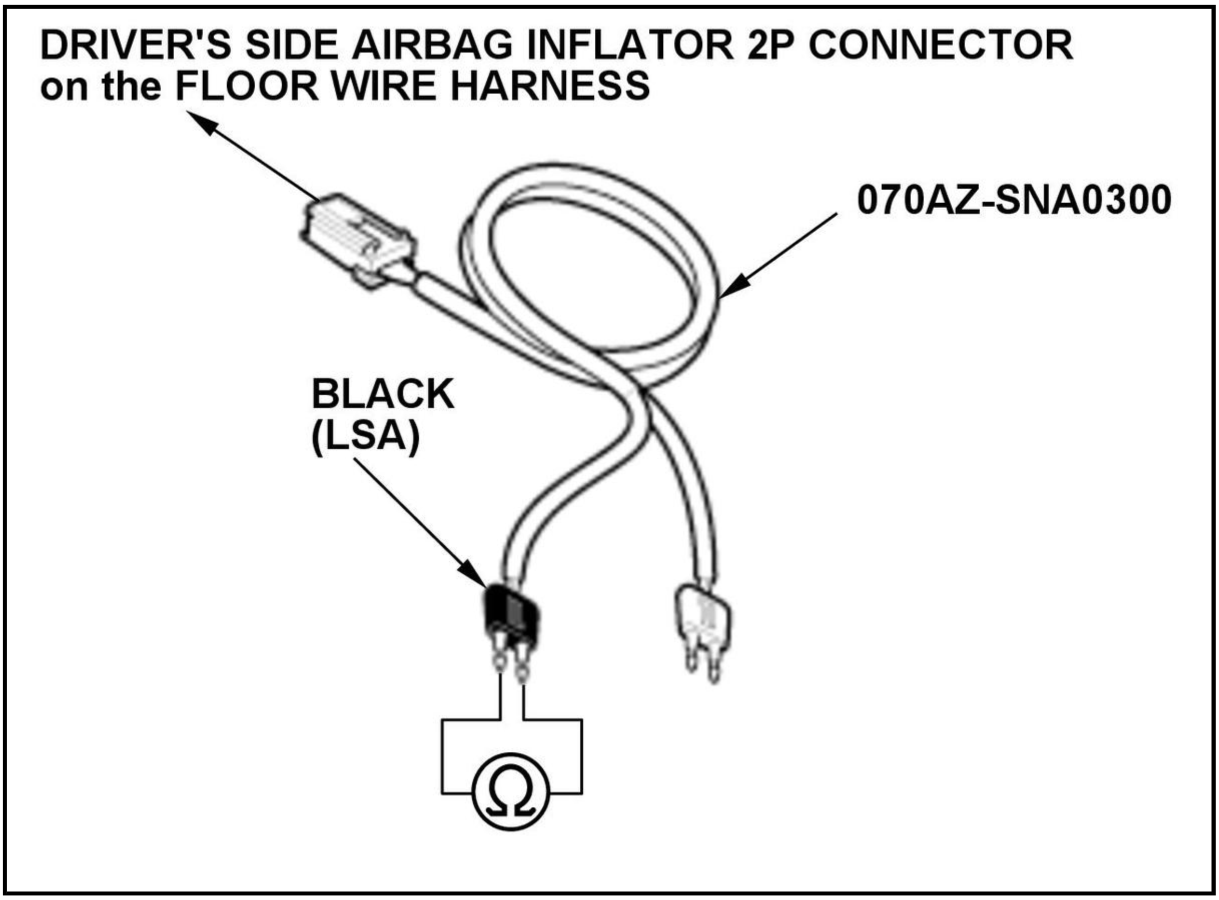
-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the driver's side airbag inflator 2P connector on the floor wire harness.

-5. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Driver's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
Test point	SRS simulator lead L black terminal



DRIVER'S SIDE AIRBAG INFLATOR 2P CONNECTOR on the FLOOR WIRE HARNESS
070AZ-SNA0300
BLACK (LSA)
Ω

Is there 1.0 Ω or less?

YES

The LSA+ and LSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0020-1A, B0020-2B

DTC B0020-1A : Decreased Resistance in the Driver's Side Airbag Inflator

DTC B0020-2B : Short to Another Wire Harness in the Driver's Side Airbag Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead L 070AZ-SNA0300

-SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0020-1A Decreased resistance in the driver's side airbag inflator	B
B0020-2B Short to another wire harness in the driver's side airbag inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0020-1A Decreased resistance in the driver's side airbag inflator	B
B0020-2B Short to another wire harness in the driver's side airbag inflator	B

   Is DTC B0020-1A or B0020-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

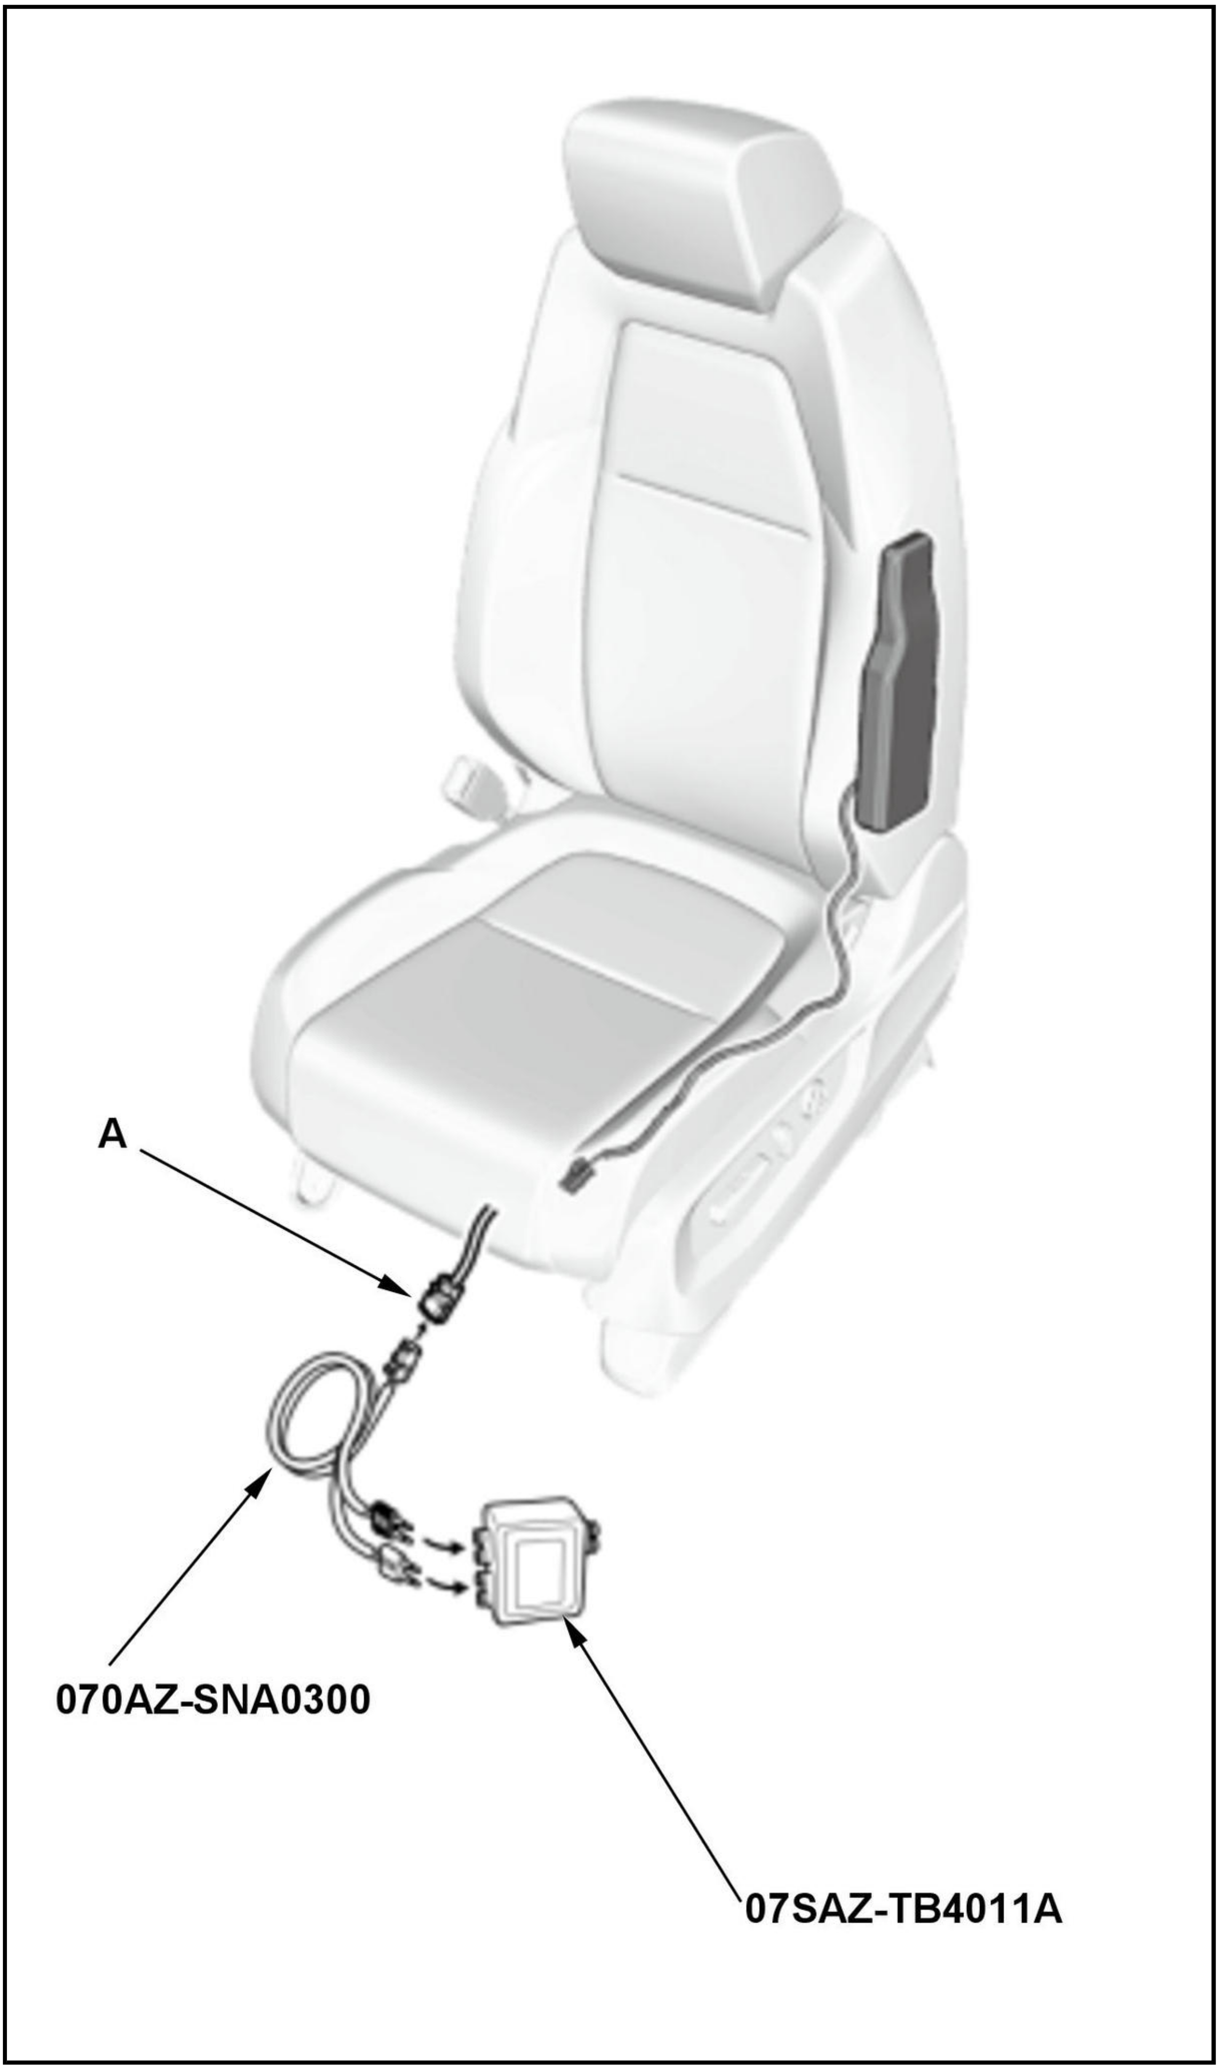
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's side airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the driver's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the driver's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0020-1A Decreased resistance in the driver's side airbag inflator	B
B0020-2B Short to another wire harness in the driver's side airbag inflator	B

Is DTC B0020-1A or B0020-2B indicated?

YES

Go to step 3.

NO

Short to another wire in the driver's side airbag inflator; **replace the driver's side airbag** , then clear the DTC.

3. Shorted wire check (LSA+ line to LSA- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

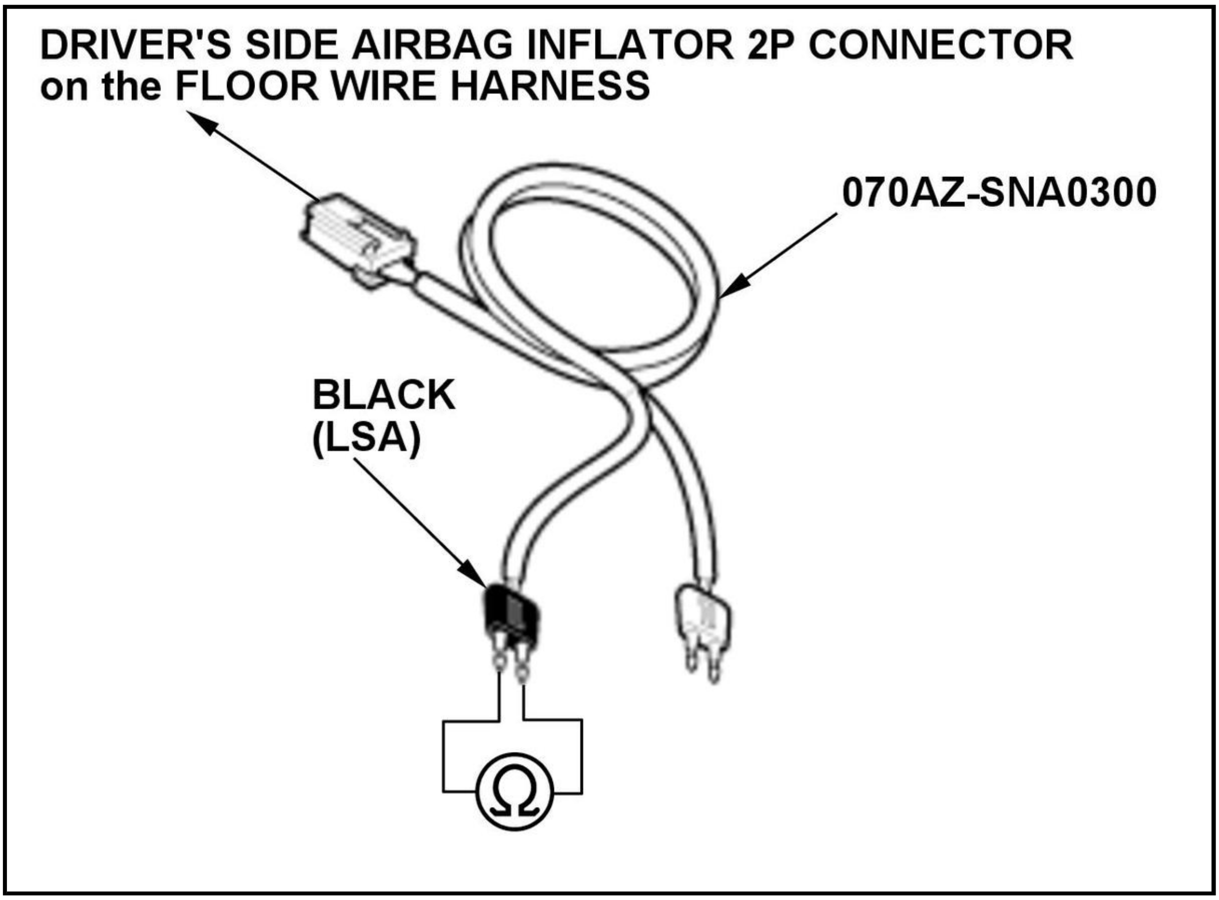
SRS unit connector B (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the driver's side airbag inflator 2P connector on the floor wire harness.

-5. **Connect the SRS short canceller to SRS unit connector B (39P) terminals No. 5 and No. 6** .

-6. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Driver's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
	SRS unit connector B (39P) No. 5 and No. 6: connected to SRS short canceller
Test point	SRS simulator lead L black terminal



DRIVER'S SIDE AIRBAG INFLATOR 2P CONNECTOR on the FLOOR WIRE HARNESS
070AZ-SNA0300
BLACK (LSA)
Ω

Is there an open circuit, or at least 1 MΩ?

YES

The LSA+ and LSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0021-11

DTC B0021-11 : Short to Ground in the Left Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0021-11 Short to ground in the left side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0021-11 Short to ground in the left side curtain airbag first inflator	B

Is DTC B0021-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (LCA+, LCA- lines) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the headliner** .

-4. Disconnect the following connector.

Left side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0021-11 Short to ground in the left side curtain airbag first inflator	B

Is DTC B0021-11 indicated?

YES

Go to step 3.

NO

Short to ground in the left side curtain airbag inflator; **replace the left side curtain airbag** , then clear the DTC.

3. Shorted wire check (LCA+, LCA- lines) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Left side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 9**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 10**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The LCA+ and LCA- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0021-12

DTC B0021-12 : Short to Power in the Left Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0021-12 Short to power in the left side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0021-12 Short to power in the left side curtain airbag first inflator	B

Is DTC B0021-12 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (LCA+, LCA- lines to power) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the headliner** .

-4. Disconnect the following connector.

Left side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0021-12 Short to power in the left side curtain airbag first inflator	B

Is DTC B0021-12 indicated?

YES

Go to step 3.

NO

Short to power in the left side curtain airbag inflator; **replace the left side curtain airbag** , then clear the DTC.

3. Shorted wire check (LCA+, LCA- lines to power) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Left side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 9**
Test point 2	Body ground

Test point 1	SRS unit connector B (39P) No. 10
Test point 2	Body ground

Is there 0.2 V or less?

YES

The LCA+ and LCA- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit .

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0021-13

DTC B0021-13 : Open or Increased Resistance in the Left Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0021-13 Open or increased resistance in the left side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0021-13 Open or increased resistance in the left side curtain airbag first inflator	B

   Is DTC B0021-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Left side curtain airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

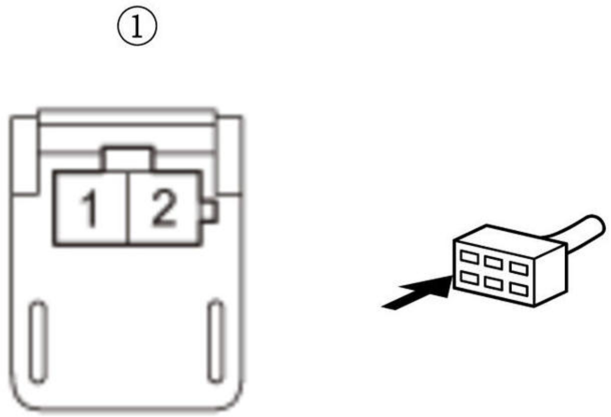
-3. **Remove the headliner** .

-4. Disconnect the following connector.

Left side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Connect terminals A and B with a jumper wire.

Terminal A	Left side curtain airbag first inflator 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Terminal B	Left side curtain airbag first inflator 2P connector (female terminals) No. 2 (on the floor wire harness): ①



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0021-13 Open or increased resistance in the left side curtain airbag first inflator	B

Is DTC B0021-13 indicated?

YES

Go to step 3.

NO

Open in the left side curtain airbag inflator; **replace the left side curtain airbag** , then clear the DTC.

3. Open wire check (LCA+, LCA- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the left side curtain airbag inflator 2P connector on the floor wire harness.

-4. Disconnect the following connector.

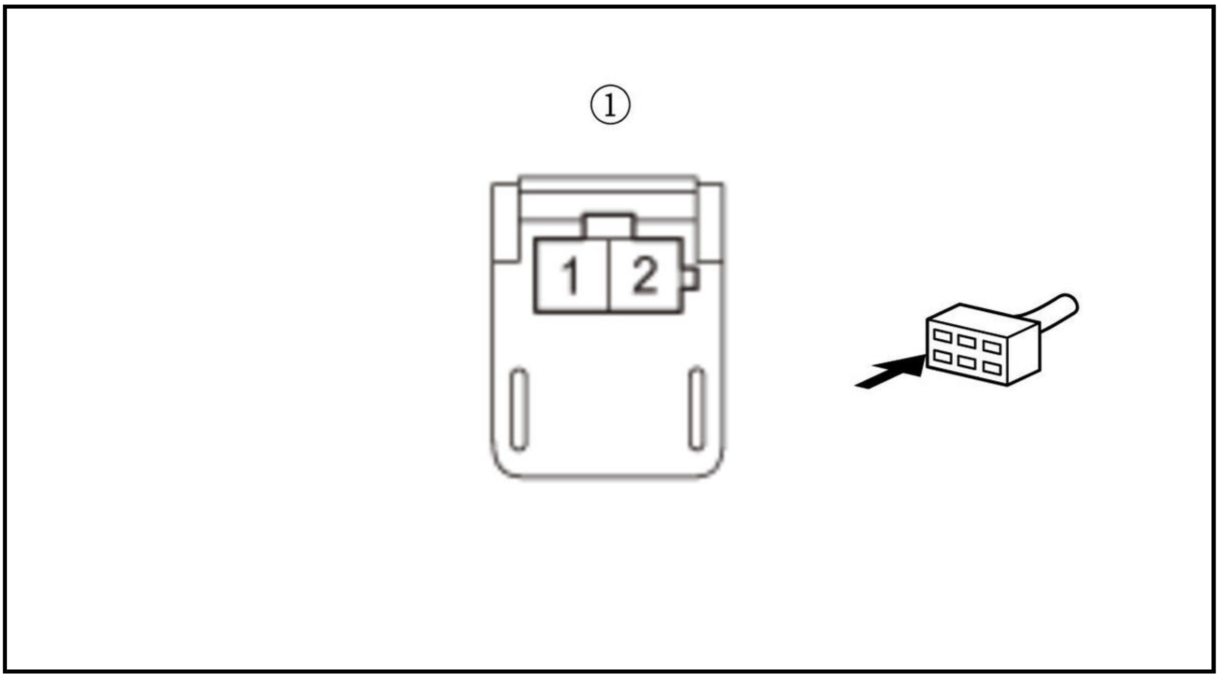
SRS unit connector B (39P)

-5. Connect terminals A and B with a jumper wire.

Terminal A	SRS unit connector B (39P) No. 9
Terminal B	SRS unit connector B (39P) No. 10

-6. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Left side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	SRS unit connector B (39P) terminals No. 9 and No. 10: jumped
Test point 1	Left side curtain airbag first inflator 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Left side curtain airbag first inflator 2P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there 1.0 Ω or less?

YES

The LCA+ and LCA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service

information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0021-1A

DTC B0021-1A : Decreased Resistance in the Left Side Curtain Airbag First Inflator

Special Tools Required

SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0021-1A Decreased resistance in the left side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0021-1A Decreased resistance in the left side curtain airbag first inflator	B

Is DTC B0021-1A indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Left side curtain airbag inflator check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the headliner** .

-4. Disconnect the following connector.

Left side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0021-1A Decreased resistance in the left side curtain airbag first inflator	B

Is DTC B0021-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the left side curtain airbag inflator; **replace the left side curtain airbag** , then clear the DTC.

3. Shorted wire check (LCA+ line to LCA- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. **Connect the SRS short canceller to SRS unit connector B (39P) terminals No. 9 and No. 10** .

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Left side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	SRS unit connector B (39P) No. 9 and No. 10: connected to SRS short canceller
Test point 1	**SRS unit connector B (39P) No. 9**
Test point 2	**SRS unit connector B (39P) No. 10**

Is there an open circuit, or at least 1 MΩ?

YES

The LCA+ and LCA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0021-2B

DTC B0021-2B : Short to Another Wire Harness in the Left Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B

   Is DTC B0021-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the left side airbag inflator	B
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the right side airbag inflator	B

DTC Description	DTC
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0001-2B, B0002-2B, B0010-2B, B0011-2B, B0020-2B, B0028-2B, B0029-2B, B0070-2B, B0072-2B, B0079-2B, B007A-2B or B0082-2B indicated with DTC B0021-2B?

YES

Go to step 3.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

3. Shorted wire check (LCA lines to another line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the headliner** .

-4. Disconnect the following connectors.

SRS unit connector A (39P)
SRS unit connector B (39P)
Left side curtain airbag inflator 2P connector (on the floor wire harness)
Inflator connectors which are assigned to 2B codes listed on HDS

-5. Check for continuity between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	SRS unit connector B (39P): disconnected
	Left side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

DTC	Test point 1	Test point 2

	SRS unit connector B (39P) No. 10	SRS unit connector A (39P) No. 3

Is there continuity?

YES

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

NO

The LCA wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

DTC B0028-11

DTC B0028-11 : Short to Ground in the Front Passenger's Side Airbag Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead L 070AZ-SNA0300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0028-11 Short to ground in the front passenger's side airbag inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0028-11 Short to ground in the front passenger's side airbag inflator	B

   Is DTC B0028-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

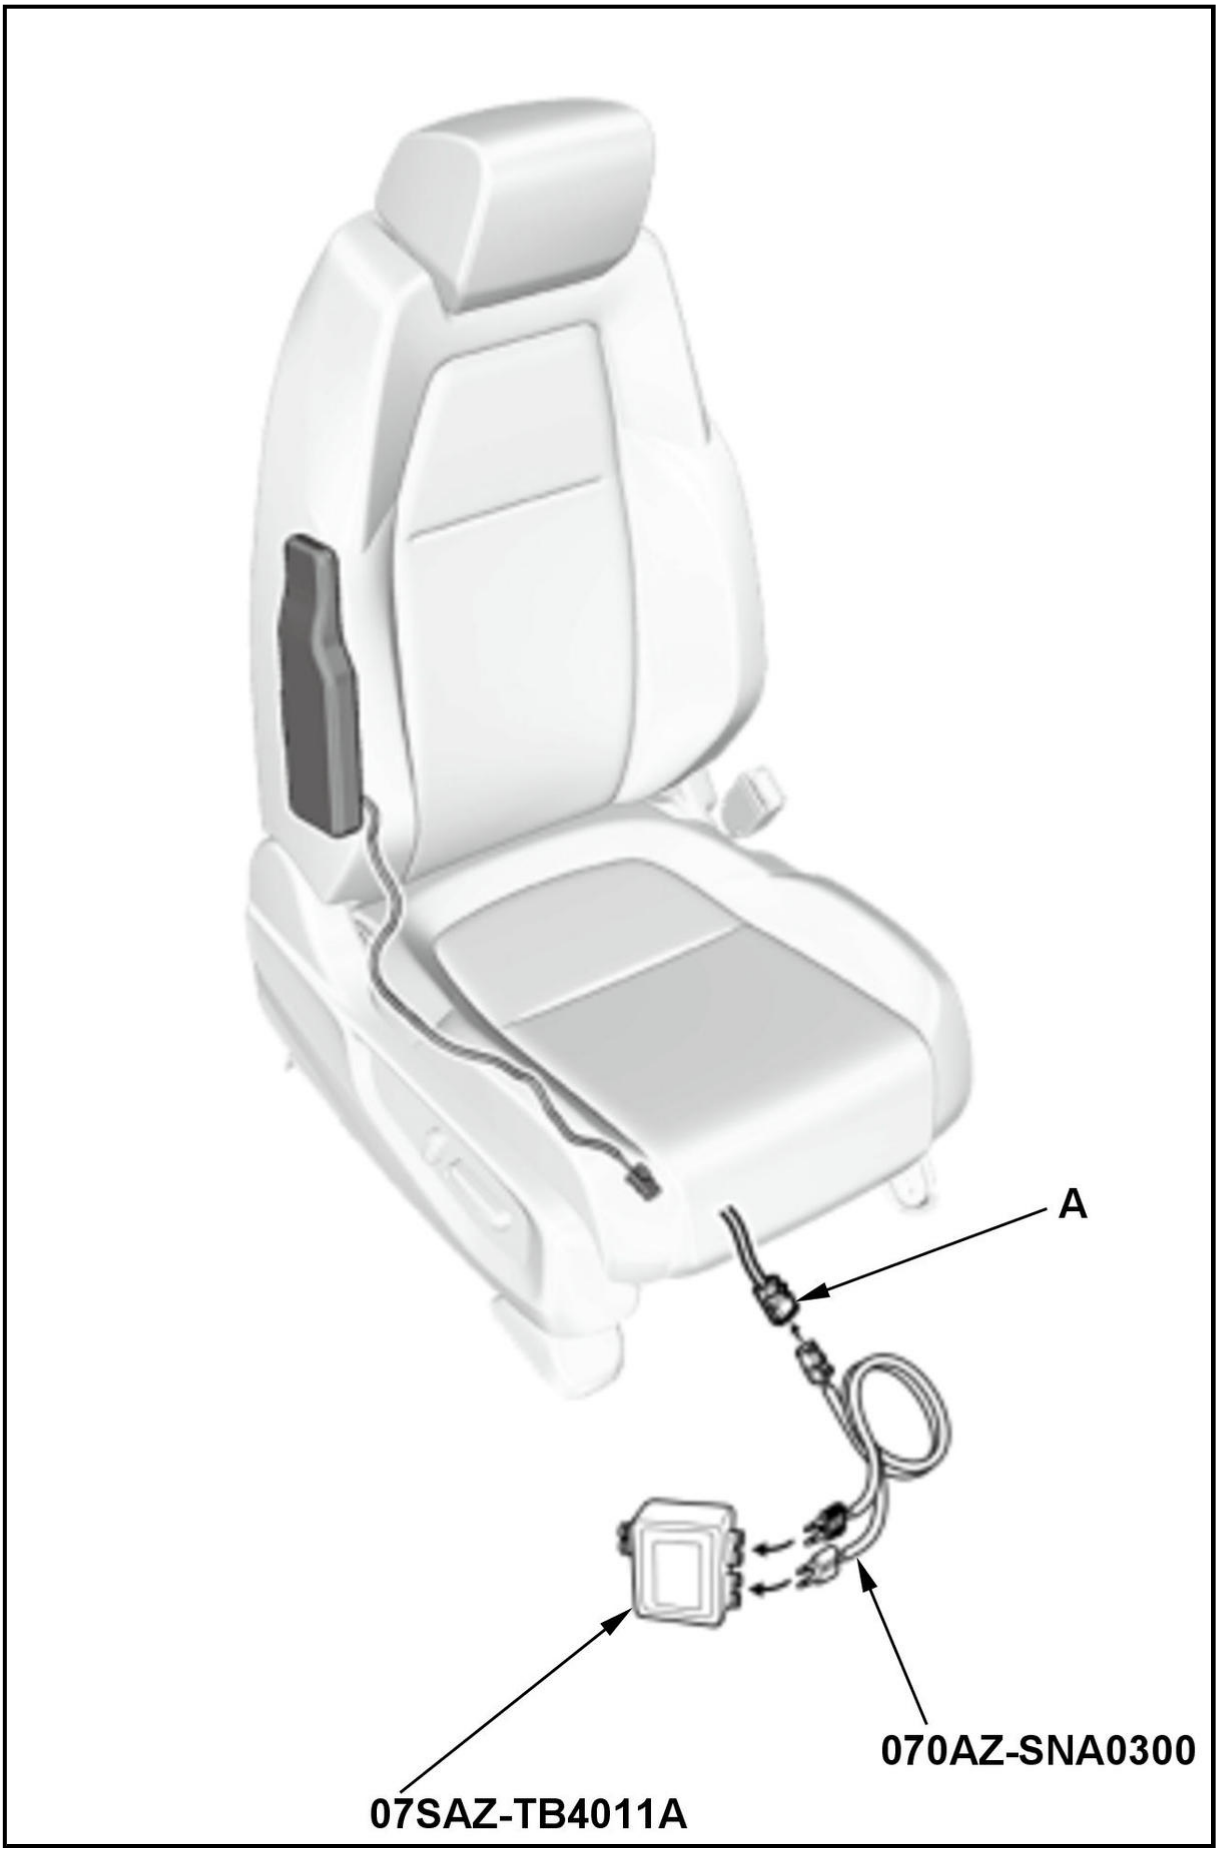
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's side airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the front passenger's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0028-11 Short to ground in the front passenger's side airbag inflator	B

Is DTC B0028-11 indicated?

YES

Go to step 3.

NO

Short to ground in the front passenger's side airbag inflator; **replace the front passenger's side airbag** , then clear the DTC.

3. Shorted wire check (RSA+, RSA- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
Test point 1	SRS simulator lead L black terminal
Test point 2	Body ground

2P CONNECTOR on the FLOOR WIRE HARNESS
070AZ-SNA0300
BLACK
(RSA)
Ω
Ω

Is there an open circuit, or at least 1 MΩ?

YES

The RSA+ and RSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0028-12

DTC B0028-12 : Short to Power in the Front Passenger's Side Airbag Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead L 070AZ-SNA0300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0028-12 Short to power in the front passenger's side airbag inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0028-12 Short to power in the front passenger's side airbag inflator	B

   Is DTC B0028-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

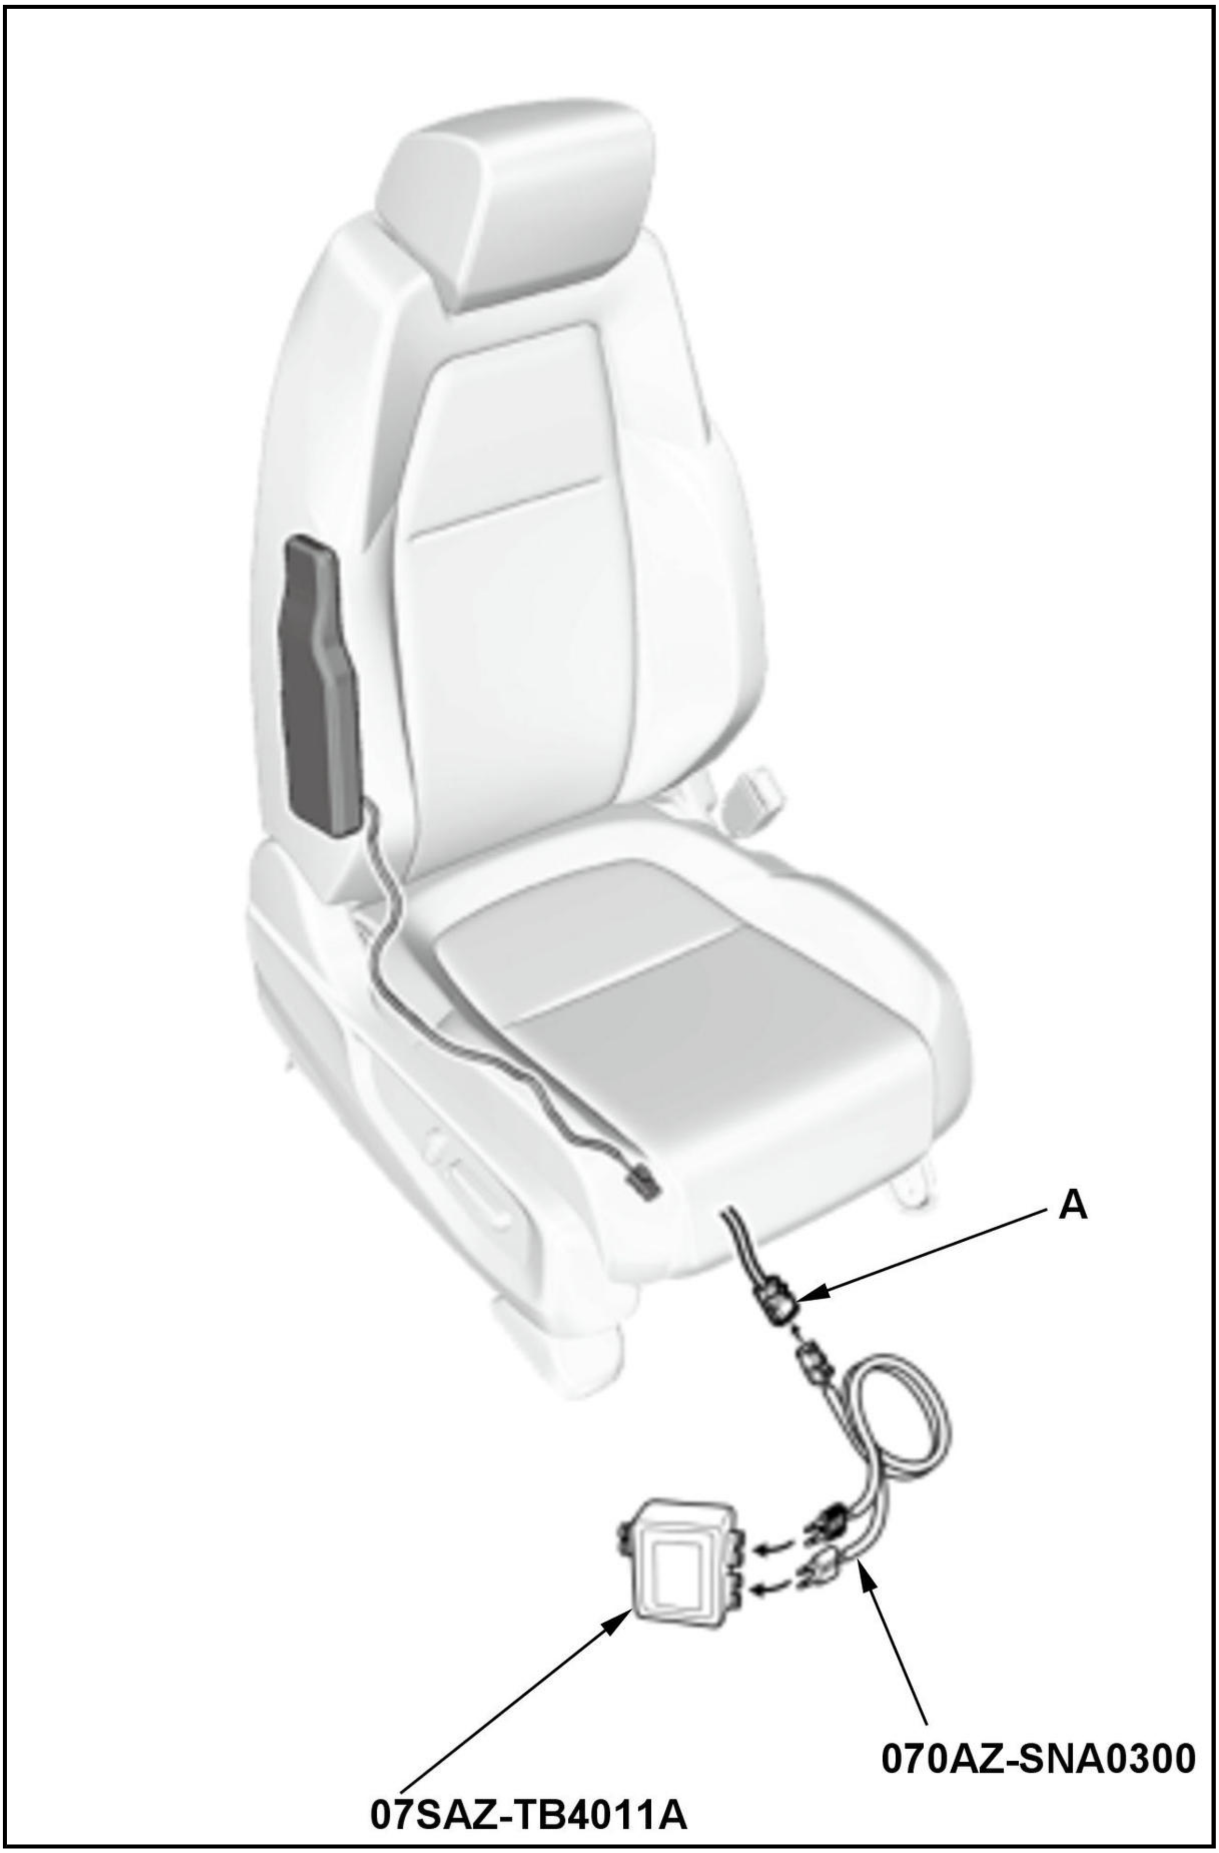
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's side airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the front passenger's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0028-12 Short to power in the front passenger's side airbag inflator	B

Is DTC B0028-12 indicated?

YES

Go to step 3.

NO

Short to power in the front passenger's side airbag inflator; **replace the front passenger's side airbag** , then clear the DTC.

3. Shorted wire check (RSA+, RSA- lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
Test point 1	SRS simulator lead L black terminal
Test point 2	Body ground

BLACK
(RSA)
V
V

Is there 0.2 V or less?

YES

The RSA+ and RSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0028-13

DTC B0028-13 : Open or Increased Resistance in the Front Passenger's Side Airbag Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead L 070AZ-SNA0300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0028-13 Open or increased resistance in the front passenger's side airbag inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0028-13 Open or increased resistance in the front passenger's side airbag inflator	B

   Is DTC B0028-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

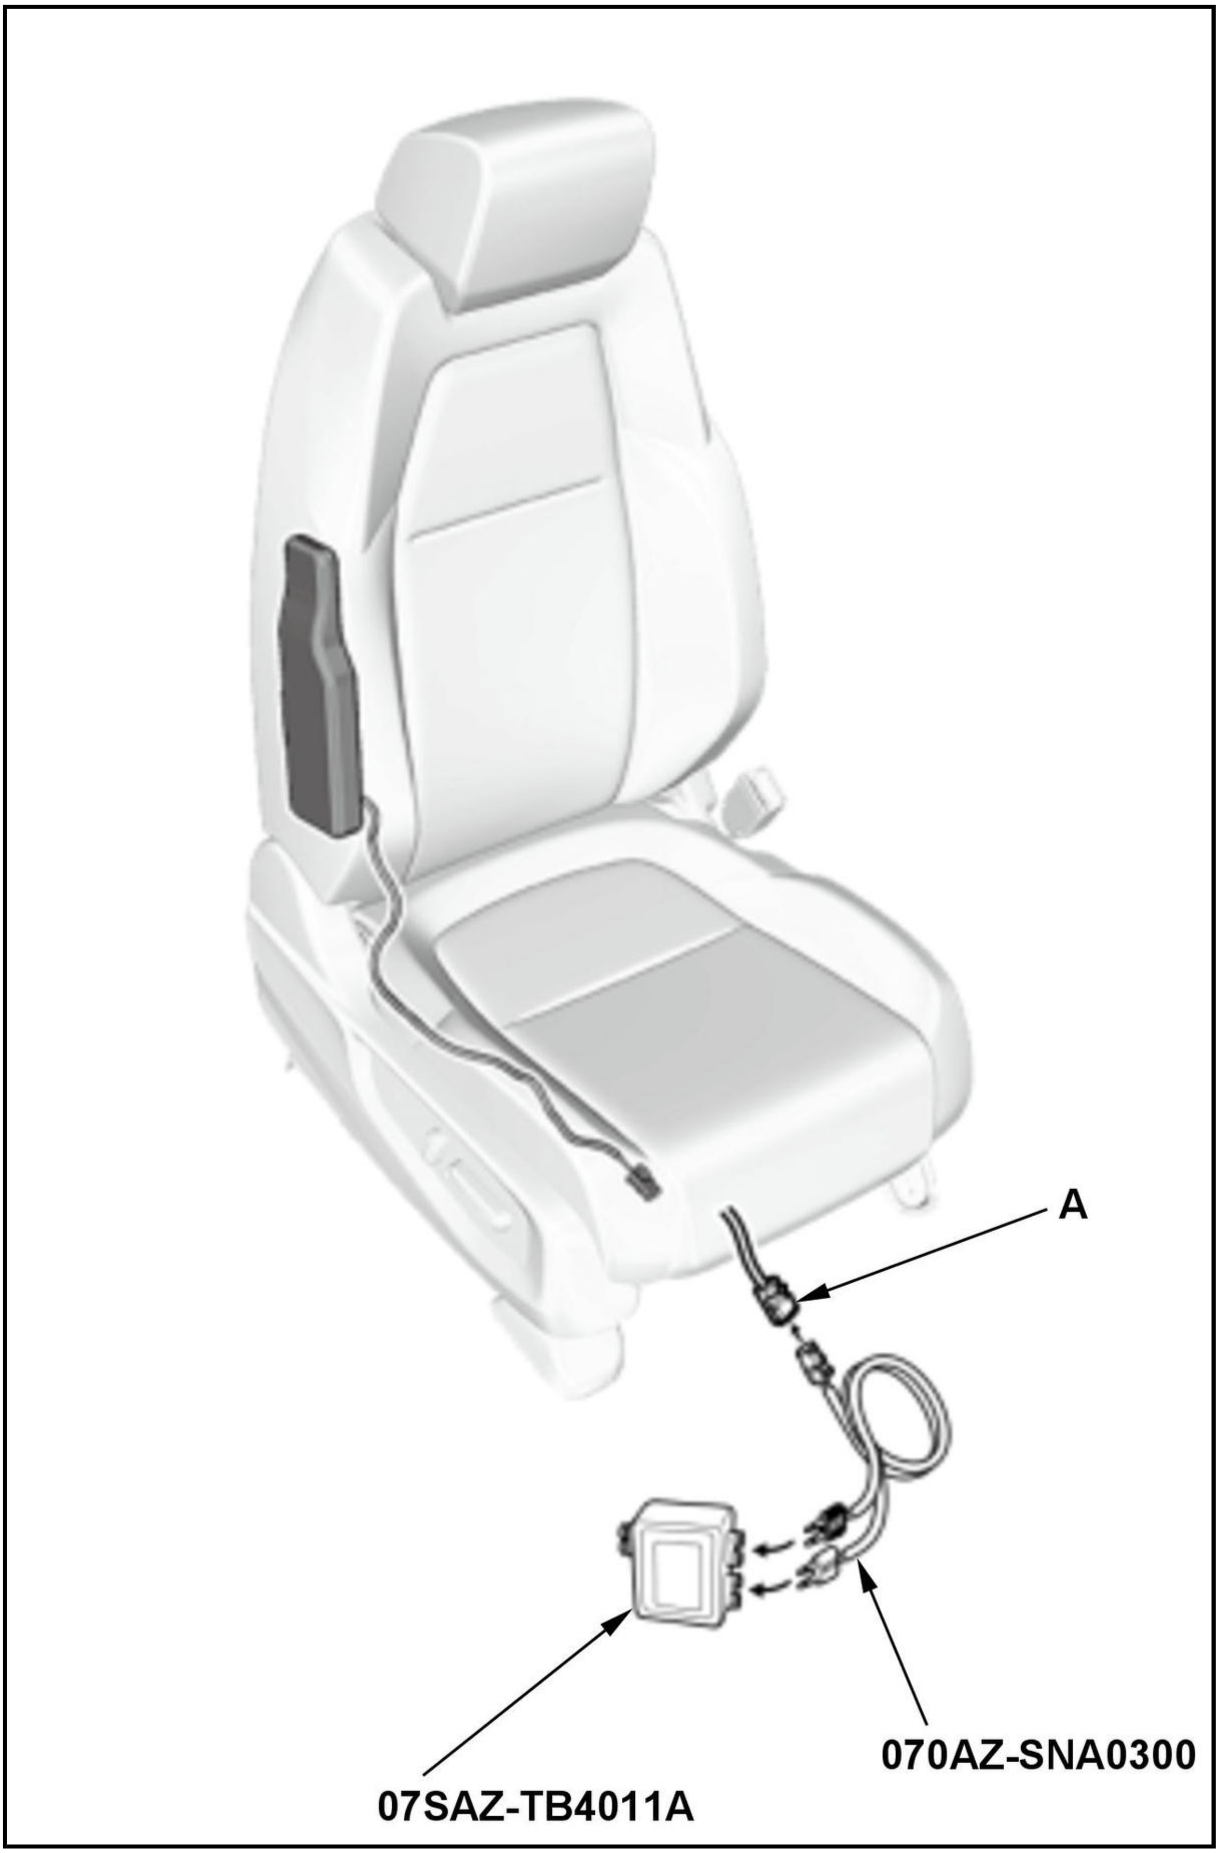
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's side airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the front passenger's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0028-13 Open or increased resistance in the front passenger's side airbag inflator	B

Is DTC B0028-13 indicated?

YES

Go to step 3.

NO

Open in the front passenger's side airbag inflator; **replace the front passenger's side airbag** , then clear the DTC.

3. Open wire check (RSA+, RSA- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

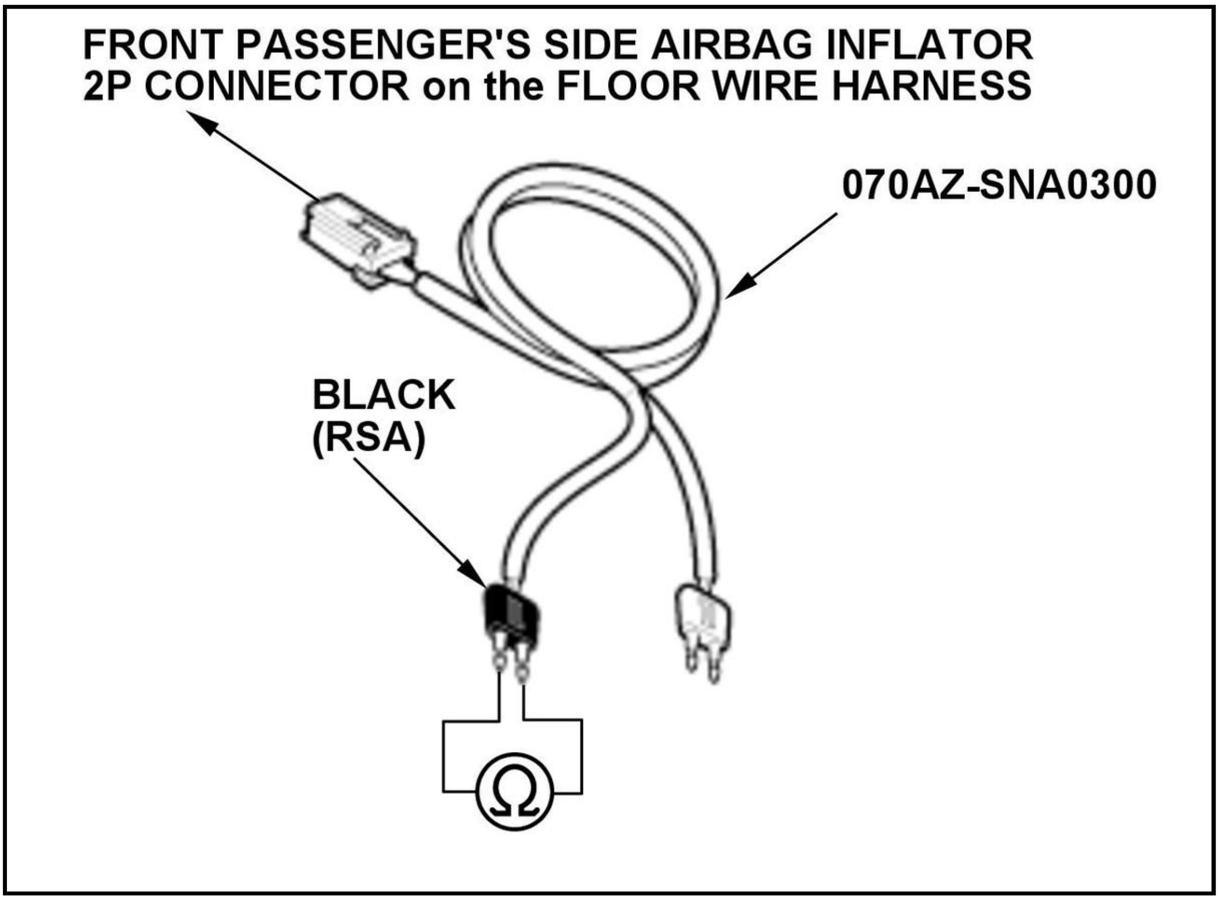
-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
Test point	SRS simulator lead L black terminal



FRONT PASSENGER'S SIDE AIRBAG INFLATOR

070AZ-SNA0300
BLACK
(RSA)
Ω

Is there 1.0 Ω or less?

YES

The RSA+ and RSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0028-1A, B0028-2B

DTC B0028-1A : Decreased Resistance in the Front Passenger's Side Airbag Inflator

DTC B0028-2B : Short to Another Wire Harness in the Front Passenger's Side Airbag Inflator

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead L 070AZ-SNA0300

-SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0028-1A Decreased Resistance in the front passenger's side airbag inflator	B
B0028-2B Short to another wire in the front passenger's side airbag inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0028-1A Decreased Resistance in the front passenger's side airbag inflator	B
B0028-2B Short to another wire in the front passenger's side airbag inflator	B

   Is DTC B0028-1A or B0028-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

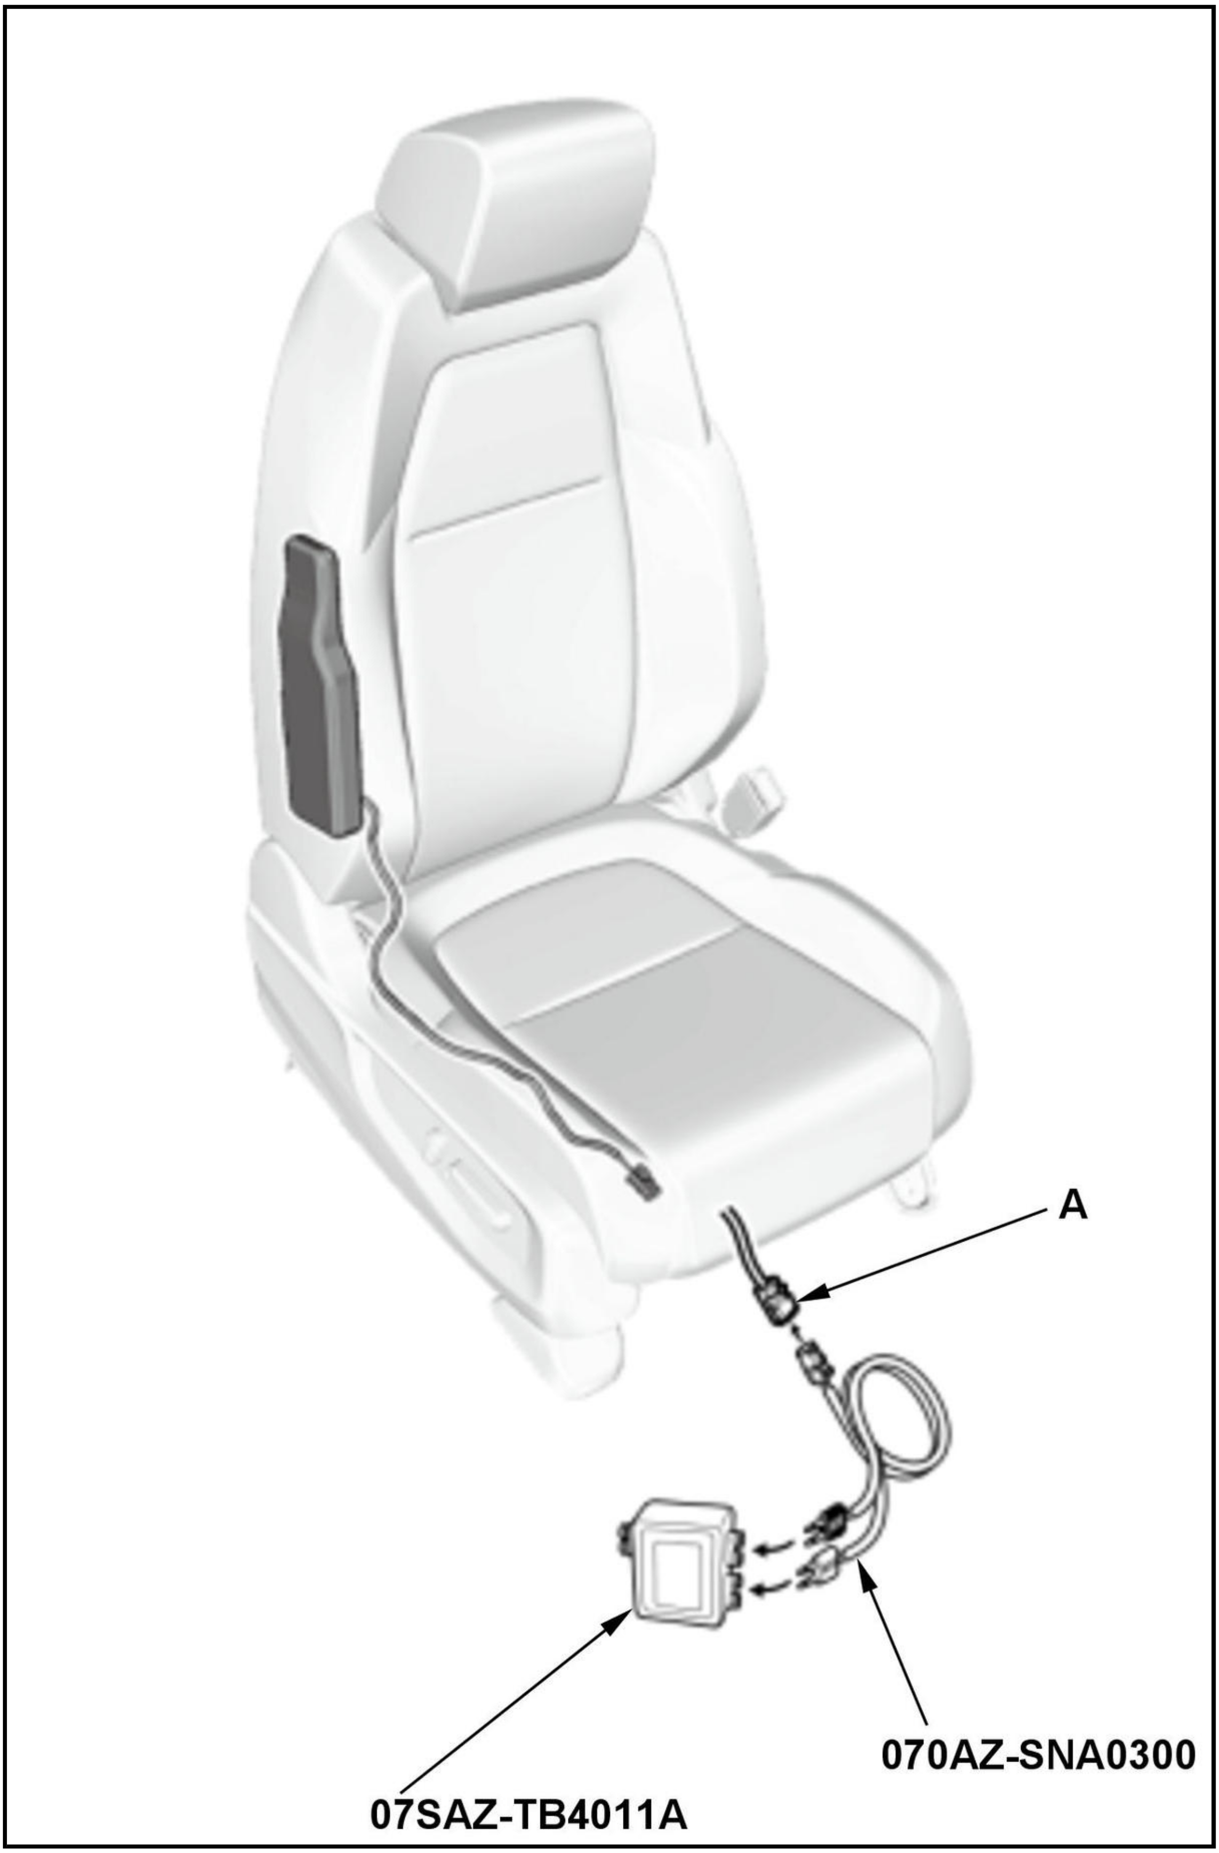
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's side airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the front passenger's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0028-1A Decreased Resistance in the front passenger's side airbag inflator	B
B0028-2B Short to another wire in the front passenger's side airbag inflator	B

Is DTC B0028-1A or B0028-2B indicated?

YES

Go to step 3.

NO

Short to another wire in the front passenger's side airbag inflator; **replace the front passenger's side airbag** , then clear the DTC.

3. Shorted wire check (RSA+ line to RSA- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. **Connect the SRS short canceller to SRS unit connector B (39P) terminals No. 3 and No. 4** .

-6. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
	SRS unit connector B (39P) No. 3 and No. 4: connected to SRS short canceller
Test point	SRS simulator lead L black terminal

Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0029-11

DTC B0029-11 : Short to Ground in the Right Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0029-11 Short to ground in the right side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0029-11 Short to ground in the right side curtain airbag first inflator	B

Is DTC B0029-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (RCA+, RCA- lines) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the headliner** .

-4. Disconnect the following connector.

Right side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0029-11 Short to ground in the right side curtain airbag first inflator	B

Is DTC B0029-11 indicated?

YES

Go to step 3.

NO

Short to ground in the right side curtain airbag inflator; **replace the right side curtain** , then clear the DTC.

3. Shorted wire check (RCA+, RCA- lines) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 7**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 8**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The RCA+ and RCA- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0029-12

DTC B0029-12 : Short to Power in the Right Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0029-12 Short to power in the right side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0029-12 Short to power in the right side curtain airbag first inflator	B

Is DTC B0029-12 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (RCA+, RCA- lines to power) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the headliner** .

-4. Disconnect the following connector.

Right side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0029-12 Short to power in the right side curtain airbag first inflator	B

Is DTC B0029-12 indicated?

YES

Go to step 3.

NO

Short to power in the right side curtain airbag inflator; **replace the left side curtain airbag** , then clear the DTC.

3. Shorted wire check (RCA+, RCA- lines to power) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Rght side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 7**
Test point 2	Body ground

Test point 1	SRS unit connector B (39P) No. 8
Test point 2	Body ground

Is there 0.2 V or less?

YES

The RCA+ and RCA- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit .

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0029-13

DTC B0029-13 : Open or Increased Resistance in the Right Side Curtain Airbag First Inflator

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and 12 Volt Battery Terminal Disconnection and Reconnection .

DTC Description	DTC
B0029-13 Open or increased resistance in the right side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0029-13 Open or increased resistance in the right side curtain airbag first inflator	B

   Is DTC B0029-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Right side curtain airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

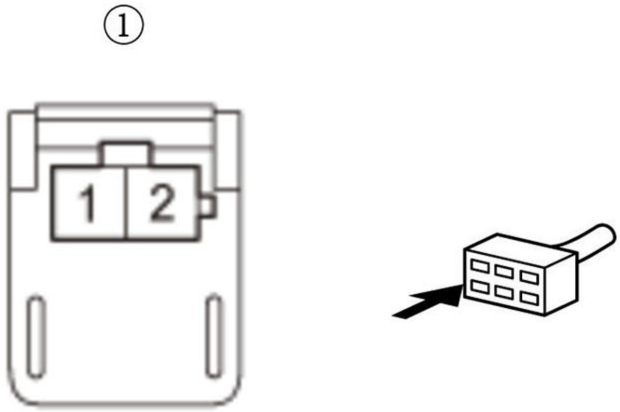
-3. **Remove the headliner** .

-4. Disconnect the following connector.

Right side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Connect terminals A and B with a jumper wire.

Terminal A	Right side curtain airbag first inflator 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Terminal B	Right side curtain airbag first inflator 2P connector (female terminals) No. 2 (on the floor wire harness): ①



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0029-13 Open or increased resistance in the right side curtain airbag first inflator	B

Is DTC B0029-13 indicated?

YES

Go to step 3.

NO

Open in the right side curtain airbag inflator; **replace the right side curtain airbag** , then clear the DTC.

3. Open wire check (RCA+, RCA- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the right side curtain airbag inflator 2P connector on the floor wire harness.

-4. Disconnect the following connector.

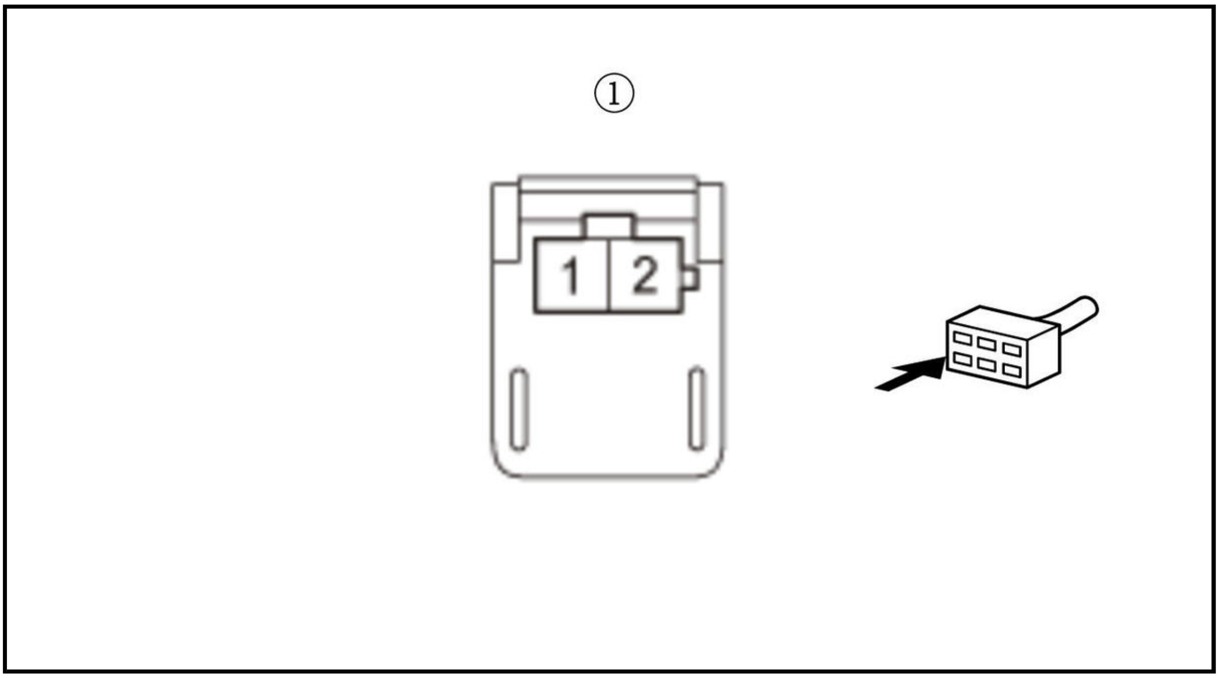
SRS unit connector B (39P)

-5. Connect terminals A and B with a jumper wire.

Terminal A	**SRS unit connector B (39P) No. 7**
Terminal B	**SRS unit connector B (39P) No. 8**

-6. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Right side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	SRS unit connector B (39P) terminals No. 7 and No. 8: jumped
Test point 1	Right side curtain airbag first inflator 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Right side curtain airbag first inflator 2P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there 1.0 Ω or less?

YES

The RCA+ and RCA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service

information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0029-1A

DTC B0029-1A : Decreased Resistance in the Right Side Curtain Airbag First Inflator

Special Tools Required

SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0029-1A Decreased resistance in the right side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0029-1A Decreased resistance in the right side curtain airbag first inflator	B

   Is DTC B0029-1A indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Right side curtain airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the headliner** .

   -4. Disconnect the following connector.

Right side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0029-1A Decreased resistance in the right side curtain airbag first inflator	B

Is DTC B0029-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the right side curtain airbag inflator; **replace the right side curtain airbag** , then clear the DTC.

3. Shorted wire check (RCA+ line to RCA- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. **Connect the SRS short canceller to SRS unit connector B (39P) terminals No. 7 and No. 8** .

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Right side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	SRS unit connector B (39P) No. 7 and No. 8: connected to SRS short canceller
Test point 1	**SRS unit connector B (39P) No. 7**
Test point 2	**SRS unit connector B (39P) No. 8**

Is there an open circuit, or at least 1 MΩ?

YES

The RCA+ and RCA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0029-2B

DTC B0029-2B : Short to Another Wire Harness in the Right Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B

   Is DTC B0029-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the left side airbag inflator	B
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the right side airbag inflator	B

DTC Description	DTC
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0001-2B, B0002-2B, B0010-2B, B0011-2B, B0020-2B, B0021-2B, B0028-2B, B0070-2B, B0072-2B, B0079-2B, B007A-2B or B0082-2B indicated with DTC B0029-2B?

YES

Go to step 3.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

3. Shorted wire check (RCA lines to another line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the headliner** .

-4. Disconnect the following connectors.

SRS unit connector A (39P)
SRS unit connector B (39P)
Right side curtain airbag inflator 2P connector (on the floor wire harness)
Inflator connectors which are assigned to 2B codes listed on HDS

-5. Check for continuity between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	SRS unit connector B (39P): disconnected
	Right side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

DTC	Test point 1	Test point 2
	From terminal	To terminal
B0001-2B	SRS unit connector B (39P) No. 8	SRS unit connector A (39P) No. 9
	SRS unit connector B (39P) No. 7	SRS unit connector A (39P) No. 8
B0002-2B	SRS unit connector B (39P) No. 8	SRS unit connector A (39P) No. 10
	SRS unit connector B (39P) No. 7	SRS unit connector A (39P) No. 11
B0010-2B	SRS unit connector B (39P) No. 8	SRS unit connector A (39P) No. 5
	SRS unit connector B (39P) No. 7	SRS unit connector A (39P) No. 4
B0011-2B	SRS unit connector B (39P) No. 8	SRS unit connector A (39P) No. 6
	SRS unit connector B (39P) No. 7	SRS unit connector A (39P) No. 7
B0020-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 5
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 6
B0021-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 9
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 10
B0028-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 4
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 3
B0070-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 20
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 21
B0072-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 19
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 18
B0079-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 24
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 25
B007A-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 23
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 22

DTC	Test point 1	Test point 2
	From terminal	To terminal
B0082-2B	SRS unit connector B (39P) No. 8	SRS unit connector A (39P) No. 2
	SRS unit connector B (39P) No. 7	SRS unit connector A (39P) No. 3

Is there continuity?

YES

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

NO

The RCA wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

DTC B0050-11, B0050-2B

DTC B0050-11 : Short or Decreased Resistance in the Driver's Seat Belt Buckle Switch

DTC B0050-2B : Short to Another Wire Harness in the Driver's Seat Belt Buckle Switch

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0050-11 Short or decreased resistance in the driver's seat belt buckle switch	B
B0050-2B Short to another wire harness in the driver's seat belt buckle switch	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds. Buckle and unbuckle the driver's seat belt several times.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0050-11 Short or decreased resistance in the driver's seat belt buckle switch	B
B0050-2B Short to another wire harness in the driver's seat belt buckle switch	B

   Is DTC B0050-11 or B0050-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

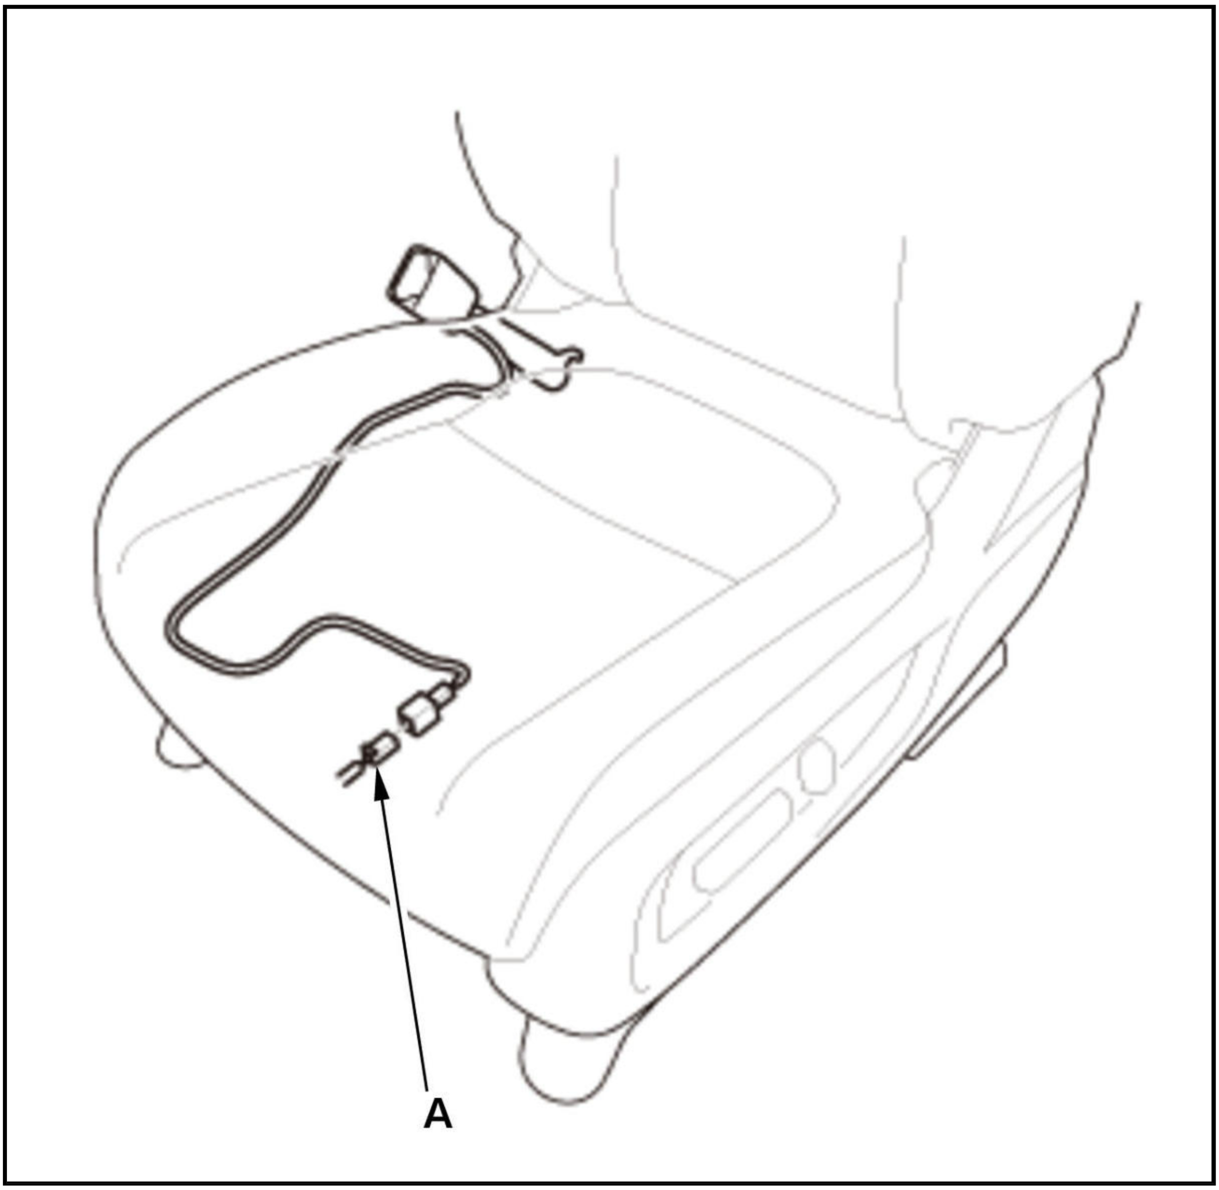
   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's seat belt buckle switch check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the driver's seat belt buckle switch 2P connector (A) on the floor wire harness.



-3. Clear the DTCs with the HDS.

-4. Turn the vehicle to the ON mode, then wait for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B0050-11 Short or decreased resistance in the driver's seat belt buckle switch	B
B0050-2B Short to another wire harness in the driver's seat belt buckle switch	B

Is DTC B0050-11 or B0050-2B indicated?

YES

Short in the floor wire harness; replace the floor wire harness, then clear the DTC.

NO

Faulty driver's seat belt buckle switch; **replace the driver's seat belt buckle assembly** , then clear the DTC.

DTC B0050-13

DTC B0050-13 : Open or Increased Resistance in the Driver's Seat Belt Buckle Switch

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0050-13 Open or increased resistance in the driver's seat belt buckle switch	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds. Buckle and unbuckle the driver's seat belt several times.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0050-13 Open or increased resistance in the driver's seat belt buckle switch	B

   Is DTC B0050-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

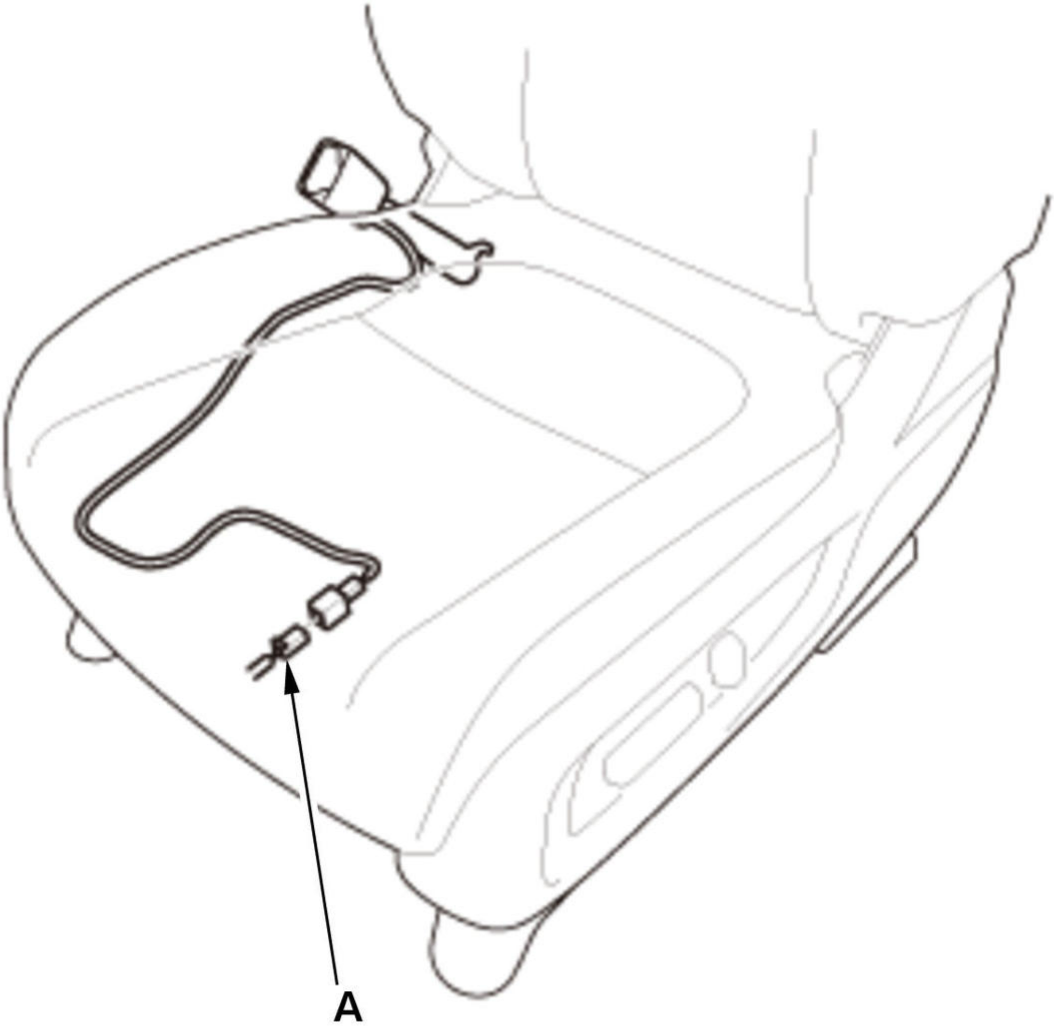
   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's seat belt buckle switch check

   -1. Turn the vehicle to the OFF (LOCK) mode.

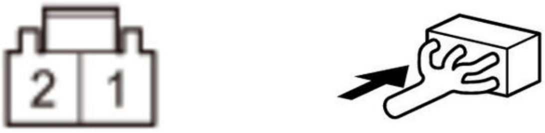
   -2. Disconnect the driver's seat belt buckle switch 2P connector (A) on the floor wire harness.



-3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's seat belt buckle switch 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Terminal B	Driver's seat belt buckle switch 2P connector (female terminals) No. 2 (on the floor wire harness): ①

①



-4. Turn the vehicle to the ON mode, then wait for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B0050-11 Short or decreased resistance in the driver's seat belt buckle switch	B

Is DTC B0050-11 indicated?

YES

Faulty driver's seat belt buckle switch; **replace the driver's seat belt buckle assembly** , then clear the DTC.

NO

Go to step 3.

3. Open wire check (FLBC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

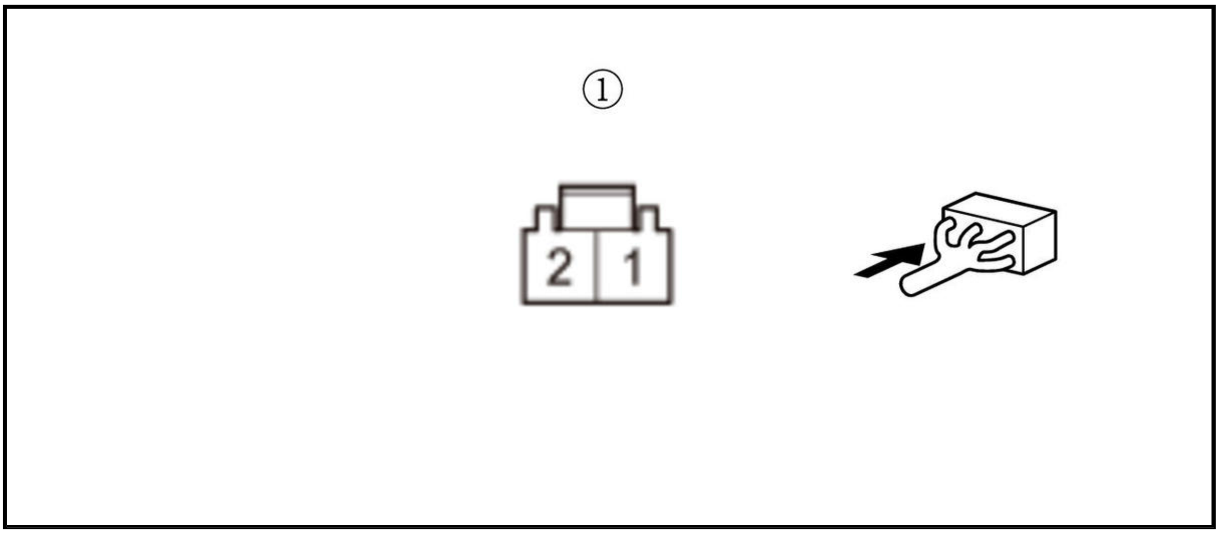
-3. Remove the jumper wire from the driver's seat belt buckle switch 2P connector on the floor wire harness.

-4. Disconnect the following connector.

SRS unit connector B (39P)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat belt buckle switch 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	Driver's seat belt buckle switch 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	**SRS unit connector B (39P) No. 29**



Is there 1.0 Ω or less?

YES

The FLBC wire is OK. Go to step 4.

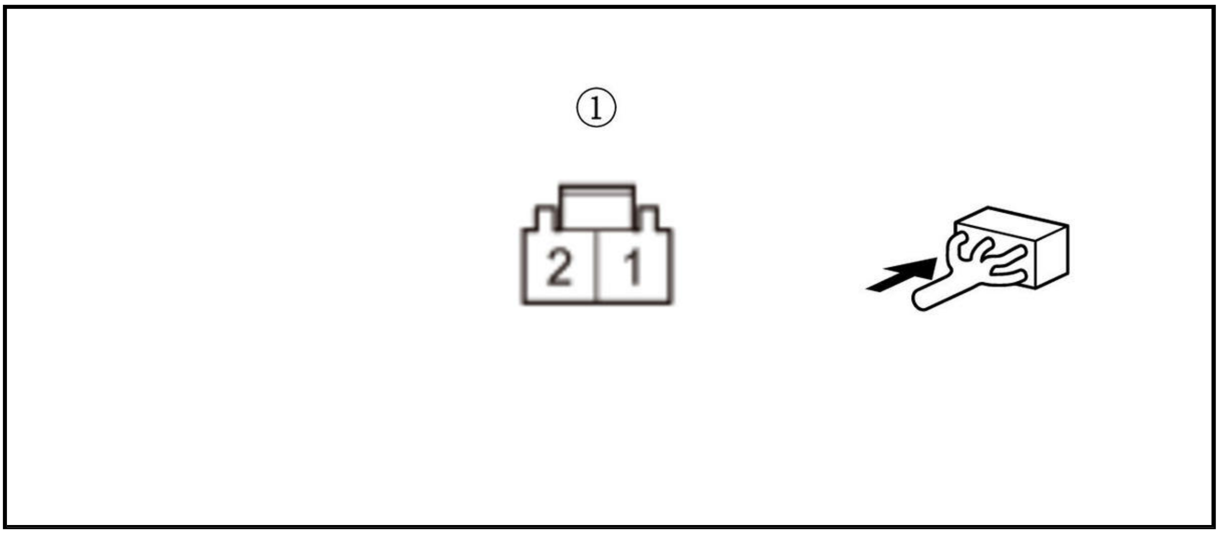
NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

4. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat belt buckle switch 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	Driver's seat belt buckle switch 2P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; check for a poor ground at G501. If the ground is OK, replace the floor wire harness, then clear the DTC.

DTC B0052-11, B0052-2B

DTC B0052-11 : Short or Decreased Resistance in the Front Passenger's Seat Belt Buckle Switch

DTC B0052-2B : Short to Another Wire Harness in the Front Passenger's Seat Belt Buckle Switch

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0052-11 Short or decreased resistance in the front passenger's seat belt buckle switch	B
B0052-2B Short to another wire harness in the front passenger's seat belt buckle switch	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds. Buckle and unbuckle the front passenger's seat belt several times.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0052-11 Short or decreased resistance in the front passenger's seat belt buckle switch	B
B0052-2B Short to another wire harness in the front passenger's seat belt buckle switch	B

   Is DTC B0052-11 or B0052-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

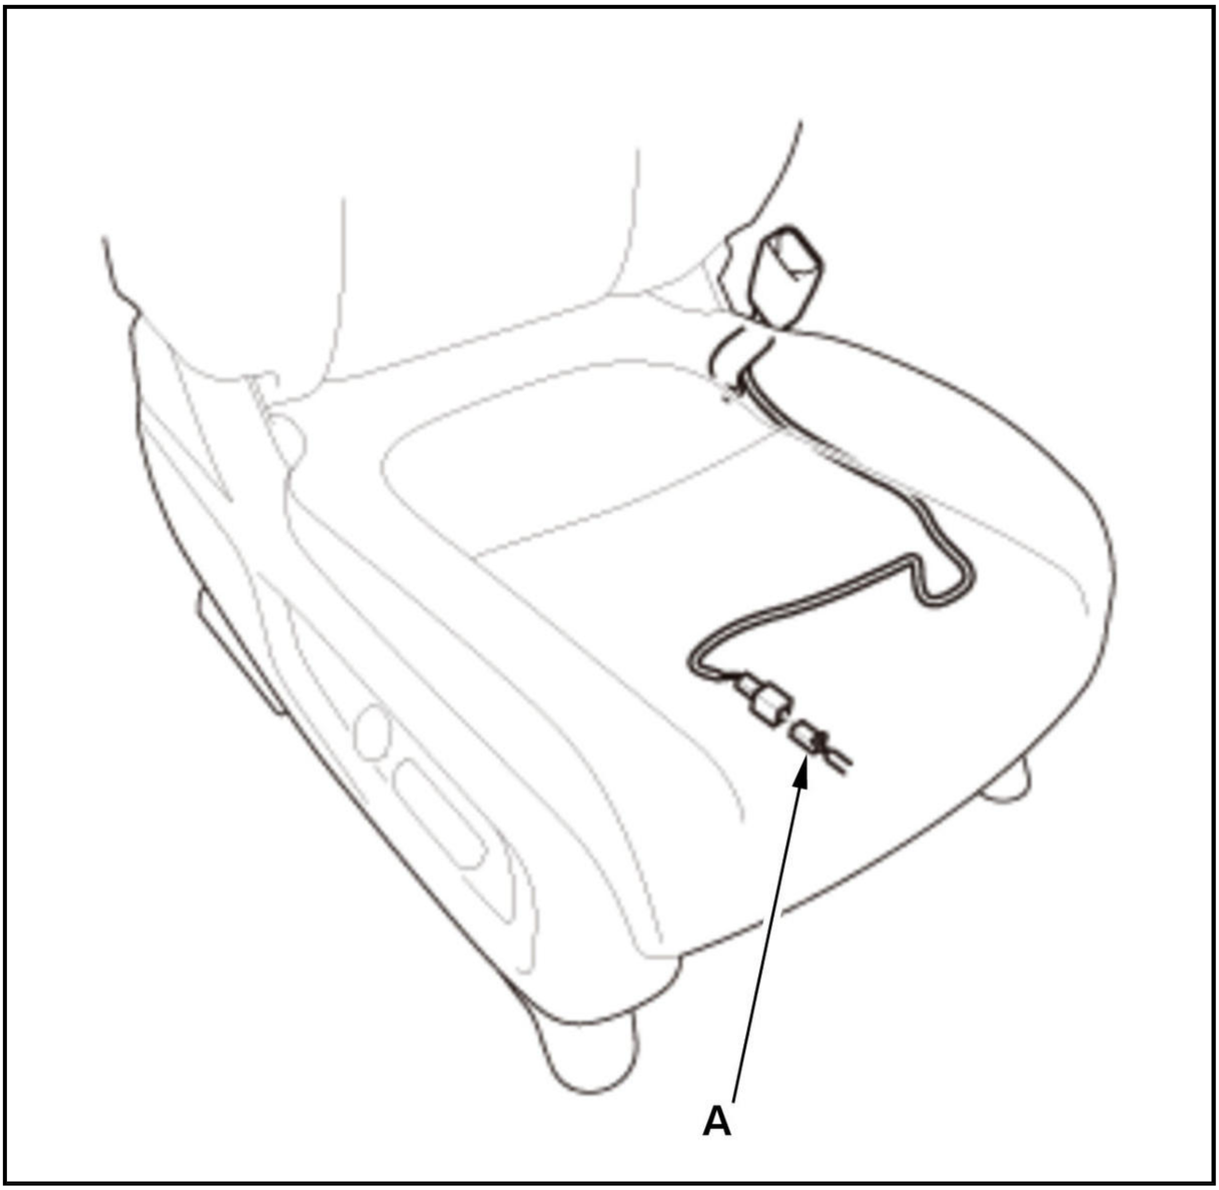
   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's seat belt buckle switch check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the front passenger's seat belt buckle switch 2P connector (A) on the floor wire harness.



-3. Clear the DTCs with the HDS.

-4. Turn the vehicle to the ON mode, then wait for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B0052-11 Short or decreased resistance in the front passenger's seat belt buckle switch	B
B0052-2B Short to another wire harness in the front passenger's seat belt buckle switch	B

Is DTC B0052-11 or B0052-2B indicated?

YES

Short in the floor wire harness; replace the floor wire harness, then clear the DTC.

NO

Faulty front passenger's seat belt buckle switch; **replace the front passenger's seat belt buckle assembly** , then clear the DTC.

DTC B0052-13

DTC B0052-13 : Open or Increased Resistance in the Front Passenger's Seat Belt Buckle Switch

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0052-13 Open or increased resistance in the front passenger's seat belt buckle switch	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds. Buckle and unbuckle the front passenger's seat belt several times.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0052-13 Open or increased resistance in the front passenger's seat belt buckle switch	B

   Is DTC B0052-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

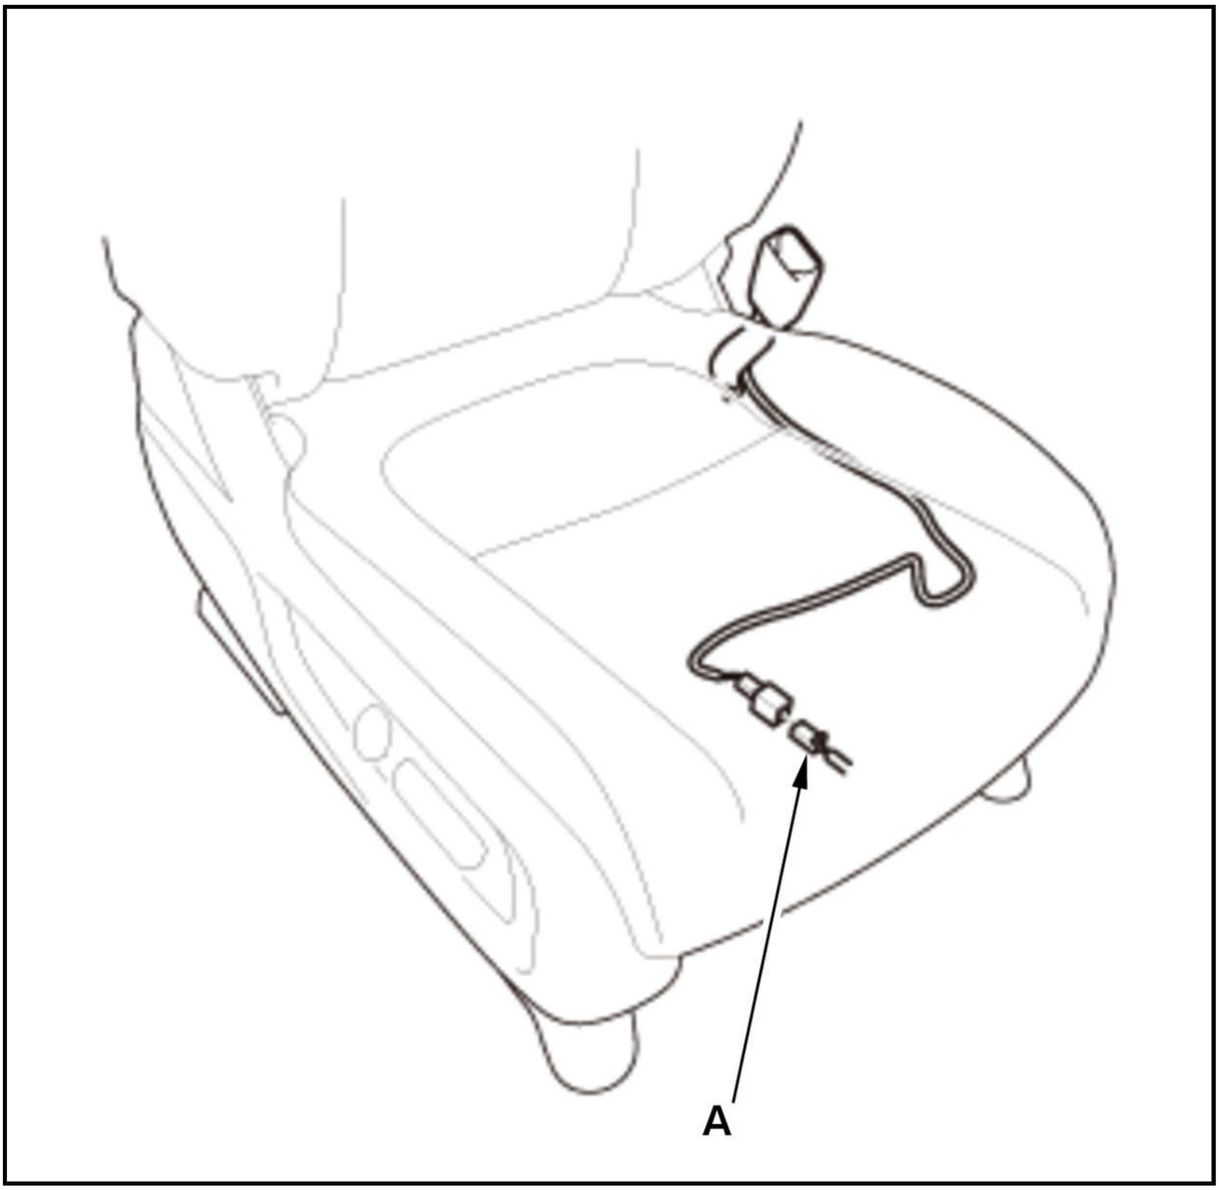
   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's seat belt buckle switch check

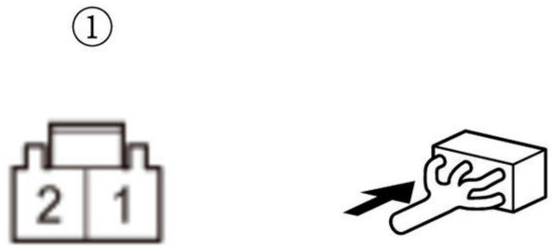
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the front passenger's seat belt buckle switch 2P connector (A) on the floor wire harness.



-3. Connect terminals A and B with a jumper wire.

Terminal A	Front passenger's seat belt buckle switch 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Terminal B	Front passenger's seat belt buckle switch 2P connector (female terminals) No. 2 (on the floor wire harness): ①



-4. Turn the vehicle to the ON mode, then wait for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	**DTC**
B0052-11 Short or decreased resistance in the front passenger's seat belt buckle switch	B

Is DTC B0052-11 indicated?

YES

Faulty front passenger's seat belt buckle switch; **replace the front passenger's seat belt buckle assembly** , then clear the DTC.

NO

Go to step 3.

3. Open wire check (FRBC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

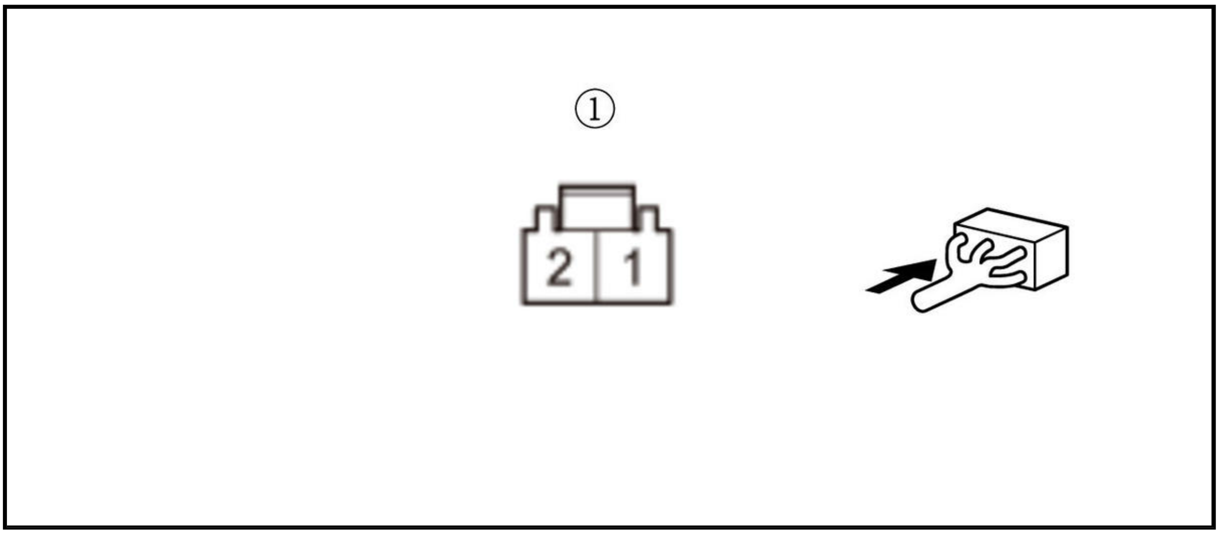
-3. Remove the jumper wire from the front passenger's seat belt buckle switch 2P connector on the floor wire harness.

-4. Disconnect the following connector.

SRS unit connector B (39P)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's seat belt buckle switch 2P connector (on the front passenger's seat wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	Front passenger's seat belt buckle switch 2P connector (female terminals) No. 1 (on the front passenger's seat wire harness): ①
Test point 2	**SRS unit connector B (39P) No. 27**



Is there 1.0 Ω or less?

YES

The FRBC wire is OK. Go to step 4.

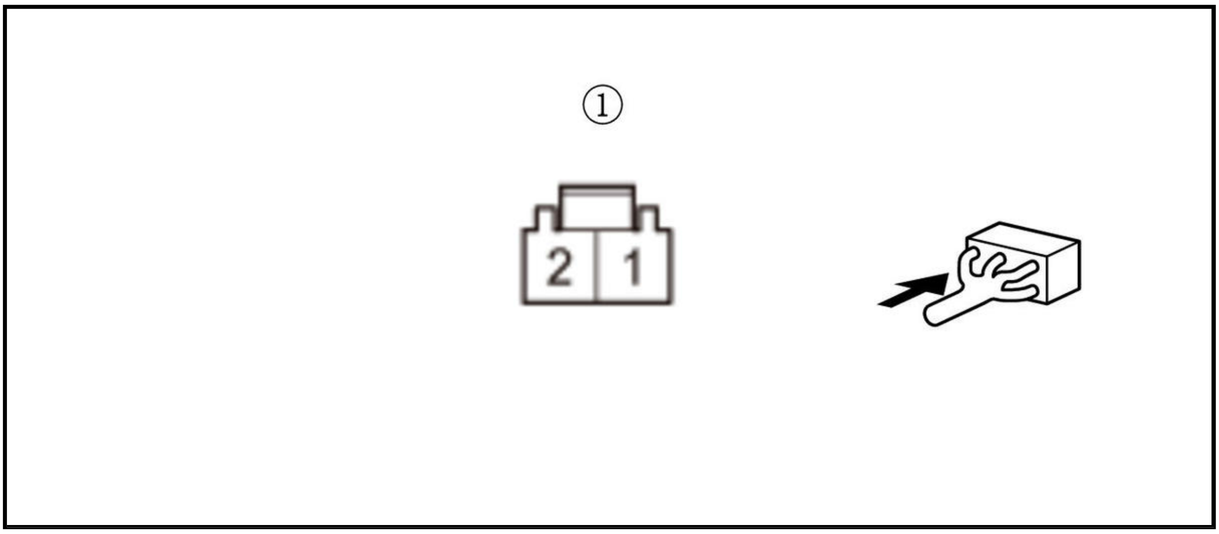
NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

4. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front passenger's seat belt buckle switch 2P connector (on the front passenger's seat wire harness): disconnected SRS unit connector B (39P): disconnected
Test point 1	Front passenger's seat belt buckle switch 2P connector (female terminals) No. 2 (on the front passenger's seat wire harness): ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; check for a poor ground at G502. If the ground is OK, replace the floor wire harness, then clear the DTC.

DTC B0070-11

DTC B0070-11 : Short to Ground in the Driver's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0070-11 Short to ground in the driver's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0070-11 Short to ground in the driver's seat belt tensioner	B

   Is DTC B0070-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (LRP+, LRP- lines) 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the left side B-pillar lower trim** .

   -4. Disconnect the following connector.

Driver's seat belt tensioner 2P connector (on the floor wire harness)

   -5. Reconnect the negative cable to the 12 volt battery.

   -6. Turn the vehicle to the ON mode, then clear the DTC.

   -7. Check for DTCs with the HDS.

DTC Description	DTC
B0070-11 Short to ground in the driver's seat belt tensioner	B

   Is DTC B0070-11 indicated?

   YES

Go to step 3.

NO

Short to ground in the driver's seat belt tensioner; **replace driver's seat belt tensioner** , then clear the DTC.

3. Shorted wire check (LRP+, LRP- lines) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Driver's seat belt tensioner 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 20**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 21**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The LRP+ and LRP- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0070-12

DTC B0070-12 : Short to Power in the Driver's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0070-12 Short to power in the driver's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0070-12 Short to power in the driver's seat belt tensioner	B

Is DTC B0070-12 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (LRP+, LRP- lines to power) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the left side B-pillar lower trim** .

-4. Disconnect the following connector.

Driver's seat belt tensioner 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0070-12 Short to power in the driver's seat belt tensioner	B

Is DTC B0070-12 indicated?

YES

Go to step 3.

NO

Short to power in the left side curtain airbag inflator; **replace the driver's seat belt tensioner** , then clear the DTC.

3. Shorted wire check (LRP+, LRP- lines to power) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Driver's seat belt tensioner 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 20**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 21**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The LRP+ and LRP- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0070-13

DTC B0070-13 : Open or Increased Resistance in the Driver's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0070-13 Open or increased resistance in the driver's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0070-13 Open or increased resistance in the driver's seat belt tensioner	B

Is DTC B0070-13 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's seat belt tensioner check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

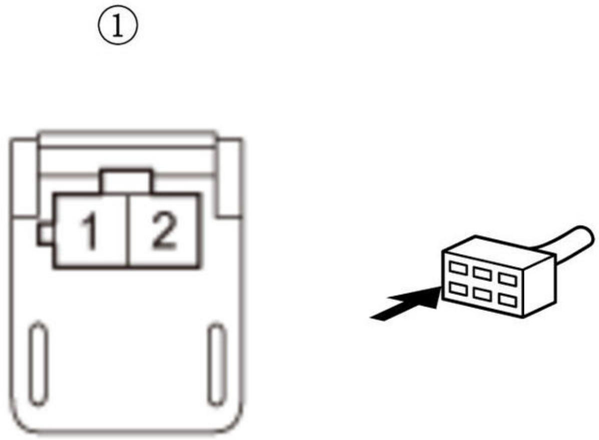
-3. **Remove the left side B-pillar lower trim** .

-4. Disconnect the following connector.

Driver's seat belt tensioner 2P connector (on the floor wire harness)

-5. Connect terminals A and B with a jumper wire.

Terminal A	Driver's seat belt tensioner 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Terminal B	Driver's seat belt tensioner 2P connector (female terminals) No. 2 (on the floor wire harness): ①



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0070-13 Open or increased resistance in the driver's seat belt tensioner	B

Is DTC B0070-13 indicated?

YES

Go to step 3.

NO

Open in the driver's seat belt tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Open wire check (LRP+, LRP- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the driver's seat belt tensioner 2P connector on the floor wire harness.

-4. Disconnect the following connector.

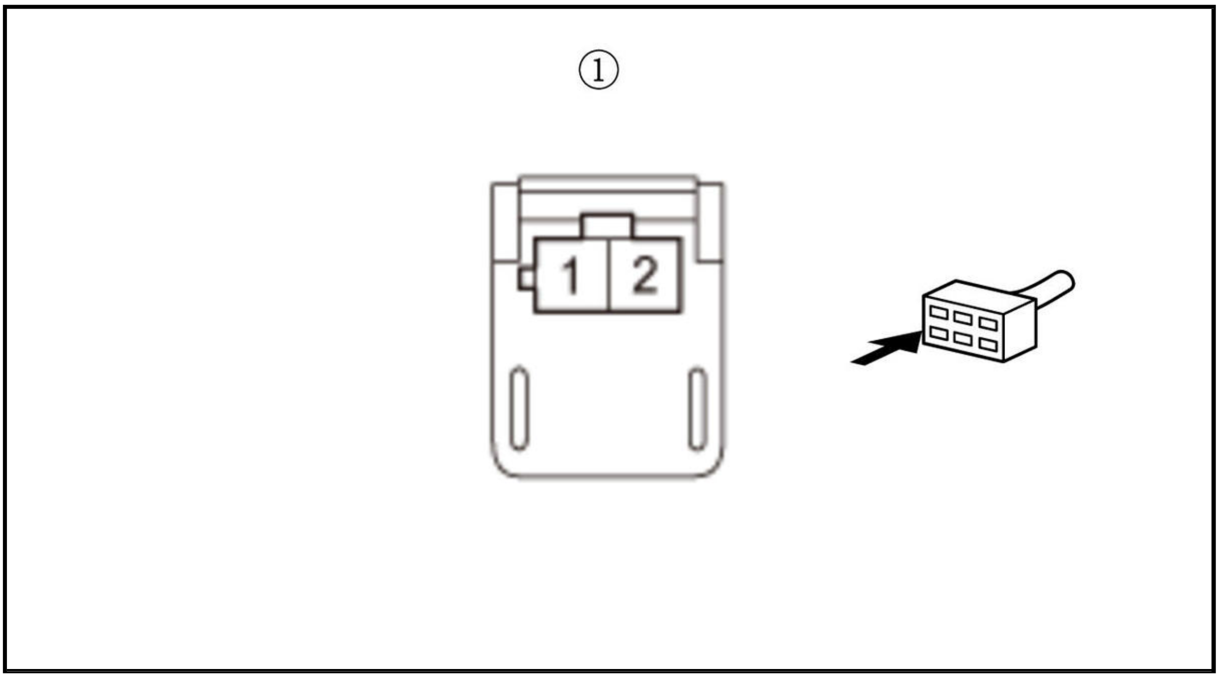
SRS unit connector B (39P)

-5. Connect terminals A and B with a jumper wire.

Terminal A	**SRS unit connector B (39P) No. 20**
Terminal B	**SRS unit connector B (39P) No. 21**

-6. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat belt tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	SRS unit connector B (39P) terminals No. 20 and No. 21: jumped
Test point 1	Driver's seat belt tensioner 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Driver's seat belt tensioner 2P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there 1.0 Ω or less?

YES

The LRP+ and LRP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0070-1A

DTC B0070-1A : Decreased Resistance in the Driver's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0070-1A Decreased resistance in the driver's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0070-1A Decreased resistance in the driver's seat belt tensioner	B

Is DTC B0070-1A indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's seat belt tensioner check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the left side B-pillar lower trim** .

-4. Disconnect the following connector.

Driver's seat belt tensioner 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0070-1A Decreased resistance in the driver's seat belt tensioner	B

Is DTC B0070-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the driver's seat belt tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Shorted wire check (LRP+ line to LRP- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat belt tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 20**
Test point 2	**SRS unit connector B (39P) No. 21**

Is there an open circuit, or at least 1 MΩ?

YES

The LRP+ and LRP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC TROUBLESHOOTING

DTC B0070-2B

DTC B0070-2B : Short to Another Wire Harness in the Driver's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B

   Is DTC B0070-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the left side airbag inflator	B

DTC Description	DTC
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the right side airbag inflator	B
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0001-2B, B0002-2B, B0010-2B, B0011-2B, B0020-2B, B0021-2B, B0028-2B, B0029-2B, B0072-2B, B0079-2B, B007A-2B or B0082-2B indicated with DTC B0070-2B?

YES

Go to step 3.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

3. Shorted wire check (LRP lines to another line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the left side center piller lower trim** .

-4. Disconnect the following connectors.

SRS unit connector A (39P)
SRS unit connector B (39P)
Driver's seat belt tensioner 2P connector (on the floor wire harness)
Inflator connectors which are assigned to 2B codes listed on HDS

-5. Check for continuity between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	SRS unit connector B (39P): disconnected
	Driver's seat belt tensioner 2P connector (on the floor wire harness): disconnected
	Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

DTC	Test point 1	Test point 2
	From terminal	To terminal
B0001-2B	SRS unit connector B (39P) No. 20	SRS unit connector A (39P) No. 9
	SRS unit connector B (39P) No. 21	SRS unit connector A (39P) No. 8
B0002-2B	SRS unit connector B (39P) No. 20	SRS unit connector A (39P) No. 10
	SRS unit connector B (39P) No. 21	SRS unit connector A (39P) No. 11
B0010-2B	SRS unit connector B (39P) No. 20	SRS unit connector A (39P) No. 5
	SRS unit connector B (39P) No. 21	SRS unit connector A (39P) No. 4
B0011-2B	SRS unit connector B (39P) No. 20	SRS unit connector A (39P) No. 6
	SRS unit connector B (39P) No. 21	SRS unit connector A (39P) No. 7
B0020-2B	SRS unit connector B (39P) No. 20	SRS unit connector B (39P) No. 5
	SRS unit connector B (39P) No. 21	SRS unit connector B (39P) No. 6
B0021-2B	SRS unit connector B (39P) No. 20	SRS unit connector B (39P) No. 9
	SRS unit connector B (39P) No. 21	SRS unit connector B (39P) No. 10
B0028-2B	SRS unit connector B (39P) No. 20	SRS unit connector B (39P) No. 4
	SRS unit connector B (39P) No. 21	SRS unit connector B (39P) No. 3
B0029-2B	SRS unit connector B (39P) No. 20	SRS unit connector B (39P) No. 8
	SRS unit connector B (39P) No. 21	SRS unit connector B (39P) No. 7
B0072-2B	SRS unit connector B (39P) No. 20	SRS unit connector B (39P) No. 19
	SRS unit connector B (39P) No. 21	SRS unit connector B (39P) No. 18
B0079-2B	SRS unit connector B (39P) No. 20	SRS unit connector B (39P) No. 24
	SRS unit connector B (39P) No. 21	SRS unit connector B (39P) No. 25
B007A-2B	SRS unit connector B (39P) No. 20	SRS unit connector B (39P) No. 23
	SRS unit connector B (39P) No. 21	SRS unit connector B (39P) No. 22
B0082-2B	SRS unit connector B (39P) No. 20	SRS unit connector A (39P) No. 2
	SRS unit connector B (39P) No. 21	SRS unit connector A (39P) No. 3

Is there continuity?

YES

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

NO

The LRP wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

DTC B0072-11

DTC B0072-11 : Short to Ground in the Front Passenger's Seat Belt Tensioner

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and 12 Volt Battery Terminal Disconnection and Reconnection .

DTC Description	DTC
B0072-11 Short to ground in the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0072-11 Short to ground in the front passenger's seat belt tensioner	B

   Is DTC B0072-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (RRP+, RRP- lines) 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the right side B-pillar lower trim** .

   -4. Disconnect the following connector.

Front passenger's seat belt tensioner 2P connector (on the floor wire harness)

   -5. Reconnect the negative cable to the 12 volt battery.

   -6. Turn the vehicle to the ON mode, then clear the DTC.

   -7. Check for DTCs with the HDS.

DTC Description	DTC
B0072-11 Short to ground in the front passenger's seat belt tensioner	B

   Is DTC B0072-11 indicated?

   NO

   Go to step 3.

   YES

   Short to ground in the front passenger's seat belt tensioner; **replace the front passenger's seat belt tensioner** , then clear the DTC.

3. Shorted wire check (RRP+, RRP- lines) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's seat belt tensioner 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 18**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 19**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The RRP+ and RRP-wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0072-12

DTC B0072-12 : Short to Power in the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0072-12 Short to power in the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0072-12 Short to power in the front passenger's seat belt tensioner	B

Is DTC B0072-12 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (RRP+, RRP- lines to power) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the right side B-pillar lower trim** .

-4. Disconnect the following connector.

Front passenger's seat belt tensioner 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0072-12 Short to power in the front passenger's seat belt tensioner	B

Is DTC B0072-12 indicated?

NO

Go to step 3.

YES

Short to power in the front passenger's seat belt tensioner; **replace the front passenger's seat belt tensioner** , then clear the DTC.

3. Shorted wire check (RRP+, RRP- lines to power) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Front passenger's seat belt tensioner 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 18**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 19**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The RRP+ and RRP- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0072-13

DTC B0072-13 : Open or Increased Resistance in the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0072-13 Open or increased resistance in the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0072-13 Open or increased resistance in the front passenger's seat belt tensioner	B

Is DTC B0072-13 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's seat belt tensioner check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

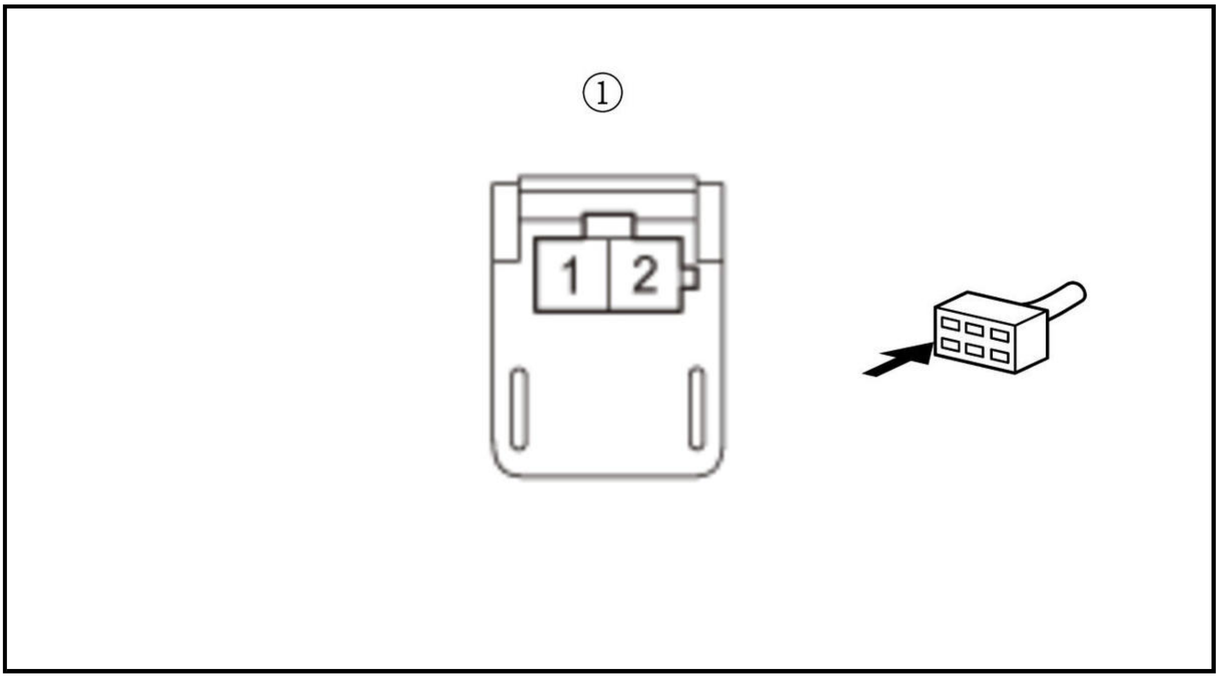
-3. **Remove the right side B-pillar lower trim** .

-4. Disconnect the following connector.

Front passenger's seat belt tensioner 2P connector (on the floor wire harness)

-5. Connect terminals A and B with a jumper wire.

Terminal A	Front passenger's seat belt tensioner 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Terminal B	Front passenger's seat belt tensioner 2P connector (female terminals) No. 2 (on the floor wire harness): ①



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0072-13 Open or increased resistance in the front passenger's seat belt tensioner	B

Is DTC B0072-13 indicated?

YES

Go to step 3.

NO

Open in the front passenger's seat belt tensioner; **replace the front passenger's seat belt** , then clear the DTC.

3. Open wire check (RRP+, RRP- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the front passenger's seat belt tensioner 2P connector on the floor wire harness.

-4. Disconnect the following connector.

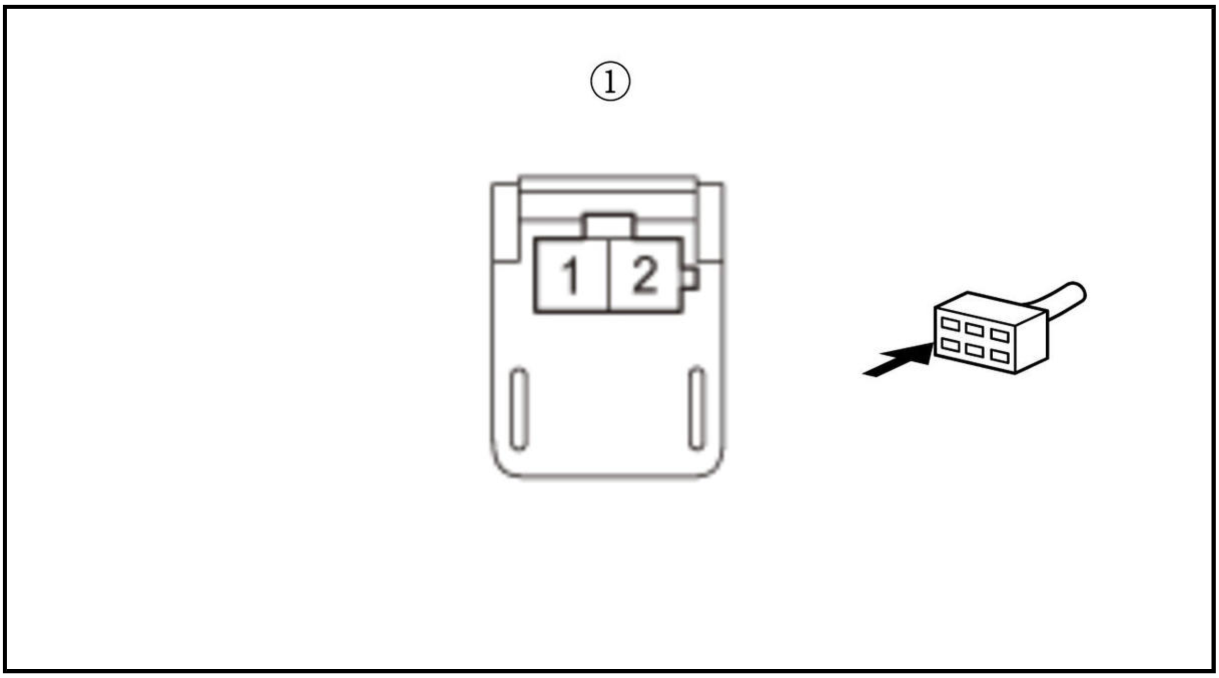
SRS unit connector B (39P)

-5. Connect terminals A and B with a jumper wire.

Terminal A	**SRS unit connector B (39P) No. 18**
Terminal B	**SRS unit connector B (39P) No. 19**

-6. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's seat belt tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	SRS unit connector B (39P) terminals No. 18 and No. 19: jumped
Test point 1	Front passenger's belt tensioner 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Front passenger's seat belt tensioner 2P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there 1.0 Ω or less?

YES

The RRP+ and RRP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0072-1A

DTC B0072-1A : Decreased Resistance in the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0072-1A Decreased resistance in the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0072-1A Decreased resistance in the front passenger's seat belt tensioner	B

Is DTC B0072-1A indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's seat belt tensioner check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the right side B-pillar lower trim** .

-4. Disconnect the following connector.

Front passenger's seat belt tensioner 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0072-1A Decreased resistance in the front passenger's seat belt tensioner	B

Is DTC B0072-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the front passenger's seat belt tensioner; **replace the front passenger's seat belt** , then clear the DTC.

3. Shorted wire check (RRP+ line to RRP- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's seat belt tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 18**
Test point 2	**SRS unit connector B (39P) No. 19**

Is there an open circuit, or at least 1 MΩ?

YES

The RRP+ and RRP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0072-2B

DTC B0072-2B : Short to Another Wire Harness in the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B

Is DTC B0072-2B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the left side airbag inflator	B
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the right side airbag inflator	B
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0001-2B, B0002-2B, B0010-2B, B0011-2B, B0020-2B, B0021-2B, B0028-2B, B0029-2B, B0070-2B, B0079-2B, B007A-2B or B0082-2B indicated with DTC B0072-2B?

YES

Go to step 3.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

3. Shorted wire check (RRP lines to another line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the right side center piller lower trim** .

-4. Disconnect the following connectors.

SRS unit connector A (39P)	
SRS unit connector B (39P)	
Front passenger's seat belt tensioner 2P connector (on the floor wire harness)	
Inflator connectors which are assigned to 2B codes listed on HDS	

-5. Check for continuity between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	SRS unit connector B (39P): disconnected
	Front passenger's seat belt tensioner 2P connector (on the floor wire harness): disconnected
	Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

DTC	Test point 1	Test point 2
	From terminal	To terminal
B0001-2B	SRS unit connector B (39P) No. 19	SRS unit connector A (39P) No. 9
	SRS unit connector B (39P) No. 18	SRS unit connector A (39P) No. 8

	SRS unit connector B (39P) No. 18	SRS unit connector B (39P) No. 22

DTC	Test point 1	Test point 2
	From terminal	To terminal
B0082-2B	SRS unit connector B (39P) No. 19	SRS unit connector A (39P) No. 2
	SRS unit connector B (39P) No. 18	SRS unit connector A (39P) No. 3

Is there continuity?

YES

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

NO

The RRP wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

DTC B0079-11

DTC B0079-11 : Short to Ground in the Driver's Seat Belt Outer Lap Tensioner

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0079-11 Short to ground in the driver's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0079-11 Short to ground in the driver's seat belt outer lap tensioner	B

   Is DTC B0079-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

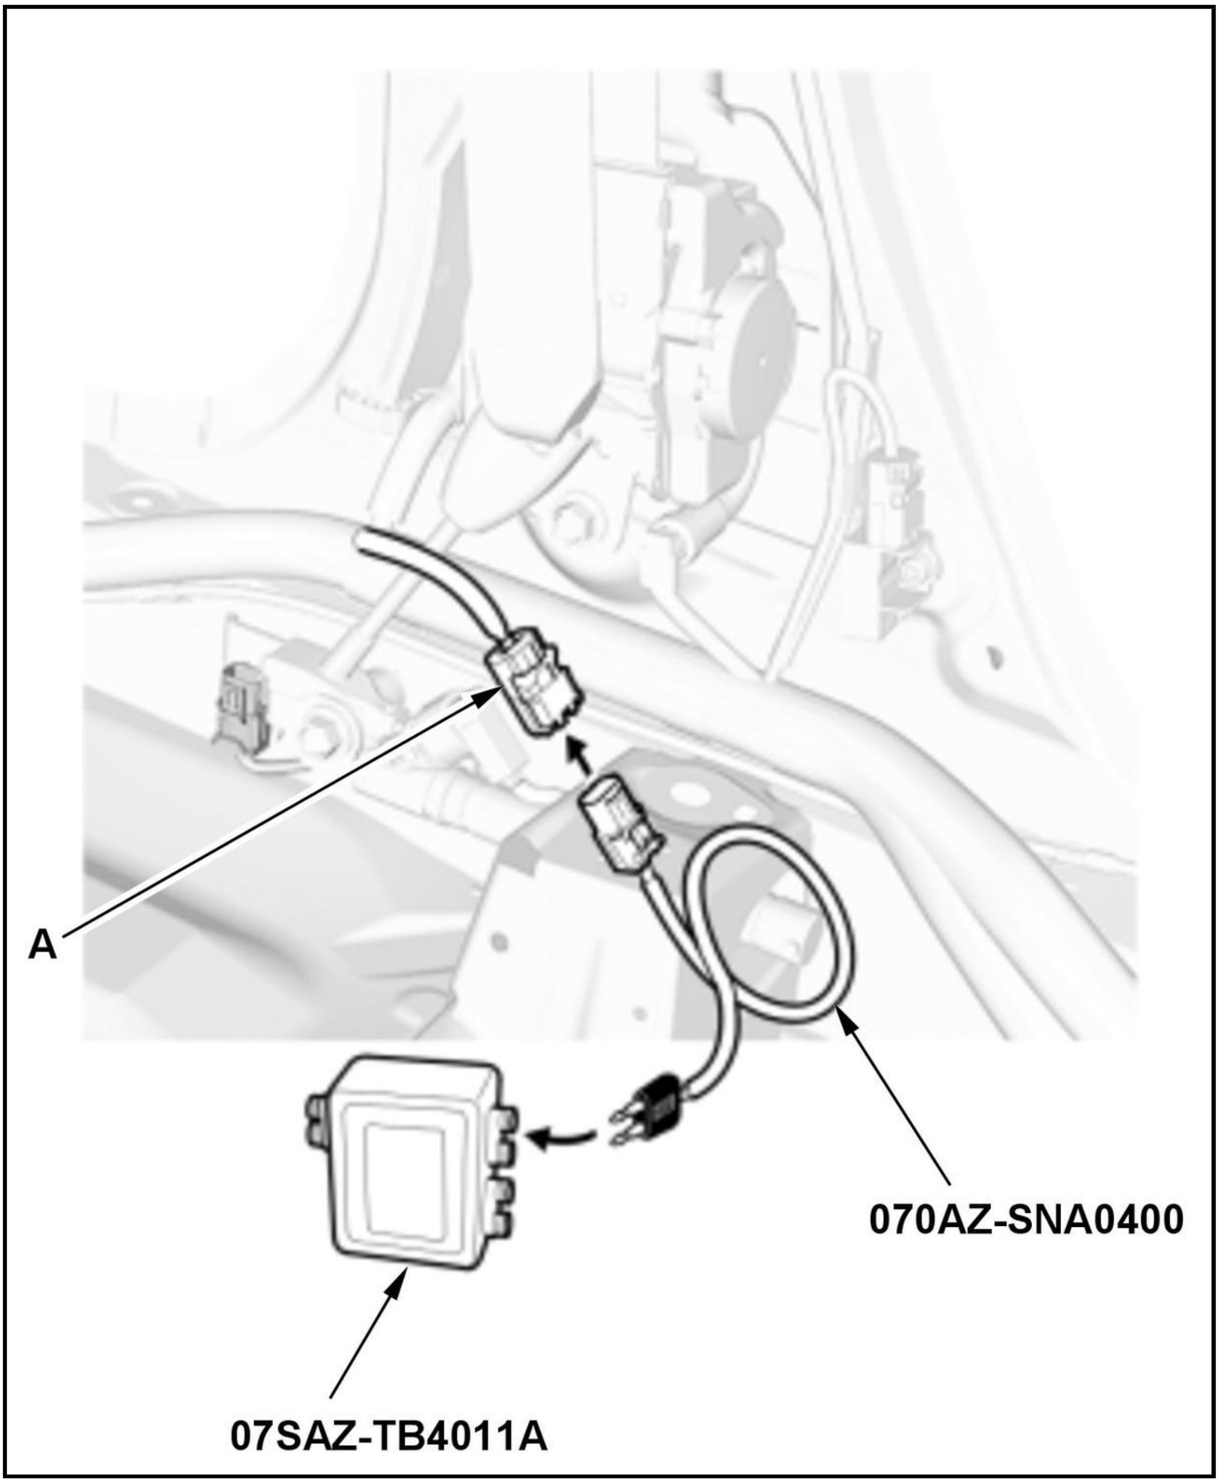
2. Driver's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the left side B-pillar lower trim cover** .

   -4. Disconnect the driver's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-5. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0079-11 Short to ground in the driver's seat belt outer lap tensioner	B

Is DTC B0079-11 indicated?

YES

Go to step 3.

NO

Short to ground in the driver's seat belt outer lap tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Shorted wire check (LLP+, LLP- lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the following connector:

SRS unit connector B (39P)

-4. Disconnect SRS simulator lead M from the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 24**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 25**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The LLP+ and LLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0079-12

DTC B0079-12 : Short to Power in the Driver's Seat Belt Outer Lap Tensioner

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0079-12 Short to power in the driver's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0079-12 Short to power in the driver's seat belt outer lap tensioner	B

   Is DTC B0079-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

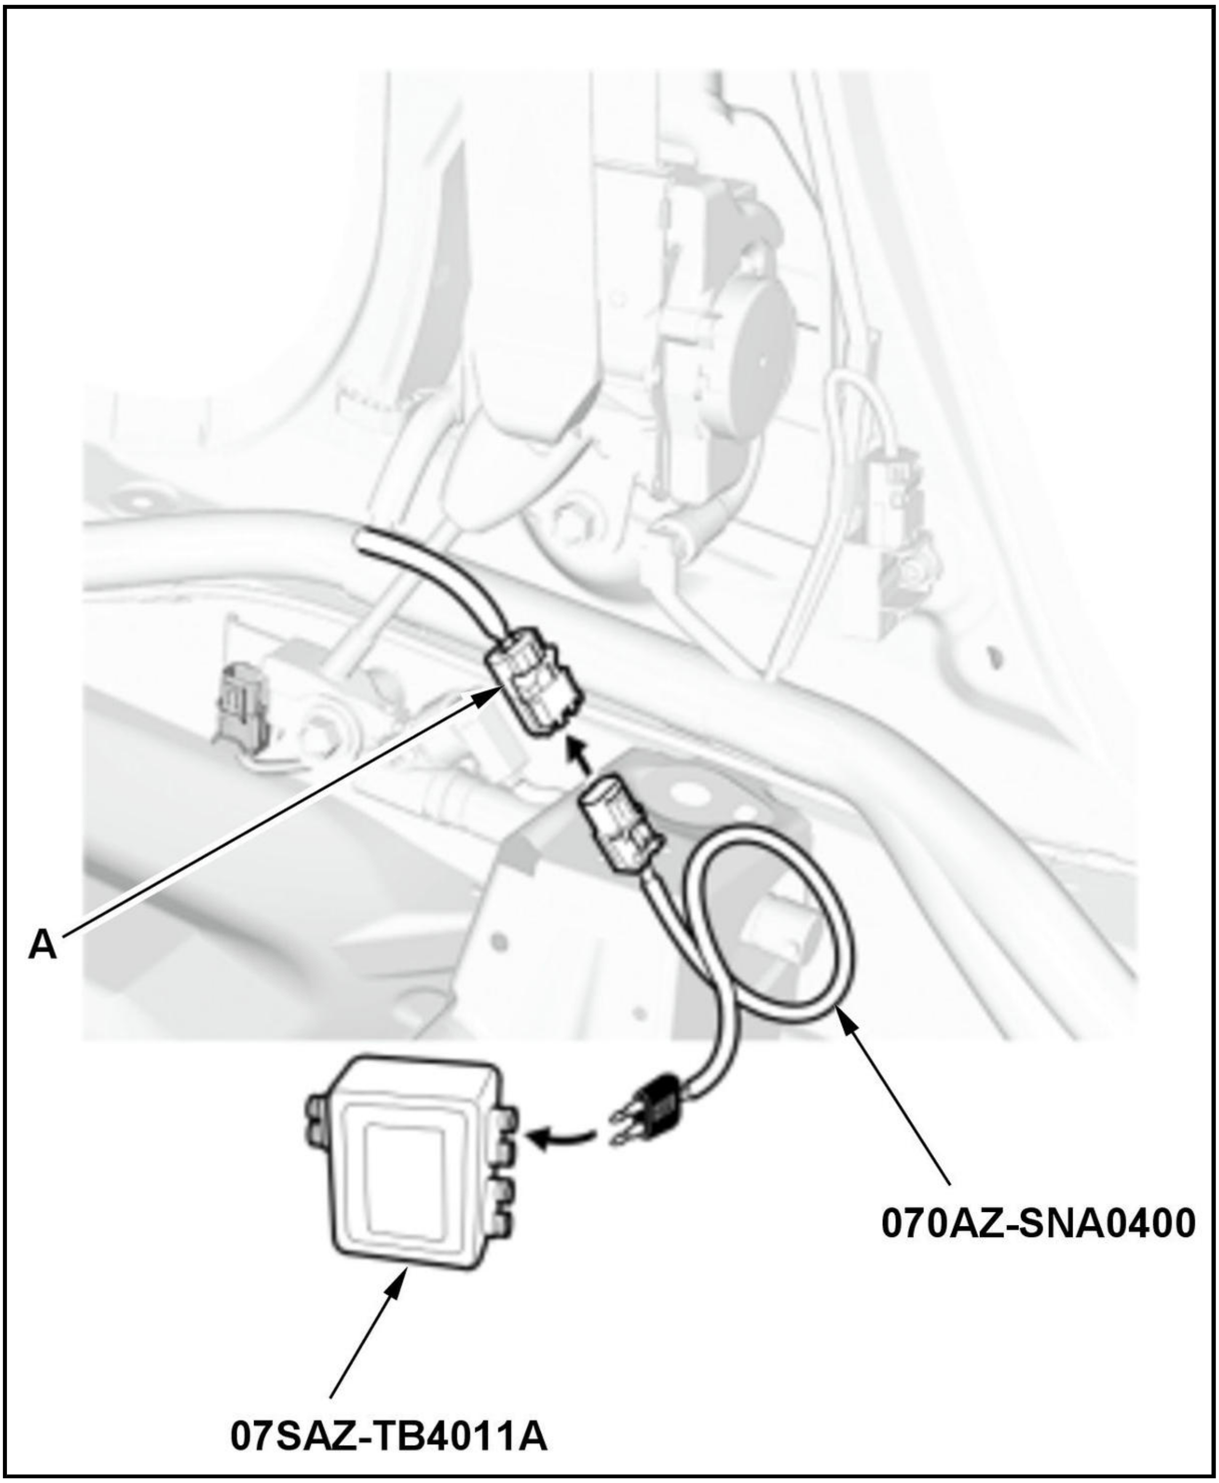
2. Driver's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the left side B-pillar lower trim cover** .

   -4. Disconnect the driver's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-5. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0079-12 Short to power in the driver's seat belt outer lap tensioner	B

Is DTC B0079-12 indicated?

YES

Go to step 3.

NO

Short to power in the driver's seat belt outer lap tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Shorted wire check (LLP+, LLP- lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector:

SRS unit connector B (39P)

-4. Disconnect SRS simulator lead M from the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Driver's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 24**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 25**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The LLP+ and LLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0079-13

DTC B0079-13 : Open or Increased Resistance in the Driver's Seat Belt Outer Lap Tensioner

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0079-13 Open or increased resistance in the driver's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0079-13 Open or increased resistance in the driver's seat belt outer lap tensioner	B

   Is DTC B0079-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

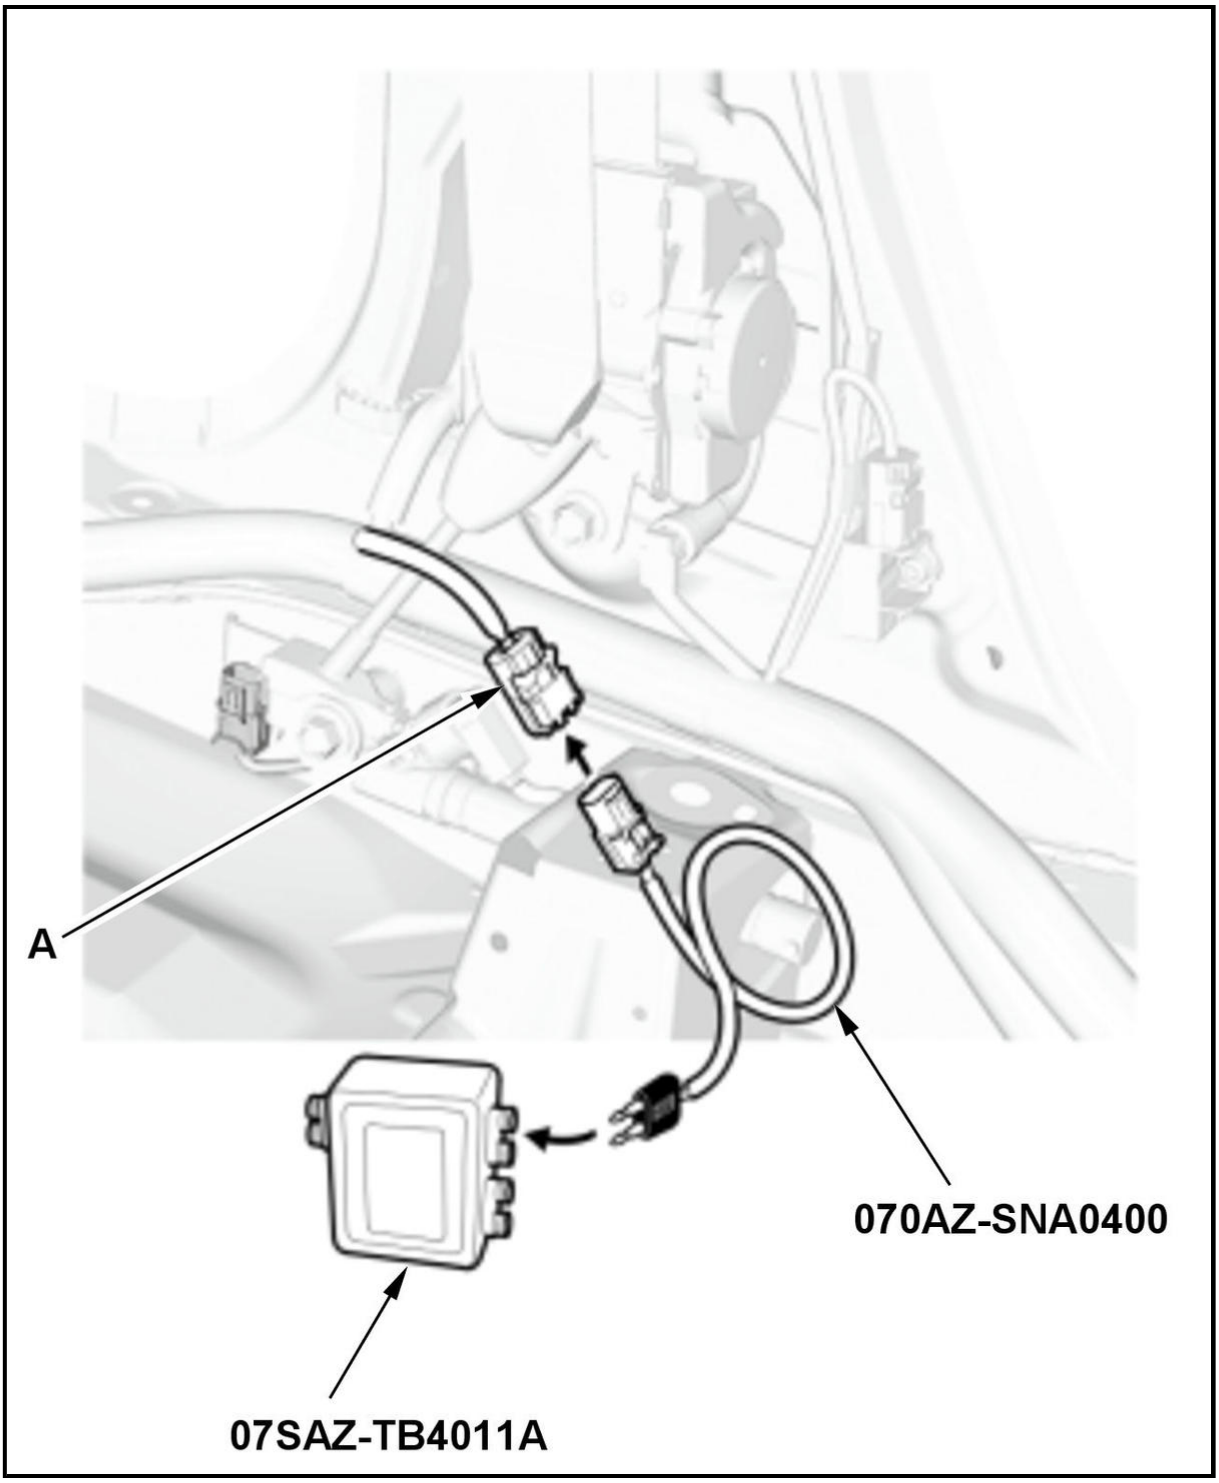
2. Driver's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the left side B-pillar lower trim cover** .

   -4. Disconnect the driver's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-5. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0079-13 Open or increased resistance in the driver's seat belt outer lap tensioner	B

Is DTC B0079-13 indicated?

YES

Go to step 3.

NO

Open in the driver's seat belt outer lap tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Open wire check (LLP+, LLP- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector:

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Driver's seat belt outer lap tensioner 2P connector (on the floor wire harness): connected to SRS simulator lead M
Test point 1	**SRS unit connector B (39P) No. 24**
Test point 2	**SRS unit connector B (39P) No. 25**

Is there 2.0-3.0 Ω?

YES

The LLP+ and LLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0079-1A, B0079-2B

DTC B0079-1A : Decreased Resistance in the Driver's Seat Belt Outer Lap Tensioner

DTC B0079-2B : Short to Another Wire Harness in the Driver's Seat Belt Outer Lap Tensioner

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0079-1A Decreased resistance in the driver's seat belt outer lap tensioner	B
B0079-2B Short to another wire in the driver's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0079-1A Decreased resistance in the driver's seat belt outer lap tensioner	B

DTC Description	DTC
B0079-2B Short to another wire in the driver's seat belt outer lap tensioner	B

   Is DTC B0079-1A or B0079-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

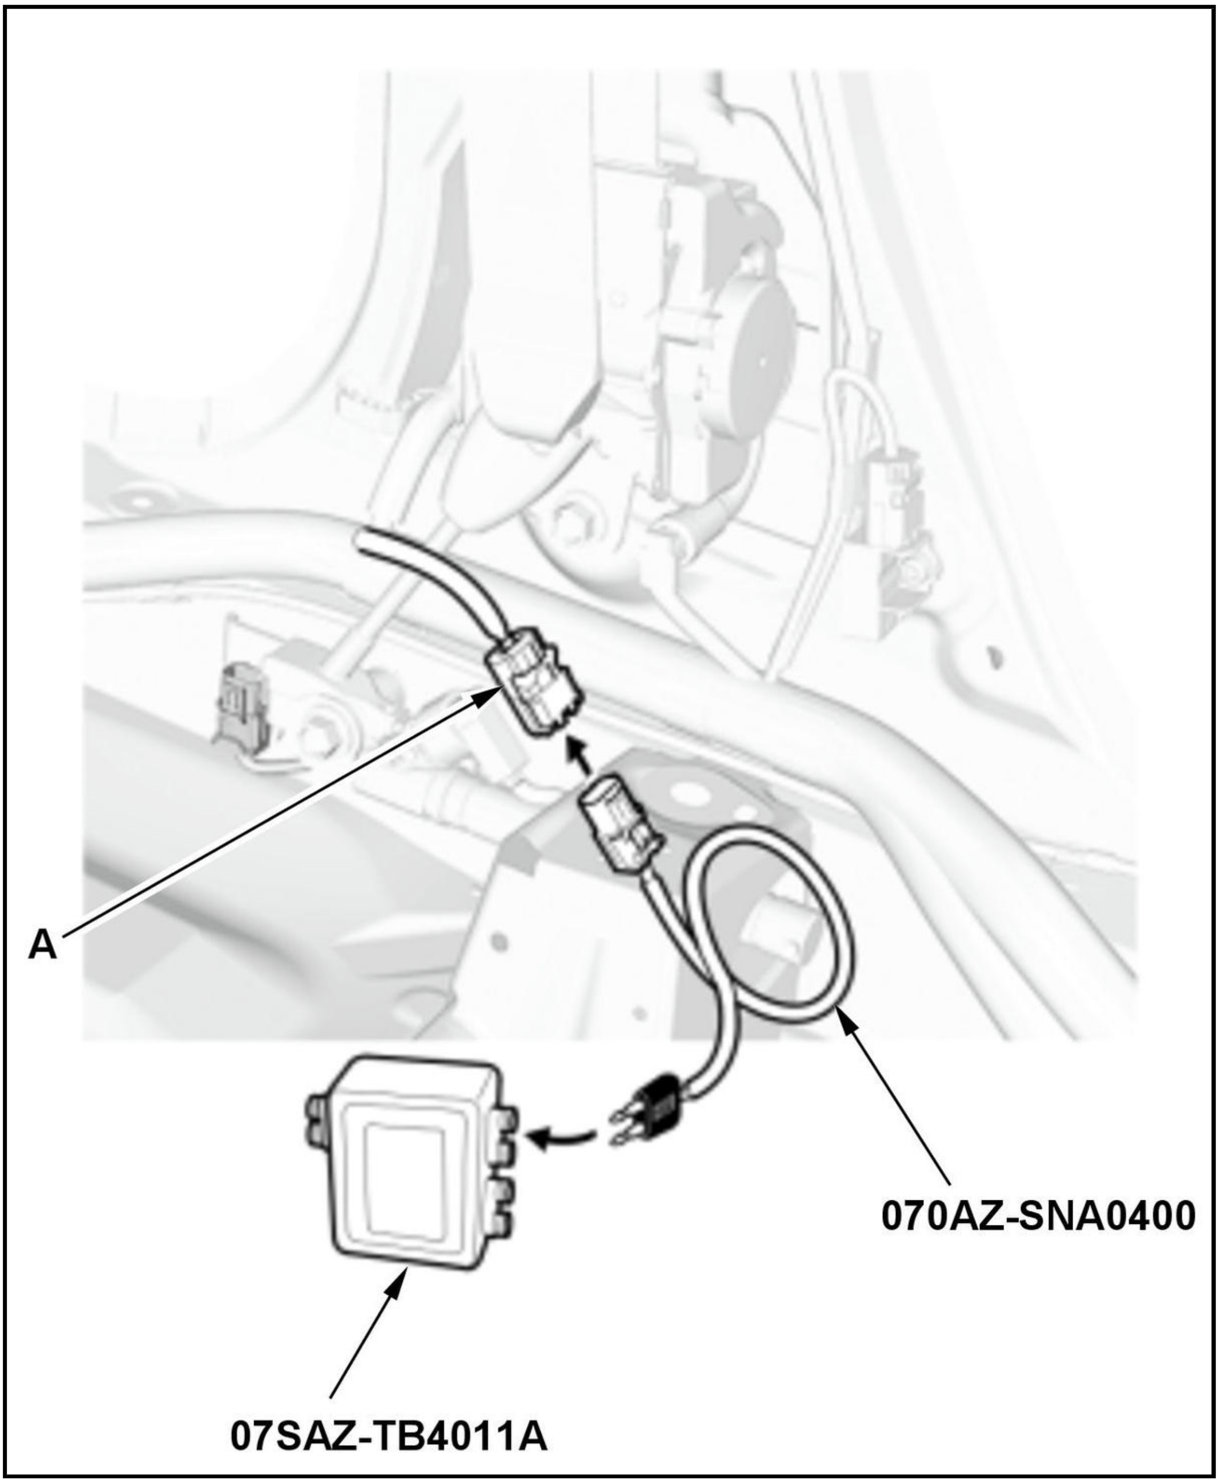
2. Driver's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the left side B-pillar lower trim cover** .

   -4. Disconnect the driver's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-5. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0079-1A Decreased resistance in the driver's seat belt outer lap tensioner	B
B0079-2B Short to another wire in the driver's seat belt outer lap tensioner	B

Is DTC B0079-1A or B0079-2B indicated?

YES

Go to step 3.

NO

Short to another wire in the driver's seat belt outer lap tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Shorted wire check (LLP+ line to LLP- line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the following connector:

SRS unit connector B (39P)

   -4. Disconnect SRS simulator lead M from the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

   -5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 24**
Test point 2	**SRS unit connector B (39P) No. 25**

Is there an open circuit, or at least 1 MΩ?

YES

The LLP+ and LLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B007A-11

DTC B007A-11 : Short to Ground in the Front Passenger's Seat Belt Outer Lap Tensioner

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number**

and were properly installed .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B007A-11 Short to ground in the front passenger's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B007A-11 Short to ground in the front passenger's seat belt outer lap tensioner	B

   Is DTC B007A-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

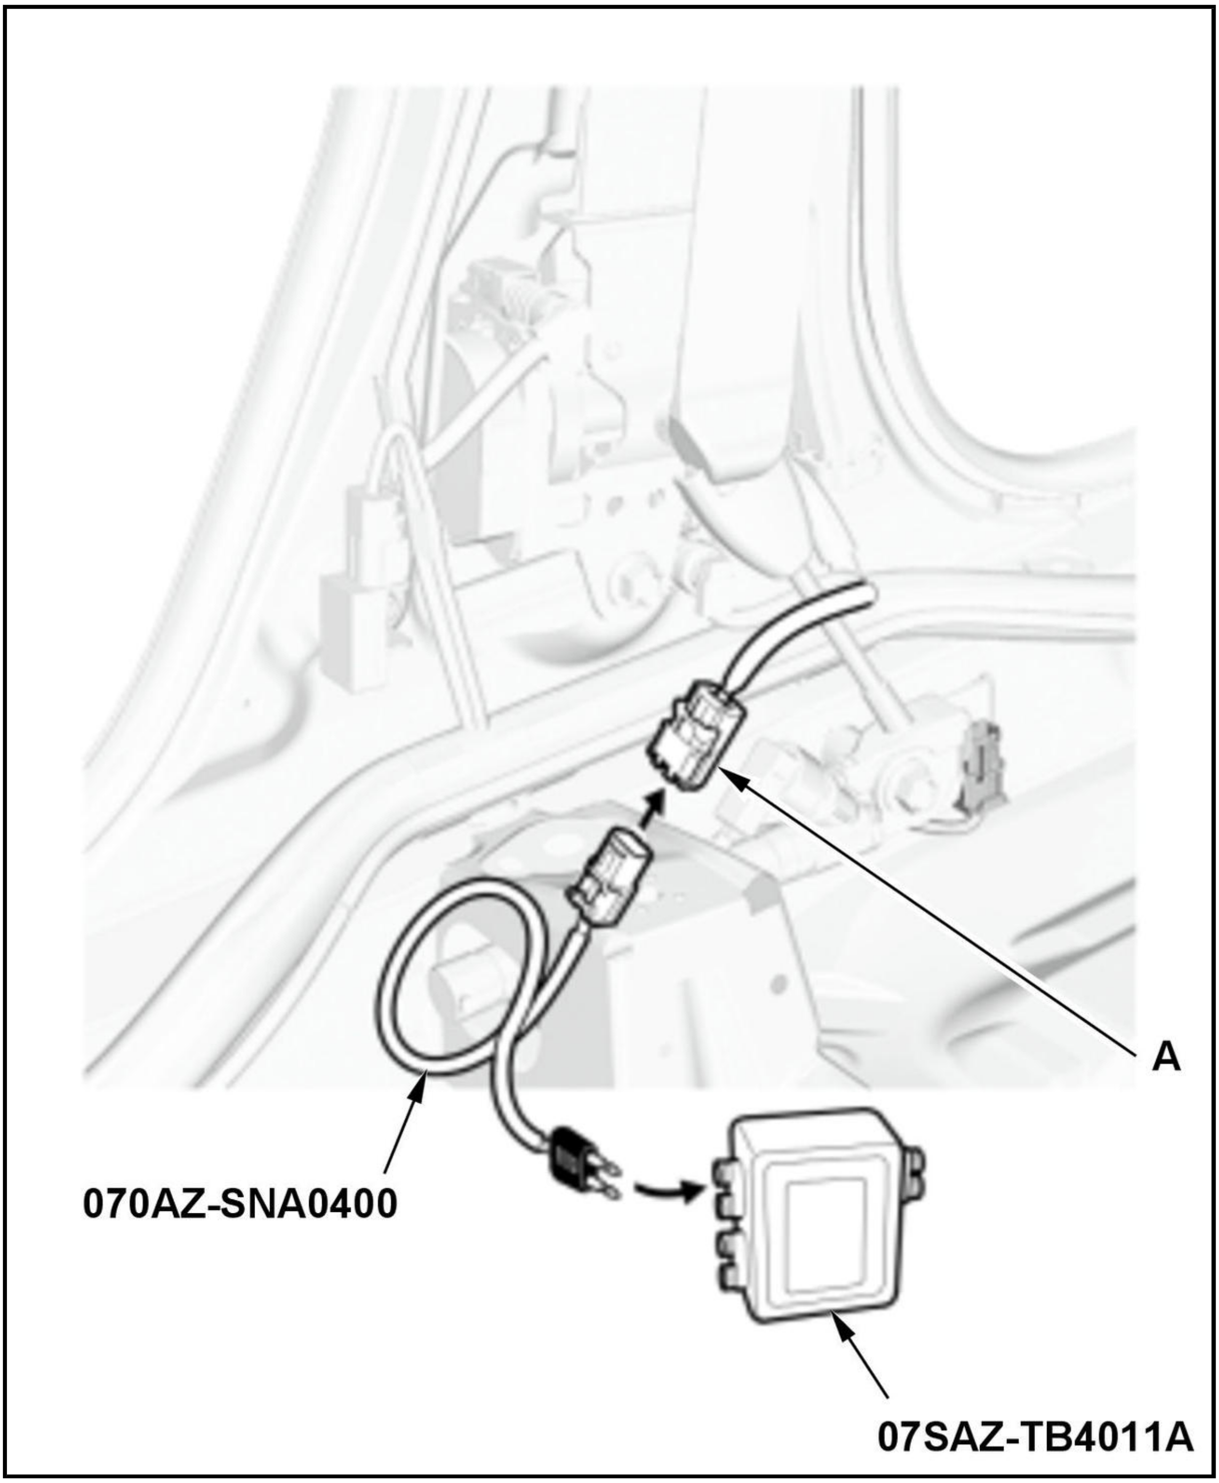
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the front passenger's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-4. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B007A-11 Short to ground in the front passenger's seat belt outer lap tensioner	B

Is DTC B007A-11 indicated?

YES

Go to step 3.

NO

Short to ground in the front passenger's seat belt outer lap tensioner; replace the front passenger's seat belt outer lap tensioner , then clear the DTC.

3. Shorted wire check (RLP+, RLP- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector:

SRS unit connector B (39P)

-4. Disconnect SRS simulator lead M from the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	SRS unit connector B (39P) No. 22
Test point 2	Body ground

Test point 1	SRS unit connector B (39P) No. 23
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The RLP+ and RLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, replace the SRS unit . If the DTC does not clear, replace the floor wire harness.

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B007A-12

DTC B007A-12 : Short to Power in the Front Passenger's Seat Belt Outer Lap Tensioner

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B007A-12 Short to power in the front passenger's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B007A-12 Short to power in the front passenger's seat belt outer lap tensioner	B

   Is DTC B007A-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

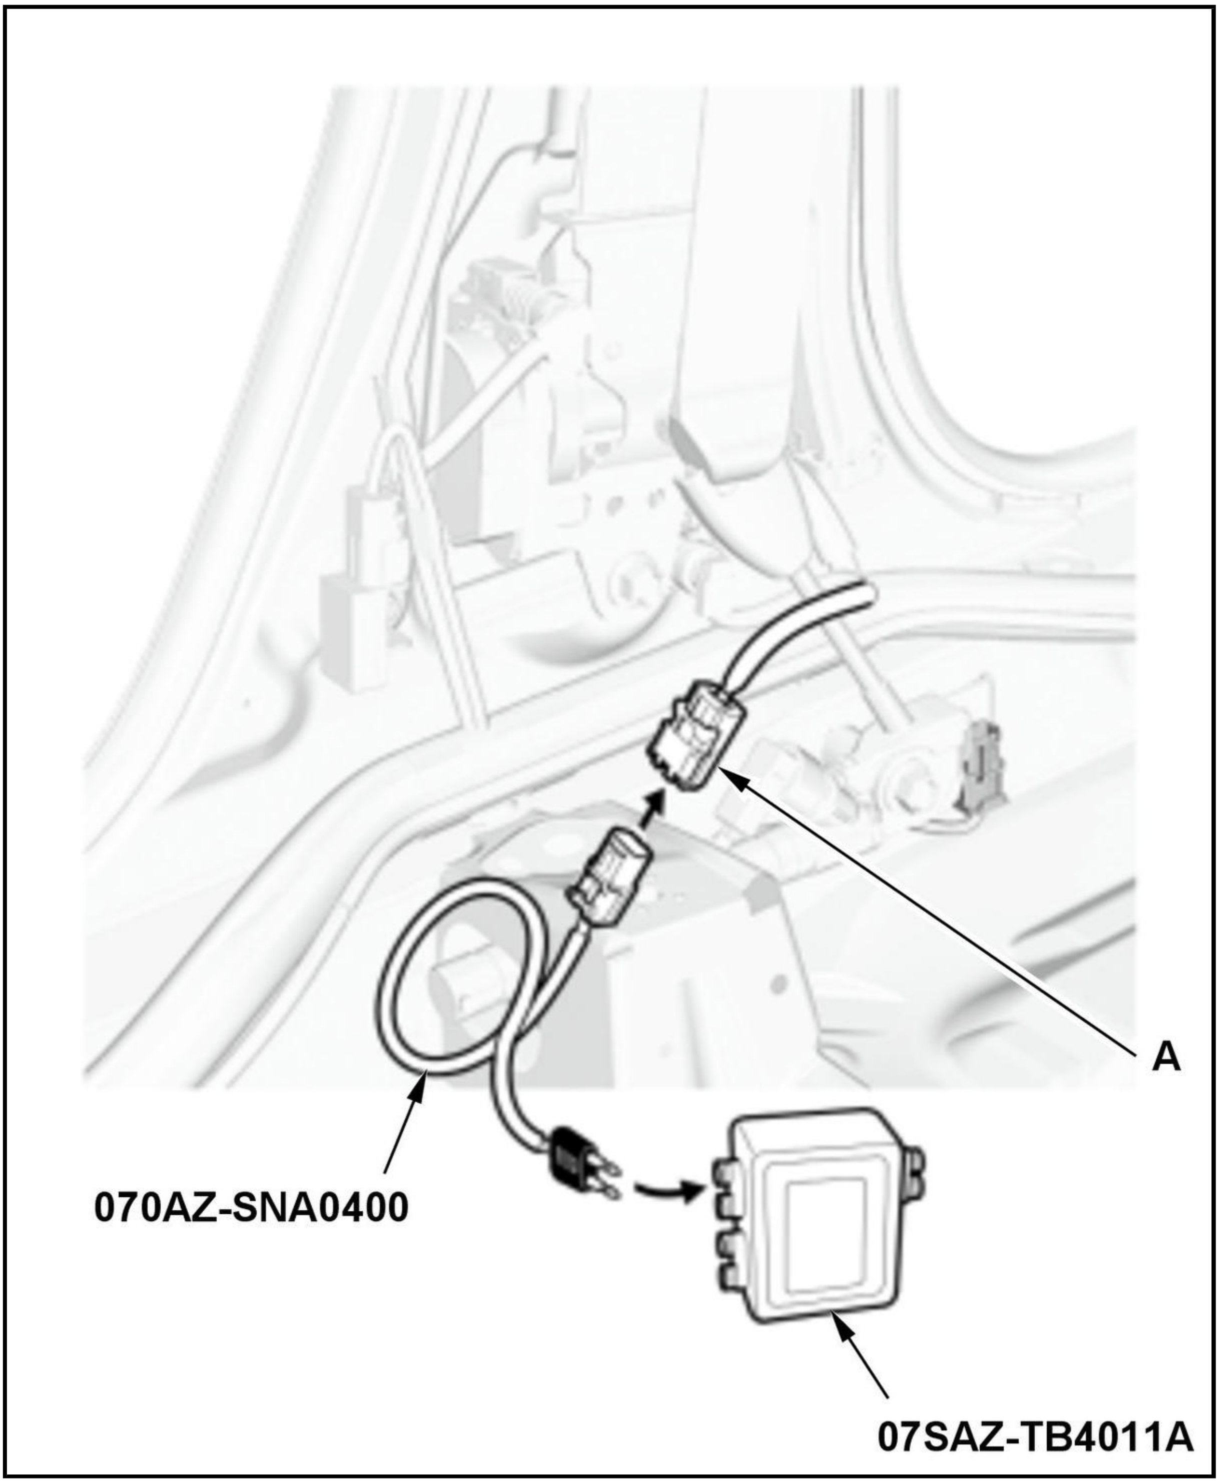
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the front passenger's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-4. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B007A-12 Short to power in the front passenger's seat belt outer lap tensioner	B

Is DTC B007A-12 indicated?

YES

Go to step 3.

NO

Short to power in the front passenger's seat belt outer lap tensioner; **replace the front passenger's seat belt outer lap tensioner** , then clear the DTC.

3. Shorted wire check (RLP+, RLP- lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector:

SRS unit connector B (39P)

-4. Disconnect SRS simulator lead M from the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Front passenger's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 22**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 23**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The RLP+ and RLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B007A-13

DTC B007A-13 : Open or Increased Resistance in the Front Passenger's Seat Belt Outer Lap Tensioner

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B007A-13 Open or increased resistance in the front passenger's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B007A-13 Open or increased resistance in the front passenger's seat belt outer lap tensioner	B

   Is DTC B007A-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

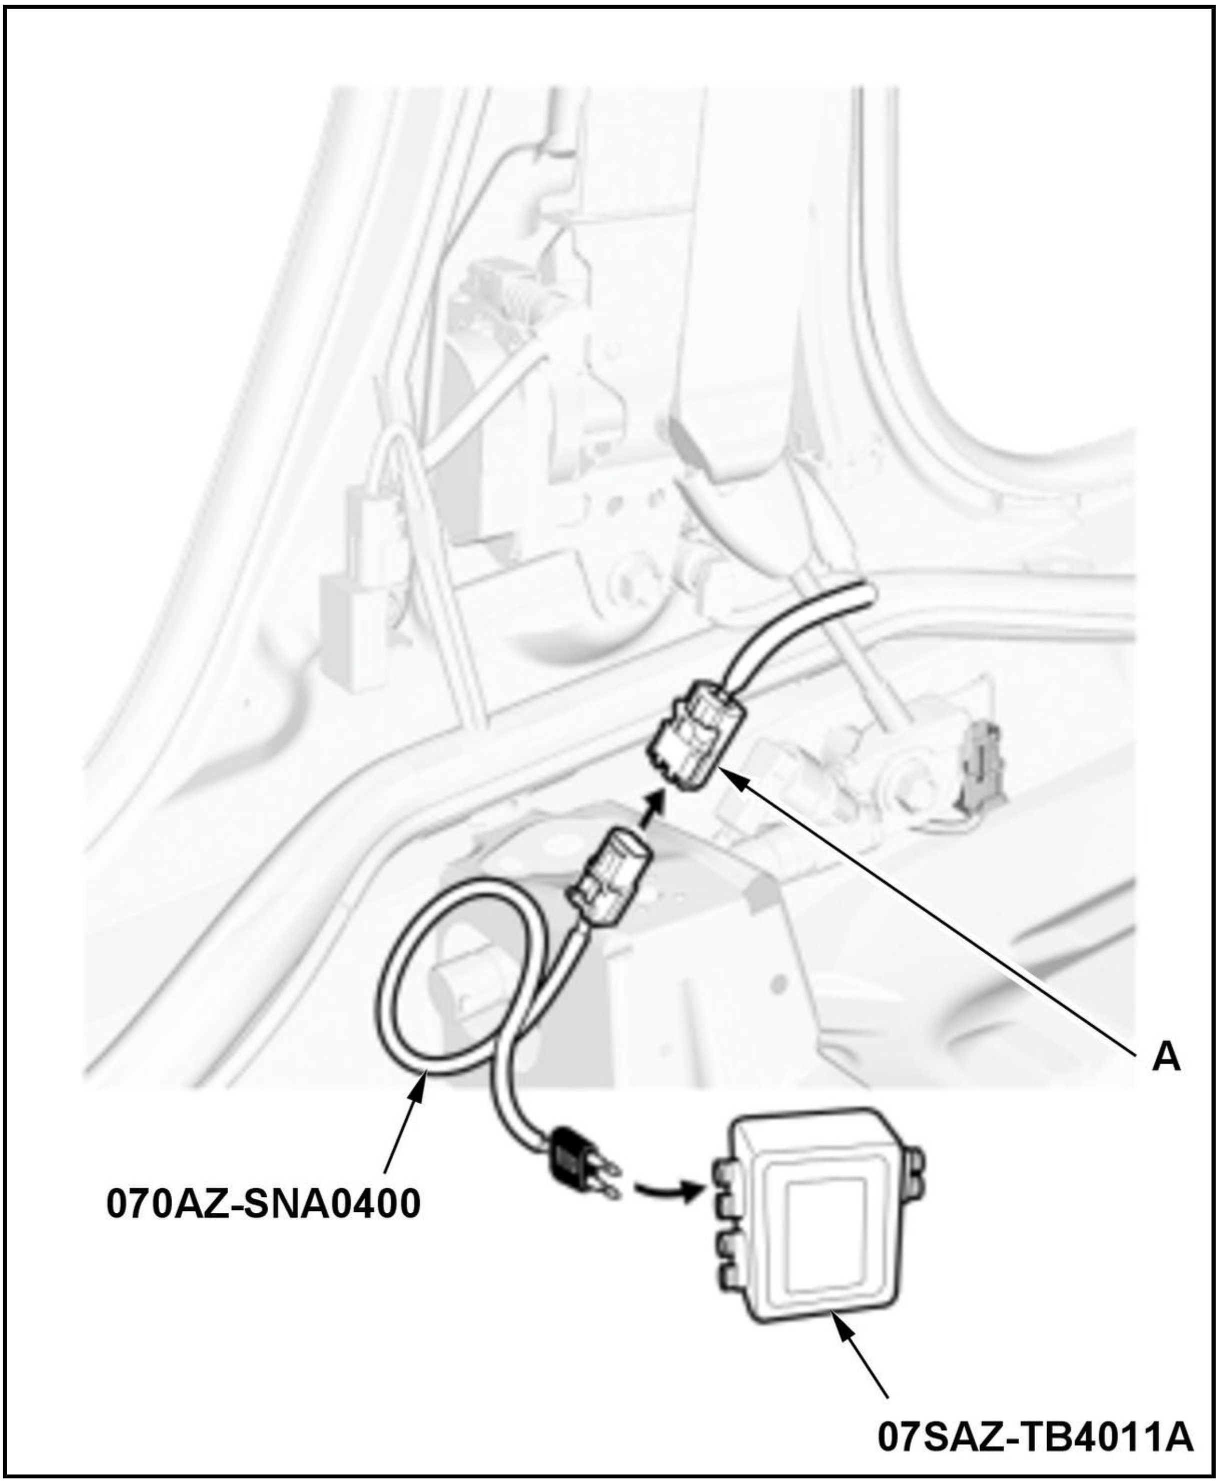
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the front passenger's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-4. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B007A-13 Open or increased resistance in the front passenger's seat belt outer lap tensioner	B

Is DTC B007A-13 indicated?

YES

Go to step 3.

NO

Open in the front passenger's seat belt outer lap tensioner; **replace the front passenger's seat belt outer lap tensioner** , then clear the DTC.

3. Open wire check (RLP+, RLP- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector:

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Front passenger's seat belt outer lap tensioner 2P connector (on the floor wire harness): connected to SRS simulator lead M
Test point 1	**SRS unit connector B (39P) No. 22**
Test point 2	**SRS unit connector B (39P) No. 23**

Is there 2.0-3.0 Ω?

YES

The RLP+ and RLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B007A-1A, B007A-2B

DTC B007A-1A : Decreased Resistance in the Front Passenger's Seat Belt Outer Lap Tensioner

DTC B007A-2B : Short to Another Wire Harness in the Front Passenger's Seat Belt Outer Lap Tensioner

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B007A-1A Decreased resistance in the front passenger's seat belt outer lap tensioner	B
B007A-2B Short to another wire in the front passenger's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B007A-1A Decreased resistance in the front passenger's seat belt outer lap tensioner	B
B007A-2B Short to another wire in the front passenger's seat belt outer lap tensioner	B

   Is DTC B007A-1A or B007A-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

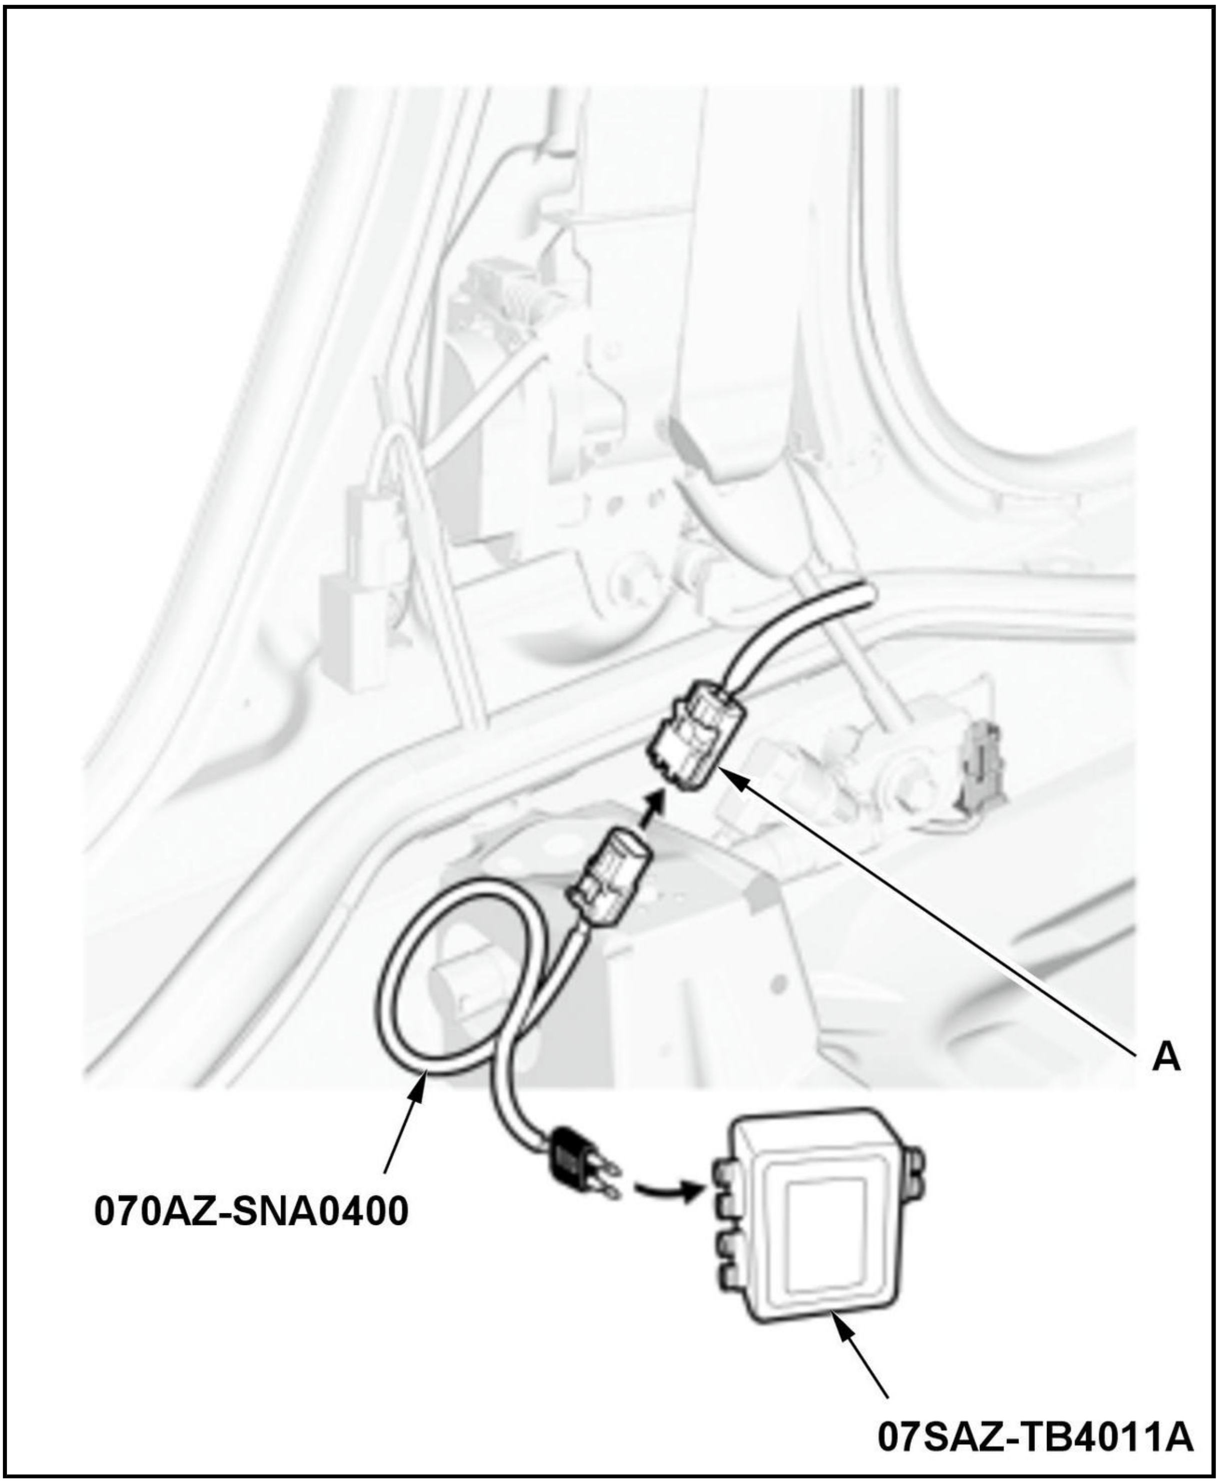
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the front passenger's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-4. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B007A-1A Decreased resistance in the front passenger's seat belt outer lap tensioner	B

DTC Description	DTC
B007A-2B Short to another wire in the front passenger's seat belt outer lap tensioner	B

Is DTC B007A-1A or B007A-2B indicated?

YES

Go to step 3.

NO

Short to another wire in the front passenger's seat belt outer lap tensioner; **replace the front passenger's seat belt outer lap tensioner** , then clear the DTC.

3. Shorted wire check (RLP+ line to RLP- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector:

SRS unit connector B (39P)

-4. Disconnect SRS simulator lead M from the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 22**
Test point 2	**SRS unit connector B (39P) No. 23**

Is there an open circuit, or at least 1 MΩ?

YES

The RLP+ and RLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0082-11

DTC B0082-11 : Short to Ground in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number**

and were properly installed .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0082-11 Short to ground in the selectable energy absorption device of the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0082-11 Short to ground in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0082-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (RVEA+, RVEA- lines) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the right side B-pillar lower trim** .

-4. Disconnect the following connector.

Selectable energy absorption device 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0082-11 Short to ground in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0082-11 indicated?

NO

Go to step 3.

YES

Short to ground in the selectable energy absorption device; **replace the front passenger's seat belt** , then clear the DTC.

3. Shorted wire check (RVEA+, RVEA- lines) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Selectable energy absorption device 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 2**
Test point 2	Body ground

Test point 1	**SRS unit connector A (39P) No. 3**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The RVEA+ and RVEA- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0082-12

DTC B0082-12 : Short to Power in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0082-12 Short to power in the selectable energy absorption device of the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0082-12 Short to power in the selectable energy absorption device of the front passenger's seat belt tensioner	B

   Is DTC B082-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (RVEA+, RVEA- lines to power) 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the right side B-pillar lower trim** .

   -4. Disconnect the following connector.

Selectable energy absorption device 2P connector (on the floor wire harness)

   -5. Reconnect the negative cable to the 12 volt battery.

   -6. Turn the vehicle to the ON mode, then clear the DTC.

   -7. Check for DTCs with the HDS.

DTC Description	DTC
B0082-12 Short to power in the selectable energy absorption device of the front passenger's seat belt tensioner	B

   Is DTC B082-12 indicated?

   NO

   Go to step 3.

   YES

   Short to power in the selectable energy absorption device; **replace the front passenger's seat belt** , then clear the DTC.

3. Shorted wire check (RVEA+, RVEA- lines to power) 2

   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector A (39P): disconnected
	Selectable energy absorption device 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 2**
Test point 2	Body ground

Test point 1	**SRS unit connector A (39P) No. 3**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The RVEA+ and RVEA- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0082-13

DTC B0082-13 : Open or Increased Resistance in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0082-13 Open or increased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0082-13 Open or increased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0082-13 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Selectable energy absorption device check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

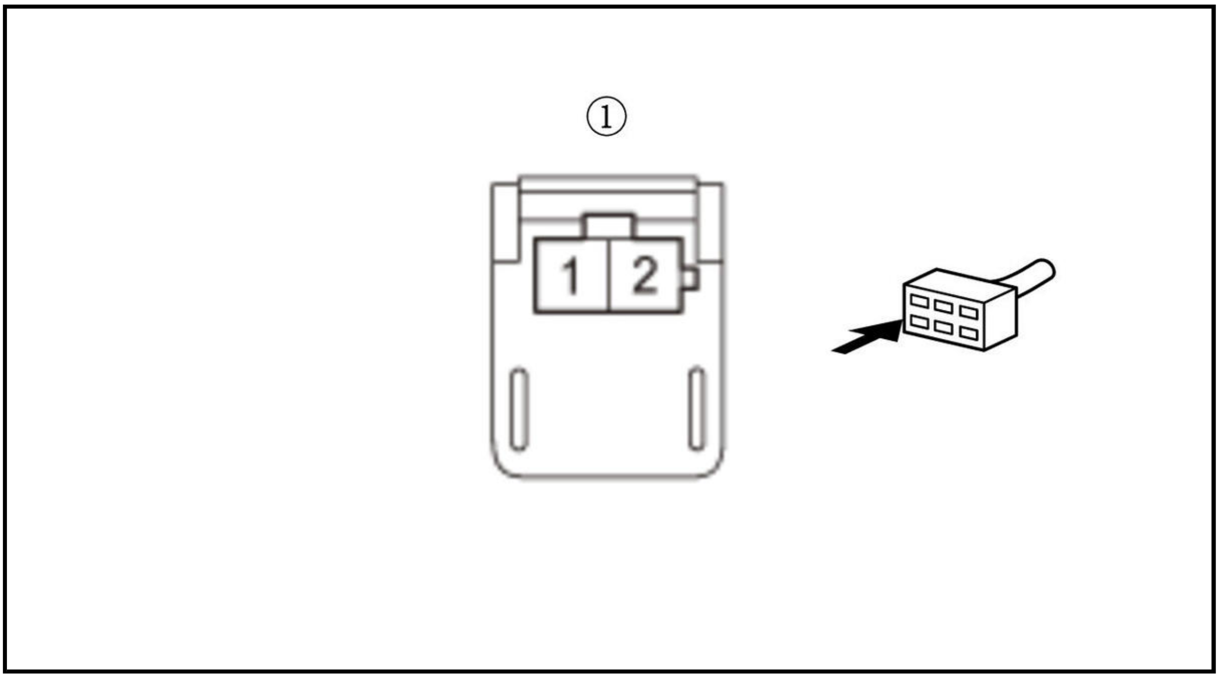
-3. **Remove the right side B-pillar lower trim** .

-4. Disconnect the following connector.

Selectable energy absorption device 2P connector (on the floor wire harness)

-5. Connect terminals A and B with a jumper wire.

Terminal A	Selectable energy absorption device 2P connector No. 1 (on the floor wire harness)
Terminal B	Selectable energy absorption device 2P connector No. 2 (on the floor wire harness)



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0082-13 Open or increased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0082-13 indicated?

YES

Go to step 3.

NO

Open in the selectable energy absorption device; **replace the front passenger's seat belt** , then clear the DTC.

3. Open wire check (RVEA+, RVEA- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the selectable energy absorption device 2P connector on the floor wire harness.

-4. Disconnect the following connector.

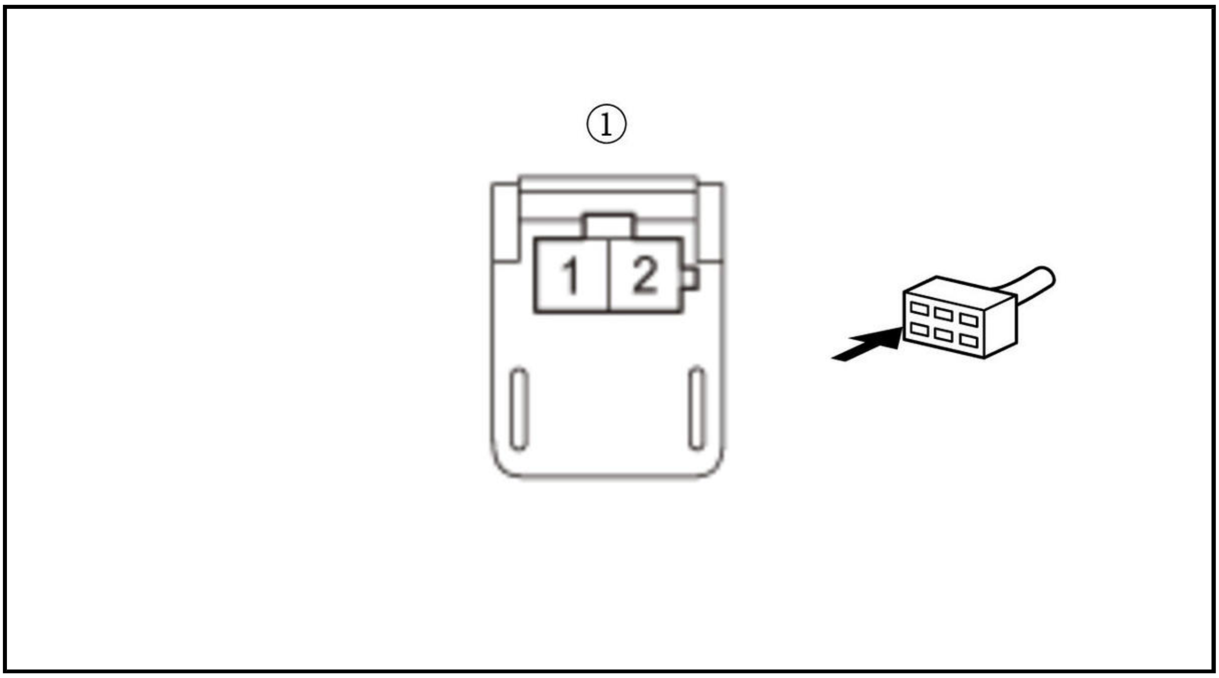
SRS unit connector A (39P)

-5. Connect terminals A and B with a jumper wire.

Terminal A	**SRS unit connector A (39P) No. 2**
Terminal B	**SRS unit connector A (39P) No. 3**

-6. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Selectable energy absorption device 2P connector (on the floor wire harness): disconnected
	SRS unit connector A (39P): disconnected
	SRS unit connector A (39P) terminals No. 2 and No. 3: jumped
Test point 1	Selectable energy absorption device 2P connector No. 1 (on the floor wire harness)
Test point 2	Selectable energy absorption device 2P connector No. 2 (on the floor wire harness)



Is there 1.0 Ω or less?

YES

The RVEA+ and RVEA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0082-1A

DTC B0082-1A : Decreased Resistance in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

Special Tools Required

SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0082-1A Decreased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0082-1A Decreased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0082-1A indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Selectable energy absorption device check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the right side B-pillar lower trim** .

-4. Disconnect the following connector.

Selectable energy absorption device 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0082-1A Decreased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0082-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the selectable energy absorption device; **replace the front passenger's seat belt** , then clear the DTC.

3. Shorted wire check (RVEA+ line to RVEA- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. **Connect the SRS short canceller to SRS unit connector A (39P) terminals No. 2 and No. 3** .

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Selectable energy absorption device 2P connector (on the floor wire harness): disconnected
	SRS unit connector A (39P): disconnected
	SRS unit connector A (39P) No. 2 and No. 3: connected to SRS short canceller
Test point 1	**SRS unit connector A (39P) No. 2**
Test point 2	**SRS unit connector A (39P) No. 3**

Is there an open circuit, or at least 1 MΩ?

YES

The RVEA+ and RVEA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0082-2B

DTC B0082-2B : Short to Another Wire Harness in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0082-2B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the left side airbag inflator	B
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the right side airbag inflator	B
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0001-2B, B0002-2B, B0010-2B, B0011-2B, B0020-2B, B0021-2B, B0028-2B, B0029-2B, B0070-2B, B0072-2B, B0079-2B or B007A-2B indicated with DTC B0082-2B?

YES

Go to step 3.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

3. Shorted wire check (RVEA lines to another line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connectors.

SRS unit connector A (39P)
SRS unit connector B (39P)
Selectable energy absorption device 2P connector (on the floor wire harness)
Inflator connectors which are assigned to 2B codes listed on HDS

-4. Check for continuity between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	SRS unit connector B (39P): disconnected
	Selectable energy absorption device 2P connector (on the floor wire harness): disconnected
	Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

DTC	**Test point 1**	**Test point 2**
	From terminal	**To terminal**
B0001-2B	SRS unit connector B (39P) No. 2	SRS unit connector A (39P) No. 9
	SRS unit connector B (39P) No. 3	SRS unit connector A (39P) No. 8
B0002-2B	SRS unit connector B (39P) No. 2	SRS unit connector A (39P) No. 10
	SRS unit connector B (39P) No. 3	SRS unit connector A (39P) No. 11
B0010-2B	SRS unit connector B (39P) No. 2	SRS unit connector A (39P) No. 5
	SRS unit connector B (39P) No. 3	SRS unit connector A (39P) No. 4

	SRS unit connector B (39P) No. 3	SRS unit connector B (39P) No. 10
B0028-2B	SRS unit connector B (39P) No. 2	SRS unit connector B (39P) No. 4
	SRS unit connector B (39P) No. 3	SRS unit connector B (39P) No. 3
B0029-2B	SRS unit connector B (39P) No. 2	SRS unit connector B (39P) No. 8
	SRS unit connector B (39P) No. 3	SRS unit connector B (39P) No. 7
B0070-2B	SRS unit connector B (39P) No. 2	SRS unit connector B (39P) No. 20
	SRS unit connector B (39P) No. 3	SRS unit connector B (39P) No. 21
B0072-2B	SRS unit connector B (39P) No. 2	SRS unit connector A (39P) No. 19
	SRS unit connector B (39P) No. 3	SRS unit connector A (39P) No. 18
B0079-2B	SRS unit connector B (39P) No. 2	SRS unit connector B (39P) No. 24
	SRS unit connector B (39P) No. 3	SRS unit connector B (39P) No. 25
B007A-2B	SRS unit connector B (39P) No. 2	SRS unit connector B (39P) No. 23
	SRS unit connector B (39P) No. 3	SRS unit connector B (39P) No. 22

Is there continuity?

YES

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

NO

The RVEA wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

DTC B0090-4A, B0090-92

DTC B0090-4A, B0090-92 : Internal Failure of the Left Front Impact Sensor

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0090-4A Internal failure of the left front impact sensor	B
B0090-92 Internal failure of the left front impact sensor	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0090-4A Internal failure of the left front impact sensor	B
B0090-92 Internal failure of the left front impact sensor	B

Is DTC B0090-4A or B0090-92 indicated?

YES

The failure is duplicated. **Replace the left front impact sensor** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B0090-87

DTC B0090-87 : No Signal From the Left Front Impact Sensor

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead L 070AZ-SNA0300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0090-87 No signal from the left front impact sensor	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0090-87 No signal from the left front impact sensor	B

   Is DTC B0090-87 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Connector connection check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following connections.

SRS unit connector A (39P)
Left front impact sensor 2P connector (on the engine compartment wire harness)
Connector between the SRS unit and the left front impact sensor

   Are the connectors OK?

   YES

   Go to step 4.

   NO

   Go to step 3.

3. System check

-1. Reset the loose connections that caused the problem in step 2.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B0090-87 No signal from the left front impact sensor	B

Is DTC B0090-87 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 4.

NO

The system is OK at this time.

4. Shorted wire check (LFS+ line to LFS- line)

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. Disconnect the following connectors.

SRS unit connector A (39P)
Left front impact sensor 2P connector (on the engine compartment wire harness)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Left front impact sensor 2P connector (on the engine compartment wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 31**
Test point 2	**SRS unit connector A (39P) No. 32**

Is there an open circuit, or at least 1 MΩ?

YES

The LFS+ and LFS- wires are not shorted. Go to step 5.

NO

Short to another wire in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

5. Shorted wire check (LFS+, LFS- lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Left front impact sensor 2P connector (on the engine compartment wire harness): disconnected

Test point 1	**SRS unit connector A (39P) No. 31**
Test point 2	Body ground

Test point 1	**SRS unit connector A (39P) No. 32**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The LFS+ and LFS- wires are not shorted. Go to step 6.

NO

Short to ground in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

6. Shorted wire check (LFS+, LFS- lines to power)

-1. Reconnect the negative cable to the 12 volt battery.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector A (39P): disconnected
	Left front impact sensor 2P connector (on the engine compartment wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 31**
Test point 2	Body ground

Test point 1	**SRS unit connector A (39P) No. 32**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The LFS+ and LFS- wires are not shorted to power. Go to step 7.

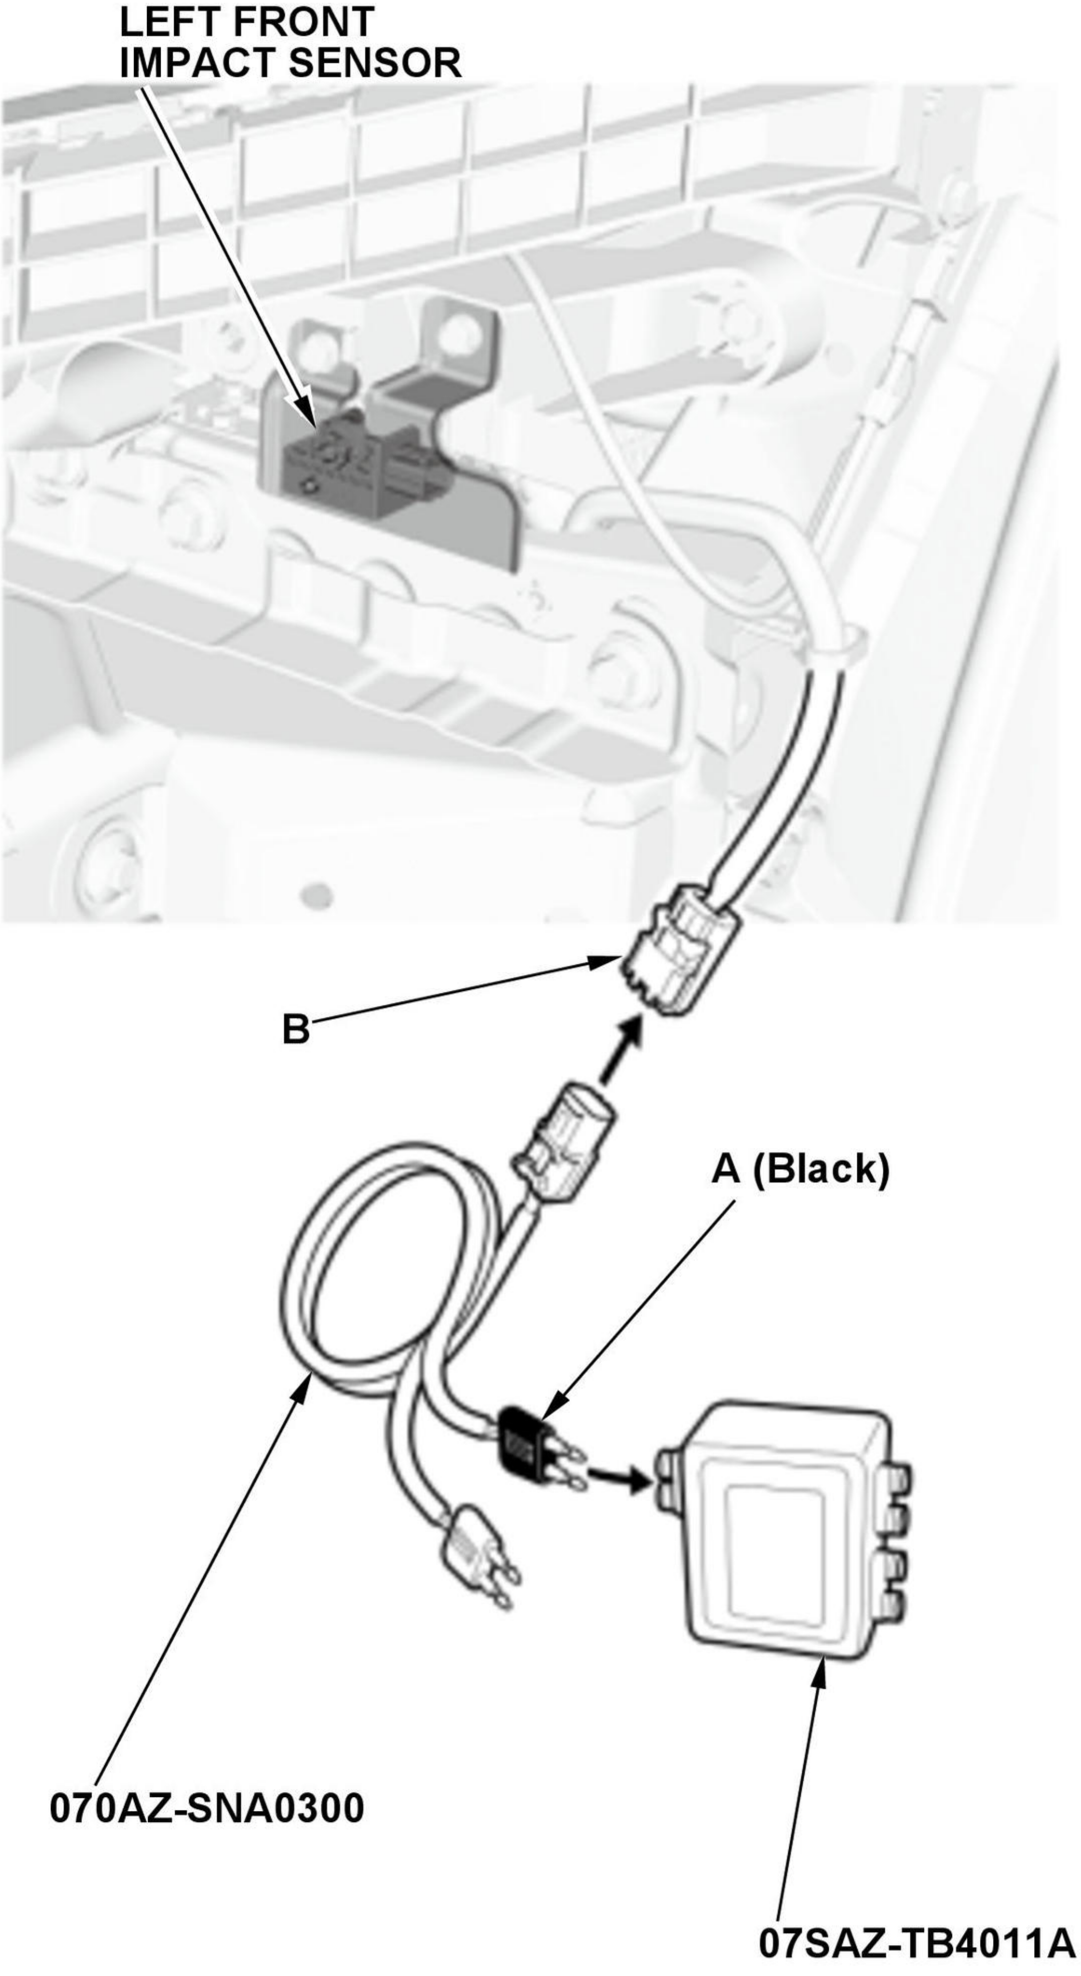
NO

Short to power in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

7. Open wire check (LFS+, LFS- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect the black terminal (A) of SRS simulator lead L to the SRS inflator simulator (jumper connector), then connect SRS simulator lead L to the left front impact sensor 2P connector (B) on the engine compartment wire harness.



LEFT FRONT IMPACT SENSOR
B
A (Black)
070AZ-SNA0300
07SAZ-TB4011A

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Left front impact sensor 2P connector (on the engine compartment wire harness): disconnected
	Left front impact sensor 2P connector (on the engine compartment wire harness): connected to SRS simulator lead L
Test point 1	**SRS unit connector A (39P) No. 31**
Test point 2	**SRS unit connector A (39P) No. 32**

Is there 1.0 Ω or less?

YES

The LFS+ and LFS- wires are OK. **Replace the left front impact sensor** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

DTC B0091-4A, B0091-92

DTC B0091-4A, B0091-92 : Internal Failure of the Left Side Impact Sensor (first)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0091-4A Internal failure of the left side impact sensor (first)	B
B0091-92 Internal failure of the left side impact sensor (first)	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0091-4A Internal failure of the left side impact sensor (first)	B
B0091-92 Internal failure of the left side impact sensor (first)	B

Is DTC B0091-4A or B0091-92 indicated?

YES

The failure is duplicated. **Replace the left side impact sensor (first)** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B0091-87, B0092-87

DTC B0091-87 : No Signal From the Left Side Impact Sensor (first)

DTC B0092-87 : No Signal From the Left Side Impact Sensor (second)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0091-87 No signal from the left side impact sensor (first)	B
B0092-87 No signal from the left side impact sensor (second)	B

DTC (SRS)

1. DTC check

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0091-4A Internal failure of the left side impact sensor (first)	B
B0091-87 No signal from the left side impact sensor (first)	B
B0091-92 Internal failure of the left side impact sensor (first)	B
B0092-4A Internal failure of the left side impact sensor (second)	B
B0092-87 No signal from the left side impact sensor (second)	B
B0092-92 Internal failure of the left side impact sensor (second)	B

Are DTCs indicated?

DTC B0091-87

Go to step 2.

DTC B0092-87

Go to step 10.

DTC B0091-4A or B0091-92

Replace the left side impact sensor (first) , then clear the DTC.

DTC B0092-4A or B0092-92

Replace the left side impact sensor (second) , then clear the DTC.

NO DTC

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Harness visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for damage on the floor wire harness that side impact sensor is connected to.

Is the floor wire harness OK?

YES

Go to step 3.

NO

Replace the floor wire harness, then clear the DTC, and retest.

3. Connector connection check

-1. Check the following connections.

SRS unit connector B (39P)
Left side impact sensor (first) 4P connector (on the floor wire harness)
Left side impact sensor (second) 2P connector (on the floor wire harness)

Are the connectors OK?

YES

Go to step 5.

NO

Go to step 4.

4. System check

-1. Reset the loose connections that caused the problem in step 3.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B0091-87 No signal from the left side impact sensor (first)	B

Is DTC B0091-87 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 5.

NO

The system is OK at this time.

5. Left side impact sensor (first) substituting

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. **Substitute a known-good left side impact sensor (first)** .

-3. Reconnect the negative cable to the 12 volt battery.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the ON mode, then wait for 10 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B0091-87 No signal from the left side impact sensor (first)	B

Is DTC B0091-87 indicated?

YES

Go to step 6.

NO

Replace the left side impact sensor (first) , then clear the DTC.

6. Shorted wire check (LS1+ line to LS1- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Return the left side impact sensor (first) which was replaced.

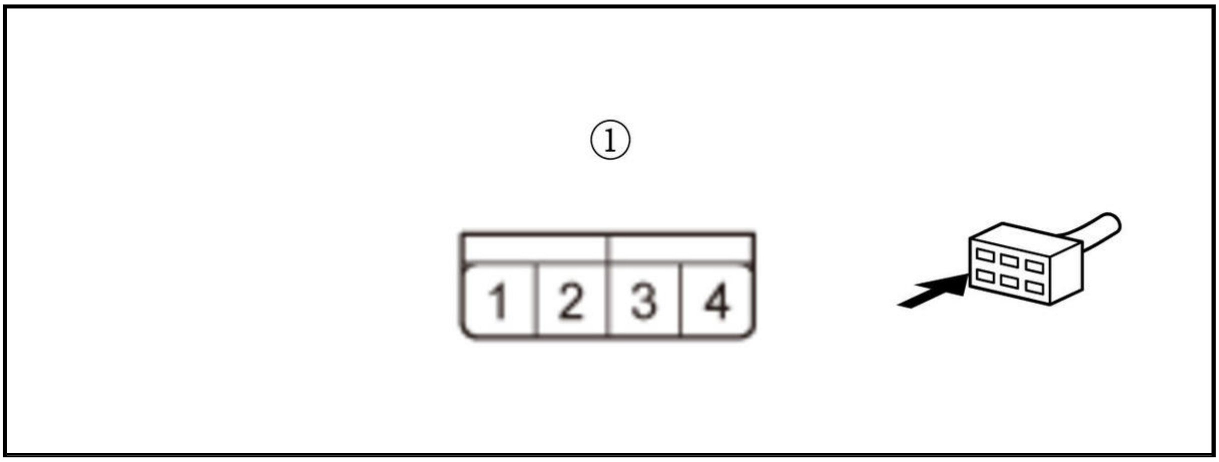
-4. Disconnect the following connectors.

SRS unit connector B (39P)
Left side impact sensor (first) 4P connector (on the floor wire harness)
Left side impact sensor (second) 2P connector (on the floor wire harness)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①

Test point 2	Left side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①



Is there an open circuit, or at least 1 MΩ?

YES

The LS1+ and LS1- wires are not shorted. Go to step 7.

NO

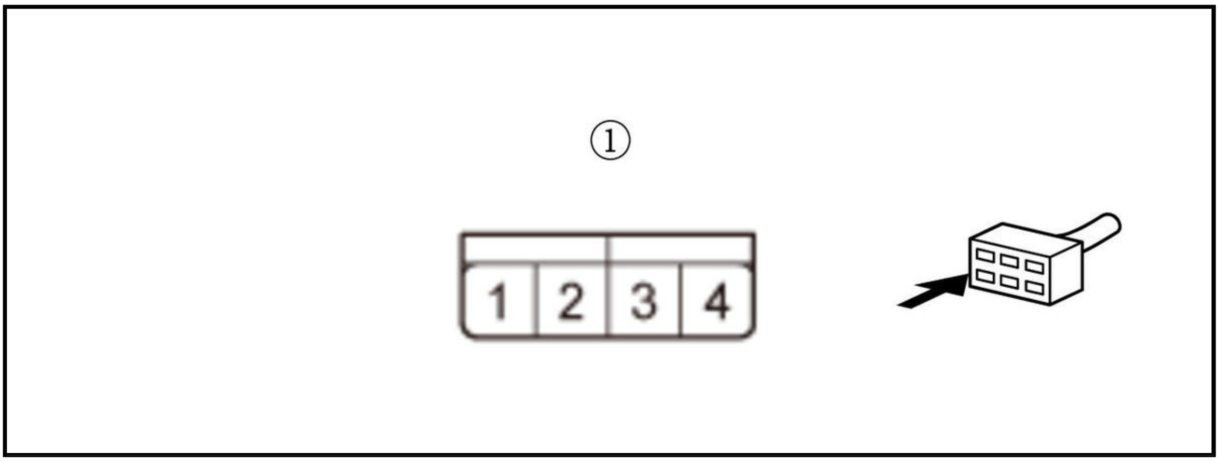
Short to another wire in the floor wire harness between the SRS unit and the left side impact sensor (first); replace the floor wire harness, then clear the DTC.

7. Shorted wire check (LS1+, LS1- lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①
Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The LS1+ and LS1- wires are not shorted. Go to step 8.

NO

Short to ground in the floor wire harness between the SRS unit and the left side impact sensor (first); replace the floor wire harness, then clear the DTC.

8. Shorted wire check (LS1+, LS1- lines to power)

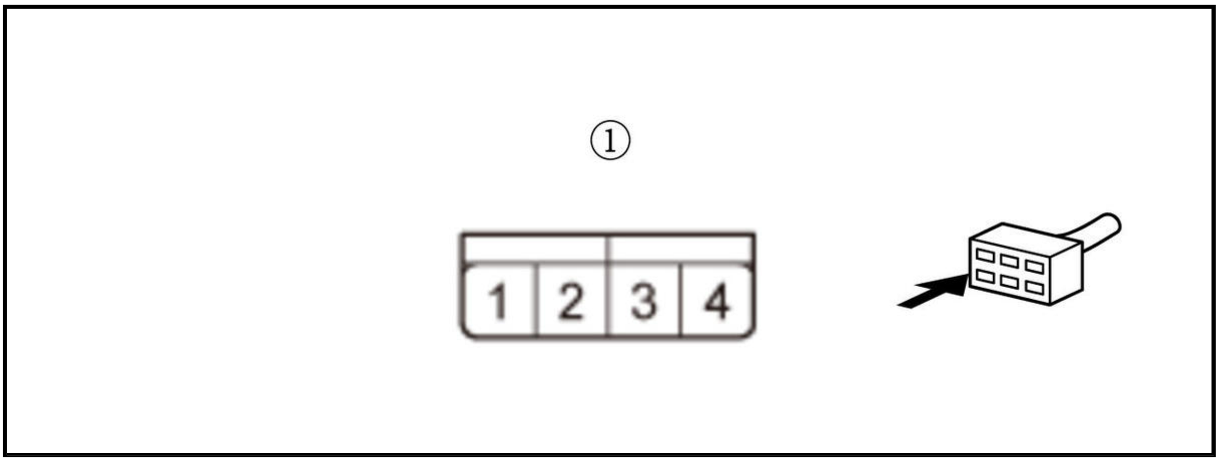
-1. Reconnect the negative cable to the 12 volt battery.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①
Test point 2	Body ground



Is there 0.2 V or less?

YES

The LS1+ and LS1- wires are not shorted to power. Go to step 9.

NO

Short to power in the floor wire harness between the SRS unit and the left side impact sensor (first); replace the floor wire harness, then clear the DTC.

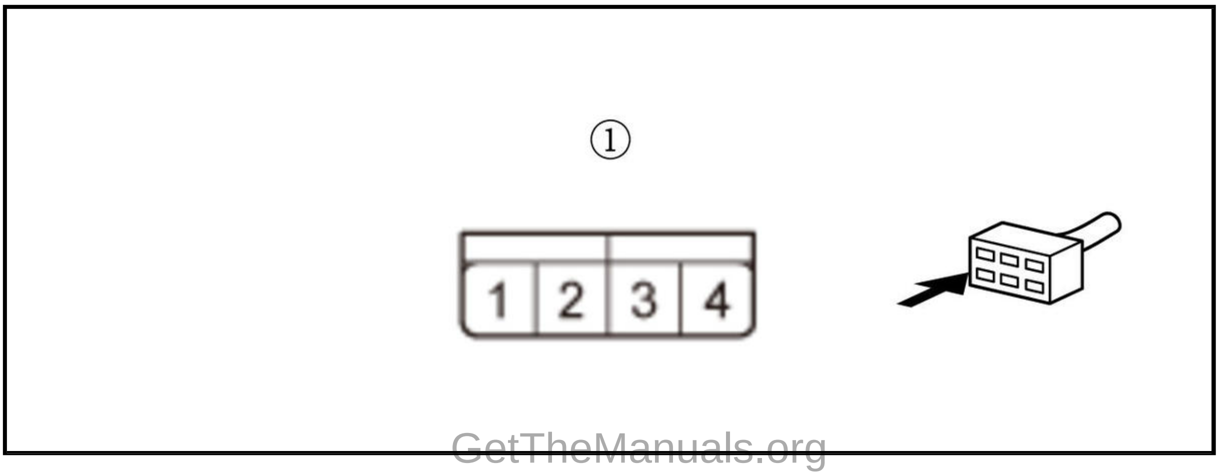
9. Open wire check (LS1+, LS1- lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode SRS unit connector B (39P): disconnected Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	SRS unit connector B (39P) No. 38
Test point 2	Left side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①

Test point 1	SRS unit connector B (39P) No. 39
Test point 2	Left side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there 1.0 Ω or less?

YES

The LS1+ and LS1- wires are OK. Disconnect and reconnect the connector, and then check the DTC again. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the floor wire harness between the SRS unit and the left side impact sensor (first); replace the floor wire harness, then clear the DTC.

10. Harness visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for damage on the floor wire harness that side impact sensor is connected to.

Is the floor wire harness OK?

YES

Go to step 11.

NO

Replace the floor wire harness, then clear the DTC, and retest.

11. Connector connection check

-1. Check the following connections.

SRS unit connector B (39P)
Left side impact sensor (first) 4P connector (on the floor wire harness)

Left side impact sensor (second) 2P connector (on the floor wire harness)

Are the connectors OK?

YES

Go to step 13.

NO

Go to step 12.

12. System check

-1. Reset the loose connections that caused the problem in step 11.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B0092-87 No signal from the left side impact sensor (second)	B

Is DTC B0092-87 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 13.

NO

The system is OK at this time.

13. Left side impact sensor (second) substituting

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. **Substitute a known-good left side impact sensor (second)** .

-3. Reconnect the negative cable to the 12 volt battery.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the ON mode, then wait for 10 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B0092-87 No signal from the left side impact sensor (second)	B

Is DTC B0092-87 indicated?

YES

Go to step 14.

NO

Replace the left side impact sensor (second) , then clear the DTC.

14. Left side impact sensor (first) substituting

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Return the left side impact sensor (second) which was replaced.

-4. **Substitute a known-good left side impact sensor (first)** .

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0092-87 No signal from the left side impact sensor (second)	B

Is DTC B0092-87 indicated?

YES

Go to step 15.

NO

Replace the left side impact sensor (first) , then clear the DTC.

15. Shorted wire check (LS2+ line to LS2- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

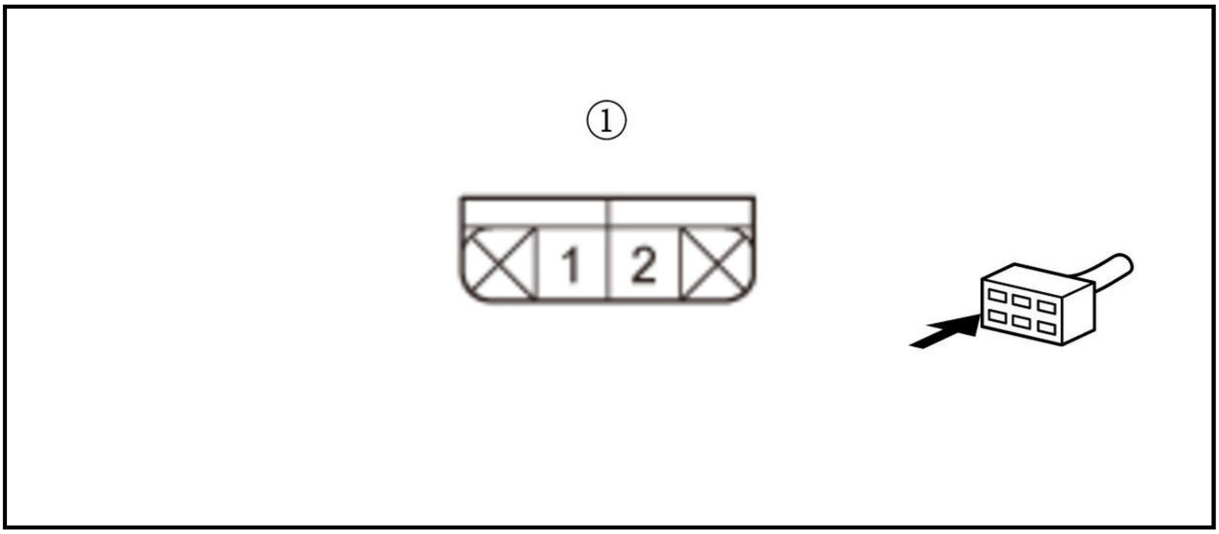
-3. Return the left side impact sensor (first) which was replaced.

-4. Disconnect the following connectors.

SRS unit connector B (39P)
Left side impact sensor (first) 4P connector (on the floor wire harness)
Left side impact sensor (second) 2P connector (on the floor wire harness)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Left side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there an open circuit, or at least 1 MΩ?

YES

The LS2+ and LS2- wires are not shorted. Go to step 16.

NO

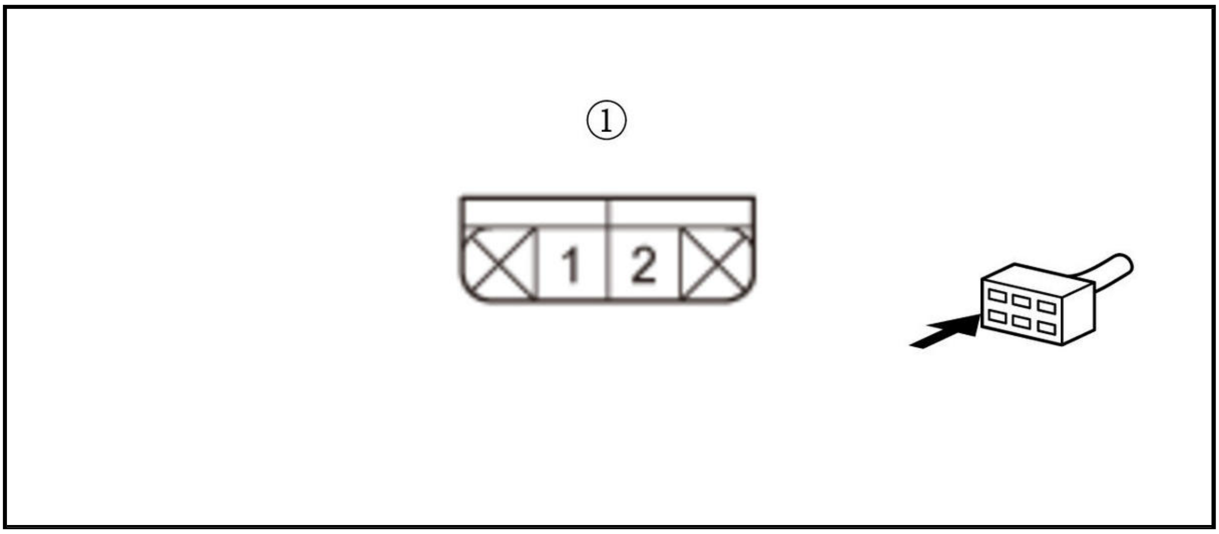
Short to another wire in the floor wire harness between the left side impact sensor (first) and the left side impact sensor (second); replace the floor wire harness, then clear the DTC.

16. Shorted wire check (LS2+, LS2- lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Left side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The LS2+ and LS2- wires are not shorted. Go to step 17.

NO

Short to ground in the floor wire harness between the left side impact sensor (first) and the left side impact sensor (second); replace the floor wire harness, then clear the DTC.

17. Shorted wire check (LS2+, LS2- lines to power)

-1. Reconnect the negative cable to the 12 volt battery.

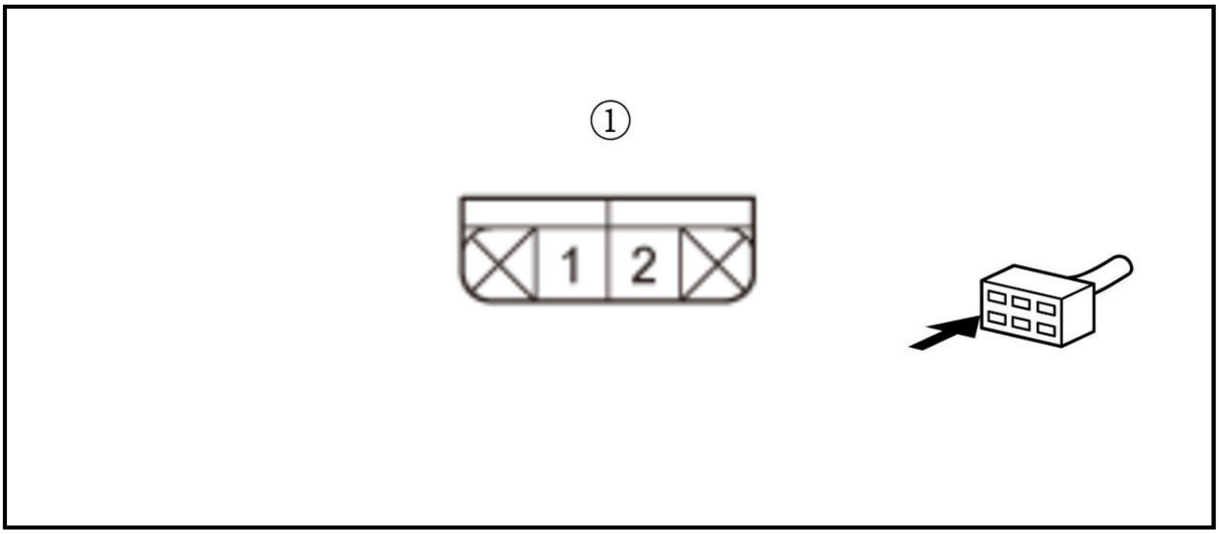
-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Left side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground



Is there 0.2 V or less?

YES

The LS2+ and LS2- wires are not shorted to power. Go to step 18.

NO

Short to power in the floor wire harness between the left side impact sensor (first) and the left side impact sensor (second); replace the floor wire harness, then clear the DTC.

18. Open wire check (LS2+, LS2- lines)

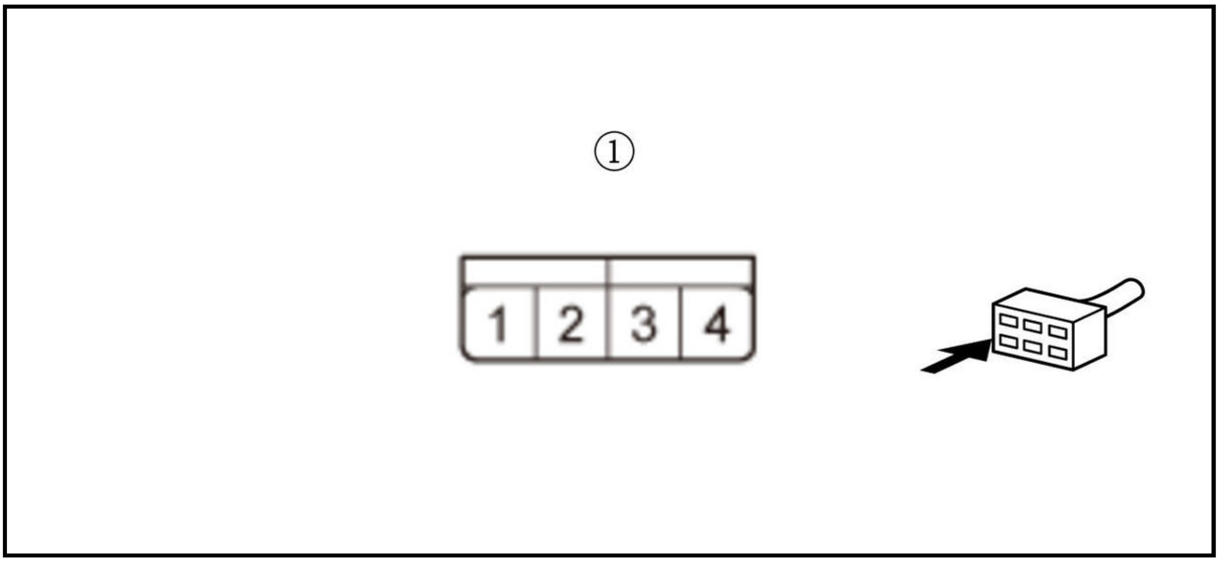
-1. Turn the vehicle to the OFF (LOCK) mode.

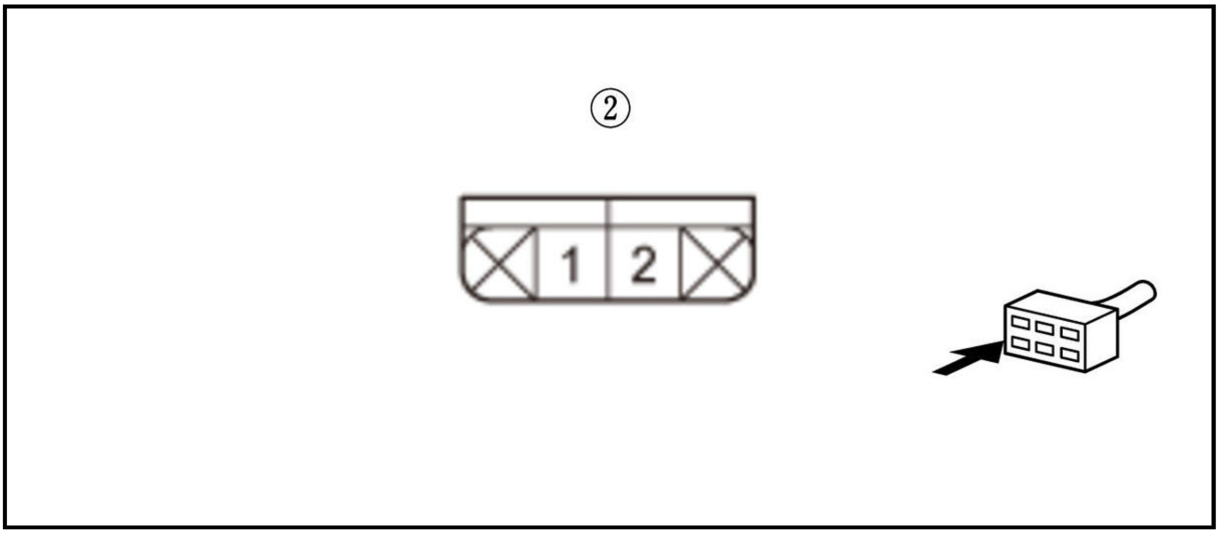
-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 1 (on the floor wire harness): ①

Test point 2	Left side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ②

Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 4 (on the floor wire harness): ①
Test point 2	Left side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ②





Is there 1.0 Ω or less?

YES

The LS2+ and LS2- wires are OK. Disconnect and reconnect the connector, and then check the DTC again. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the floor wire harness between the left side impact sensor (first) and the left side impact sensor (second); replace the floor wire harness, then clear the DTC.

DTC B0092-4A, B0092-92

DTC B0092-4A, B0092-92 : Internal Failure of the Left Side Impact Sensor (second)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0092-4A Internal failure of the left side impact sensor (second)	B
B0092-92 Internal failure of the left side impact sensor (second)	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0092-4A Internal failure of the left side impact sensor (second)	B
B0092-92 Internal failure of the left side impact sensor (second)	B

   Is DTC B0092-4A or B0092-92 indicated?

   YES

   The failure is duplicated. **Replace the left side impact sensor (second)** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B0095-4A, B0095-92

DTC B0095-4A, B0095-92 : Internal Failure of the Right Front Impact Sensor

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0095-4A Internal failure of the right front impact sensor	B
B0095-92 Internal failure of the right front impact sensor	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0095-4A Internal failure of the right front impact sensor	B
B0095-92 Internal failure of the right front impact sensor	B

Is DTC B0095-4A or B0095-92 indicated?

YES

The failure is duplicated. **Replace the right front impact sensor** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B0095-87

DTC B0095-87 : No Signal From the Right Front Impact Sensor

Special Tools Required

-SRS Inflator Simulator 07SAZ-TB4011A

-SRS Simulator Lead L 070AZ-SNA0300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0095-87 No signal from the right front impact sensor	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0095-87 No signal from the right front impact sensor	B

Is DTC B0095-87 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Connector connection check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following connections.

SRS unit connector A (39P)
Right front impact sensor 2P connector (on the engine compartment wire harness)
Connector between the SRS unit and the right front impact sensor

Are the connectors OK?

YES

Go to step 4.

NO

Go to step 3.

3. System check

-1. Reset the loose connections that caused the problem in step 2.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B0095-87 No signal from the right front impact sensor	B

Is DTC B0095-87 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 4.

NO

The system is OK at this time.

4. Shorted wire check (RFS+ line to RFS- line)

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. Disconnect the following connectors.

SRS unit connector A (39P)
Right front impact sensor 2P connector (on the engine compartment wire harness)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Right front impact sensor 2P connector (on the engine compartment wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 29**
Test point 2	**SRS unit connector A (39P) No. 30**

Is there an open circuit, or at least 1 MΩ?

YES

The RFS+ and RFS- wires are not shorted. Go to step 5.

NO

Short to another wire in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

5. Shorted wire check (RFS+, RFS- lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Right front impact sensor 2P connector (on the engine compartment wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 29**
Test point 2	Body ground

Test point 1	**SRS unit connector A (39P) No. 30**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The RFS+ and RFS- wires are not shorted. Go to step 6.

NO

Short to ground in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

6. Shorted wire check (RFS+, RFS- lines to power)

-1. Reconnect the negative cable to the 12 volt battery.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode SRS unit connector A (39P): disconnected Right front impact sensor 2P connector (on the engine compartment wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 29**
Test point 2	Body ground

Test point 1	**SRS unit connector A (39P) No. 30**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The RFS+ and RFS- wires are not shorted to power. Go to step 7.

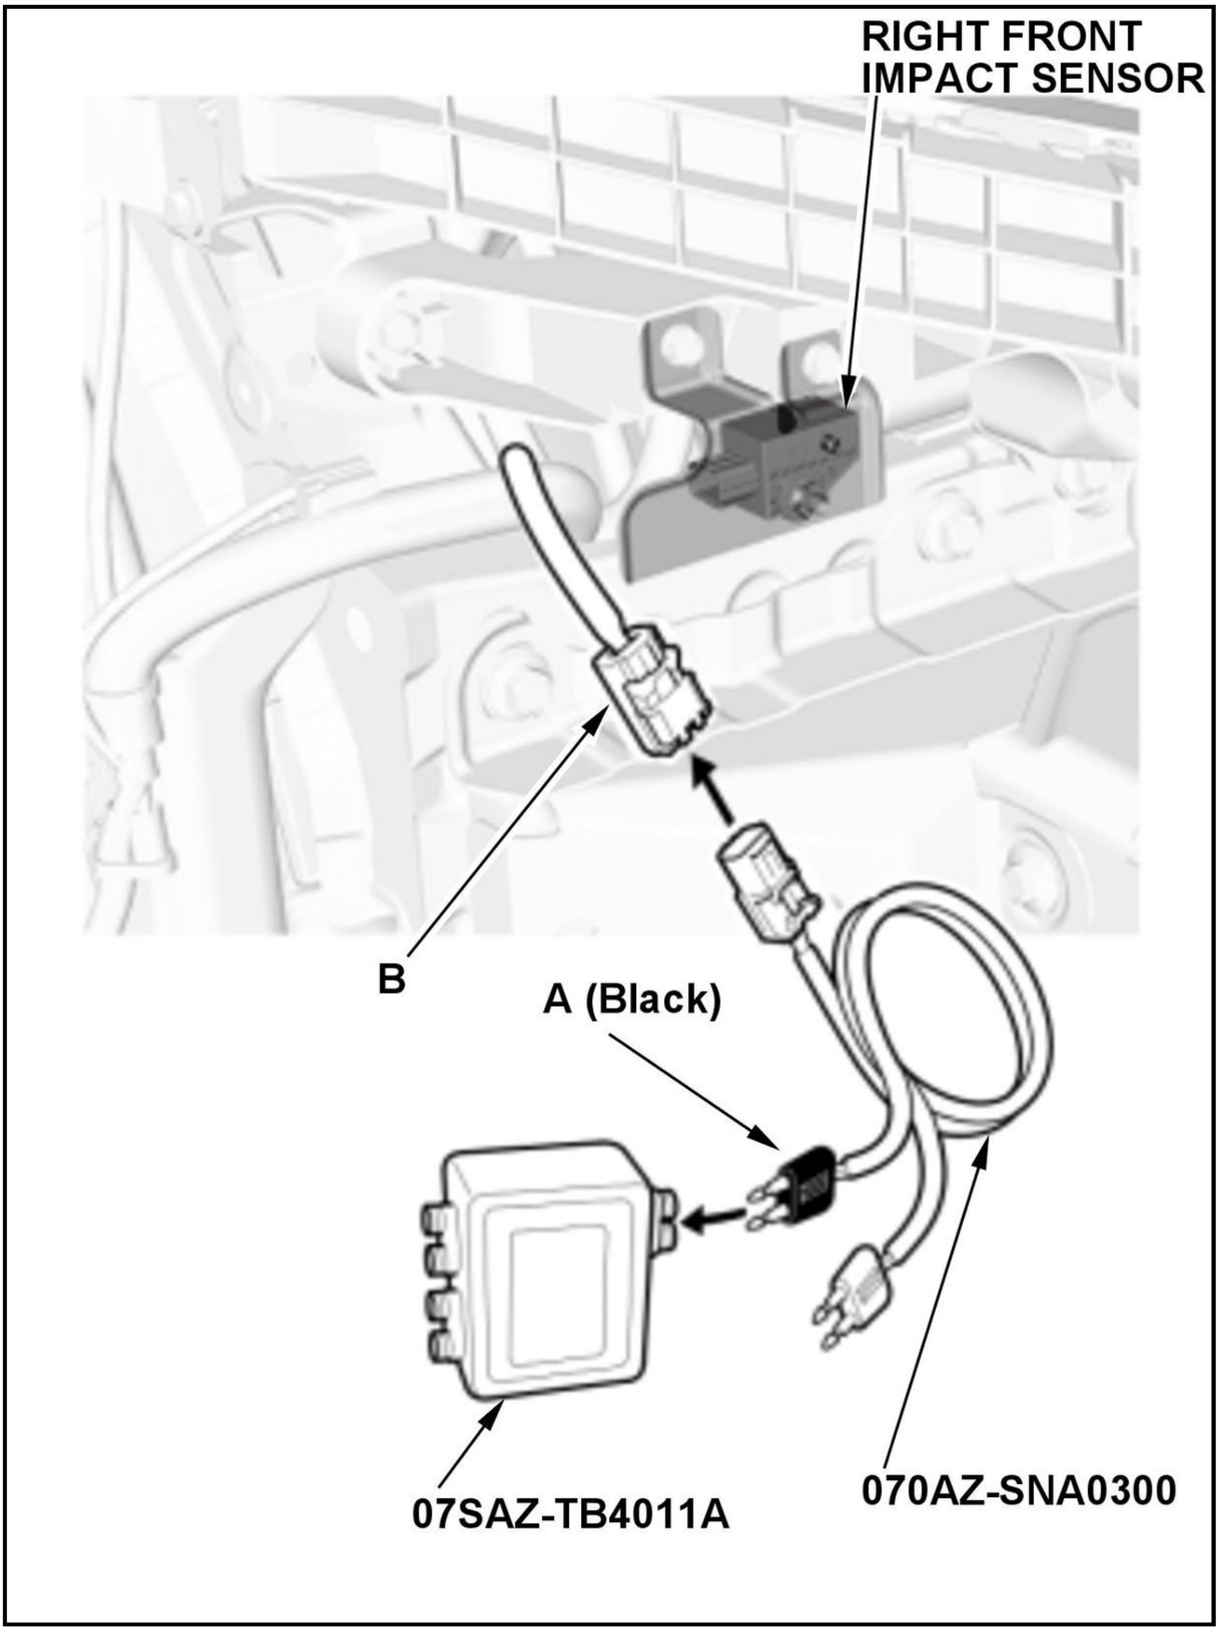
NO

Short to power in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

7. Open wire check (RFS+, RFS- lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Connect the black terminal (A) of SRS simulator lead L to the SRS inflator simulator (jumper connector), then connect SRS simulator lead L to the right front impact sensor 2P connector (B) on the engine compartment wire harness.



RIGHT FRONT IMPACT SENSOR
B
A (Black)
07SAZ-TB4011A
070AZ-SNA0300

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Right front impact sensor 2P connector (on the engine compartment wire harness): disconnected
	Right front impact sensor 2P connector (on the engine compartment wire harness): connected to SRS simulator lead L
Test point 1	**SRS unit connector A (39P) No. 29**
Test point 2	**SRS unit connector A (39P) No. 30**

Is there 1.0 Ω or less?

YES

The RFS+ and RFS- wires are OK. **Replace the right front impact sensor** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

DTC B0096-4A, B0096-92

DTC B0096-4A, B0096-92 : Internal Failure of the Right Side Impact Sensor (first)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0096-4A Internal failure of the right side impact sensor (first)	B
B0096-92 Internal failure of the right side impact sensor (first)	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0096-4A Internal failure of the right side impact sensor (first)	B
B0096-92 Internal failure of the right side impact sensor (first)	B

Is DTC B0096-4A or B0096-92 indicated?

YES

The failure is duplicated. **Replace the right side impact sensor (first)** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B0096-87, B0097-87

DTC B0096-87 : No Signal From the Right Side Impact Sensor (first)

DTC B0097-87 : No Signal From the Right Side Impact Sensor (second)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0096-87 No signal from the right side impact sensor (first)	B
B0097-87 No signal from the right side impact sensor (second)	B

DTC (SRS)

1. DTC check

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0096-4A Internal failure of the right side impact sensor (first)	B
B0096-87 No signal from the right side impact sensor (first)	B
B0096-92 Internal failure of the right side impact sensor (first)	B
B0097-4A Internal failure of the right side impact sensor (second)	B
B0097-87 No signal from the right side impact sensor (second)	B
B0097-92 Internal failure of the right side impact sensor (second)	B

   Are DTCs indicated?

   DTC B0096-87

   Go to step 2.

   DTC B0097-87

   Go to step 10.

   DTC B0096-4A or B0096-92

   Replace the right side impact sensor (first) , then clear the DTC.

   DTC B0097-4A or B0097-92

   Replace the right side impact sensor (second) , then clear the DTC.

   NO DTC

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Harness visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the damage on the floor wire harness that side impact sensor is connected to.

Is the floor wire harness OK?

YES

Go to step 3.

NO

Replace the floor wire harness, then clear the DTC, and retest.

3. Connector connection check

-1. Check the following connections.

SRS unit connector B (39P)
Right side impact sensor (first) 4P connector (on the floor wire harness)
Right side impact sensor (second) 2P connector (on the floor wire harness)

Are the connectors OK?

YES

Go to step 5.

NO

Go to step 4.

4. System check

-1. Reset the loose connections that caused the problem in step 3.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B0096-87 No signal from the right side impact sensor (first)	B

Is DTC B0096-87 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 5.

NO

The system is OK at this time.

5. Right side impact sensor (first) substituting

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. **Substitute a known-good right side impact sensor (first)** .

-3. Reconnect the negative cable to the 12 volt battery.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the ON mode, then wait for 10 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B0096-87 No signal from the right side impact sensor (first)	B

Is DTC B0096-87 indicated?

YES

Go to step 6.

NO

Replace the right side impact sensor (first) , then clear the DTC.

6. Shorted wire check (RS1+ line to RS1- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

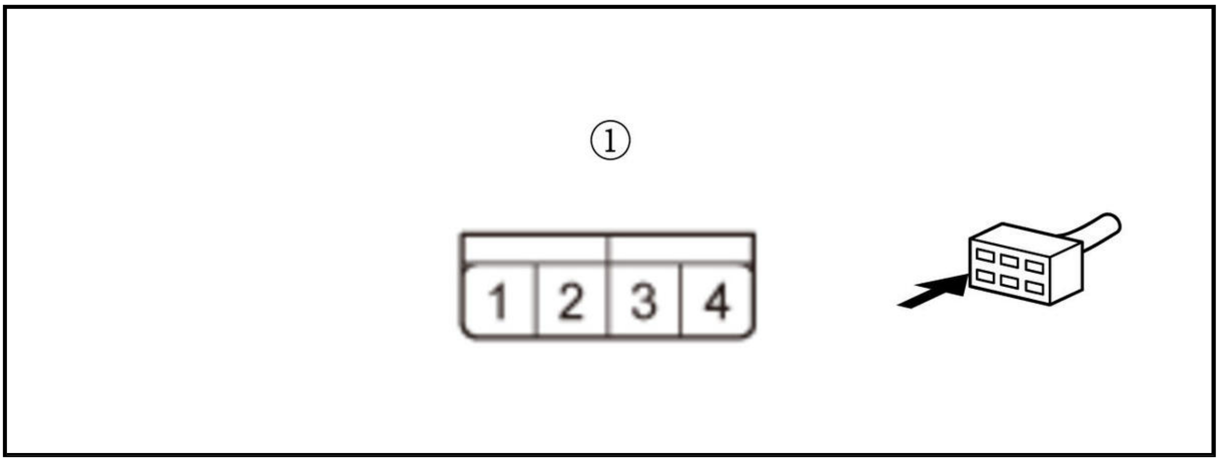
-3. Return the right side impact sensor (first) which was replaced.

-4. Disconnect the following connectors.

SRS unit connector B (39P)
Right side impact sensor (first) 4P connector (on the floor wire harness)
Right side impact sensor (second) 2P connector (on the floor wire harness)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Right side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①



Is there an open circuit, or at least 1 MΩ?

YES

The RS1+ and RS1- wires are not shorted. Go to step 7.

NO

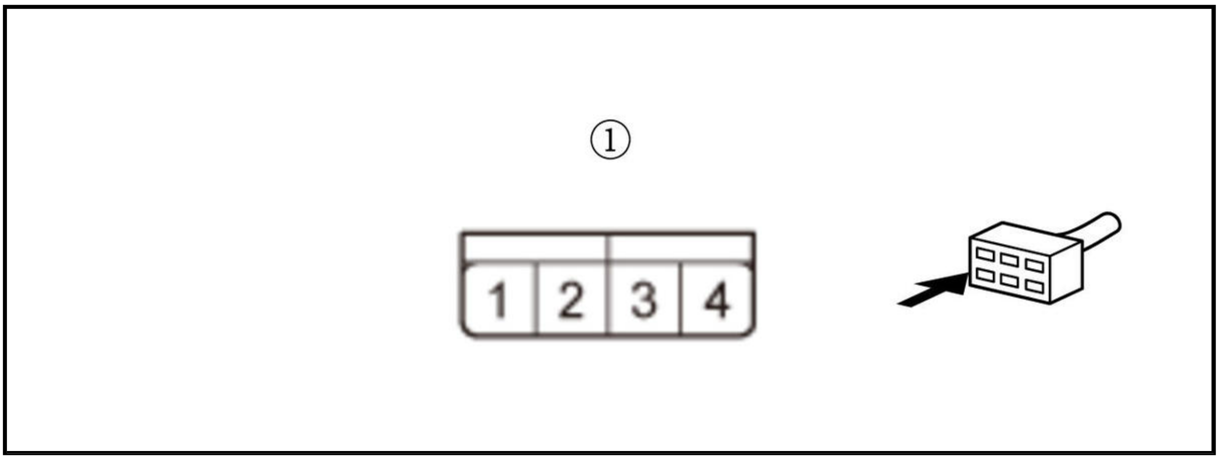
Short to another wire in the floor wire harness between the SRS unit and the right side impact sensor (first); replace the floor wire harness, then clear the DTC.

7. Shorted wire check (RS1+, RS1- lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①
Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The RS1+ and RS1- wires are not shorted. Go to step 8.

NO

Short to ground in the floor wire harness between the SRS unit and the right side impact sensor (first); replace the floor wire harness, then clear the DTC.

8. Shorted wire check (RS1+, RS1- lines to power)

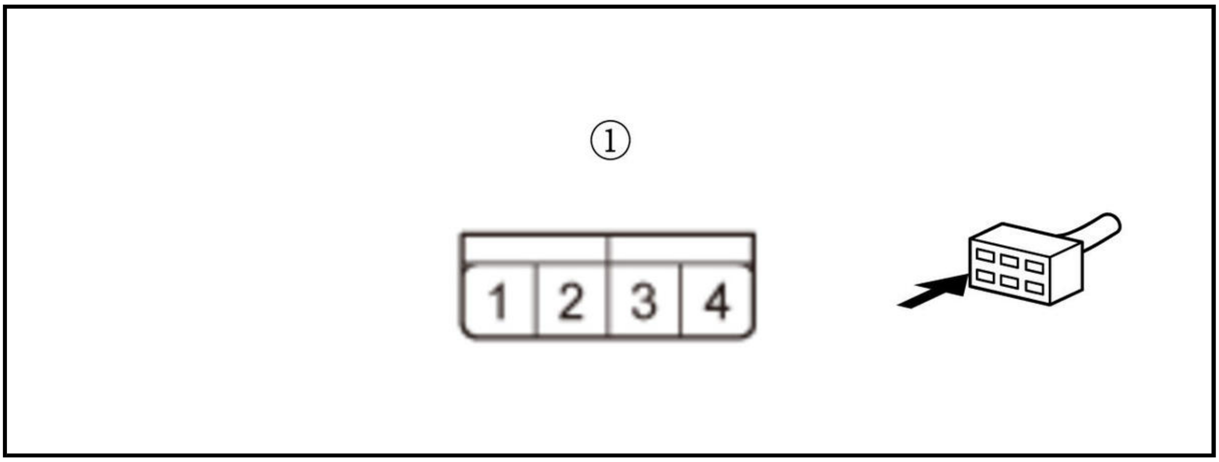
-1. Reconnect the negative cable to the 12 volt battery.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①
Test point 2	Body ground



Is there 0.2 V or less?

YES

The RS1+ and RS1- wires are not shorted to power. Go to step 9.

NO

Short to power in the floor wire harness between the SRS unit and the right side impact sensor (first); replace the floor wire harness, then clear the DTC.

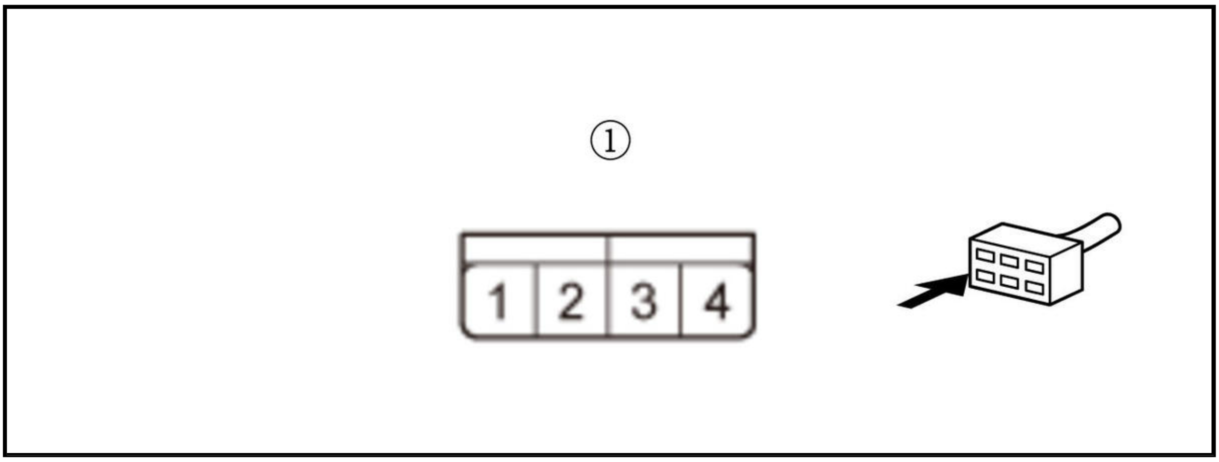
9. Open wire check (RS1+, RS1- lines)

 -1. Turn the vehicle to the OFF (LOCK) mode.

 -2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	SRS unit connector B (39P) No. 36
Test point 2	Right side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①

Test point 1	SRS unit connector B (39P) No. 37
Test point 2	Right side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there 1.0 Ω or less?

YES

The RS1+ and RS1- wires are OK. Disconnect and reconnect the connector, and then check the DTC again. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit .

NO

Open in the floor wire harness between the SRS unit and the right side impact sensor (first); replace the floor wire harness, then clear the DTC.

10. Harness visual check

 -1. Turn the vehicle to the OFF (LOCK) mode.

 -2. Check the damage on the floor wire harness that side impact sensor is connected to.

Is the floor wire harness OK?

YES

Go to step 11.

NO

Replace the floor wire harness, then clear the DTC, and retest.

11. Connector connection check

-1. Check the following connections.

SRS unit connector B (39P)
Right side impact sensor (first) 4P connector (on the floor wire harness)

Right side impact sensor (second) 2P connector (on the floor wire harness)

Are the connectors OK?

YES

Go to step 13.

NO

Go to step 12.

12. System check

-1. Reset the loose connections that caused the problem in step 11.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B0097-87 No signal from the right side impact sensor (second)	B

Is DTC B0097-87 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 13.

NO

The system is OK at this time.

13. Right side impact sensor (second) substituting

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. **Substitute a known-good right side impact sensor (second)** .

-3. Reconnect the negative cable to the 12 volt battery.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the ON mode, then wait for 10 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B0097-87 No signal from the right side impact sensor (second)	B

Is DTC B0097-87 indicated?

YES

Go to step 14.

NO

Replace the right side impact sensor (second) , then clear the DTC.

14. Right side impact sensor (first) substituting

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Return the right side impact sensor (second) which was replaced.

-4. **Substitute a known-good right side impact sensor (first)** .

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0097-87 No signal from the right side impact sensor (second)	B

Is DTC B0097-87 indicated?

YES

Go to step 15.

NO

Replace the right side impact sensor (first) , then clear the DTC.

15. Shorted wire check (RS2+ line to RS2- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

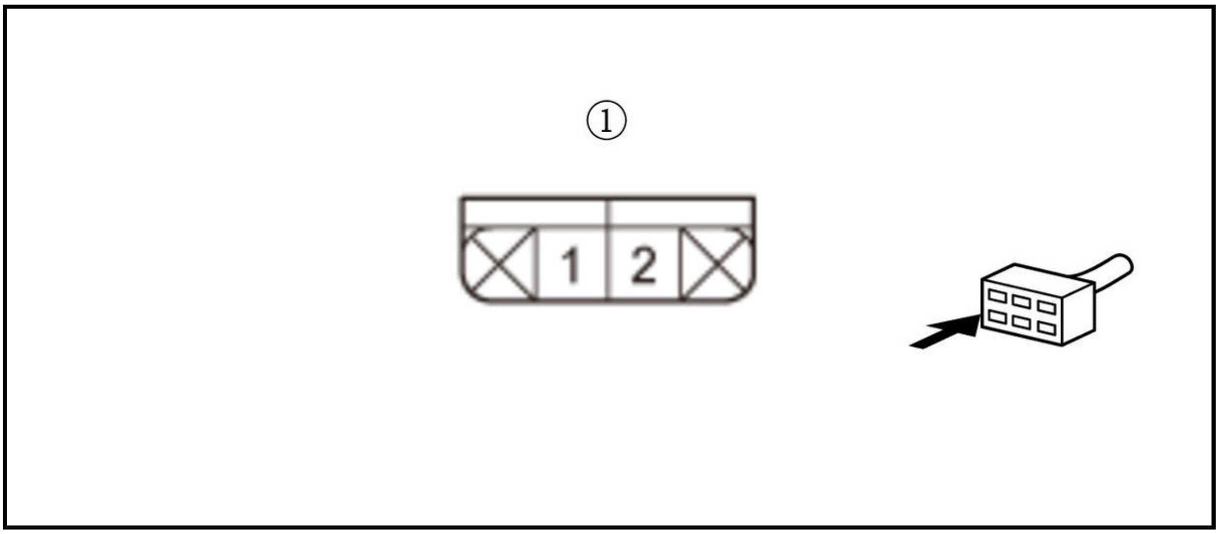
-3. Return the right side impact sensor (first) which was replaced.

-4. Disconnect the following connectors.

SRS unit connector B (39P)
Right side impact sensor (first) 4P connector (on the floor wire harness)
Right side impact sensor (second) 2P connector (on the floor wire harness)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Right side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there an open circuit, or at least 1 MΩ?

YES

The RS2+ and RS2- wires are not shorted. Go to step 16.

NO

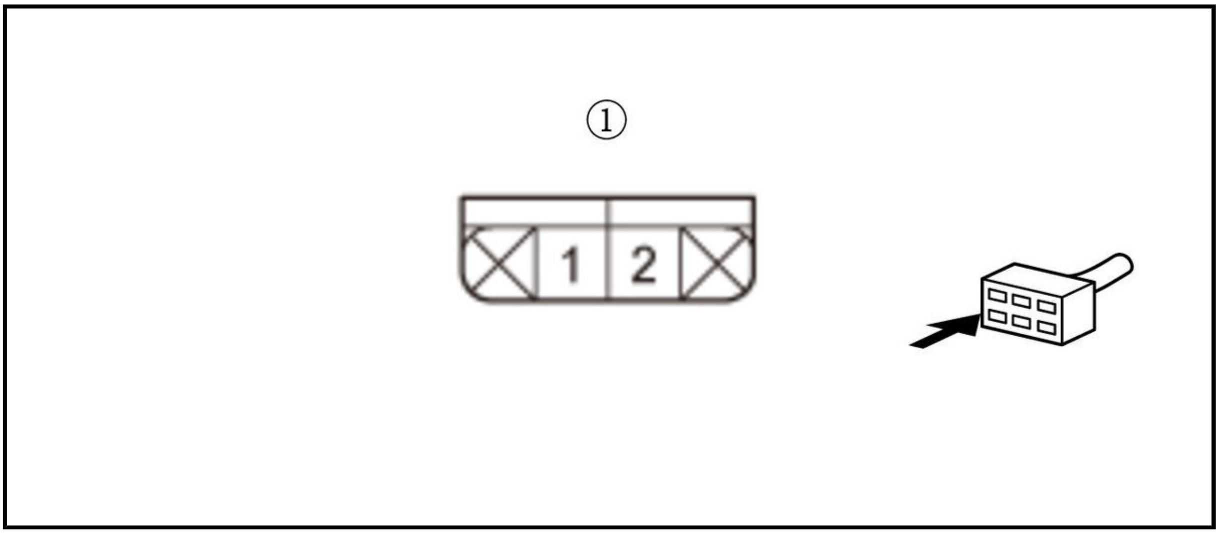
Short to another wire in the floor wire harness between the right side impact sensor (first) and the right side impact sensor (second); replace the floor wire harness, then clear the DTC.

16. Shorted wire check (RS2+, RS2- lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Right side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The RS2+ and RS2- wires are not shorted. Go to step 17.

NO

Short to ground in the floor wire harness between the right side impact sensor (first) and the right side impact sensor (second); replace the floor wire harness, then clear the DTC.

17. Shorted wire check (RS2+, RS2- lines to power)

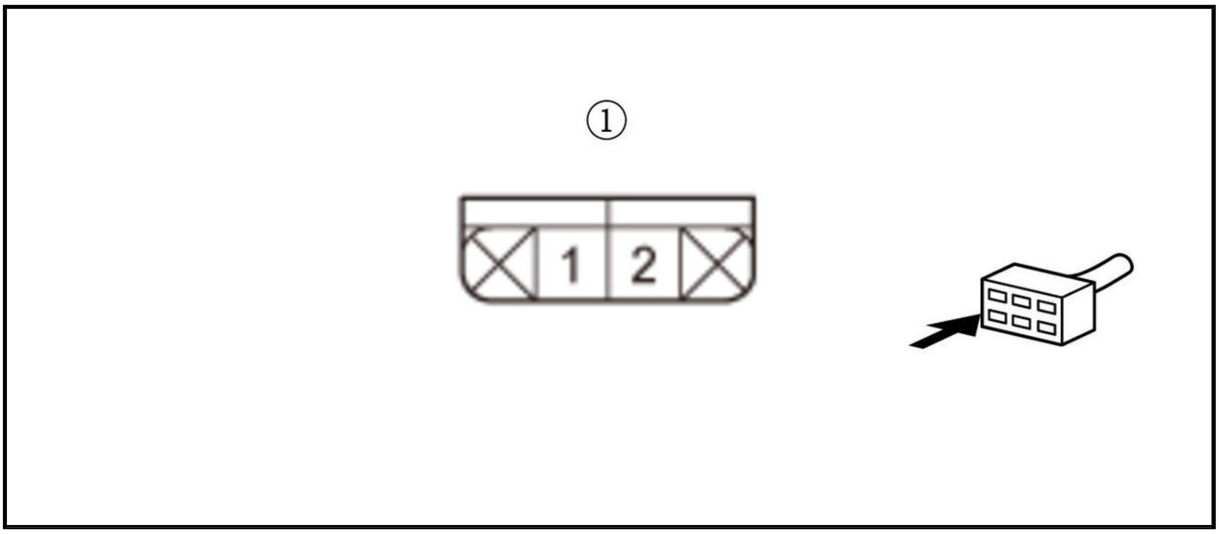
-1. Reconnect the negative cable to the 12 volt battery.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Right side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground



Is there 0.2 V or less?

YES

The RS2+ and RS2- wires are not shorted to power. Go to step 18.

NO

Short to power in the floor wire harness between the right side impact sensor (first) and the right side impact sensor (second); replace the floor wire harness, then clear the DTC.

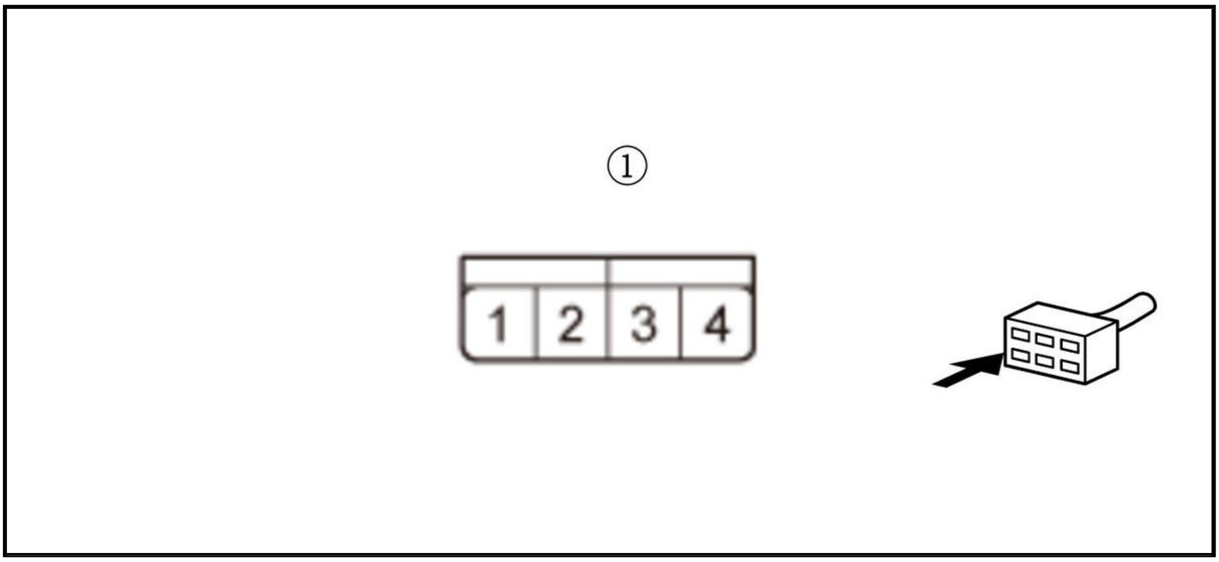
18. Open wire check (RS2+, RS2- lines)

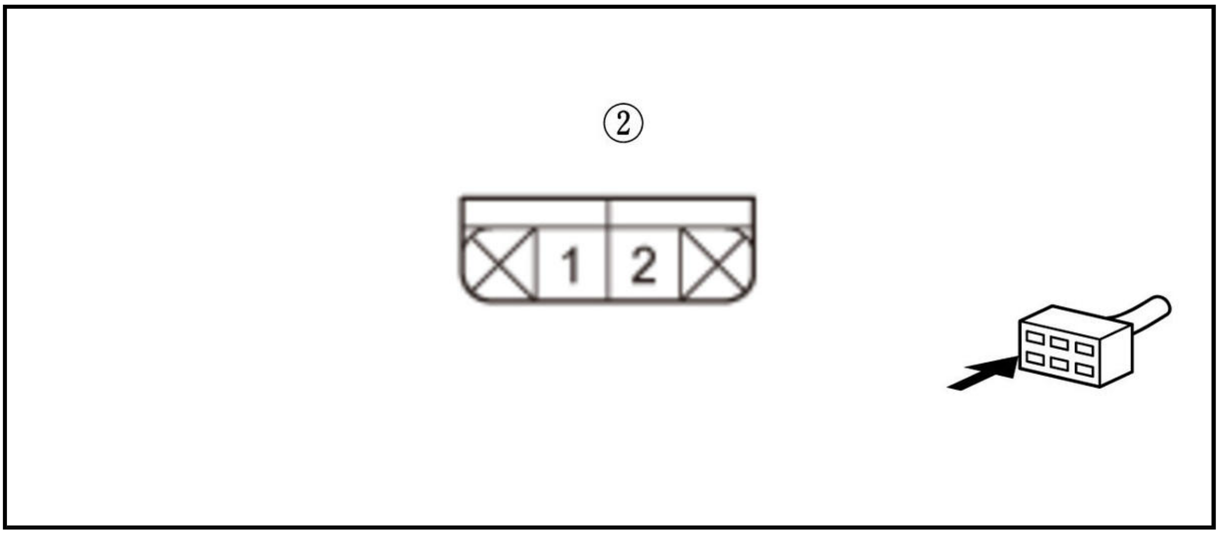
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Right side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ②

Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 4 (on the floor wire harness): ①
Test point 2	Right side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ②





Is there 1.0 Ω or less?

YES

The RS2+ and RS2- wires are OK. Disconnect and reconnect the connector, and then check the DTC again. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the floor wire harness between the right side impact sensor (first) and the right side impact sensor (second); replace the floor wire harness, then clear the DTC.

DTC B0097-4A, B0097-92

DTC B0097-4A, B0097-92 : Internal Failure of the Right Side Impact Sensor (second)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0097-4A Internal failure of the right side impact sensor (second)	B
B0097-92 Internal failure of the right side impact sensor (second)	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0097-4A Internal failure of the right side impact sensor (second)	B
B0097-92 Internal failure of the right side impact sensor (second)	B

   Is DTC B0097-4A or B0097-92 indicated?

   YES

   The failure is duplicated. **Replace the right side impact sensor (second)** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B00A0-54

DTC B00A0-54 : Front Passenger's Weight Sensor not Calibrated

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B00A0-54 Front passenger's weight sensor not calibrated	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B00A0-54 Front passenger's weight sensor not calibrated	B

Is DTC B00A0-54 indicated?

YES

The failure is duplicated. **Do the front passenger's weight sensor initialization** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B00B5-11, B00B5-2B

DTC B00B5-11 : Short or Decreased Resistance in the Driver's Seat Position Sensor

DTC B00B5-2B : Short to Another Wire Harness in the Driver's Seat Position Sensor

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B00B5-11 Short or decreased resistance in the driver's seat position sensor	B
B00B5-2B Short to another wire harness in the driver's seat position sensor	B

DTC (SRS)

1. Problem verification

-1. Raise the driver's seat all the way up, and position all the way rearward.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B00B5-11 Short or decreased resistance in the driver's seat position sensor	B
B00B5-2B Short to another wire harness in the driver's seat position sensor	B

Is DTC B00B5-11 or DTC B00B5-2B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's seat position sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's seat position sensor 2P connector (on the driver's seat wire harness)

-3. Clear the DTCs with the HDS.

-4. Turn the vehicle to the ON mode, then wait for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B00B5-11 Short or decreased resistance in the driver's seat position sensor	B
B00B5-2B Short to another wire harness in the driver's seat position sensor	B

Is DTC B00B5-11 or DTC B00B5-2B indicated?

YES

Go to step 3.

NO

Replace the driver's seat position sensor , then clear the DTC.

3. Shorted wire check (SS+ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat position sensor 2P connector (on the driver's seat wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 11**

Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The SS+ wire is OK. **Replace the driver's seat position sensor** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the floor wire harness or the driver's seat wire harness; replace the faulty harness, then clear the DTC.

DTC B00B5-13

DTC B00B5-13 : Open or Increased Resistance in the Driver's Seat Position Sensor

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B00B5-13 Open or increased resistance in the driver's seat position sensor	B

DTC (SRS)

1. Problem verification

   -1. Raise the driver's seat all the way up, and position all the way rearward.

   -2. Clear the DTCs with the HDS.

   -3. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B00B5-13 Open or increased resistance in the driver's seat position sensor	B

   Is DTC B00B5-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Connector connection check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following connections.

SRS unit connector B (39P)
Driver's seat position sensor 2P connector (on the driver's seat wire harness)
Connector between the SRS unit and the driver's seat position sensor

   Are the connectors OK?

   YES

Go to step 4.

NO

Go to step 3.

3. System check

-1. Reset the loose connections that caused the problem in step 2.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B00B5-13 Open or increased resistance in the driver's seat position sensor	B

Is DTC B00B5-13 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 4.

NO

The system is OK at this time.

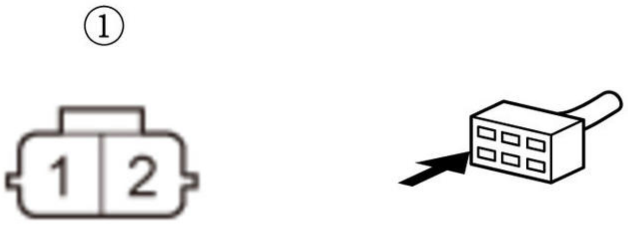
4. Open wire check (SS+, GND lines)

-1. Disconnect the following connector.

Driver's seat position sensor 2P connector (on the driver's seat wire harness)

-2. Connect terminals A and B with a jumper wire.

Terminal A	Driver's seat position sensor 2P connector (female terminals) No. 1 (on the driver's seat wire harness): ①
Terminal B	Driver's seat position sensor 2P connector (female terminals) No. 2 (on the driver's seat wire harness): ①



-3. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-4. Disconnect the following connector.

SRS unit connector B (39P)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat position sensor 2P connector (on the driver's seat wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Driver's seat position sensor 2P connector terminals No. 1 and No. 2 (on the driver's seat wire harness): jumped
Test point 1	**SRS unit connector B (39P) No. 11**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The SS+ and GND wires are OK. **Replace the driver's seat position sensor** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the floor wire harness or the driver's seat wire harness; check for a poor ground at G501. If the ground is OK, replace the faulty harness, then clear the DTC.

DTC B00C0-16, B00C0-96, B00C2-16, B00C2-96

DTC B00C0-16, B00C0-96 : Internal Failure of the Front Passenger's Weight Sensor (front inner side)

DTC B00C2-16, B00C2-96 : Internal Failure of the Front Passenger's Weight Sensor (rear inner side)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .
- Before doing this troubleshooting procedure, **check the condition of the 12 volt battery** .
- If DTC U3000-49 stored, troubleshoot DTC U3000-49 before doing this troubleshooting procedure.

DTC Description	DTC
B00C0-16 Internal failure of the front passenger's weight sensor (front inner side)	B
B00C0-96 Internal failure of the front passenger's weight sensor (front inner side)	B
B00C2-16 Internal failure of the front passenger's weight sensor (rear inner side)	B
B00C2-96 Internal failure of the front passenger's weight sensor (rear inner side)	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B00C0-16 Internal failure of the front passenger's weight sensor (front inner side)	B
B00C0-96 Internal failure of the front passenger's weight sensor (front inner side)	B

DTC Description	DTC
B00C2-16 Internal failure of the front passenger's weight sensor (rear inner side)	B
B00C2-96 Internal failure of the front passenger's weight sensor (rear inner side)	B

Is DTC B00C0-16, B00C0-96, B00C2-16, or B00C2-96 indicated?

YES

The failure is duplicated. Faulty front passenger's weight sensor. **Replace the front passenger's weight sensors as an assembly** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B00C0-4A, B00C2-4A

DTC B00C0-4A : Different Supplier ID/Function ID of the Front Passenger's Weight Sensor (front inner side)

DTC B00C2-4A : Different Supplier ID/Function ID of the Front Passenger's Weight Sensor (rear inner side)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .
- If DTC U3000-49 is stored, troubleshoot DTC U3000-49 before doing this troubleshooting procedure.

DTC Description	DTC
B00C0-4A Different supplier ID/function ID of the front passenger's weight sensor (front inner side)	B
B00C2-4A Different supplier ID/function ID of the front passenger's weight sensor (rear inner side)	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B00C0-4A Different supplier ID/function ID of the front passenger's weight sensor (front inner side)	B
B00C2-4A Different supplier ID/function ID of the front passenger's weight sensor (rear inner side)	B

Is DTC B00C0-4A or B00C2-4A indicated?

YES

The failure is duplicated. Faulty front passenger's weight sensor. **Replace the front passenger's weight sensors as an assembly** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B00C0-54, B00C2-54

DTC B00C0-54 : Different Serial ID of the Front Passenger's Weight Sensor (front inner side)

DTC B00C2-54 : Different Serial ID of the Front Passenger's Weight Sensor (rear inner side)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .
- Those DTCs are stored when replace the front passenger's weight sensor and do not the front passenger's weight sensor initialization.

DTC Description	DTC
B00C0-54 Different serial ID of the front passenger's weight sensor (front inner side)	B
B00C2-54 Different serial ID of the front passenger's weight sensor (rear inner side)	B

DTC (SRS)

1. Problem verification

-1. **Do the front passenger's weight sensor initialization procedure** .

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B00C0-54 Different serial ID of the front passenger's weight sensor (front inner side)	B
B00C2-54 Different serial ID of the front passenger's weight sensor (rear inner side)	B

Is DTC B00C0-54 or B00C2-54 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B00C0-87

DTC B00C0-87 : No Signal From the Front Passenger's Weight Sensor (front inner side)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B00C0-87 No signal from the front passenger's weight sensor (front inner side)	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B00C0-87 No signal from the front passenger's weight sensor (front inner side)	B

Is DTC B00C0-87 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Open wire check (SWS+/PWR SWS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

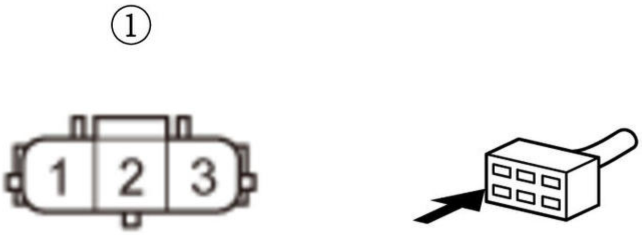
-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connectors.

SRS unit connector B (39P)
Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 26**
Test point 2	Front passenger's weight sensor (front inner side) 3P connector (female terminals) No. 1 (on the front passenger's seat wire harness): ①



Is there 1.0 Ω or less?

YES

The SWS+/PWR SWS wire is OK. Go to step 3.

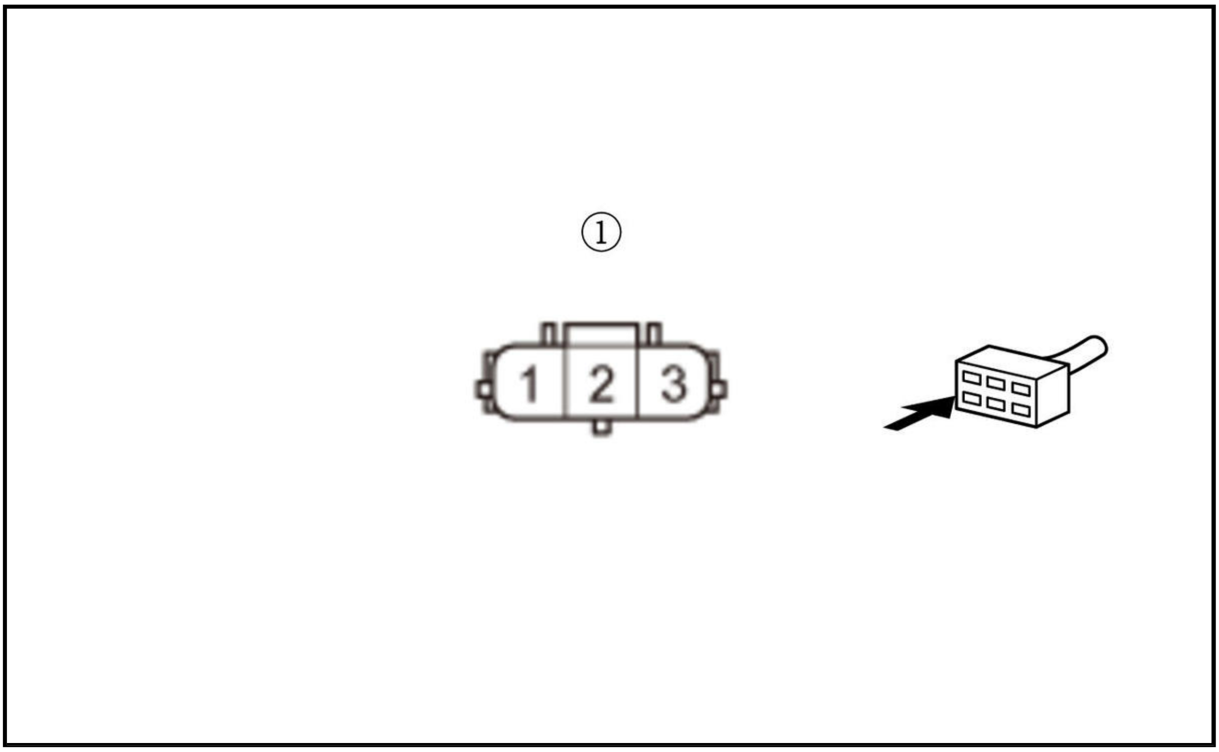
NO

Open in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

3. Open wire check (SWS-/GND SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 28**
Test point 2	Front passenger's weight sensor (front inner side) 3P connector (female terminals) No. 3 (on the front passenger's seat wire harness): ①



Is there 1.0 Ω or less?

YES

The SWS-/GND SWS wire is OK. Go to step 4.

NO

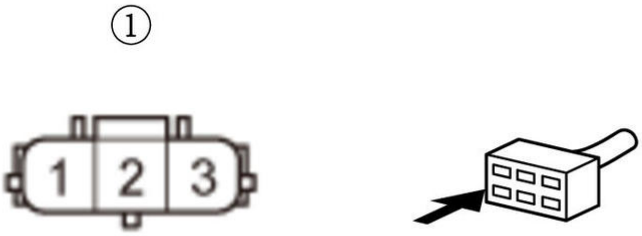
Open in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

4. Open wire check (SWSS/LIN SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 30**

Test point 2	Front passenger's weight sensor (front inner side) 3P connector (female terminals) No. 2 (on the front passenger's seat wire harness): ①



Is there 1.0 Ω or less?

YES

The SWSS/LIN SWS wire is not open. Go to step 5.

NO

Open in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

5. Shorted wire check (SWSS/LIN SWS line to power)

-1. Disconnect the following connector.

Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness)

-2. Reconnect the negative cable to the 12 volt battery.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 30**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The SWSS/LIN SWS wire is not shorted to power. Go to step 6.

NO

Short to power in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

6. Shorted wire check (SWSS/LIN SWS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 30**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The SWSS/LIN SWS wire is not shorted. Go to step 7.

NO

Short to ground in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

7. Shorted wire check (SWSS/LIN SWS line to SWS-/GND SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 30**
Test point 2	**SRS unit connector B (39P) No. 28**

Is there an open circuit, or at least 1 MΩ?

YES

The SWSS/LIN SWS and SWS-/GND SWS wires are not shorted. Go to step 8.

NO

Short to another wire in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

8. Shorted wire check (SWSS/LIN SWS line to SWS+/PWR SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 30**
Test point 2	**SRS unit connector B (39P) No. 26**

Is there an open circuit, or at least 1 MΩ?

YES

The SWSS/LIN SWS and SWS+/PWR SWS wires are OK. Go to step 9.

NO

Short to another wire in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

9. Front passenger's weight sensor check

-1. **Substitute a known-good front passenger's weight sensors as an assembly** .

-2. Reconnect the following connectors.

SRS unit connector B (39P)
Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness)
Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness)

-3. Reconnect the negative cable to the 12 volt battery.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the ON mode, then wait for 10 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B00C0-87 No signal from the front passenger's weight sensor (front inner side)	B

Is DTC B00C0-87 indicated?

YES

The front passenger's weight sensor is OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness or the front passenger's seat wire harness.

NO

Faulty front passenger's weight sensor. **Replace the front passenger's weight sensors as an assembly** .

DTC B00C2-87

DTC B00C2-87 : No Signal From the Front Passenger's Weight Sensor (rear inner side)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B00C2-87 No signal from the front passenger's weight sensor (rear inner side)	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B00C2-87 No signal from the front passenger's weight sensor (rear inner side)	B

Is DTC B00C2-87 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Open wire check (SWS+/PWR SWS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

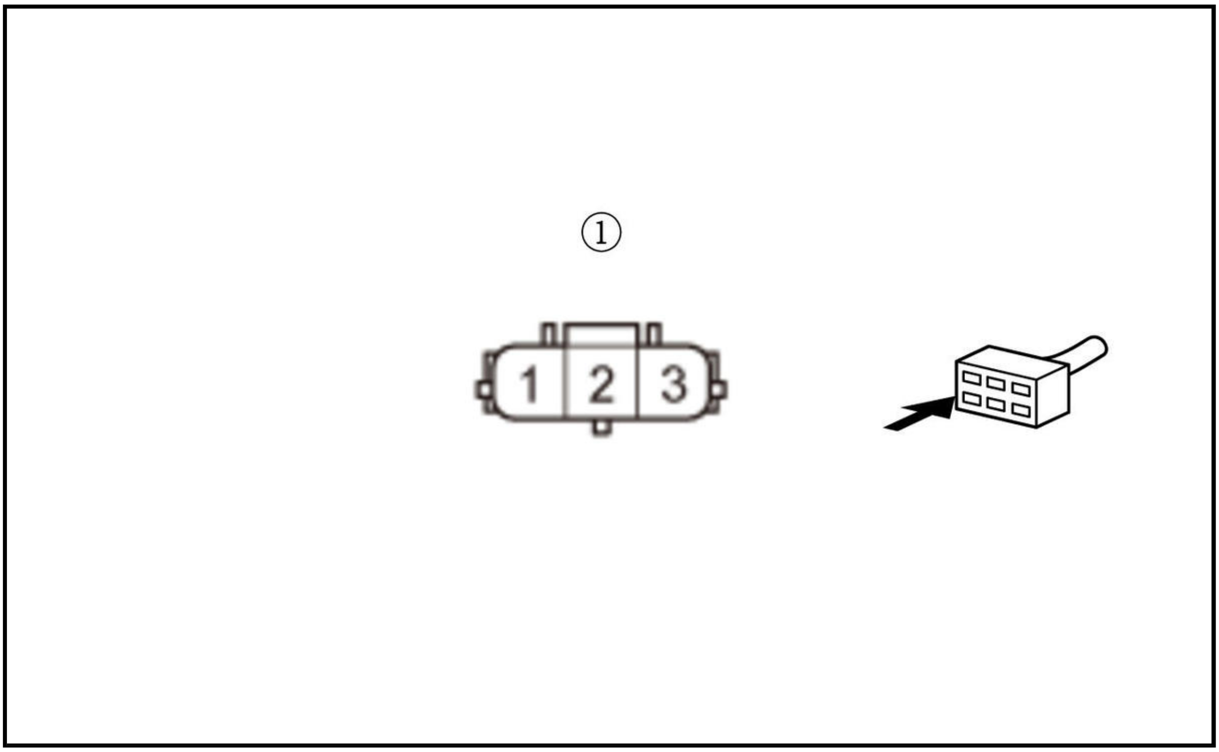
-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connectors.

SRS unit connector B (39P)
Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode SRS unit connector B (39P): disconnected Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 26**
Test point 2	Front passenger's weight sensor (rear inner side) 3P connector (female terminals) No. 1 (on the front passenger's seat wire harness): ①



Is there 1.0 Ω or less?

YES

The SWS+/PWR SWS wire is OK. Go to step 3.

NO

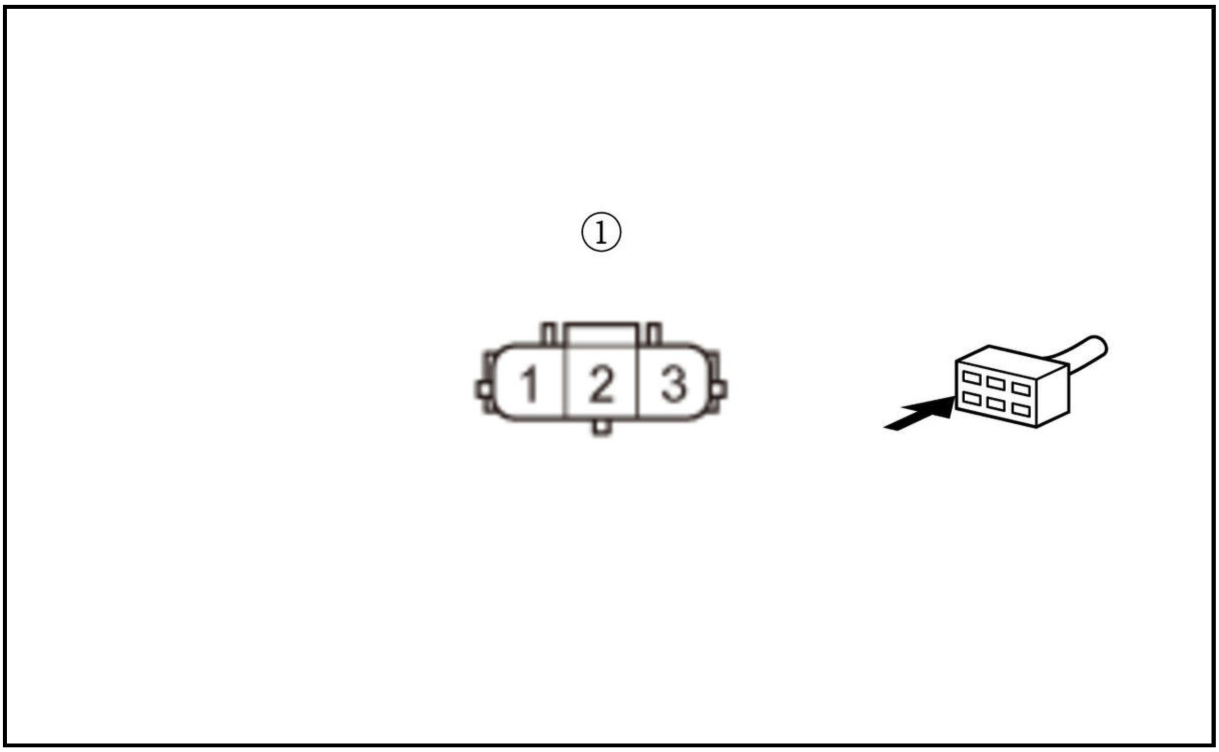
Open in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

3. Open wire check (SWS-/GND SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode SRS unit connector B (39P): disconnected Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected

Test point 1	**SRS unit connector B (39P) No. 28**
Test point 2	Front passenger's weight sensor (rear inner side) 3P connector (female terminals) No. 3 (on the front passenger's seat wire harness): ①



Is there 1.0 Ω or less?

YES

The SWS-/GND SWS wire is OK. Go to step 4.

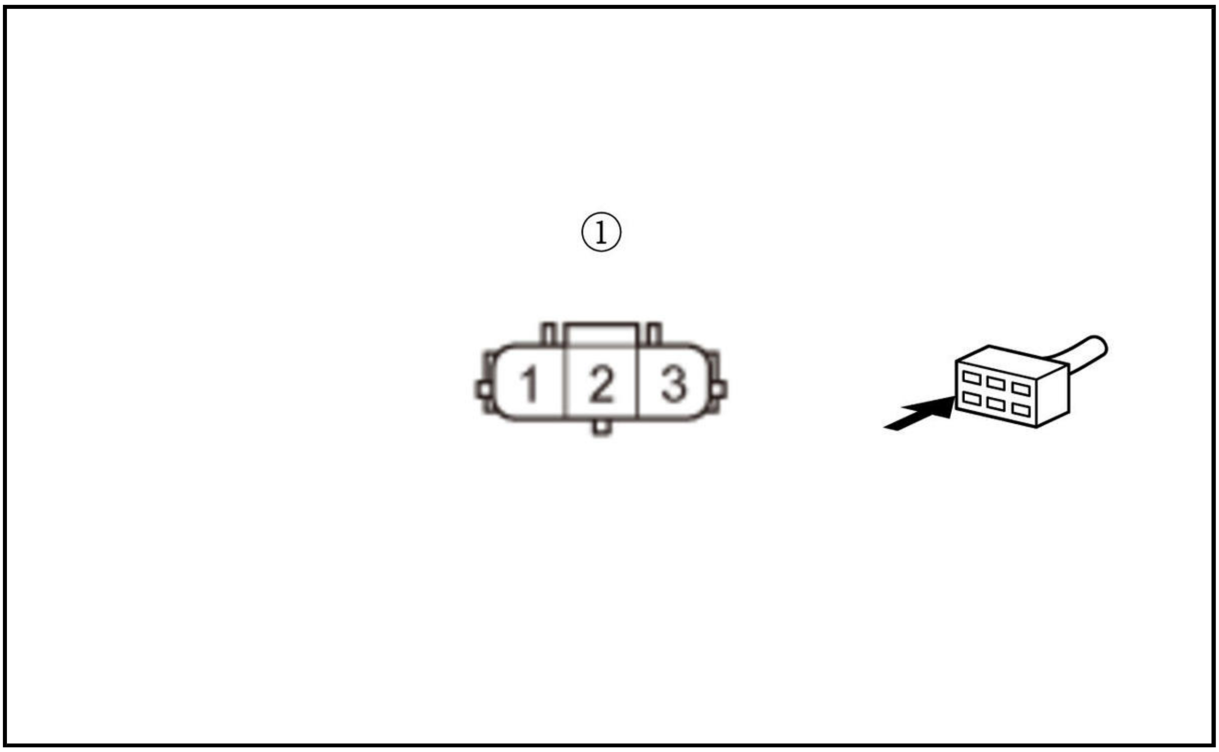
NO

Open in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

4. Open wire check (SWSS/LIN SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 30**
Test point 2	Front passenger's weight sensor (rear inner side) 3P connector (female terminals) No. 2 (on the front passenger's seat wire harness): ①



Is there 1.0 Ω or less?

YES

The SWSS/LIN SWS wire is OK. Go to step 5.

NO

Open in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

5. Front passenger's weight sensor check

-1. **Substitute a known-good front passenger's weight sensors as an assembly** .

-2. Reconnect the following connectors.

SRS unit connector B (39P)

Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness)

-3. Reconnect the negative cable to the 12 volt battery.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the ON mode, then wait for 10 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B00C2-87 No signal from the front passenger's weight sensor (rear inner side)	B

Is DTC B00C2-87 indicated?

YES

The front passenger's weight sensor is OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the floor wire harness or the front passenger's seat wire harness.

NO

Faulty front passenger's weight sensor. Replace the front passenger's weight sensors as an assembly .

DTC B00D5-14 (KA/KC)

DTC B00D5-14 : Open or Short to Ground in the Front Passenger's Airbag Cutoff Indicator

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and 12 Volt Battery Terminal Disconnection and Reconnection .
- If there are other DTCs stored with B00D5-14; troubleshoot them first.

DTC Description	DTC
B00D5-14 Open or short to ground in the front passenger's airbag cutoff indicator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B00D5-14 Open or short to ground in the front passenger's airbag cutoff indicator	B

   Is DTC B00D5-14 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Open wire check (OFF PTT line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

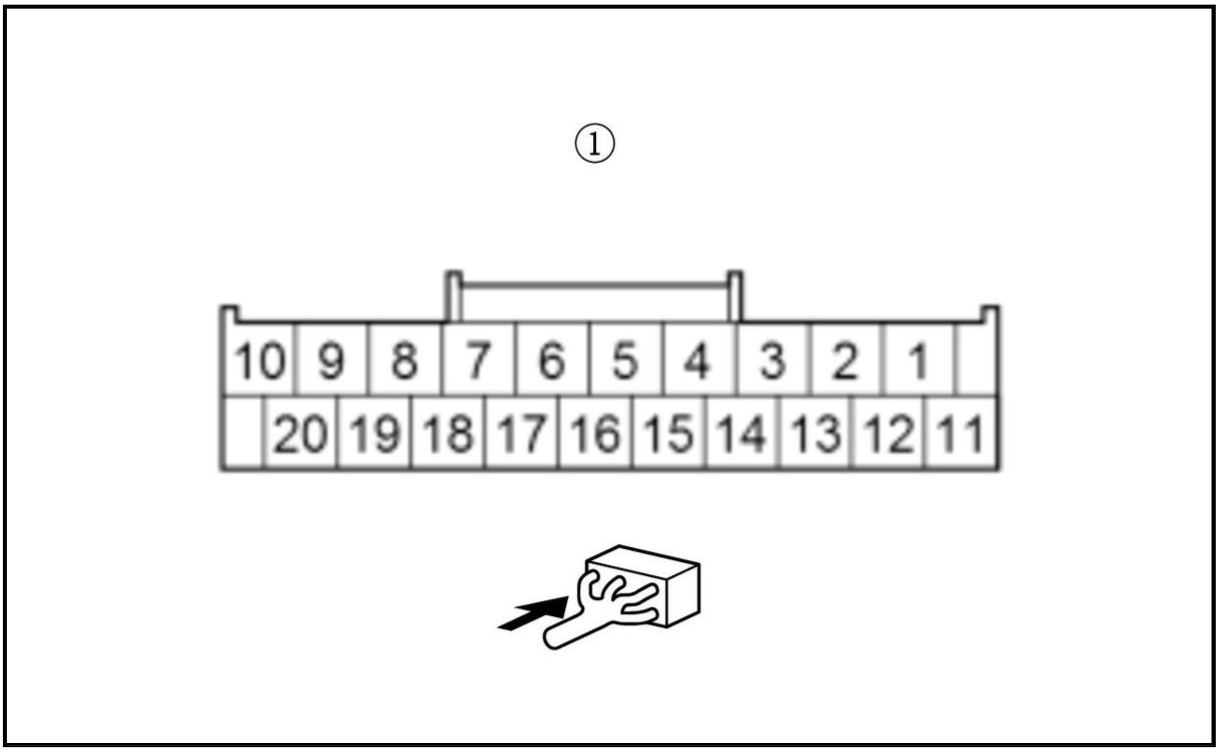
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the following connectors.

Climate control panel 20P connector (on the dashboard wire harness)
SRS unit connector A (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control panel 20P connector (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
Test point 1	**SRS unit connector A (39P) No. 28**
Test point 2	Climate control panel 20P connector (female terminals) No. 7 (on the dashboard wire harness): ①



Is there 1.0 Ω or less?

YES

The OFF PTT wire is not open. Go to step 3.

NO

Open in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

3. Shorted wire check (OFF PTT line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Climate control panel 20P connector (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
Test point 1	**SRS unit connector A (39P) No. 28**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The OFF PTT wire is OK. **Replace the front passenger's airbag cutoff indicator** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B00D5-17 (KA/KC)

DTC B00D5-17 : Short to Power in the Front Passenger's Airbag Cutoff Indicator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .
- If there are other DTCs stored with B00D5-17; troubleshoot them first.

DTC Description	DTC
B00D5-17 Short to power in the front passenger's airbag cutoff indicator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B00D5-17 Short to power in the front passenger's airbag cutoff indicator	B

   Is DTC B00D5-17 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (OFF PTT line to power)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the following connectors.

Climate control panel 20P connector (on the dashboard wire harness)
SRS unit connector A (39P)

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control panel 20P connector (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
Test point 1	**SRS unit connector A (39P) No. 28**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The OFF PTT wire is OK. **Replace the front passenger's airbag cutoff indicator** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to power in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B00DF-11, B00DF-2B

DTC B00DF-11 : Short in the Front Passenger's Airbag ON/OFF Switch

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B00DF-11 Short in the front passenger's airbag ON/OFF switch	B
B00DF-2B Short to another wire harness in the front passenger's airbag ON/OFF switch	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Push and release the front passenger's airbag ON/OFF switch 5 times repeatedly.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B00DF-11 Short in the front passenger's airbag ON/OFF switch	B
B00DF-2B Short to another wire harness in the front passenger's airbag ON/OFF switch	B

Is DTC B00DF-11 or B00DF-2B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's airbag ON/OFF switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's airbag ON/OFF switch 4P connector (on the dashboard wire harness)

-3. Clear the DTCs with the HDS.

-4. Turn the vehicle to the ON mode, then wait for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B00DF-11 Short in the front passenger's airbag ON/OFF switch	B
B00DF-2B Short to another wire harness in the front passenger's airbag ON/OFF switch	B

Is DTC B00DF-11 or B00DF-2B indicated?

YES

Go to step 3.

NO

Replace the component , then clear the DTC.

3. Shorted wire check (ACS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

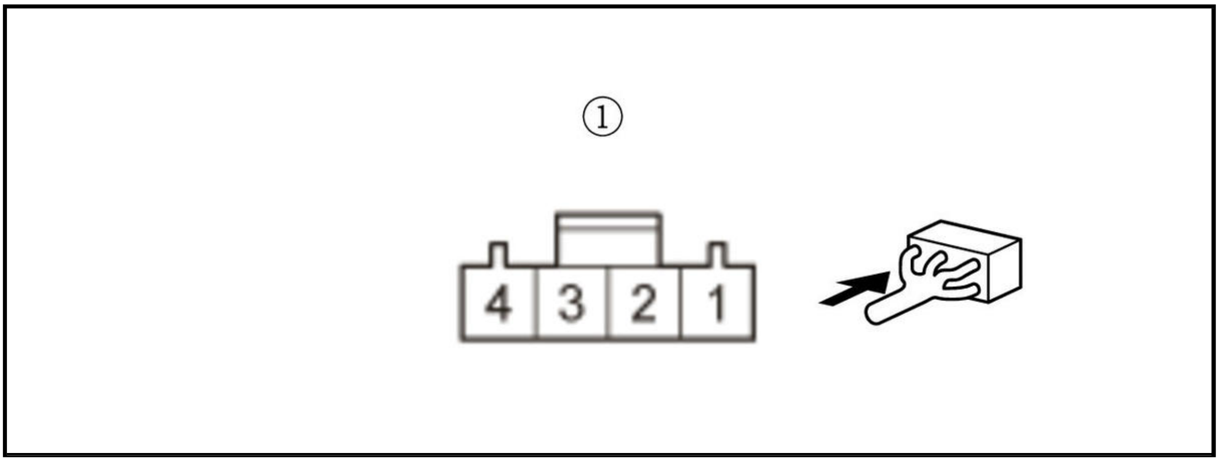
-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's airbag ON/OFF switch 4P connector (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
Test point 1	Front passenger's airbag ON/OFF switch 4P connector (female terminals) No. 4 (on the dashboard wire harness): ①

Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The ACS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B00DF-13

DTC B00DF-13 : Open in the Front Passenger's Airbag ON/OFF Switch

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B00DF-13 Open in the front passenger's airbag ON/OFF switch	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Push and release the front passenger's airbag ON/OFF switch 5 times repeatedly.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B00DF-13 Open in the front passenger's airbag ON/OFF switch	B

Is DTC B00DF-13 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's airbag ON/OFF switch check

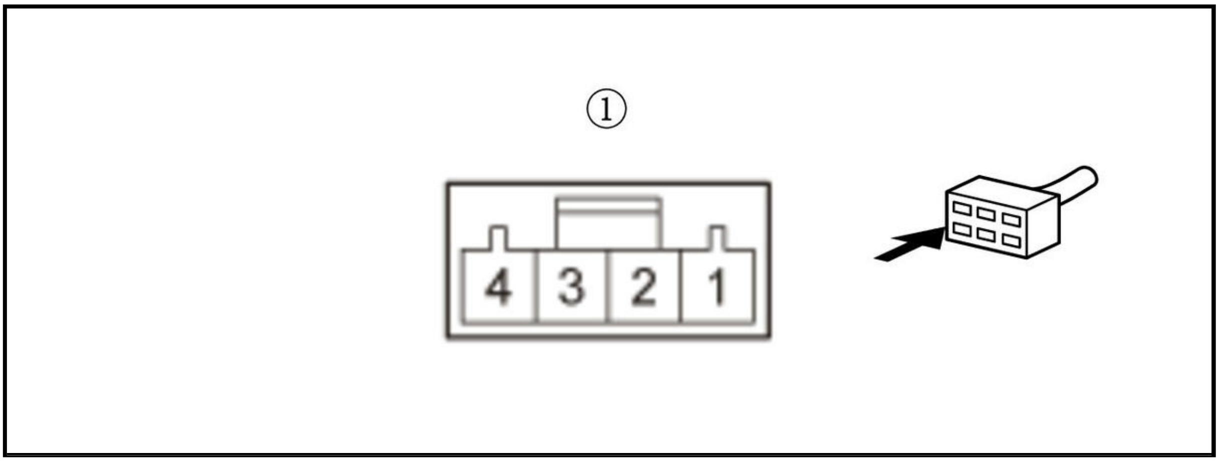
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's airbag ON/OFF switch 4P connector (on the dashboard wire harness)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front Passenger's airbag ON/OFF switch 4P connector (on the dashboard wire harness): disconnected
Test point 1	Front passenger's airbag ON/OFF switch 4P connector (male terminals) No. 1: ①
Test point 2	Front passenger's airbag ON/OFF switch 4P connector (male terminals) No. 4: ①



Position	Resistance
ON	3.11-3.80 kΩ
OFF	0.68-0.83 kΩ

Is the resistance as specified?

YES

Go to step 3.

NO

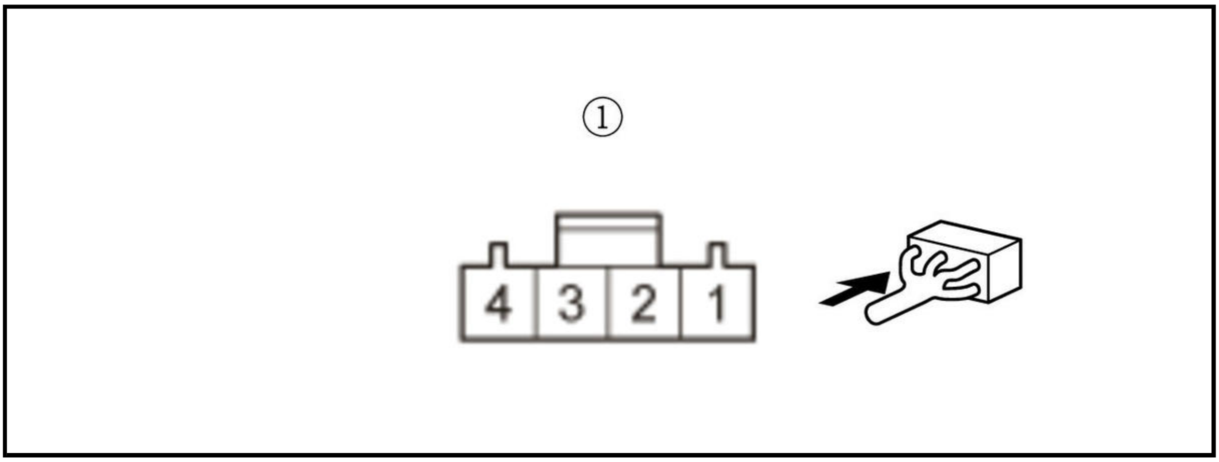
Faulty front passenger's airbag ON/OFF switch or poor connection at front passenger's airbag ON/OFF switch 4P connector and the front passenger's airbag ON/OFF switch. Check the connection; if the connection is OK, Replace the component , then clear the DTC.

3. Shorted wire check (ACS, GND lines to power)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Front passenger's airbag ON/OFF switch 4P connector (on the dashboard wire harness): disconnected
Test point 1	Front passenger's airbag ON/OFF switch 4P connector (female terminals) No. 1 (on the dashboard wire harness): ①
Test point 2	Front passenger's airbag ON/OFF switch 4P connector (female terminals) No. 4 (on the dashboard wire harness): ①



Is there 0.2 V or less?

YES

The ACS and GND wires are not shorted to power. Go to step 4.

NO

Short to power in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

4. Open wire check (ACS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

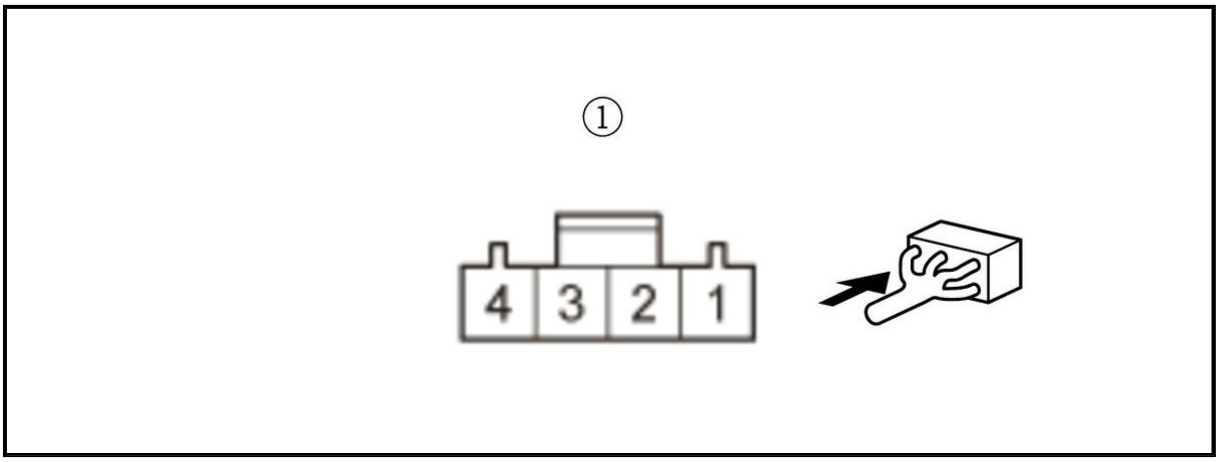
-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's airbag ON/OFF switch 4P connector (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
Test point 1	**SRS unit connector A (39P) No. 19**
Test point 2	Passenger's airbag ON/OFF switch 4P connector (female terminals) No. 4 (on the dashboard wire harness): ①



Is there 1.0 Ω or less?

YES

The ACS wire is OK. Go to step 5.

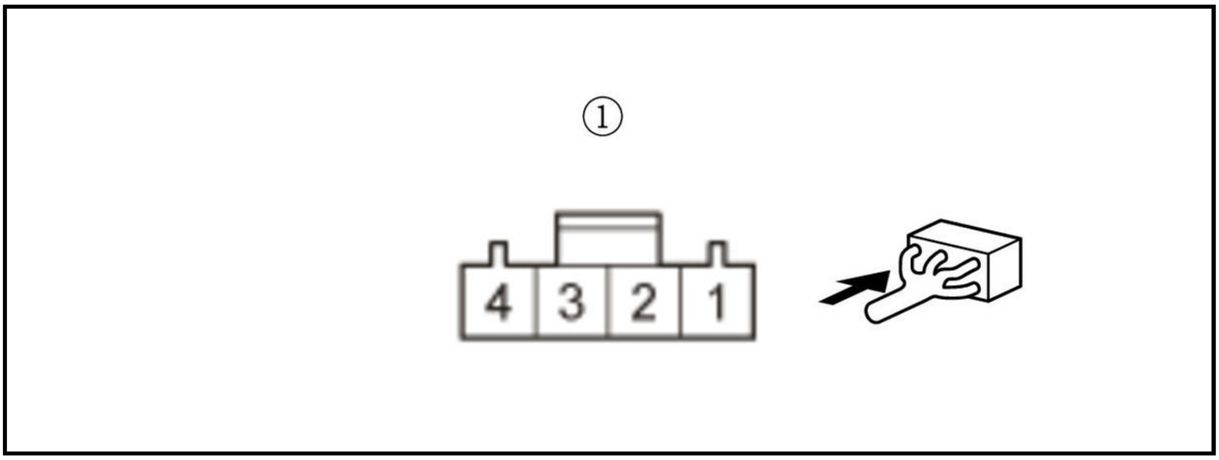
NO

Open in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

5. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's airbag ON/OFF switch 4P connector (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
Test point 1	Front passenger's airbag ON/OFF switch 4P connector (female terminals) No. 1 (on the dashboard wire harness): ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the dashboard wire harness; check for a poor ground at G503. If the ground is OK, replace the dashboard wire harness, then clear the DTC.

DTC B2800-49, B2801-49, B2802-49, C0061-96, C0063-96, U3000-49 (SRS UNIT)

DTC B2800-49, B2801-49, B2802-49, C0061-96, C0063-96, U3000-49 : Internal Failure of the SRS Unit

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before troubleshooting any of these DTCs, **check the 12 volt battery/system voltage and 12 volt battery cable connections** . If the voltage is low, repair the charging system, test and charge the 12 volt battery, or replace the 12 volt battery before troubleshooting the SRS. If the 12 volt battery/system voltage is OK, ask the customer if the 12 volt battery ever went dead or if the engine was started and run with the 12 volt battery in a low state of charge. A dead 12 volt battery may trigger one or more of these DTCs.
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B2800-49 Internal failure of the SRS unit	B
B2801-49 Internal failure of the SRS unit	B
B2802-49 Internal failure of the SRS unit	B
C0061-96 Internal failure of the SRS unit	B
C0063-96 Internal failure of the SRS unit	B
U3000-49 Internal failure of the SRS unit	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B2800-49 Internal failure of the SRS unit	B
B2801-49 Internal failure of the SRS unit	B
B2802-49 Internal failure of the SRS unit	B
C0061-96 Internal failure of the SRS unit	B
C0063-96 Internal failure of the SRS unit	B
U3000-49 Internal failure of the SRS unit	B

Is DTC B2800-49, B2801-49, B2802-49, C0061-96, C0063-96, or U3000-49 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B2840-13

DTC B2840-13 : SRS Unit Connector A Not Properly Installed

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B2840-13 SRS unit connector A not properly installed	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B2840-13 SRS unit connector A not properly installed	B

   Is DTC B2840-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Connector connection check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following connection.

SRS unit connector A (39P)

   Is the connector OK?

   YES

   Go to step 4.

   NO

   Go to step 3.

3. System check

-1. Reset the loose connections that caused the problem in step 2.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B2840-13 SRS unit connector A not properly installed	B

Is DTC B2840-13 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 4.

NO

The system is OK at this time.

4. SRS unit check

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. Disconnect the following connector.

SRS unit connector A (39P)

-3. Check for bent or damaged terminals on the SRS unit.

Are any terminals bent or damaged?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Replace the dashboard wire harness, then clear the DTC.

DTC B2841-13

DTC B2841-13 : SRS Unit Connector B Not Properly Installed

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B2841-13 SRS unit connector B not properly installed	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B2841-13 SRS unit connector B not properly installed	B

   Is DTC B2841-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Connector connection check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following connection.

SRS unit connector B (39P)

   Is the connector OK?

   YES

   Go to step 4.

   NO

   Go to step 3.

3. System check

   -1. Reset the loose connections that caused the problem in step 2.

   -2. Clear the DTCs with the HDS.

   -3. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B2841-13 SRS unit connector B not properly installed	B

   Is DTC B2841-13 indicated?

   YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 4.

NO

The system is OK at this time.

4. SRS unit check

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. Disconnect the following connector.

SRS unit connector B (39P)

-3. Check for bent or damaged terminals on the SRS unit.

Are any terminals bent or damaged?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Replace the floor wire harness, then clear the DTC.

DTC U0122-00 (SRS UNIT (WITH CAN GATEWAY))

DTC U0122-00 : Lost Communication With the VSA Modulator-Control Unit (wheel speed sensor signal error)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .
- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the SRS unit.
- Refer to the DTC shown on the display, then inspect the connectors and terminals based on the instructions.
- Information marked with an asterisk (*) applies to the CAN gateway (16P connector type).

DTC Description	DTC
U0122-00 Lost communication with the VSA modulator-control unit (wheel speed sensor signal error)	B

DTC (SRS)

1. CAN gateway system DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
U0029-00 CAN Gateway F-CAN ch A Bus Off	B
U0047-00 CAN Gateway F-CAN ch B Bus Off	B
U3000-49 CAN Gateway Internal Failure	B

Is DTC U0029-00, U0047-00, and/or U3000-49 indicated?

YES

Go to the troubleshooting for CAN gateway system DTC(s) .

NO

Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Does the SRS unit detect the CAN gateway Bus channels B?

Bus B is Not Available

Go to step 3.

Bus B is Available

Go to step 4.

3. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery.

-3. Disconnect the following connectors.

CAN gateway 12P (16P)* connector

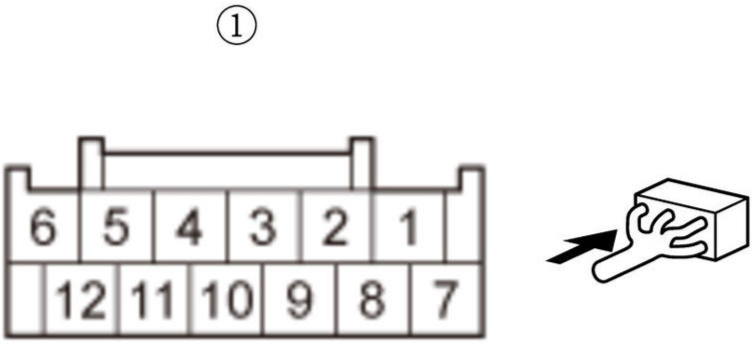
SRS unit connector A (39P)

-4. Measure the resistance between test points 1 and 2.

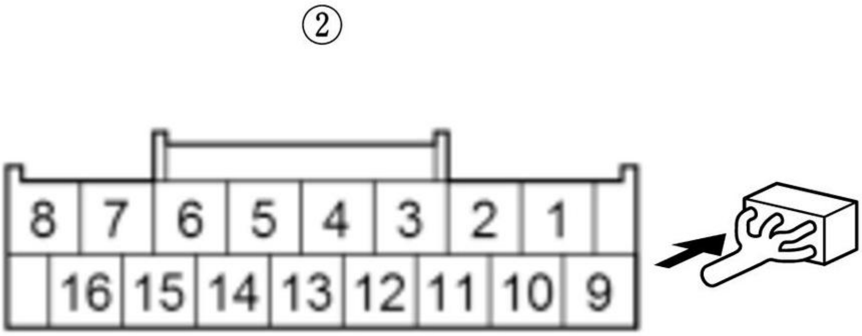
Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P (16P)* connector: disconnected
B	SRS unit connector A (39P): disconnected
Test point 1	CAN gateway 12P connector (female terminals) No. 12 (on the dashboard wire harness): ① CAN gateway 16P connector (female terminals) No. 6 (on the dashboard wire harness): ② *
Test point 2	**SRS unit connector A (39P) No. 34**

Test point 1	CAN gateway 12P connector (female terminals) No. 5 (on the dashboard wire harness): ① CAN gateway 16P connector (female terminals) No. 14 (on the dashboard wire harness): ② *
Test point 2	**SRS unit connector A (39P) No. 35**

12P Connector Type



16P Connector Type*



Is there 1.0 Ω or less?

YES

The F-CAN B_H and the F-CAN B_L wires are OK. Check for poor connections or loose terminals at the CAN gateway and the SRS unit. If the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the SRS unit** .

NO

Replace an open in the wire between the CAN gateway and the SRS unit.

4. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0122-00	VSA modulator-control unit	A, B

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0122-00: VSA modulator-control unit is Not Available for Bus A

Go to step 5.

U0122-00: VSA modulator-control unit is Not Available for Bus B

Go to step 6.

5. Open wire check (F-CAN A_H, F-CAN A_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 12P (16P)* connector
U0122-00	VSA modulator-control unit 46P connector

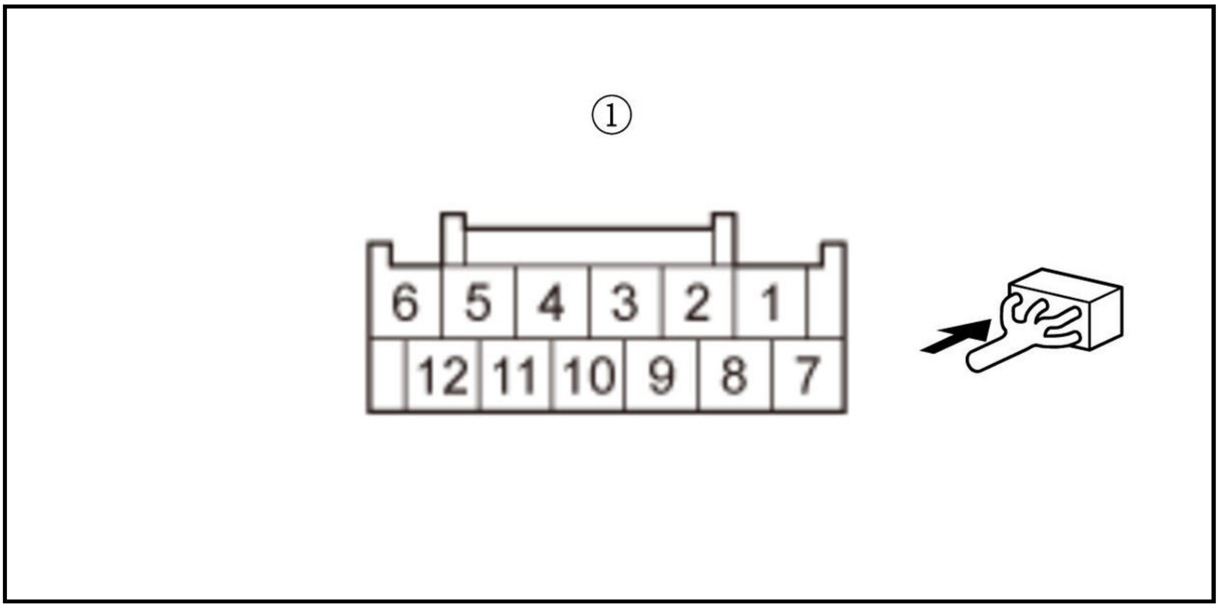
-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P (16P)* connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

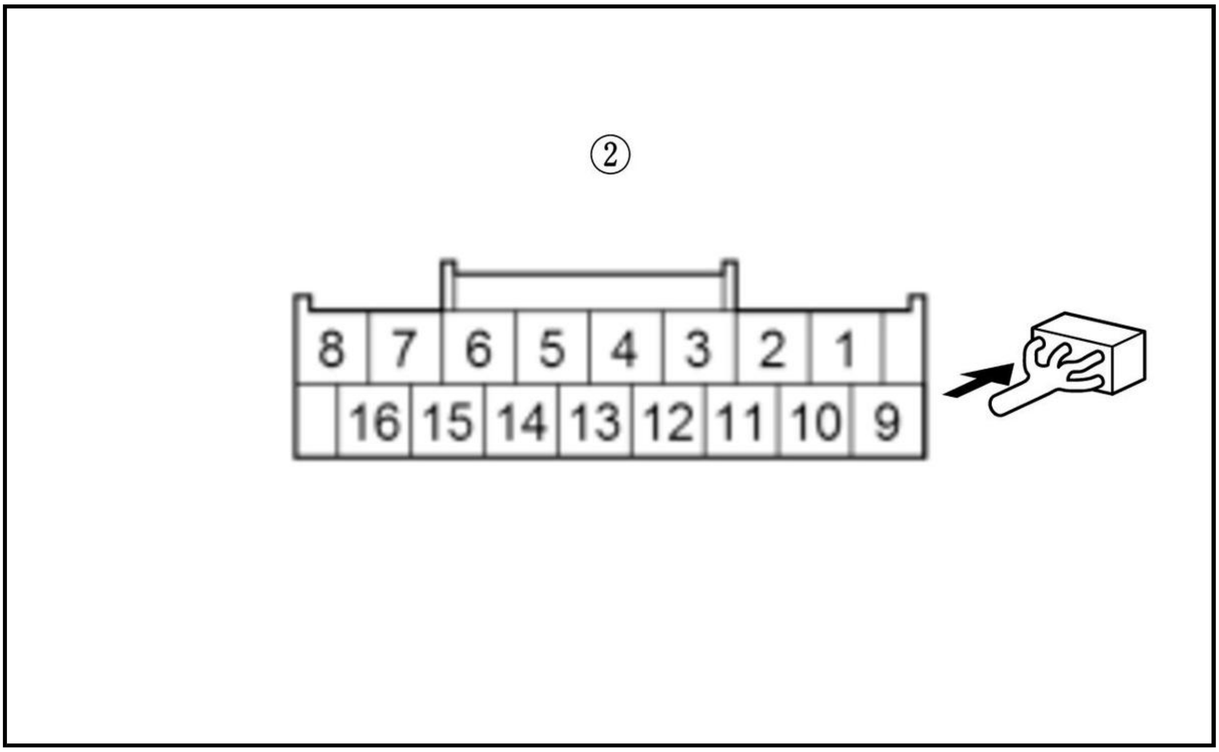
DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U0122-00	F-CAN A_H	CAN gateway 12P connector (female terminals): ① CAN gateway 16P	No. 3	VSA modulator-control unit 46P connector	No. 40
	F-CAN A_L		No. 9 (11)*		No. 28

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
		connector (female terminals): ② *			

12P Connector Type



16P Connector Type*



Is there 1.0 Ω or less?

YES

The F-CAN_H and the F-CAN_L wires are OK. Check for poor connections or loose terminals at the SRS unit and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the transmitting control unit and the CAN gateway.

6. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

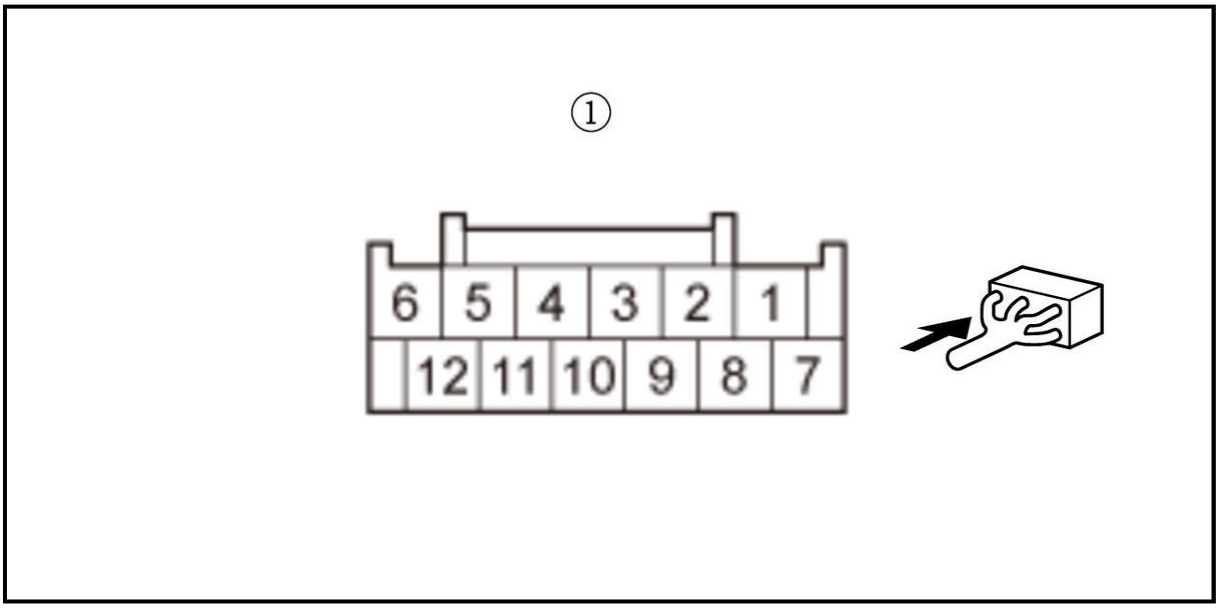
DTC	Connector
-	CAN gateway 12P (16P)* connector
U0122-00	VSA modulator-control unit 46P connector

-3. Measure the resistance between test points 1 and 2.

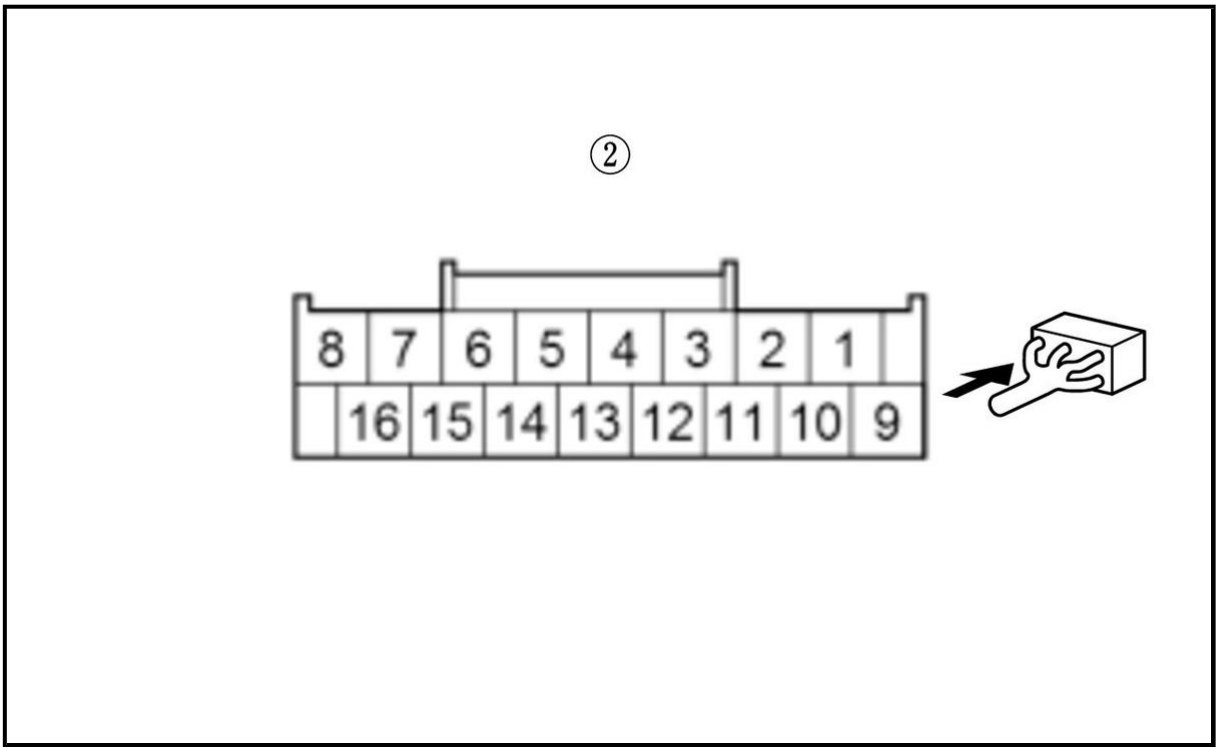
Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P (16P)* connector: disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U0122-00	F-CAN B_H	CAN gateway 12P connector (female terminals): ① CAN gateway 16P connector (female terminals): ② *	No. 12 (6)*	**VSA modulator-control unit 46P connector**	No. 46
	F-CAN B_L		No. 5 (14)*		No. 34

12P Connector Type



16P Connector Type*



Is there 1.0 Ω or less?

YES

According to the detected DTC on the following table, substitute or replace the correspond control unit. Check for poor connections or loose terminals at the SRS unit and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit.

DTC	Operation for transmitting control unit
U0122-00	Replace the VSA modulator-control unit .

NO

Repair an open in the wire between the transmitting control unit and the CAN gateway.

DTC U0122-00 (SRS UNIT (WITHOUT CAN GATEWAY))

DTC U0122-00 : Lost Communication With the VSA Modulator-Control Unit (wheel speed sensor signal error)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .
- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the SRS unit.
- Refer to the DTC shown on the display, then inspect the connectors and terminals based on the instructions.

DTC Description	DTC
U0122-00 Lost communication with the VSA modulator-control unit (wheel	B

DTC Description	DTC
speed sensor signal error)	

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
U0122-00 Lost communication with the VSA modulator-control unit (wheel speed sensor signal error)	B

Is DTC U0122-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Open wire check (F-CAN_H, F-CAN_L lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the receiving control unit connector(s).

SRS unit connector A (39P)

-4. Disconnect the transmitting control unit connector(s).

Refer to the DTC shown on the display, then disconnect the connector(s) based on the instructions (see table).

DTC	Connector
U0122-00	VSA modulator-control unit 46P connector

-5. Check for continuity between the receiving control unit and the transmitting control unit on the F-CAN_H circuit and the F-CAN_L circuit.

Test condition	Vehicle OFF (LOCK) mode
B	Receiving control unit connector(s): disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal
U0122-00	F-CAN_H	SRS unit connector A (39P)	No. 34	VSA modulator-control unit 46P	No. 40
	F-CAN_L		No. 35		No. 28

DTC	Circuit name	Receiving control unit		Transmitting control unit	
		Connector	Terminal	Connector	Terminal

connector

Is there continuity?

YES

The F-CAN_H and the F-CAN_L wires are OK. Check for poor connections or loose terminals at the SRS unit and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Replace an open in the wire between the transmitting control unit and the SRS unit.

DTC U3000-49 (SRS UNIT (KA/KC))

DTC U3000-49 : Internal Failure of the SRS Unit

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
U3000-49 Internal failure of the SRS unit	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
U3000-49 Internal failure of the SRS unit	B

   Is DTC U3000-49 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (SWS+/PWR SWS line to power)

   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connectors.

SRS unit connector B (39P)
Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness)
Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness)

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
B	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
B	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 26**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The SWS+/PWR SWS wire is not shorted to power. Go to step 3.

NO

Short to power in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

3. Shorted wire check (SWS+/PWR SWS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
B	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
B	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 26**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The SWS+/PWR SWS wire is not shorted. Go to step 4.

NO

Short to ground in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

4. Shorted wire check (SWS+/PWR SWS line to SWS-/GND SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
B	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
B	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 26**
Test point 2	**SRS unit connector B (39P) No. 28**

Is there an open circuit, or at least 1 MΩ?

YES

The SWS+/PWR SWS to SWS-/GND SWS wires are OK. Go to step 5.

NO

Short to another wire in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

5. Front passenger's weight sensor check

-1. **Substitute a known-good front passenger's weight sensors as an assembly** .

-2. Reconnect the following connectors.

SRS unit connector B (39P)
Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness)
Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness)

-3. Reconnect the negative cable to the 12 volt battery.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the ON mode, then wait for 10 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
U3000-49 Internal failure of the SRS unit	B

Is DTC U3000-49 indicated?

YES

The front passenger's weight sensor is OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness or the front passenger's seat wire harness.

NO

Faulty front passenger's weight sensor. **Replace the front passenger's weight sensors as an assembly** .

DTC U3000-51 (SRS UNIT)

DTC U3000-51 : SRS Unit Programming Error

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- This DTC is indicated when the SRS unit update is not completed properly.
- Never press the engine start/stop switch, while updating the SRS unit. If you press the engine start/stop switch, before you complete the SRS unit update procedure, the SRS unit can be damaged. If there is a problem with the update, keep the vehicle in ON mode.
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
U3000-51 SRS unit programming error	B

DTC (SRS)

1. Problem verification (update)

-1. **Do the SRS unit update procedure** .

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U3000-51 SRS unit programming error	B

Is DTC U3000-51 indicated?

YES

The failure is duplicated. **Replace the SRS unit** .

NO

Update is complete.

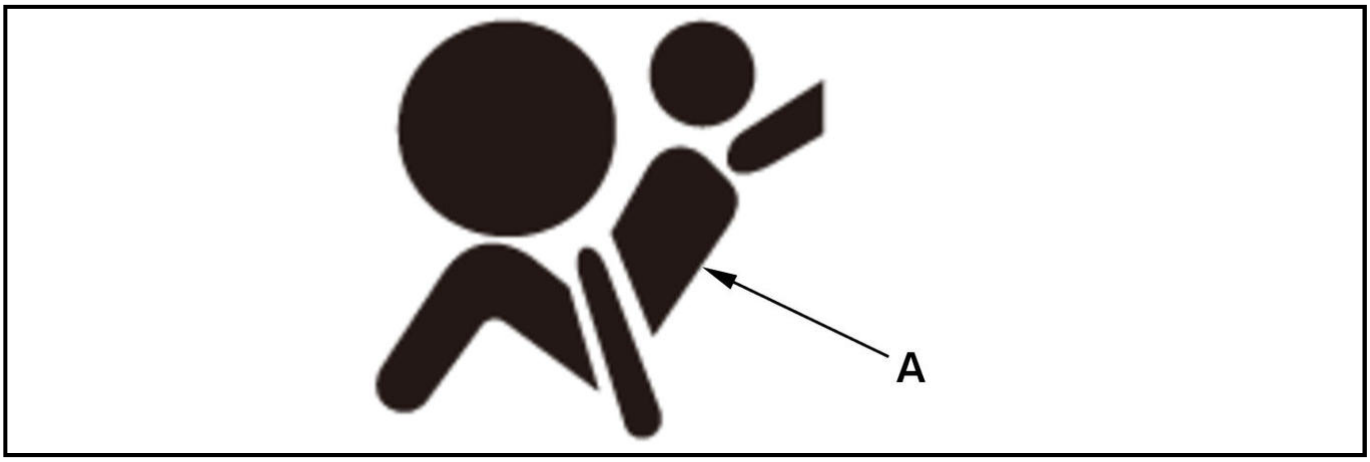
HOW TO INFORMATION

HOW TO TROUBLESHOOT THE SRS

SRS Indicator

The SRS indicator (A) on the gauge control module indicates problems related with SRS function.



If the system is OK, the SRS indicator should come on when you turn the vehicle to the ON mode, and then go off 6 seconds later. If it does not, there is a problem with the system.

NOTE: If the SRS indicator comes on, and SRS DTCs are not indicated, do the SRS symptom troubleshooting.

How to Troubleshoot Circuits at the Connectors Especially for Connectors with Terminal Test Ports

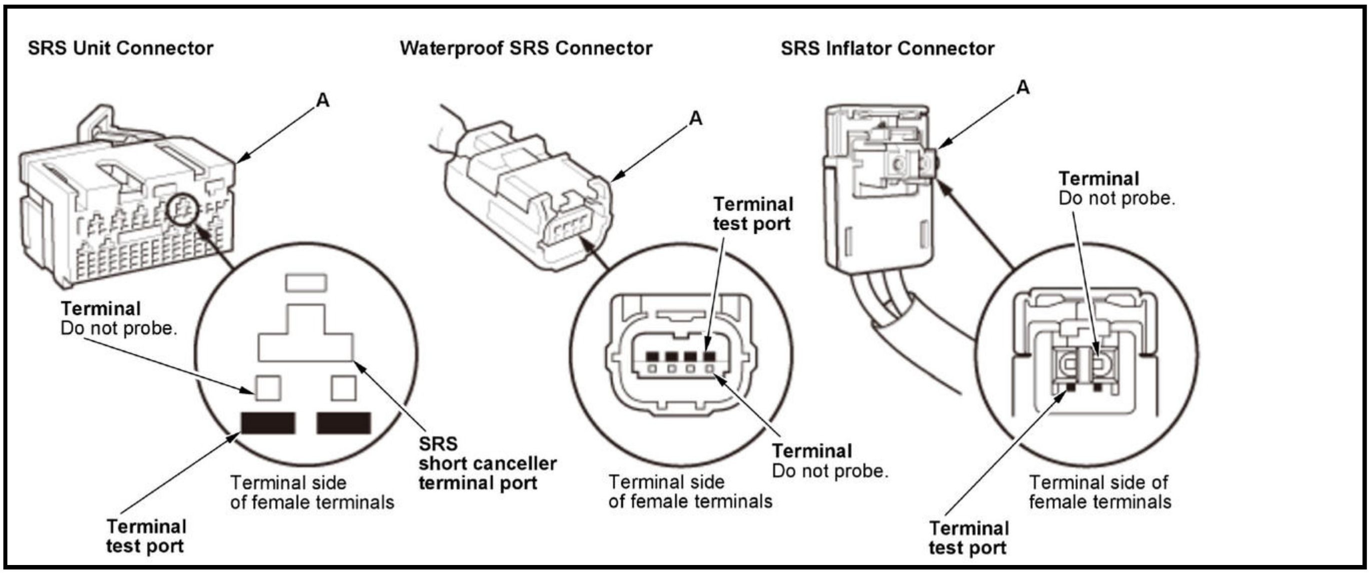
Special Tools Required

Male Pin Probe 07ZAJ-RDJA110

NOTE:

- Make sure the 12 volt battery is fully charged when doing an electrical test. If the 12 volt battery is not fully charged, the results of the tests may not be accurate.
- To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes. Damaged terminals cause a poor connection and an incorrect measurement.

1. When diagnosing or troubleshooting the circuits at the connectors (A), use the appropriate terminal test port as shown. Gently insert the pin probe of the tester or jumper wire at the terminal test port from the terminal side.



SRS Unit Connector

Terminal
Do not probe.
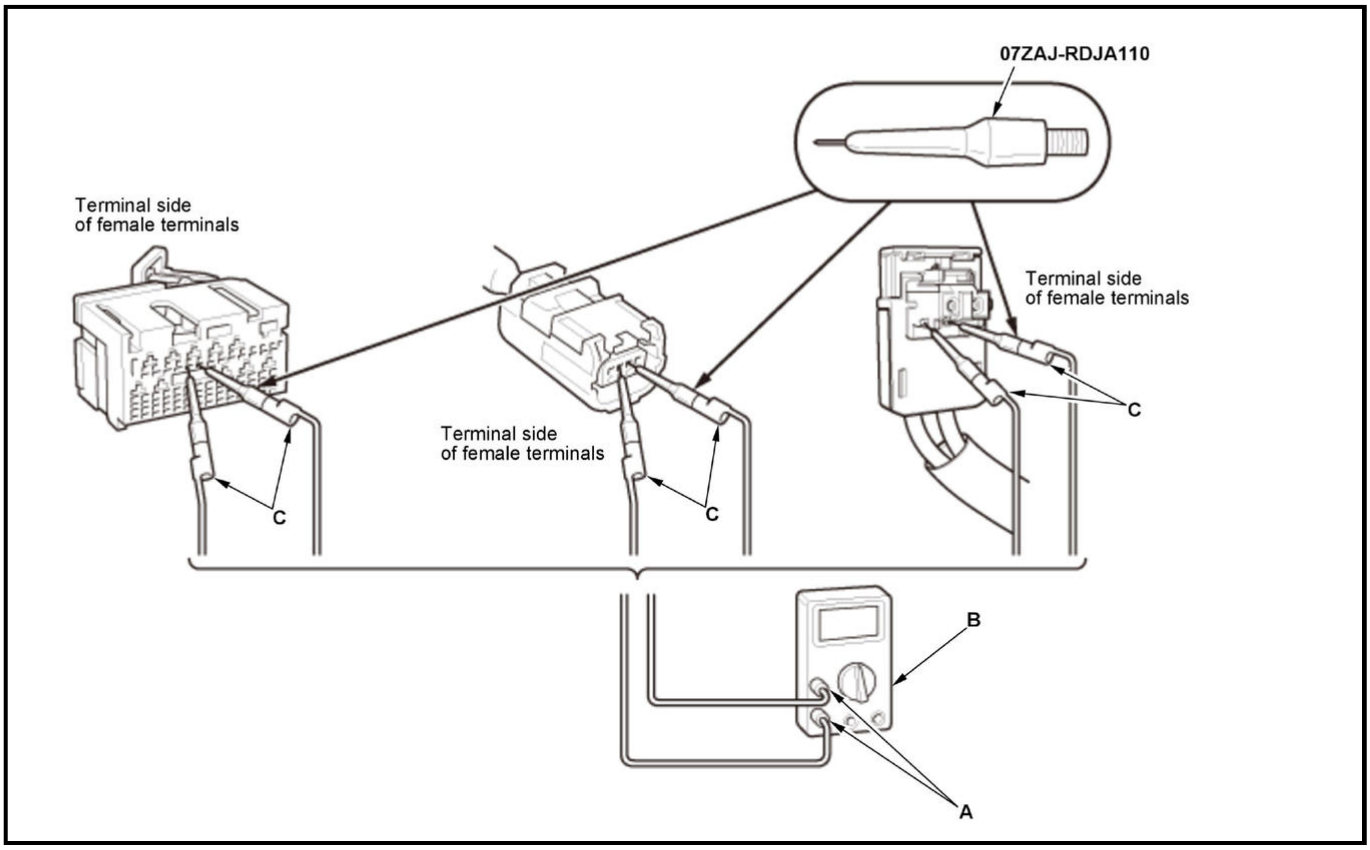
Terminal side of
female terminals
Terminal
test port

NOTE:

- Do not insert the pin probes of the tester or a jumper wire at the terminal or the SRS short canceller terminal port.
- To prevent damage to the connector terminals, do not insert the test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an

incorrect measurement.

2. Connect one side of the patch cord terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminals (C) to the male pin probe.



07ZAJ-RDJA110
Terminal side of female terminals
Terminal side of female terminals
Terminal side of female terminals
C
C
C
B
A

Gently contact the male pin probe at the terminal test port from the terminal side. Do not force the tips into the terminals.

NOTE:

- For accurate results, always use the male pin probe.
- To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes. Damaged terminals cause a poor connection and an incorrect measurement.
- Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.

How to Troubleshoot Circuits at the Connectors Except for Connectors with Terminal Test Ports

Special Tools Required

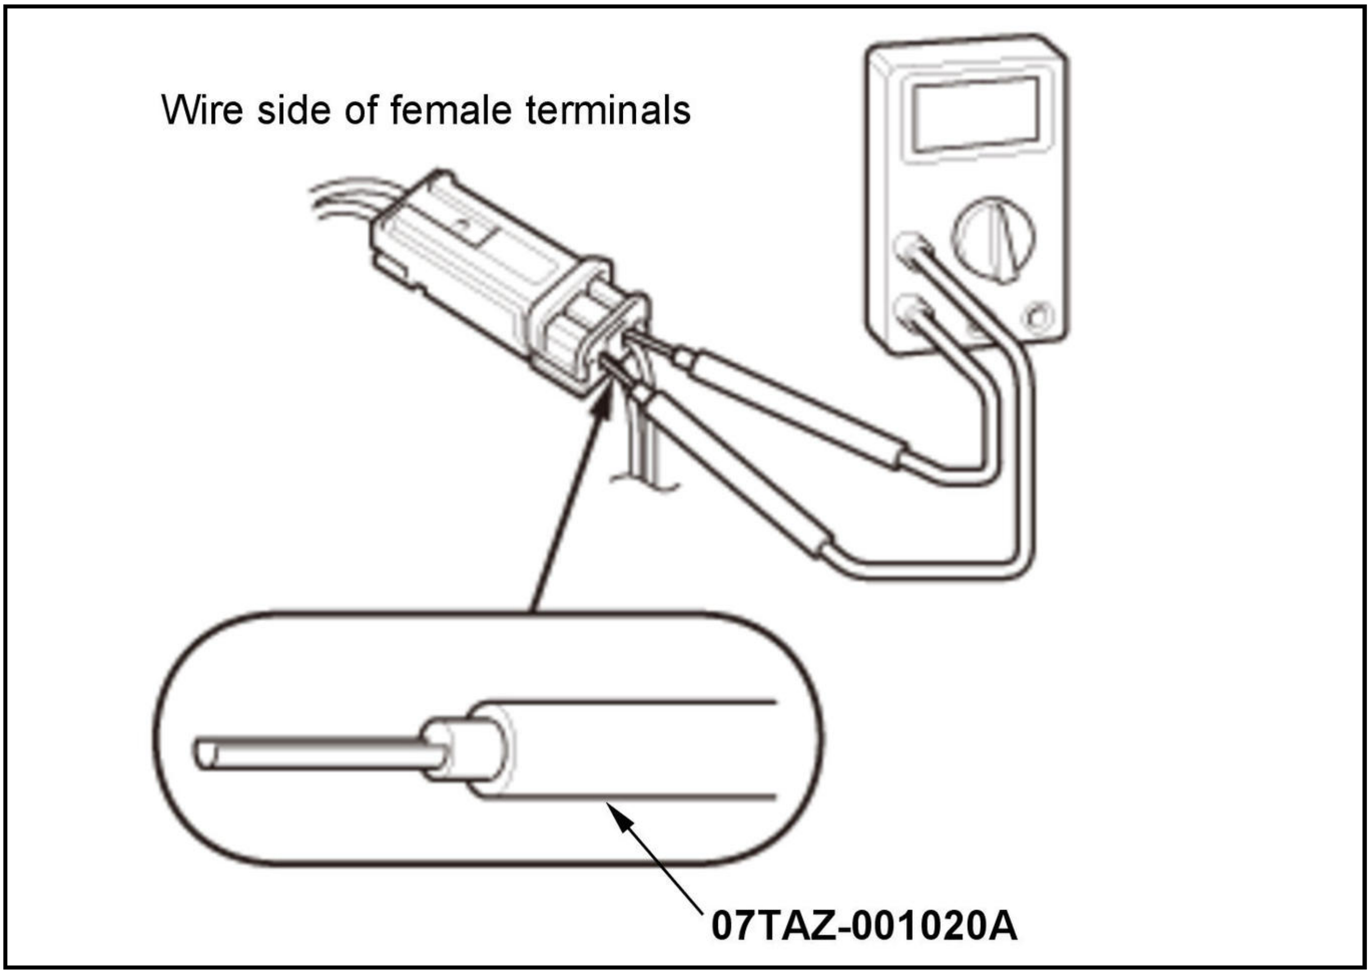
Back Probe Adapter, 17 mm 07TAZ-001020A

When using electrical test equipment, insert the back probe adapter, 17 mm of the tester into the wire side of the connector (except for connectors with terminal test ports).

NOTE:

- Make sure the 12 volt battery is fully charged when doing an electrical test. If the 12 volt battery is not fully charged, the results of the tests may not be accurate.
- Do not insert the probe of the tester into the terminal side of the connector, and do not tamper with the connector.
- To prevent damage to the connector, do not insert test equipment probes, paper clips, or other substitutes. Damaged terminals cause a poor connection and an incorrect measurement.
- Do not puncture the insulation on a wire. Punctures can cause poor or intermittent electrical connections.

- Do not insert the probe forcibly.
- Use specified service connectors in troubleshooting. Using improper tools could cause a diagnostic error due to poor metal-to-metal contact.



Opening the SRS Unit Shorting Connectors for Diagnosis

Special Tools Required

SRS Short Canceller 070AZ-SAA0100

NOTE:

- To prevent damage to the connector cavity, insert an SRS short canceller straight into the cavity from the terminal side.
- Before installing an SRS short canceller, wash it with electrical contact cleaner, then dry it with compressed air.
- Do not use an SRS short canceller if it is damaged.
- Make sure to remove an SRS short canceller before reconnecting the SRS unit connector.
- Some systems store data in memory that is lost when the 12 volt battery is disconnected. Before disconnecting the 12 volt battery, **refer to 12 Volt Battery Terminal Disconnection and Reconnection** .

When SRS unit connectors A (39P) and B (39P) are disconnected, short circuits are automatically created in the connector to prevent accidental deployment of an airbag. The circuit may need to be opened sometimes when diagnosing the system. Insert an SRS short canceller in the specified cavities when necessary to keep the circuit open for diagnosis.

DTC (Diagnostic Trouble Codes)

The self-diagnostic function of the SRS unit allows it to locate the causes of system problems and store this information in memory. For easier troubleshooting, this data can be retrieved with the HDS via the data link circuit.

- When you turn the vehicle to the ON mode, the SRS indicator should come on. If it goes off after 6 seconds, the system is normal and is not currently detecting any problems.
- If there is a problem, the system locates and defines the problem, stores this information in the memory, and turns on the SRS indicator. The data remains in the memory even if the vehicle is turned to the OFF (LOCK) mode or the 12 volt battery is disconnected.
- The data is stored in memory as a diagnostic trouble code (DTC).
- DTCs are either latching or resetting depending on the malfunction. With resetting DTCs, the SRS indicator goes off the next time the vehicle is turned to the ON mode, and the system is normal, but the DTC is still stored. With latching DTCs, the SRS indicator does not turn off until the malfunction is repaired and the DTC is cleared.
- When you connect the HDS to the data link connector (DLC), you can retrieve a more detailed DTC in the HDS "SRS" menu.
- After reading and recording the DTC, go to the troubleshooting procedure for that code.

Precautions

- Make sure the 12 volt battery is fully charged. If the 12 volt battery is dead or low, electrical measurement values may not be correct.
- Use only a digital multimeter to check the system. Make sure its output is 10 mA (0.01 A) or less when switched to the smallest value in the ohmmeter range. A tester with a higher output could damage the airbag circuit or cause accidental airbag deployment and possible injury.
- Whenever the vehicle is turned to the ON mode, or the vehicle is in the OFF (LOCK) mode for less than 3 minutes, be careful not to bump the SRS unit; the system could falsely interpret an impact or rollover, deploying airbags in response and cause damage or injuries.
- Before removing the dashboard wire harness or floor wire harness, disconnect the driver's airbag inflator connector, the front passenger's airbag inflator connector, both side airbag inflator connectors, both side curtain airbag inflator connectors, and both front seat belt tensioner connectors.
-

How to Read DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

2. Connect the HDS to the data link connector (DLC)

3. Use the HDS to check for SRS DTCs.

4. Read and record the DTC.

NOTE: Do not clear the DTC until instructed by the troubleshooting procedure.

5. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

2. Connect the HDS to the data link connector (DLC)

3. Clear the DTC(s) by following the screen prompts on the HDS.

4. Turn the vehicle to the OFF (LOCK) mode, then wait for 10 seconds.

Troubleshooting Intermittent Failures

If there was a malfunction that sets a DTC, but it does not recur, a DTC will be stored in the memory, and the SRS indicator may come on depending on the malfunction detected.

NOTE:

- **Check the condition of the 12 volt battery** . Low battery voltage may cause some intermittent failures.
- A faulty or damaged cable reel can cause intermittent problems related to the driver's airbag inflator DTCs.

After checking the DTC, troubleshoot as follows:

1. Check for DTCs with the HDS.

2. Clear the DTCs with the HDS.

3. Set the parking brake, then start the engine, and let it idle.

4. The SRS indicator comes on for about 6 seconds and then goes off.

5. Shake the related wire harnesses and the connectors, and look for loose connections, poor pin fits, and poor grounds.

6. Take a test-drive (quick acceleration, quick braking, and cornering), turn the steering wheel fully left and right, and hold it there for 5 to 10 seconds. If the problem recurs, the SRS indicator will come on.

7. If you cannot duplicate the concern, ask the customer about the conditions when it occurred, or ask the customer to demonstrate the concern.

8. If you cannot duplicate the intermittent failure, the system is OK at this time.

DTC TROUBLESHOOTING

DTC B0001-11

DTC B0001-11 : Short to Ground in the Driver's Airbag First Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0001-11 Short to ground in the driver's airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-11 Short to ground in the driver's airbag first inflator	B

   Is DTC B0001-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

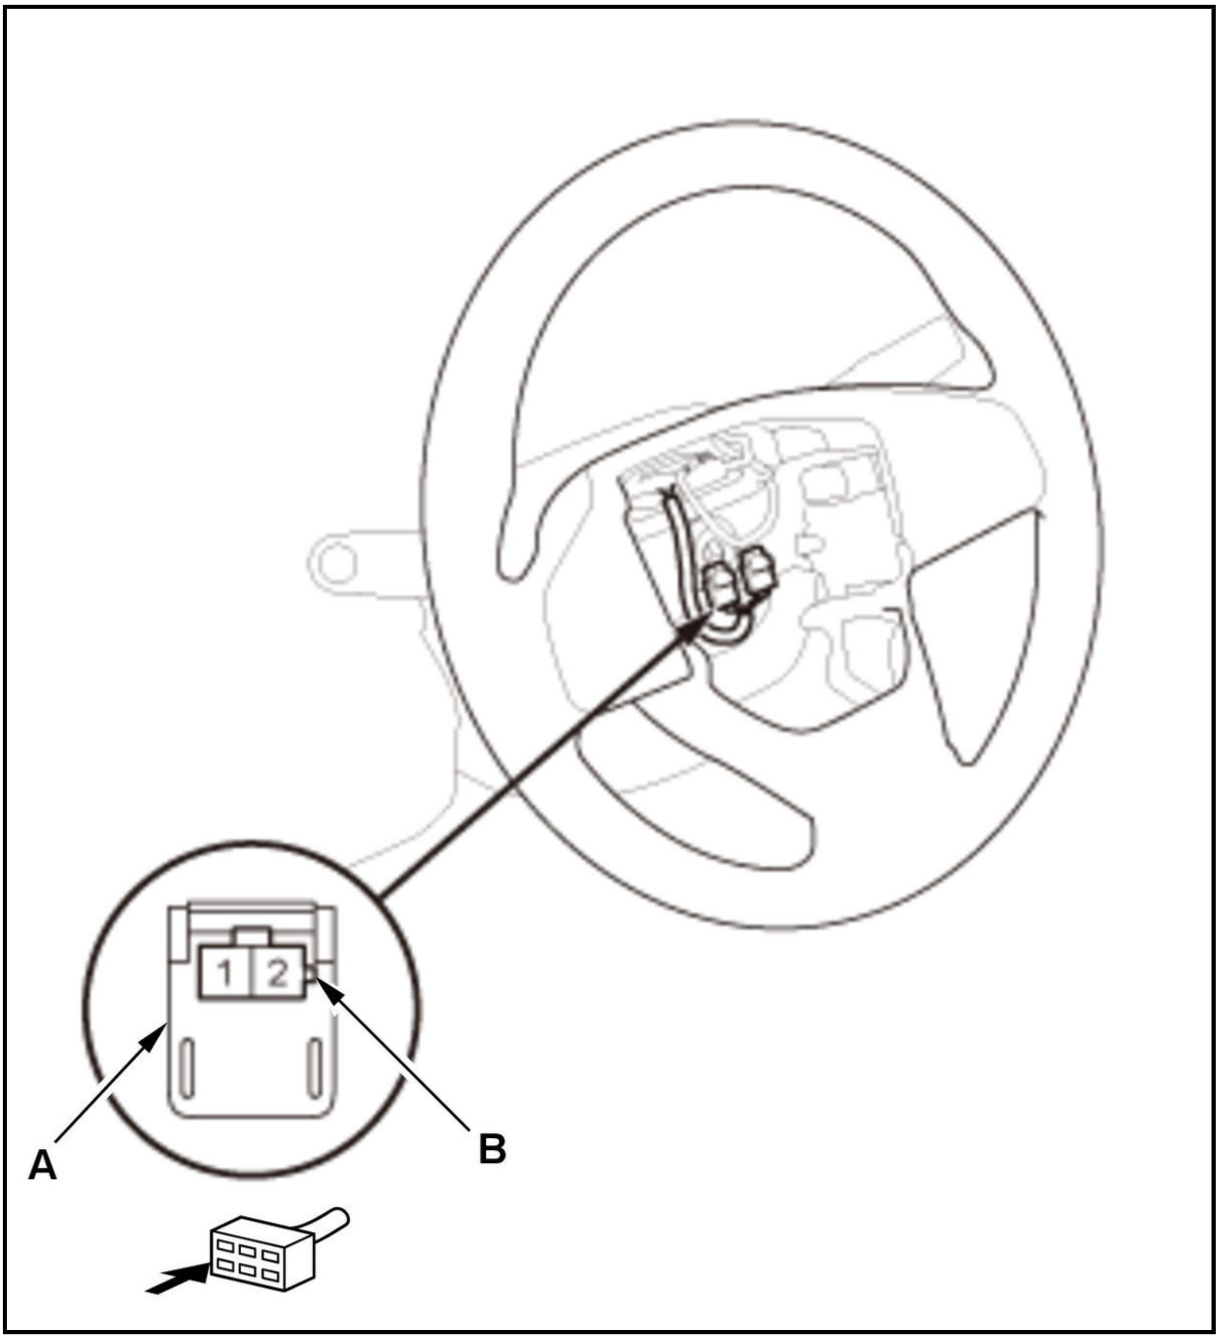
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

Driver's airbag first inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag first inflator 2P connector (A) that has a guide tab (B) on the right side of the No. 2 terminal as shown.



-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0001-11 Short to ground in the driver's airbag first inflator	B

Is DTC B0001-11 indicated?

YES

Go to step 3.

NO

Short to ground in the driver's airbag first inflator; **replace the driver's airbag** , then clear the DTC.

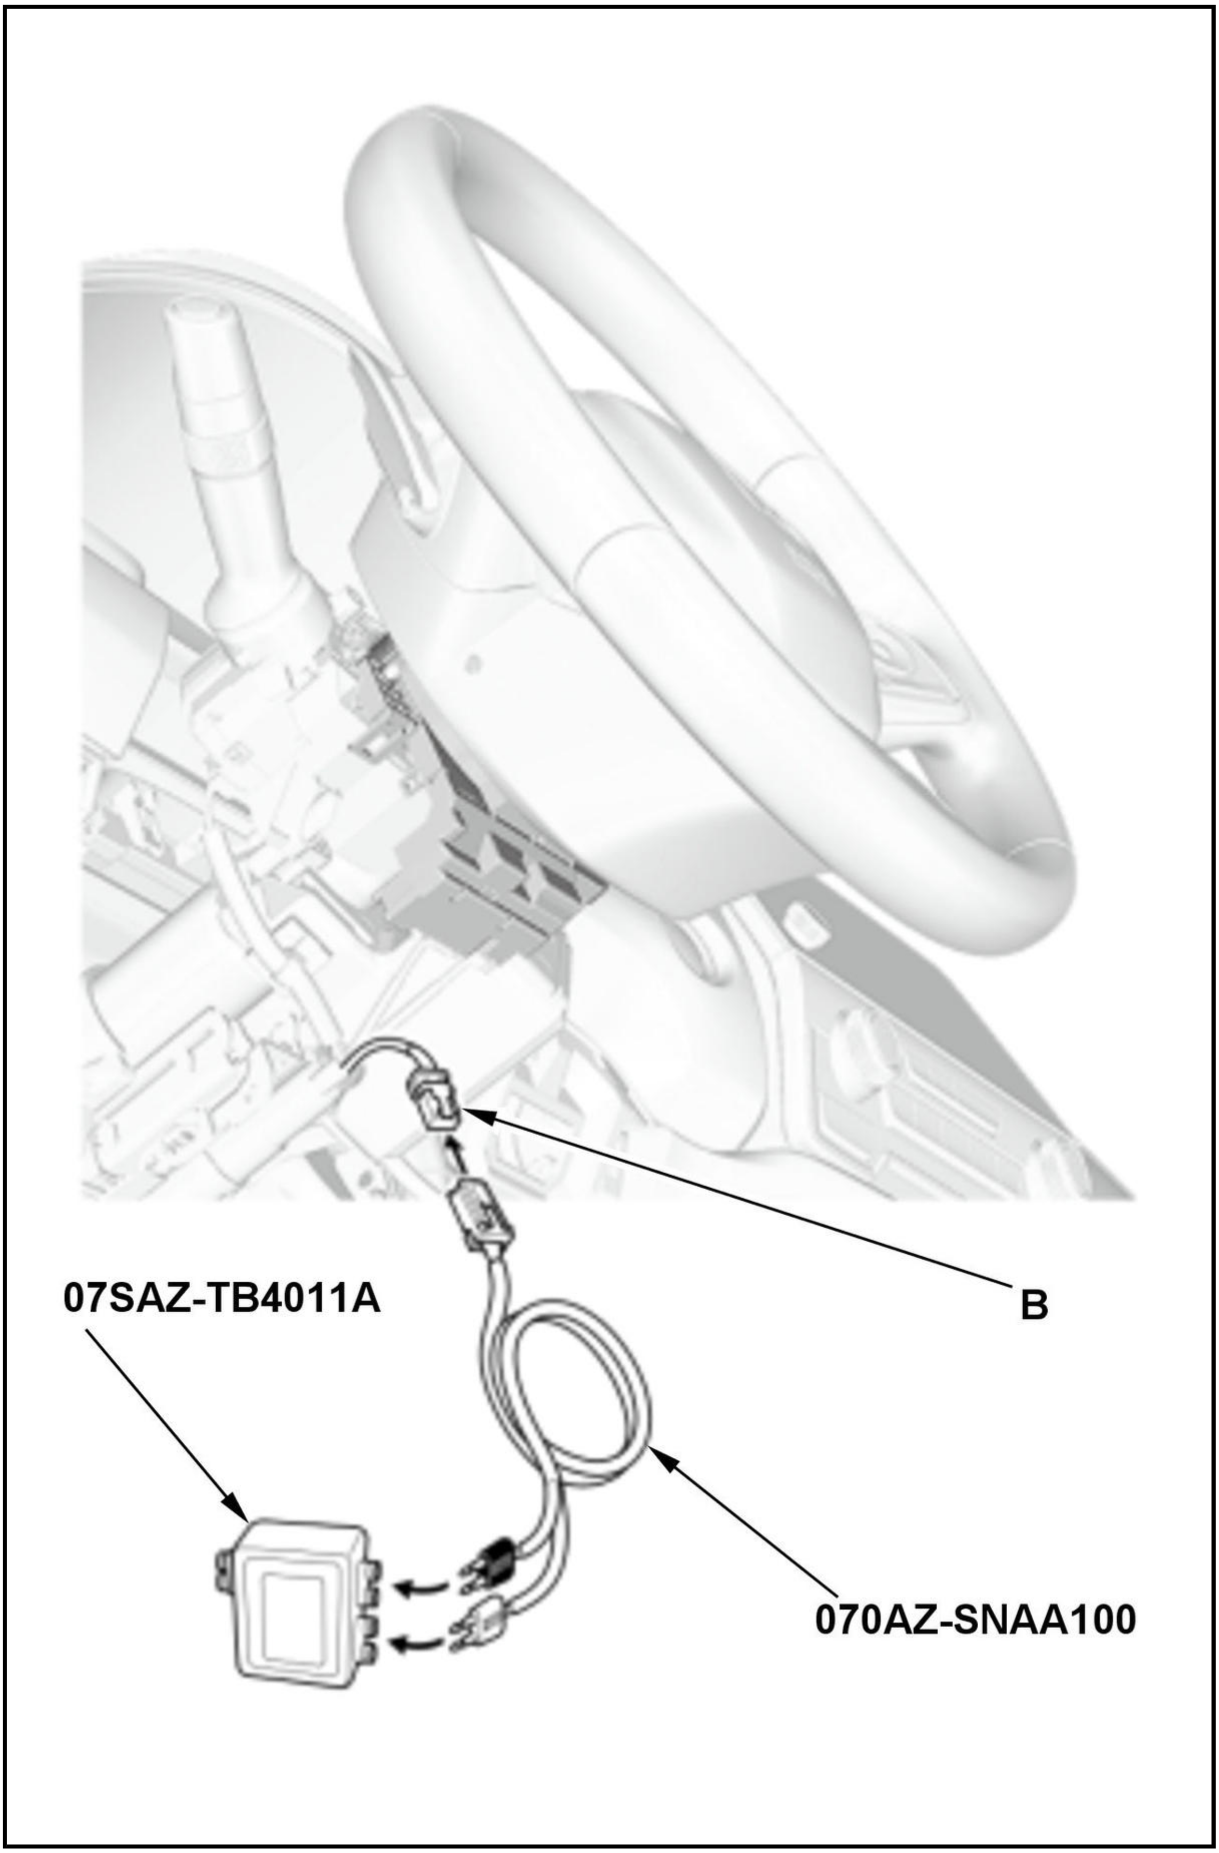
3. Cable reel check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the column covers** .

-4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0001-11 Short to ground in the driver's airbag first inflator	B

Is DTC B0001-11 indicated?

YES

Go to step 4.

NO

Short to ground in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA1+, LA1- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

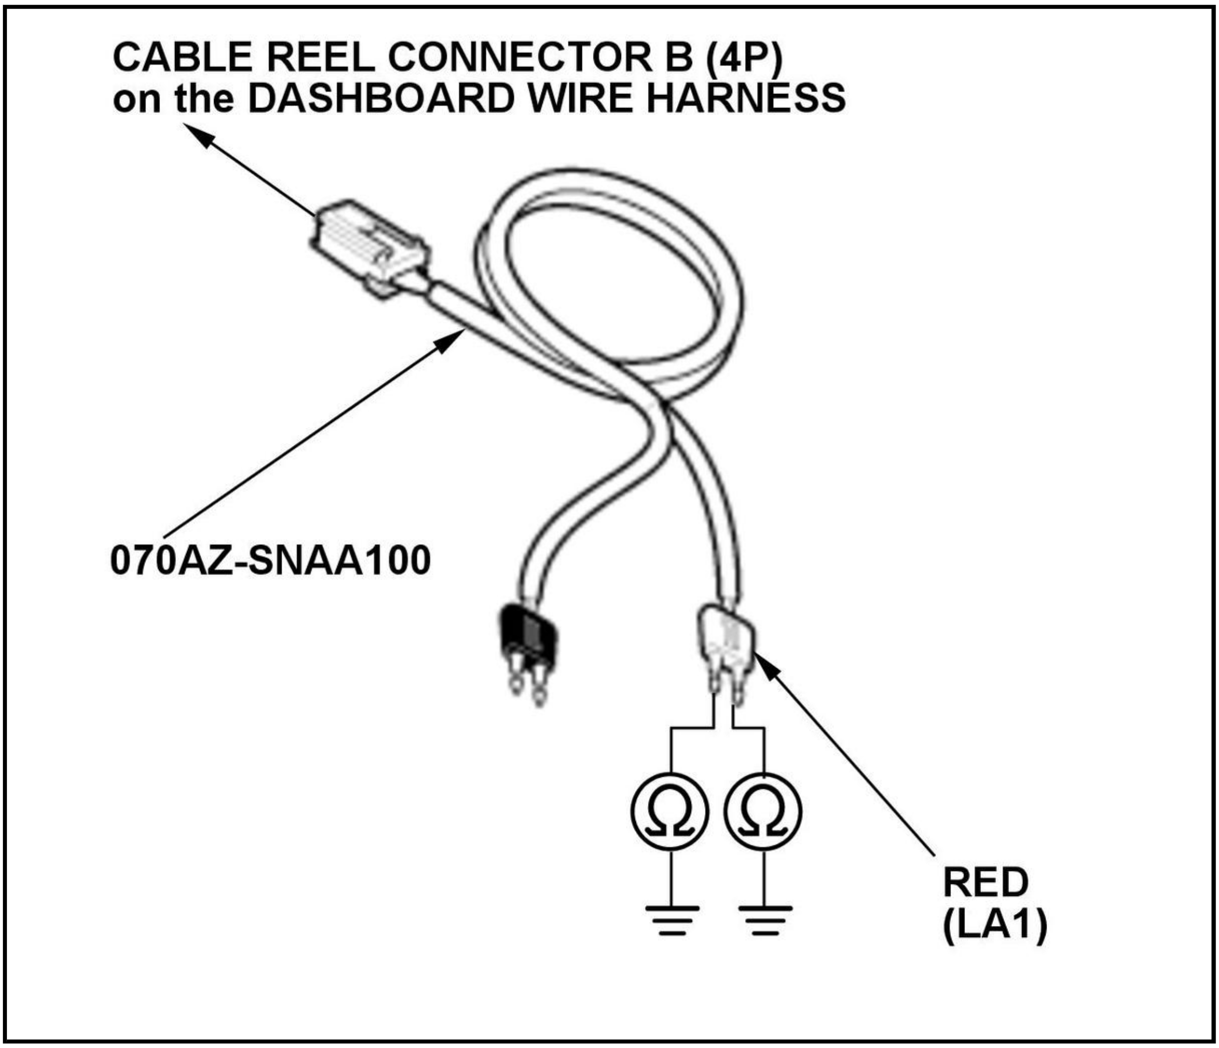
-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
Test point 1	SRS simulator lead J red terminal
Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The LA1+ and LA1- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to ground in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0001-12

DTC B0001-12 : Short to Power in the Driver's Airbag First Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .

- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information, and 12 Volt Battery Terminal Disconnection and Reconnection .

DTC Description	DTC
B0001-12 Short to power in the driver's airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-12 Short to power in the driver's airbag first inflator	B

   Is DTC B0001-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

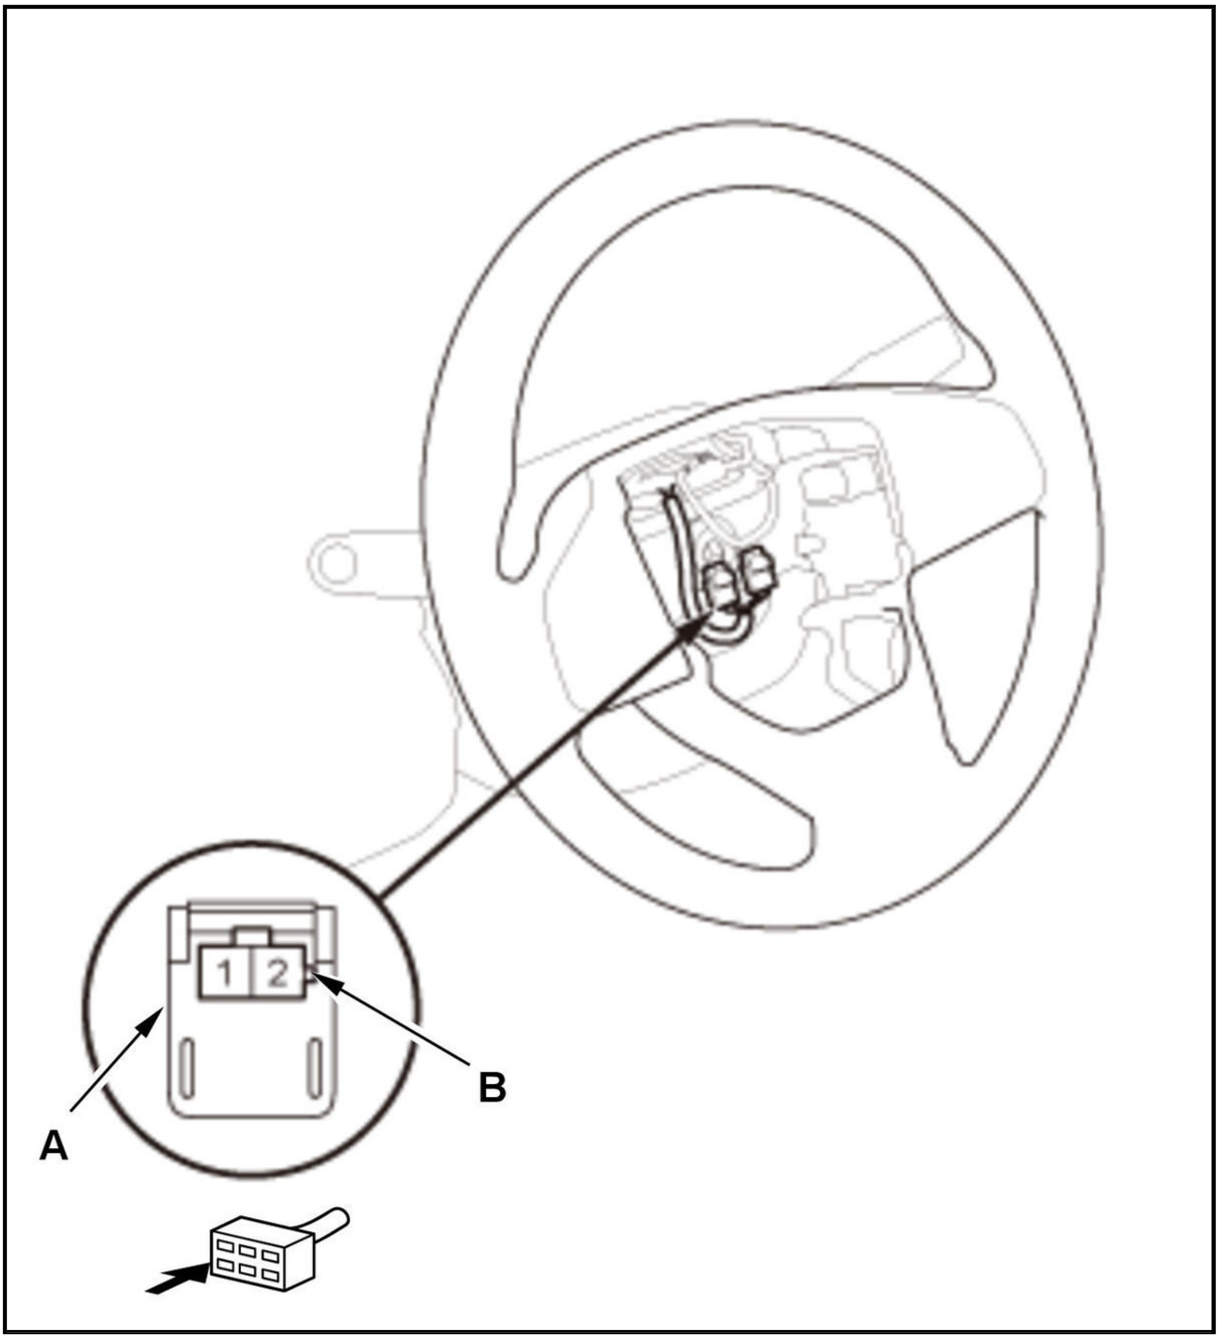
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Remove the driver's airbag .

   -4. Disconnect the following connector.

Driver's airbag first inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag first inflator 2P connector (A) that has a guide tab (B) on the right side of the No. 2 terminal as shown.



-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0001-12 Short to power in the driver's airbag first inflator	B

Is DTC B0001-12 indicated?

YES

Go to step 3.

NO

Short to power in the driver's airbag first inflator; **replace the driver's airbag** , then clear the DTC.

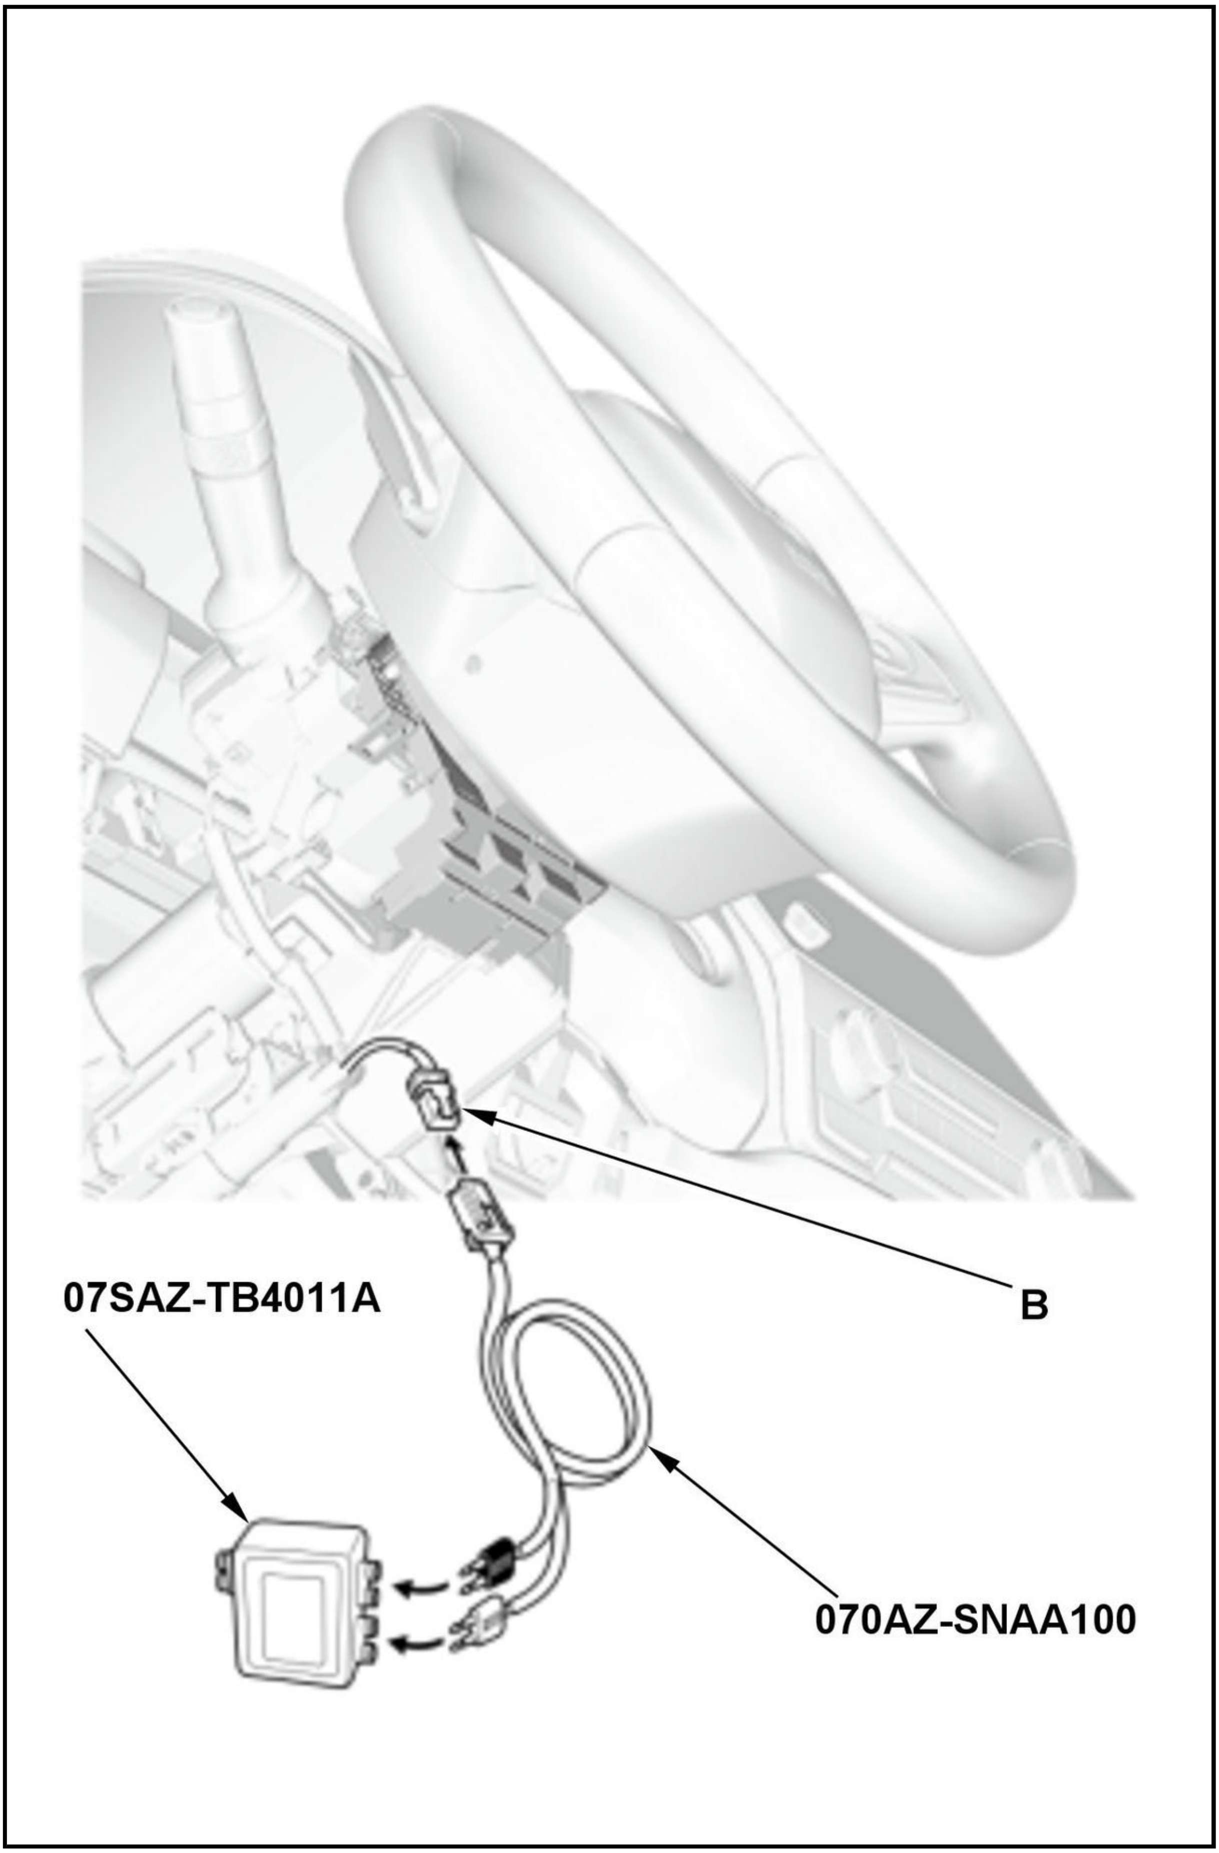
3. Cable reel check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the column covers** .

-4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0001-12 Short to power in the driver's airbag first inflator	B

Is DTC B0001-12 indicated?

YES

Go to step 4.

NO

Short to power in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA1+, LA1- lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector A (39P)

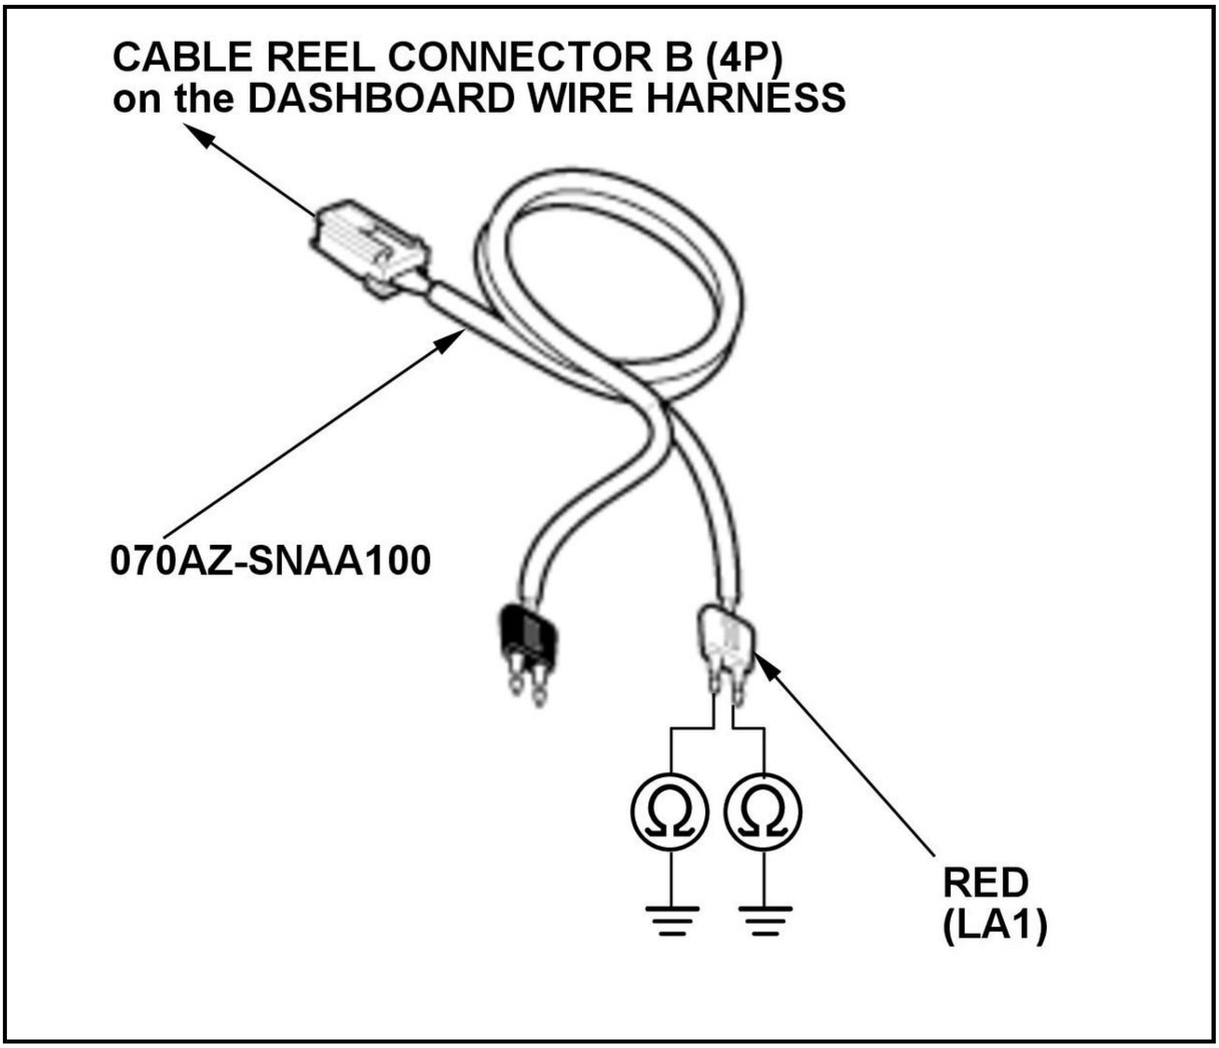
-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
Test point 1	SRS simulator lead J red terminal
Test point 2	Body ground



Is there 0.2 V or less?

YES

The LA1+ and LA1- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to power in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0001-13

DTC B0001-13 : Open or Increased Resistance in the Driver's Airbag First Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0001-13 Open or increased resistance in the driver's airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-13 Open or increased resistance in the driver's airbag first inflator	B

   Is DTC B0001-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

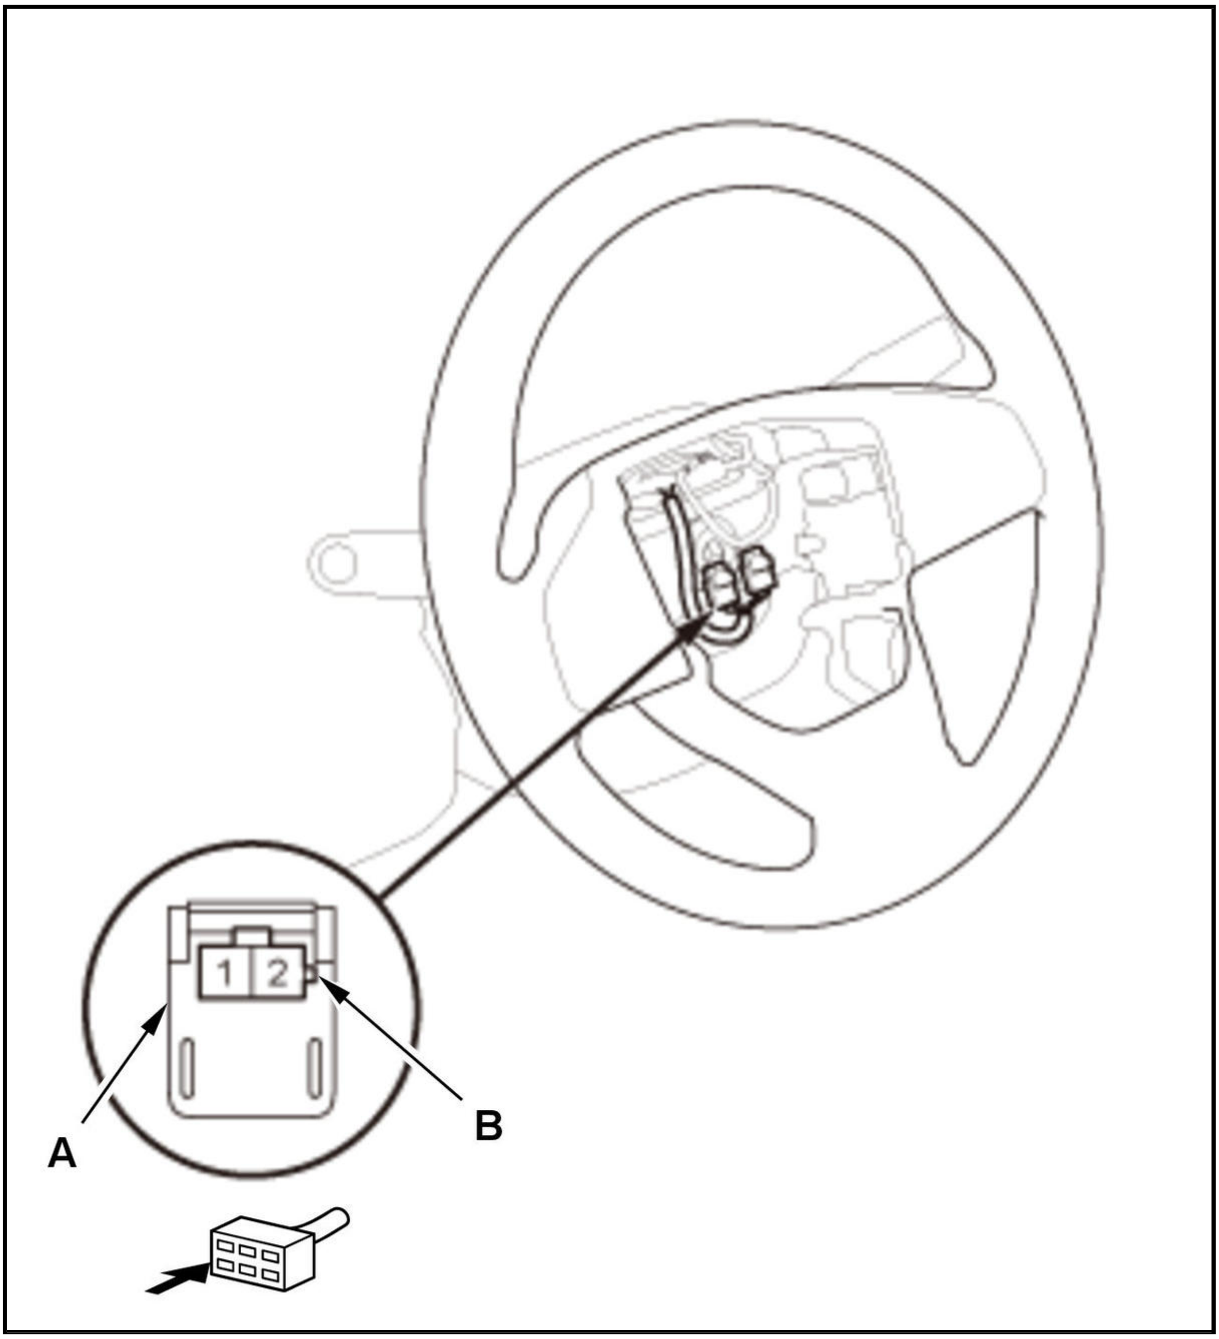
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

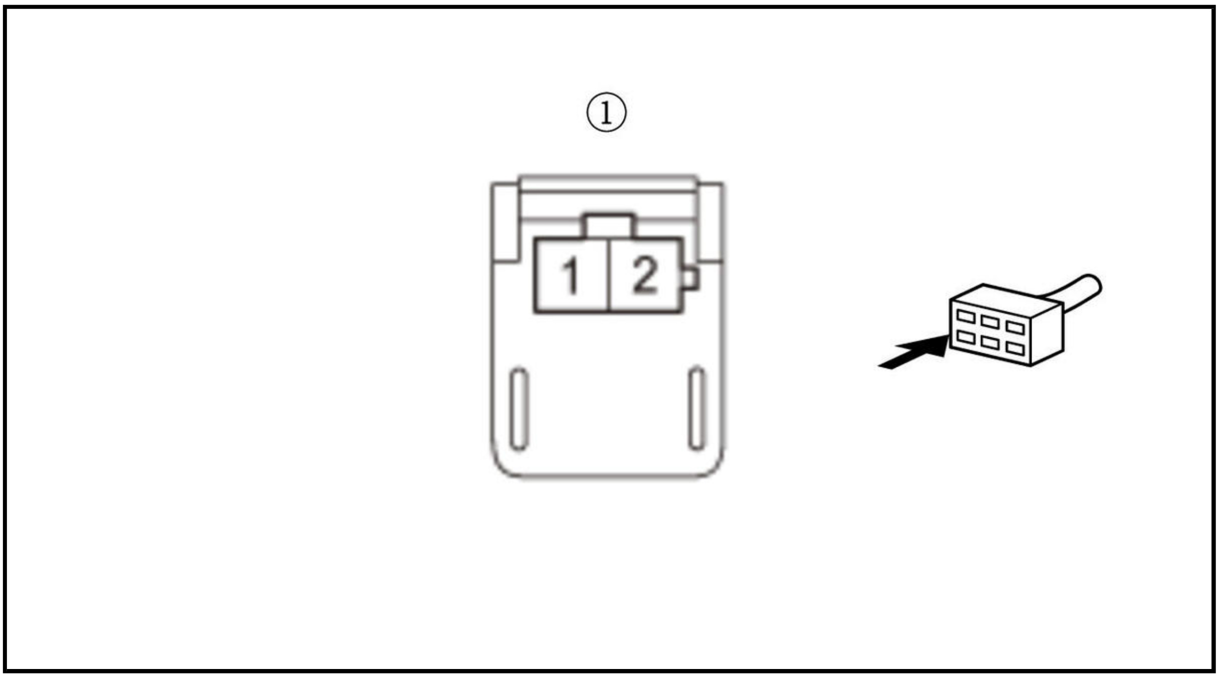
Driver's airbag first inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag first inflator 2P connector (A) that has a guide tab (B) on the right side of the No. 2 terminal as shown.



-5. Connect terminals A and B with a jumper wire.

Terminal A	Driver's airbag first inflator 2P connector (female terminals) No. 1 (on the cable reel harness): ①
Terminal B	Driver's airbag first inflator 2P connector (female terminals) No. 2 (on the cable reel harness): ①



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0001-13 Open or increased resistance in the driver's airbag first inflator	B

Is DTC B0001-13 indicated?

YES

Go to step 3.

NO

Open in the driver's airbag first inflator; **replace the driver's airbag** , then clear the DTC.

3. Cable reel check

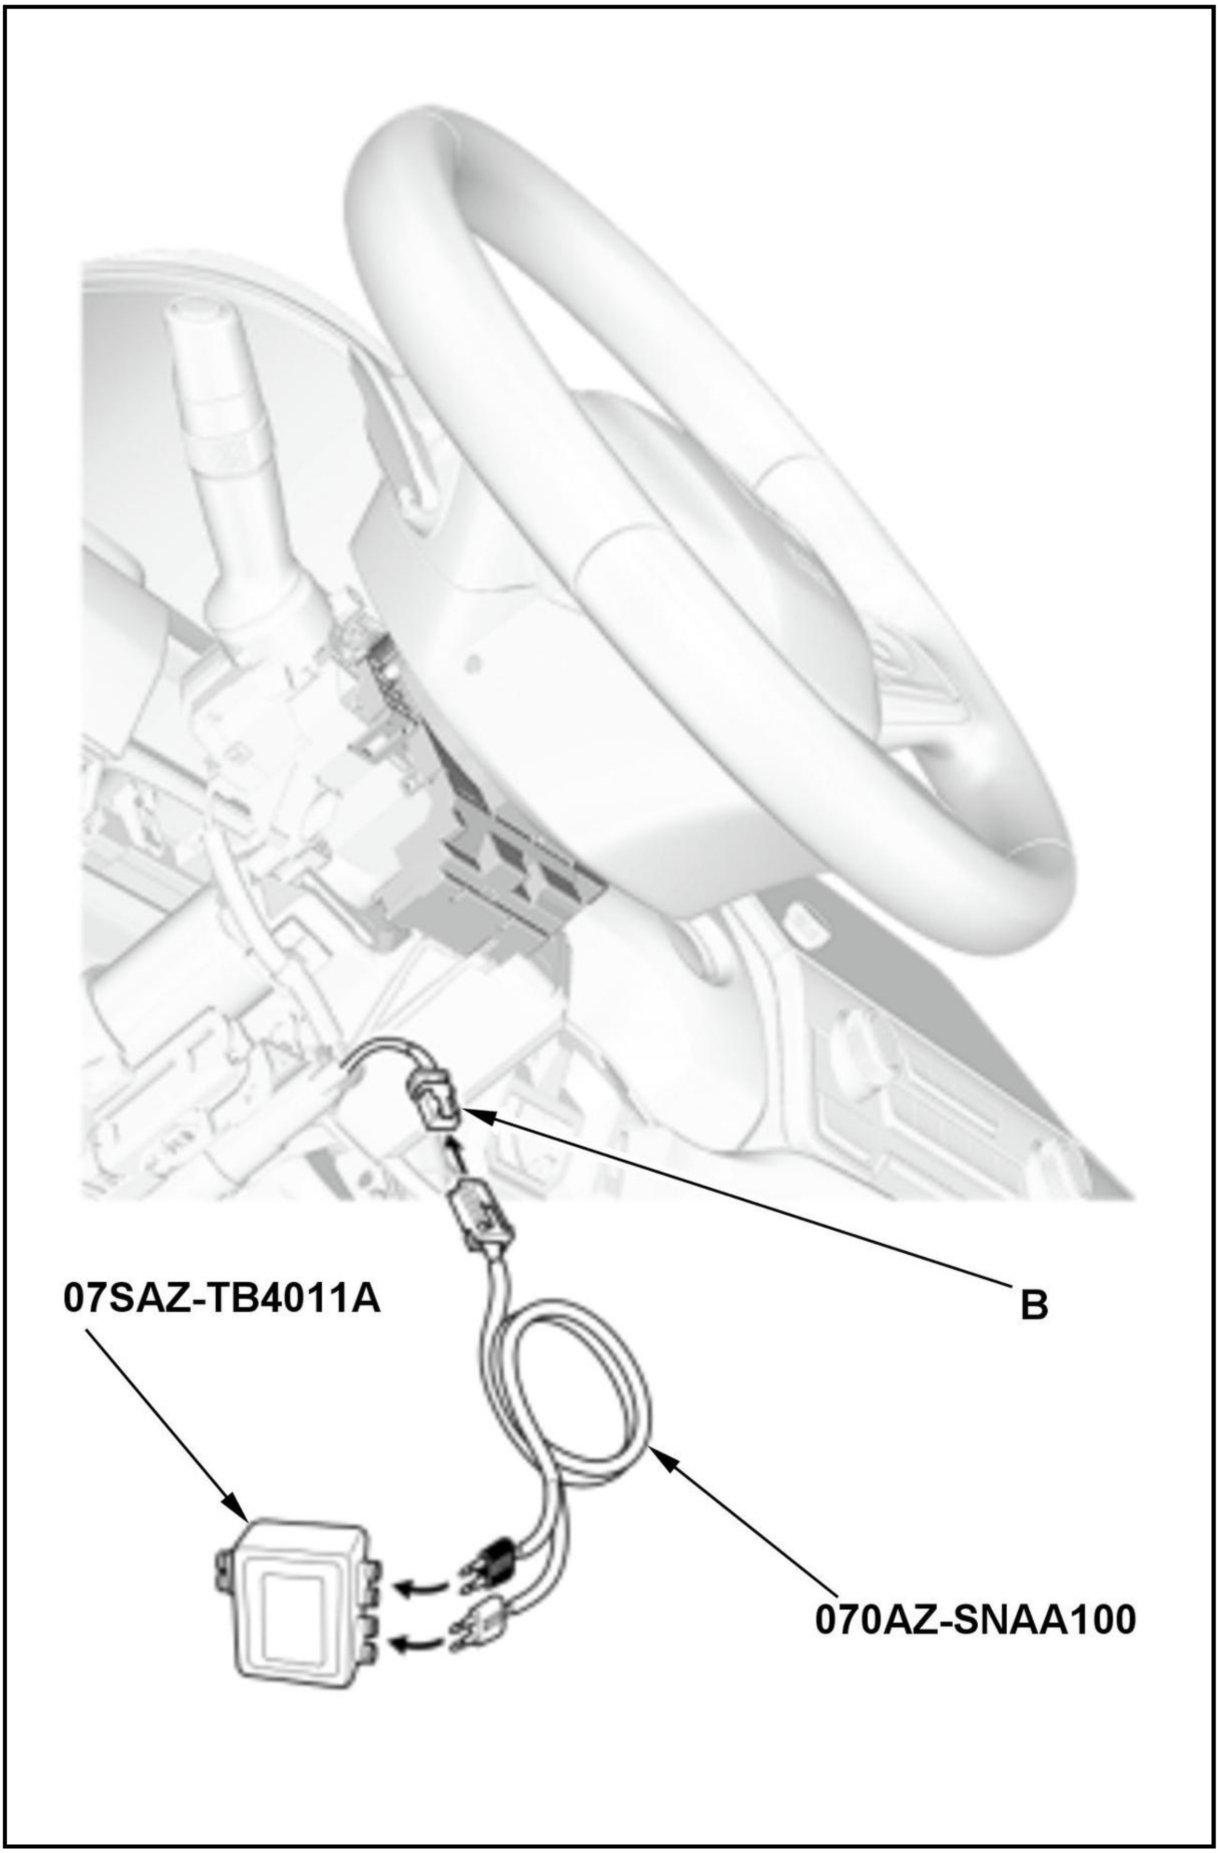
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the driver's airbag first inflator 2P connector on the cable reel harness.

-4. **Remove the column covers** .

-5. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-6. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-7. Reconnect the negative cable to the 12 volt battery.

-8. Clear the DTCs with the HDS.

-9. Turn the vehicle to the ON mode, then wait for 10 seconds.

-10.

Check for DTCs with the HDS.

DTC Description	DTC
B0001-13 Open or increased resistance in the driver's airbag first inflator	B

Is DTC B0001-13 indicated?

YES

Go to step 4.

NO

Open in the cable reel; **replace the cable reel** , then clear the DTC.

4. Open wire check (LA1+, LA1- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

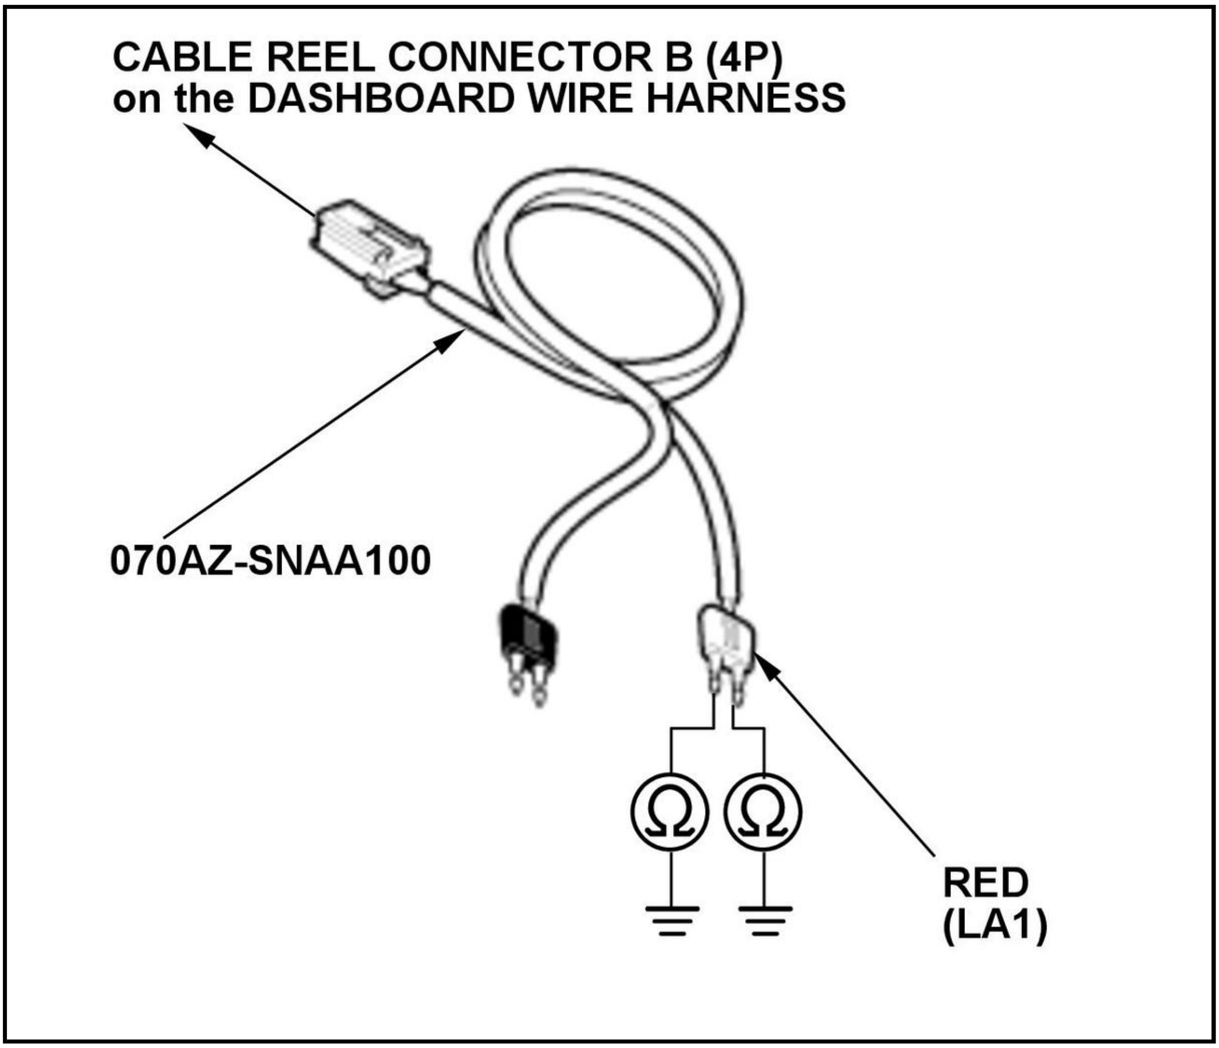
-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
Test point	SRS simulator lead J red terminal



CABLE REEL CONNECTOR B (4P)
on the DASHBOARD WIRE HARNESS
070AZ-SNAA100
Ω
Ω
RED
(LA1)

Is there 1.0 Ω or less?

YES

The LA1+ and LA1- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

NO

Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0001-1A

DTC B0001-1A : Decreased Resistance in the Driver's Airbag First Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead J 070AZ-SNAA100

SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0001-1A Decreased resistance in the driver's airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-1A Decreased resistance in the driver's airbag first inflator	B

   Is DTC B0001-1A indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

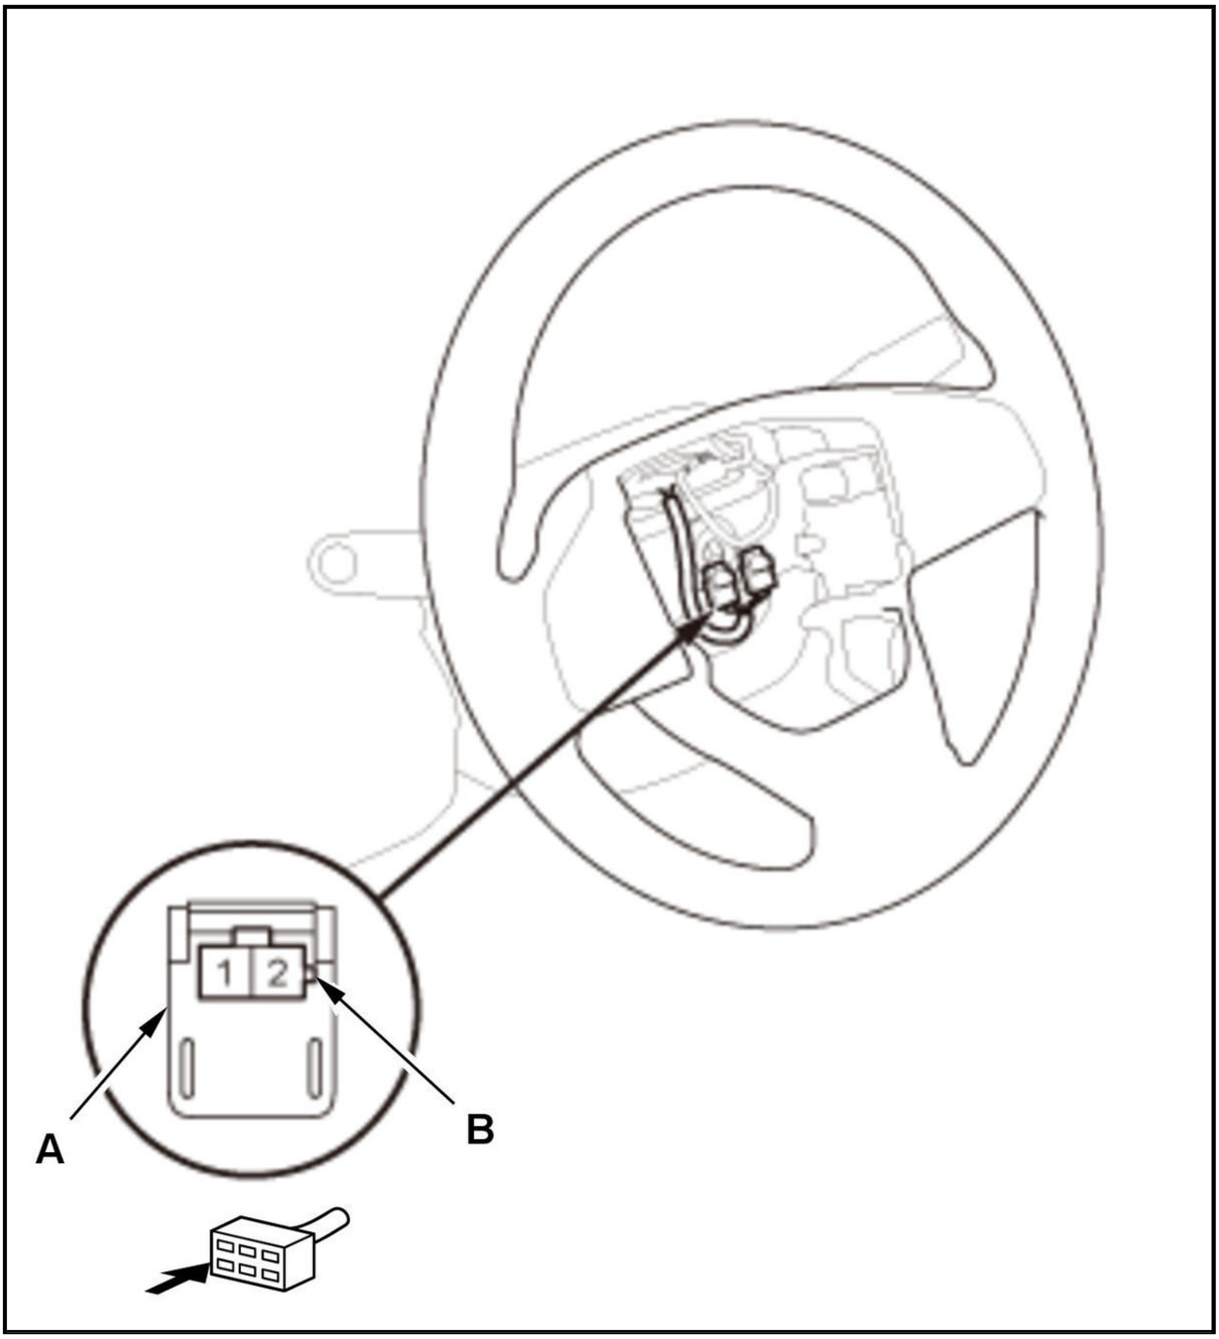
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

Driver's airbag first inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag first inflator 2P connector (A) that has a guide tab (B) on the right side of the No. 2 terminal as shown.



-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0001-1A Decreased resistance in the driver's airbag first inflator	B

Is DTC B0001-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the driver's airbag first inflator; **replace the driver's airbag** , then clear the DTC.

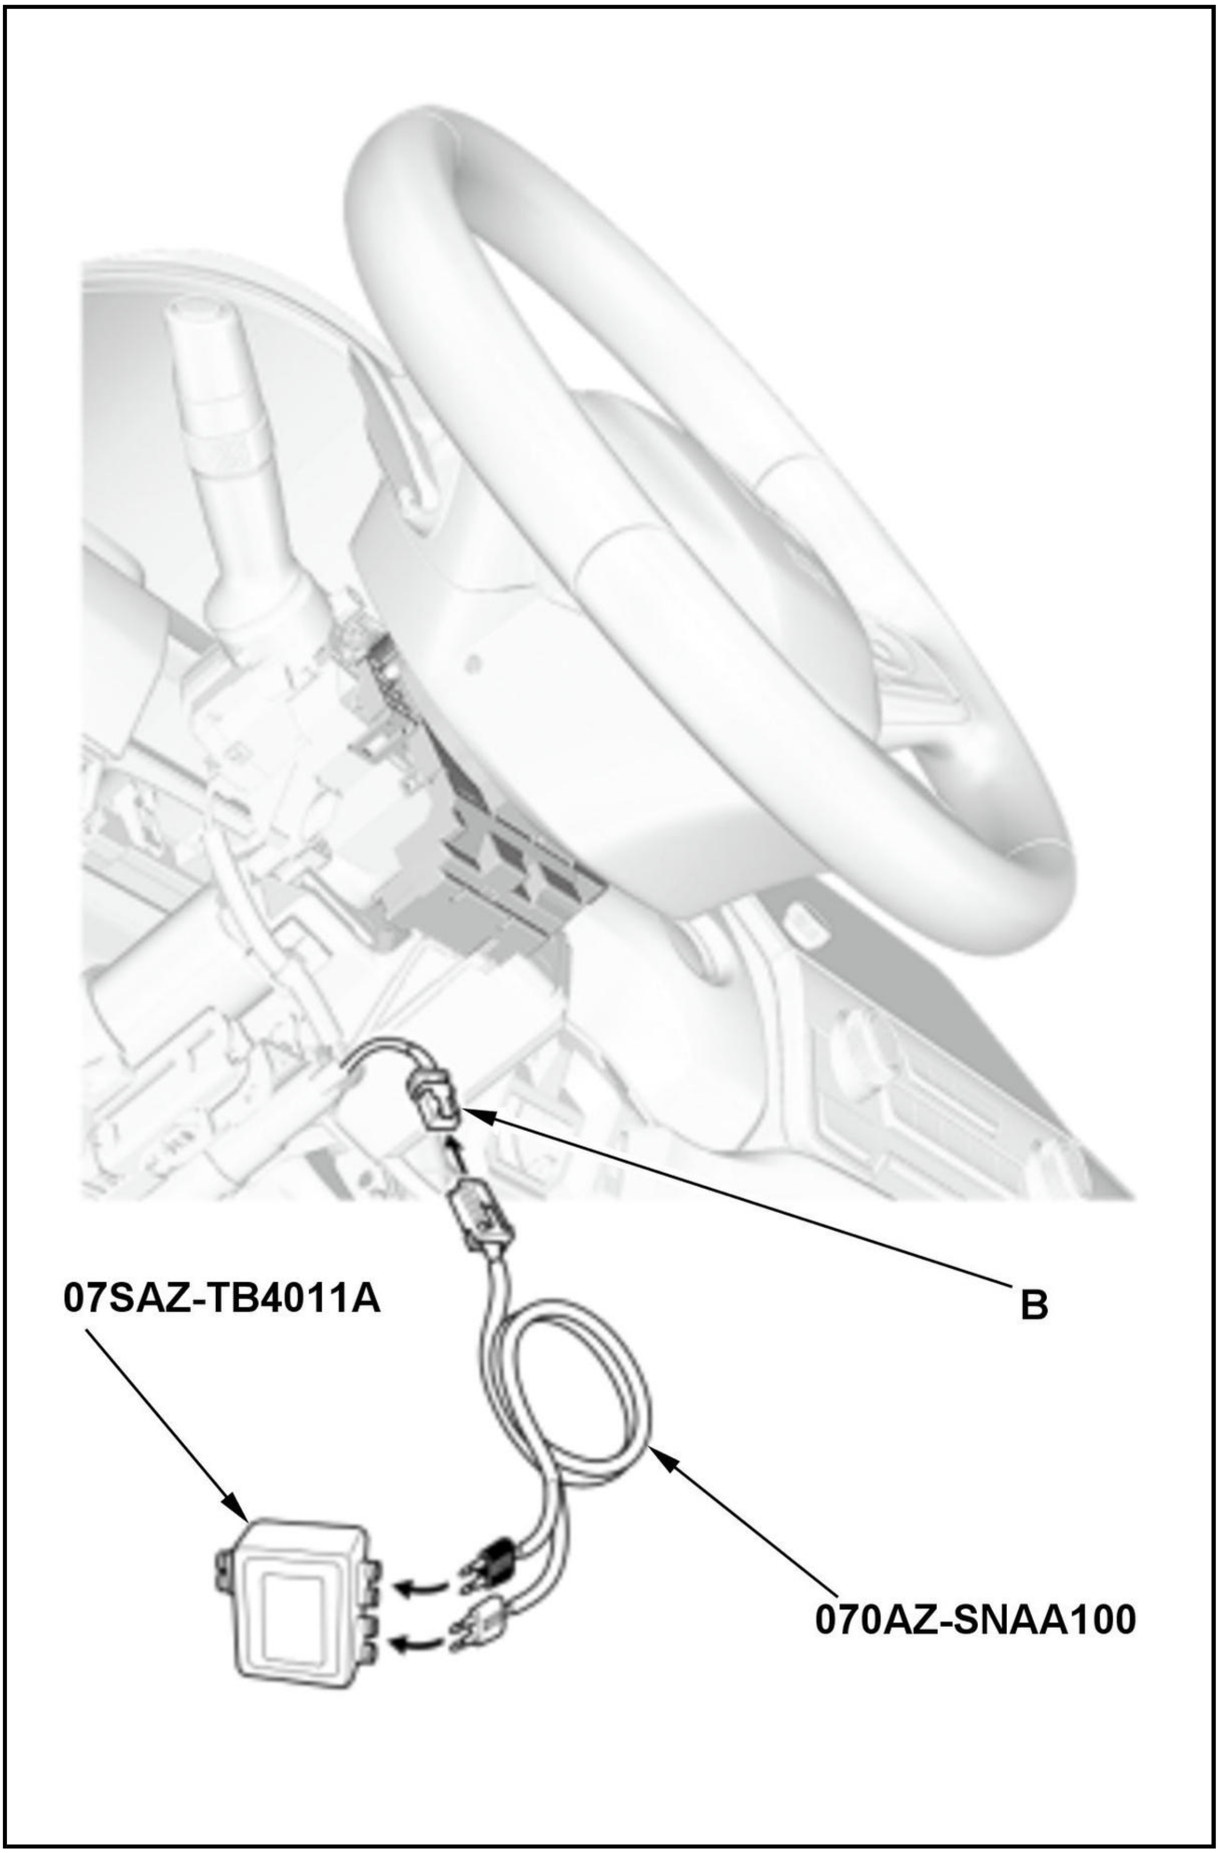
3. Cable reel check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the column covers** .

   -4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0001-1A Decreased resistance in the driver's airbag first inflator	B

Is DTC B0001-1A indicated?

YES

Go to step 4.

NO

Short to another wire in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA1+ line to LA1- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

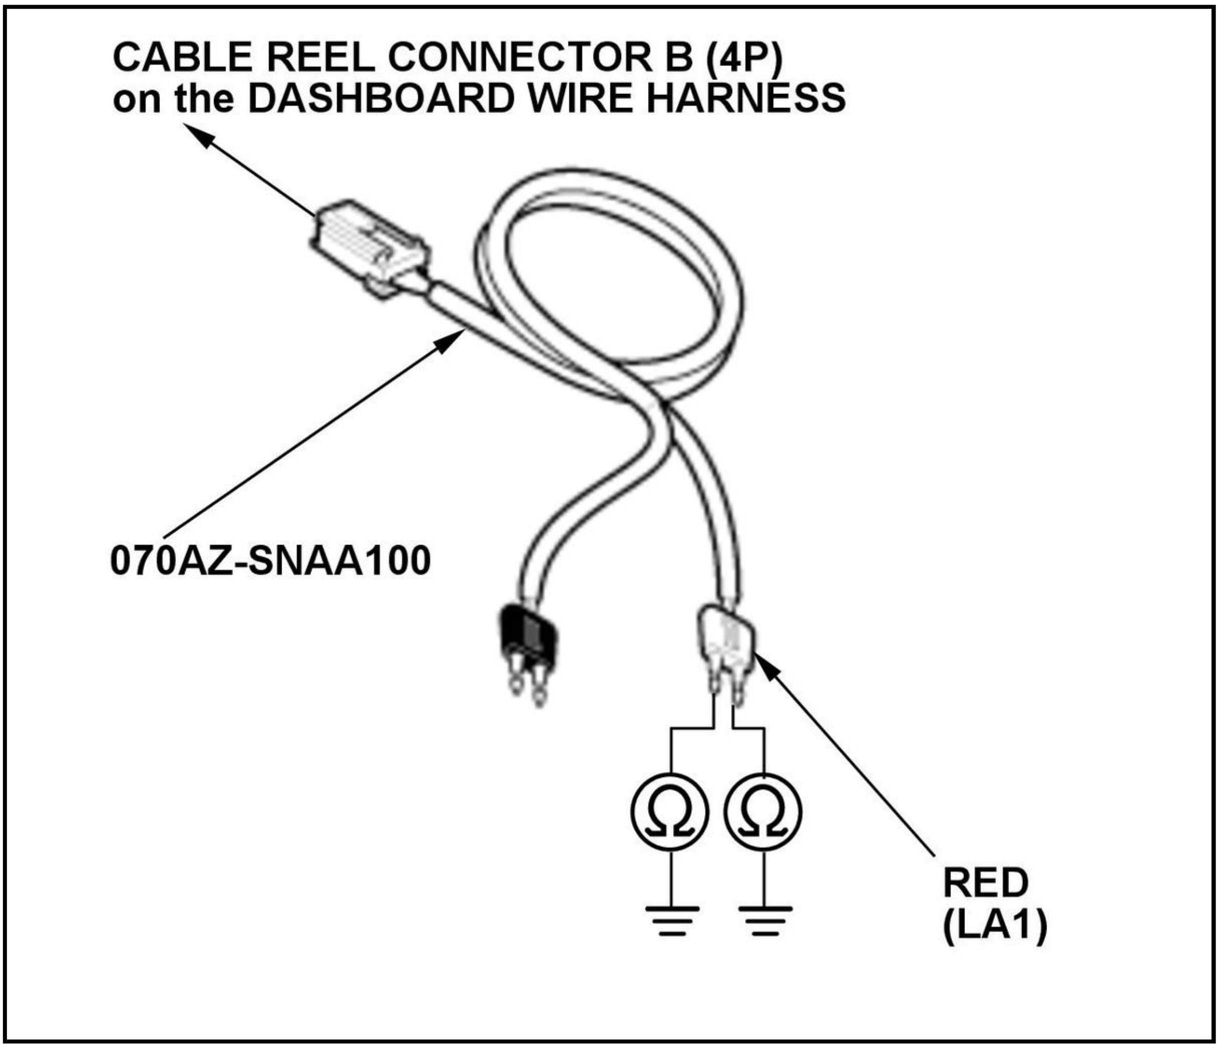
SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. **Connect the SRS short canceller to SRS unit connector A (39P) terminals No. 8 and No. 9**.

-6. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
	SRS unit connector A (39P) No. 8 and No. 9: connected to SRS short canceller
Test point	SRS simulator lead J red terminal



Is there an open circuit, or at least 1 MΩ?

YES

The LA1+ and LA1- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to another wire in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0001-2B

DTC B0001-2B : Short to Another Wire Harness in the Driver's Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B

Is DTC B0001-2B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the driver's side airbag inflator	B
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the front passenger's side airbag inflator	B
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B

DTC Description	DTC
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0002-2B, B0010-2B, B0011-2B, B0020-2B, B0021-2B, B0028-2B, B0029-2B, B0070-2B, B0072-2B, B0079-2B, B007A-2B or B0082-2B indicated with DTC B0001-2B?

YES

Go to step 3.

NO

Go to step 4.

3. Shorted wire check (LA1 lines to another line)

-1. Turn the vehicle to the OFF (LOCK) mode.

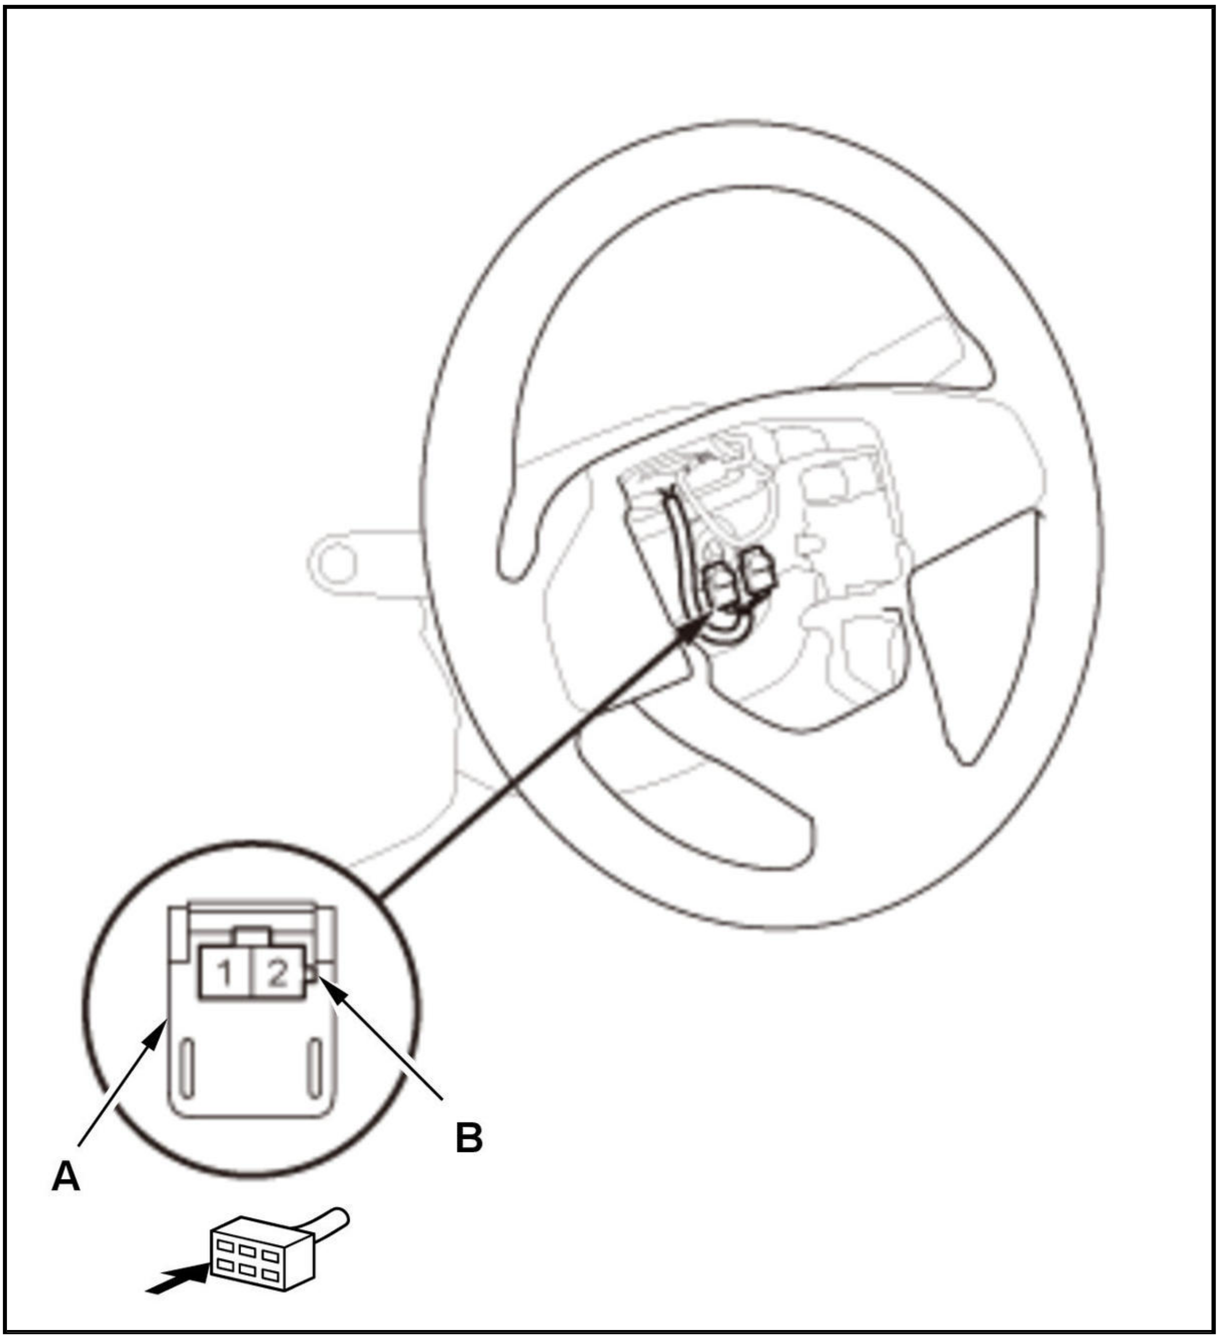
-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the driver's airbag** .

-4. Disconnect the following connectors.

SRS unit connector A (39P)
SRS unit connector B (39P)
Driver's airbag second inflator 2P connector (on the cable reel harness)
Inflator connectors which are assigned to 2B codes listed on HDS

NOTE: Make sure to work with the driver's airbag first inflator 2P connector (A) that has a guide tab (B) on the right side of the No. 2 terminal as shown.



-5. Measure the resistance between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	SRS unit connector B (39P): disconnected
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

	SRS unit connector A (39P) No. 8	SRS unit connector B (39P) No. 22
B0082-2B	SRS unit connector A (39P) No. 9	SRS unit connector A (39P) No. 2
	SRS unit connector A (39P) No. 8	SRS unit connector A (39P) No. 3

Is there 1 MΩ or more?

YES

The LA1 wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

NO

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

4. Shorted wire check (LA1+ line to LA2+ line, LA1- line to LA2- line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the driver's airbag** .

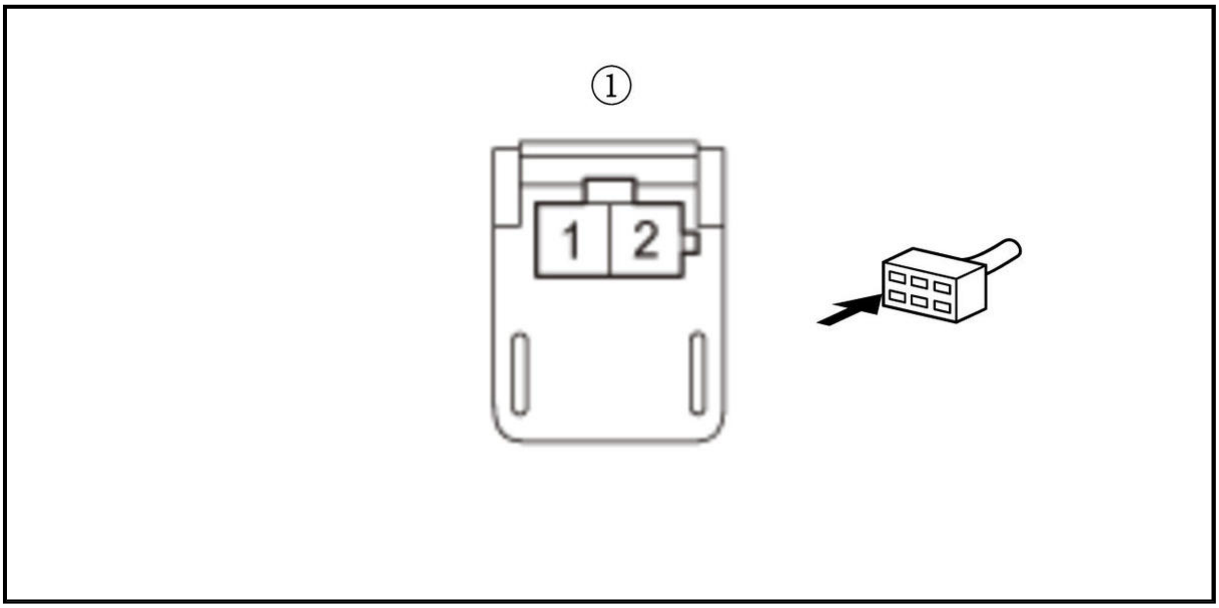
-4. Disconnect the following connector.

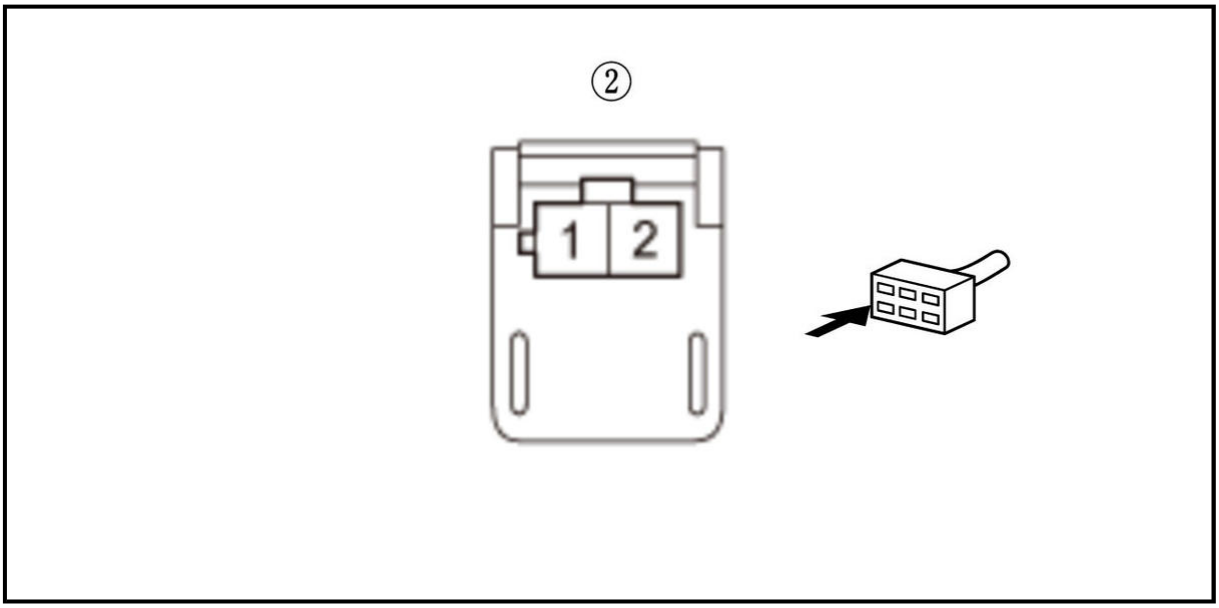
Driver's airbag first inflator 2P connector (on the cable reel harness)
Driver's airbag second inflator 2P connector (on the cable reel harness)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
Test point 1	Driver's airbag first inflator 2P connector No. 2 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 2 (on the cable reel harness) ②

Test point 1	Driver's airbag first inflator 2P connector No. 1 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 1 (on the cable reel harness) ②





Is there 1 MΩ or more?

YES

The LA1+, LA1-, LA2+, and LA2- wires are OK. Faulty driver's airbag second inflator; **replace the driver's airbag** , then clear the DTC.

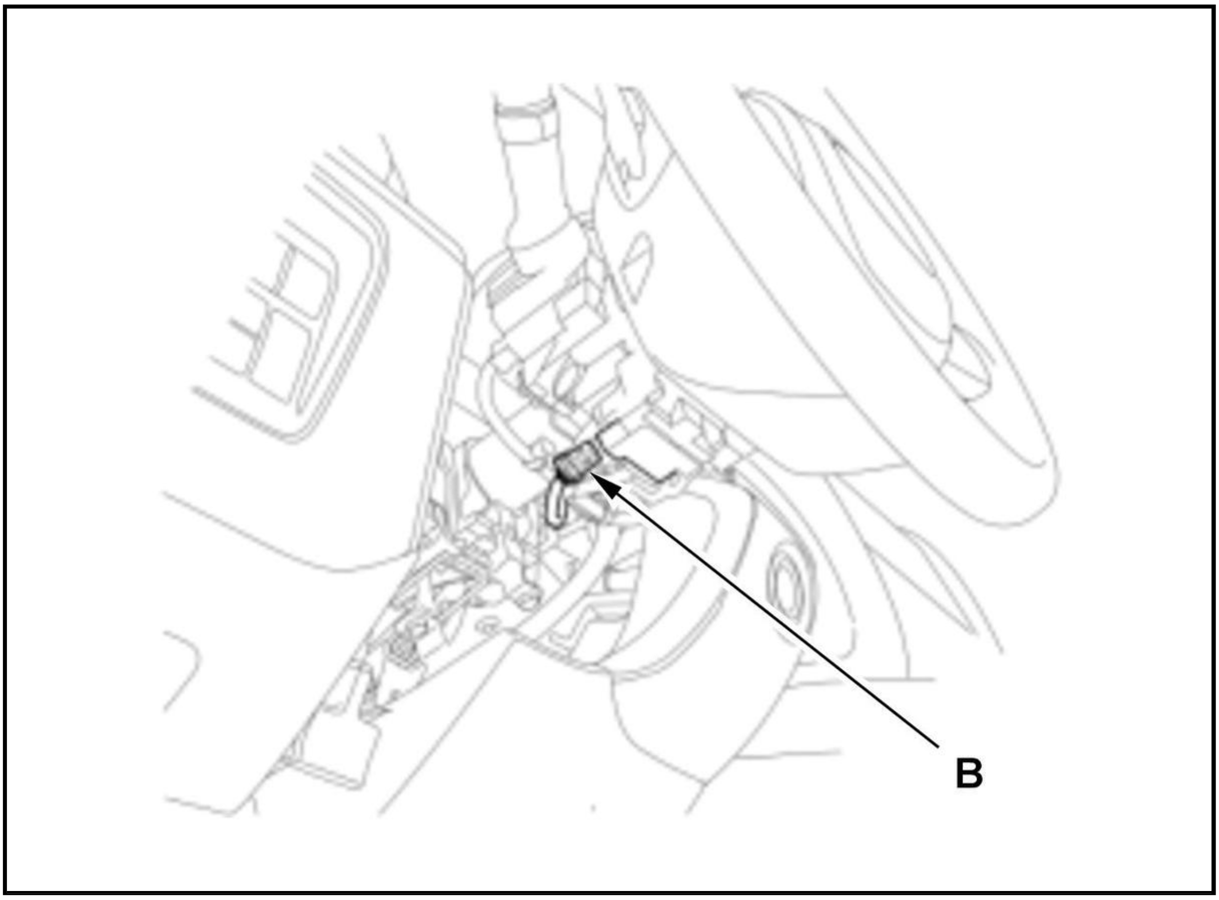
NO

Go to step 5.

5. Shorted wire check (LA1+ line to LA2+ line, LA1- line to LA2- line) 2

-1. **Remove the column covers** .

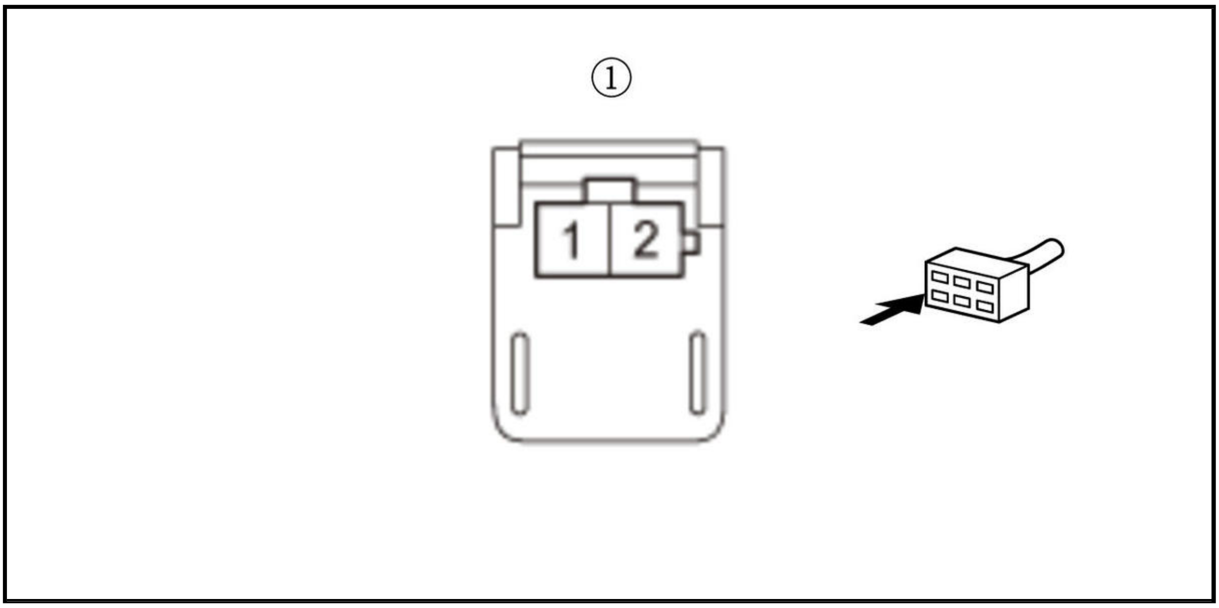
-2. Disconnect cable reel connector B (4P) on the dashboard wire harness.

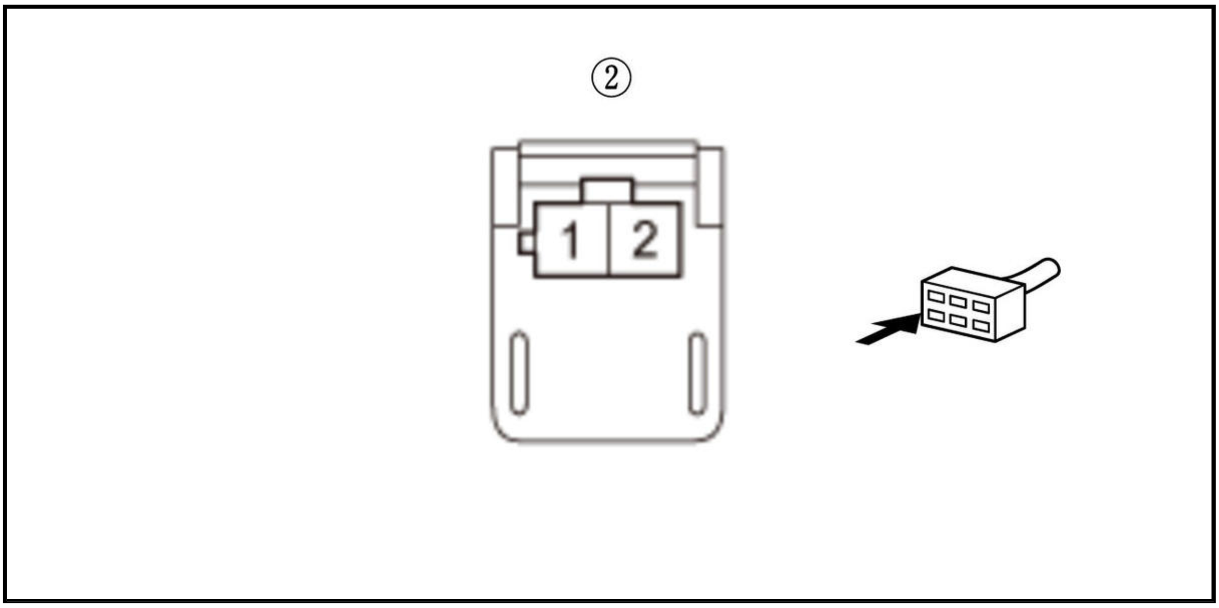


-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected Cable reel connector B (4P) (on the dashboard wire harness): disconnected
Test point 1	Driver's airbag first inflator 2P connector No. 2 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 2 (on the cable reel harness) ②

Test point 1	Driver's airbag first inflator 2P connector No. 1 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 1 (on the cable reel harness) ②





Is there 1 MΩ or more?

YES

Go to step 6.

NO

Short to another wire in the cable reel; replace the cable reel , then clear the DTC.

6. Shorted wire check (LA1+ line to LA2+ line, LA1- line to LA2- line) 3

-1. Disconnect the following connectors.

SRS unit connector A (39P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected

Test point 1	SRS unit connector A (39P) No. 9
Test point 2	SRS unit connector A (39P) No. 10

Test point 1	SRS unit connector A (39P) No. 8
Test point 2	SRS unit connector A (39P) No. 11

Is there 1 MΩ or more?

YES

The LA1+, LA1-, LA2+, and LA2- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to another wire in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0002-11

DTC B0002-11 : Short to Ground in the Driver's Airbag Second Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0002-11 Short to ground in the driver's airbag second inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0002-11 Short to ground in the driver's airbag second inflator	B

Is DTC B0002-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

-1. Turn the vehicle to the OFF (LOCK) mode.

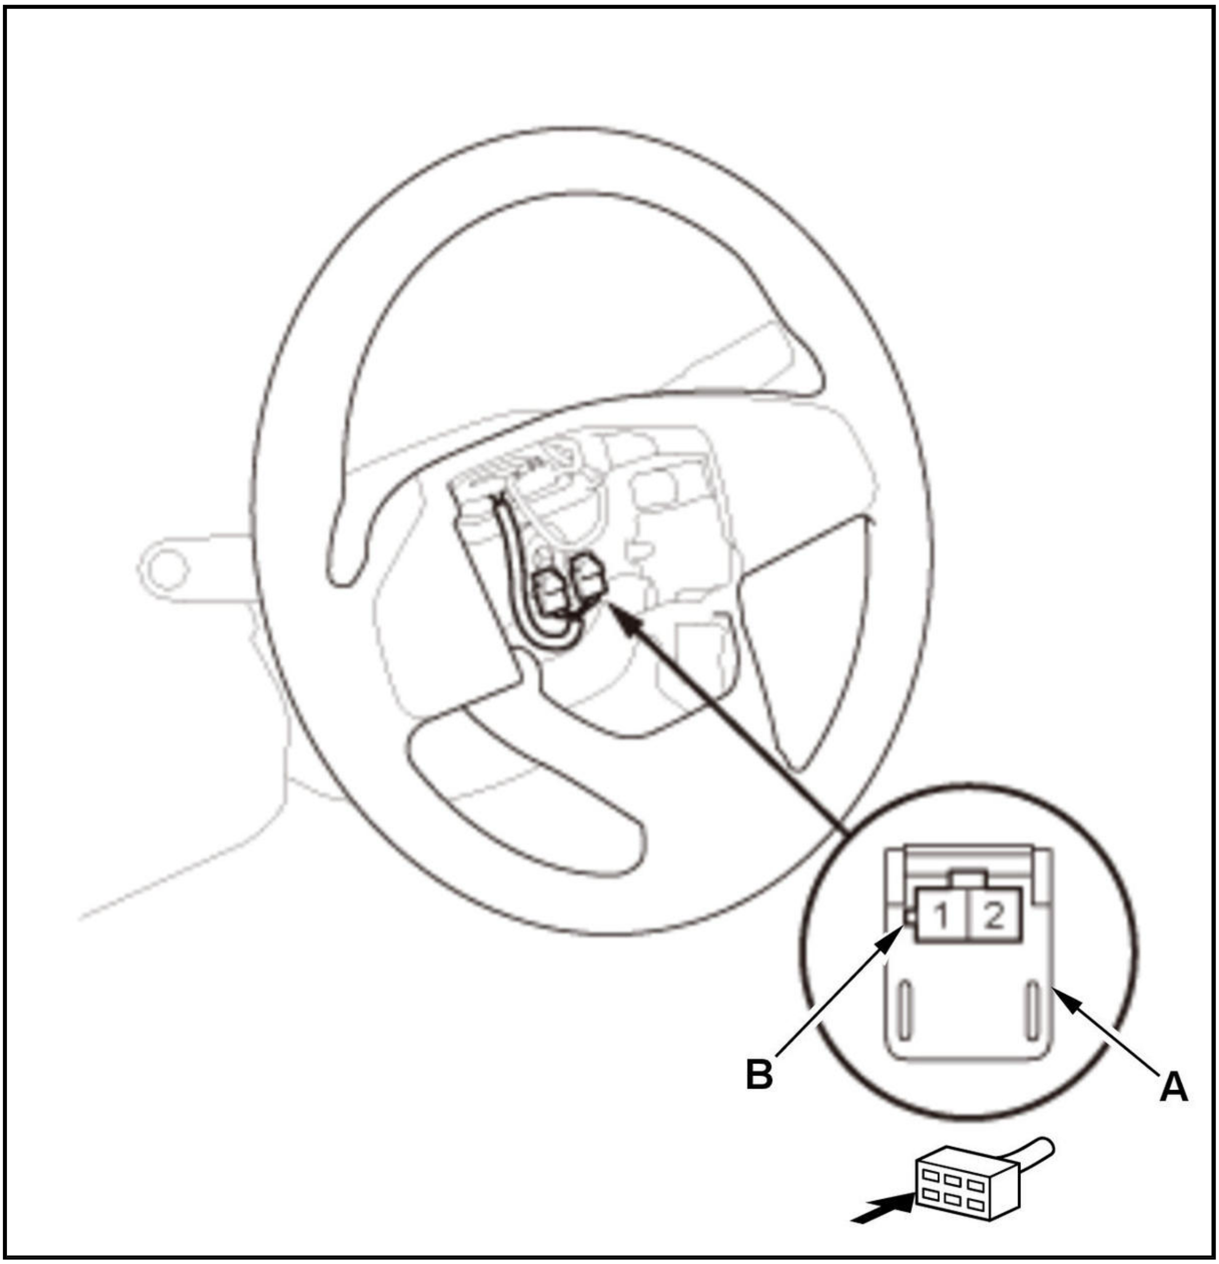
-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the driver's airbag** .

-4. Disconnect the following connector.

Driver's airbag second inflator 2P connector (on the cable reel harness)

NOTE: Make sure to work with the driver's airbag second inflator 2P connector (A) that has a guide tab (B) on the left side of the No. 1 terminal as shown.



-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0002-11 Short to ground in the driver's airbag second inflator	B

Is DTC B0002-11 indicated?

YES

Go to step 3.

NO

Short to ground in the driver's airbag second inflator; **replace the driver's airbag** , then clear the DTC.

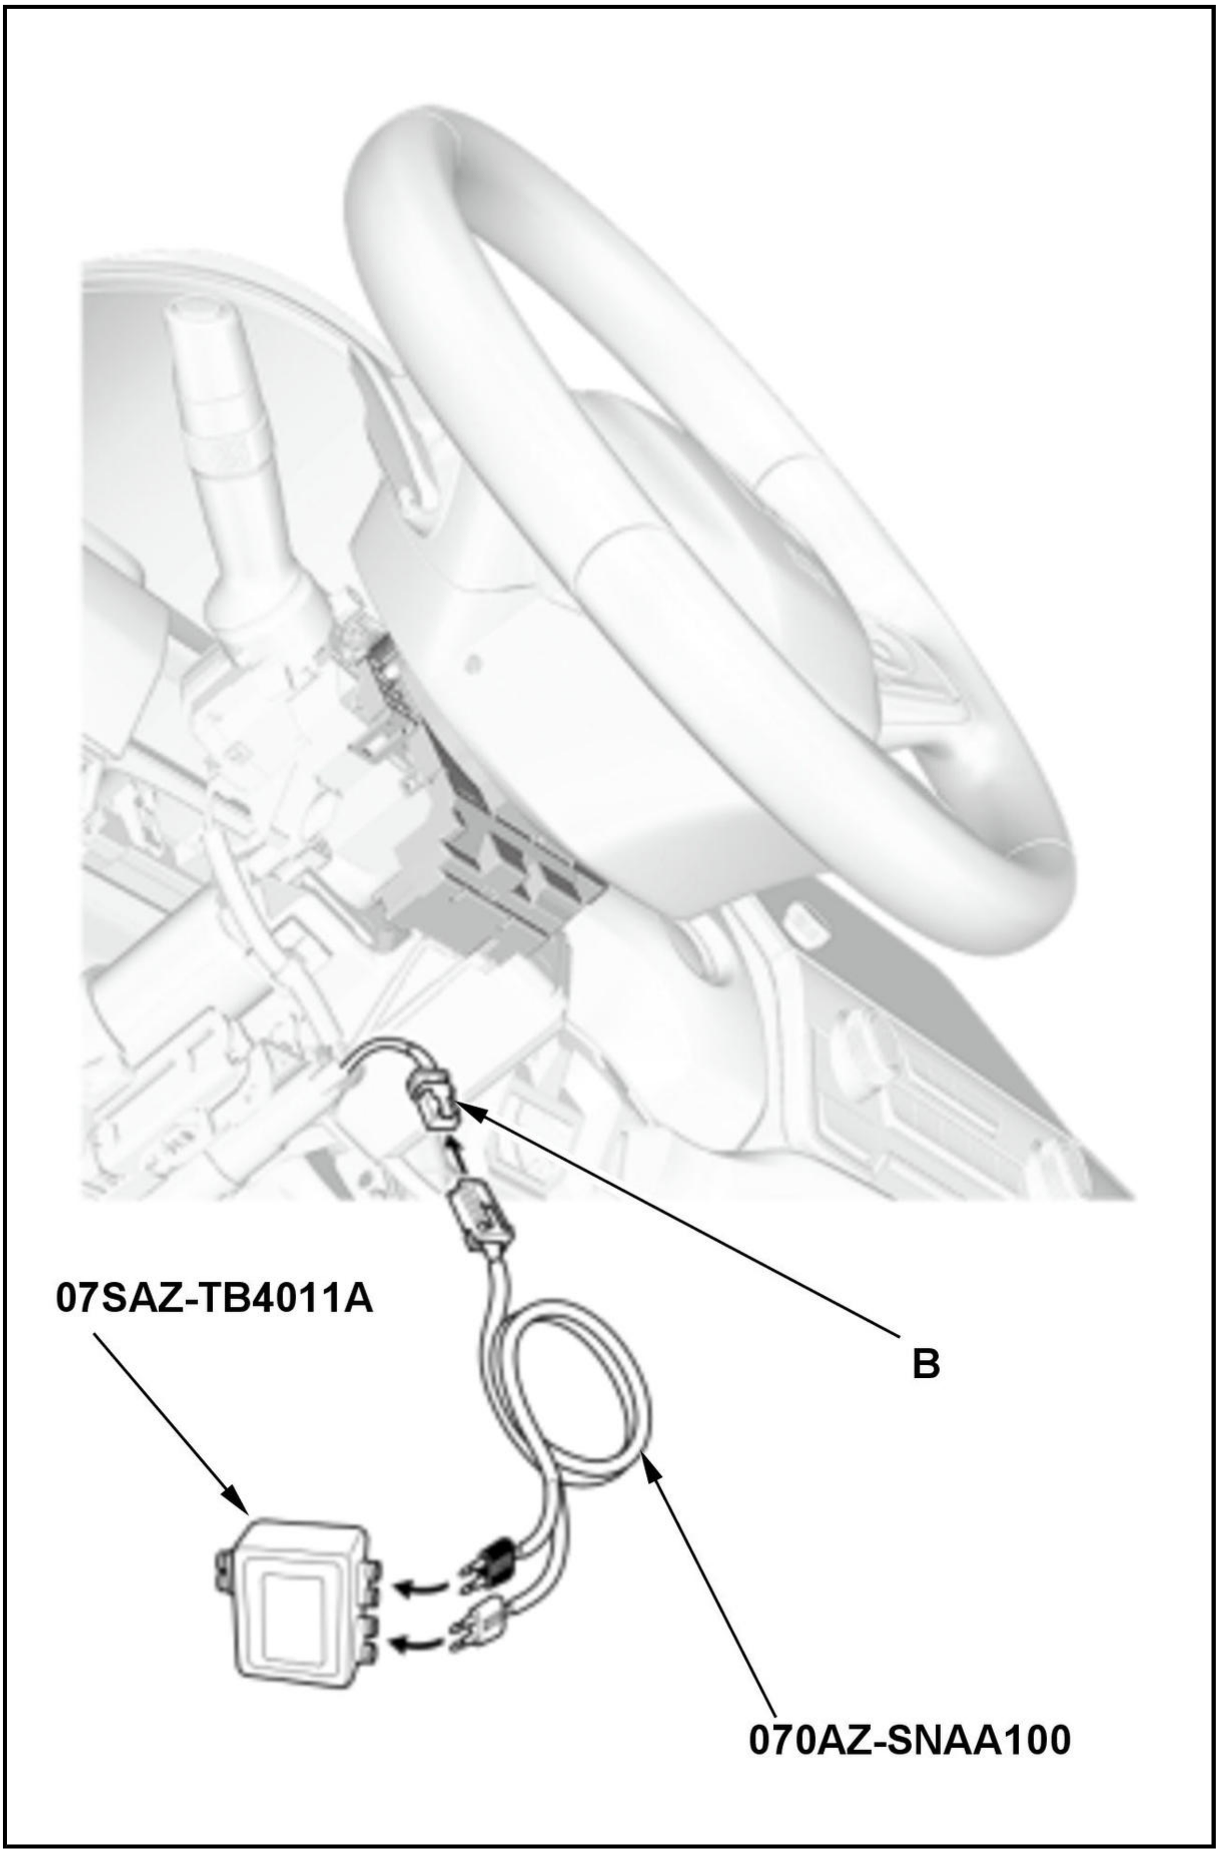
3. Cable reel check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the column covers** .

-4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0002-11 Short to ground in the driver's airbag second inflator	B

Is DTC B0002-11 indicated?

YES

Go to step 4.

NO

Short to ground in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA2+, LA2- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

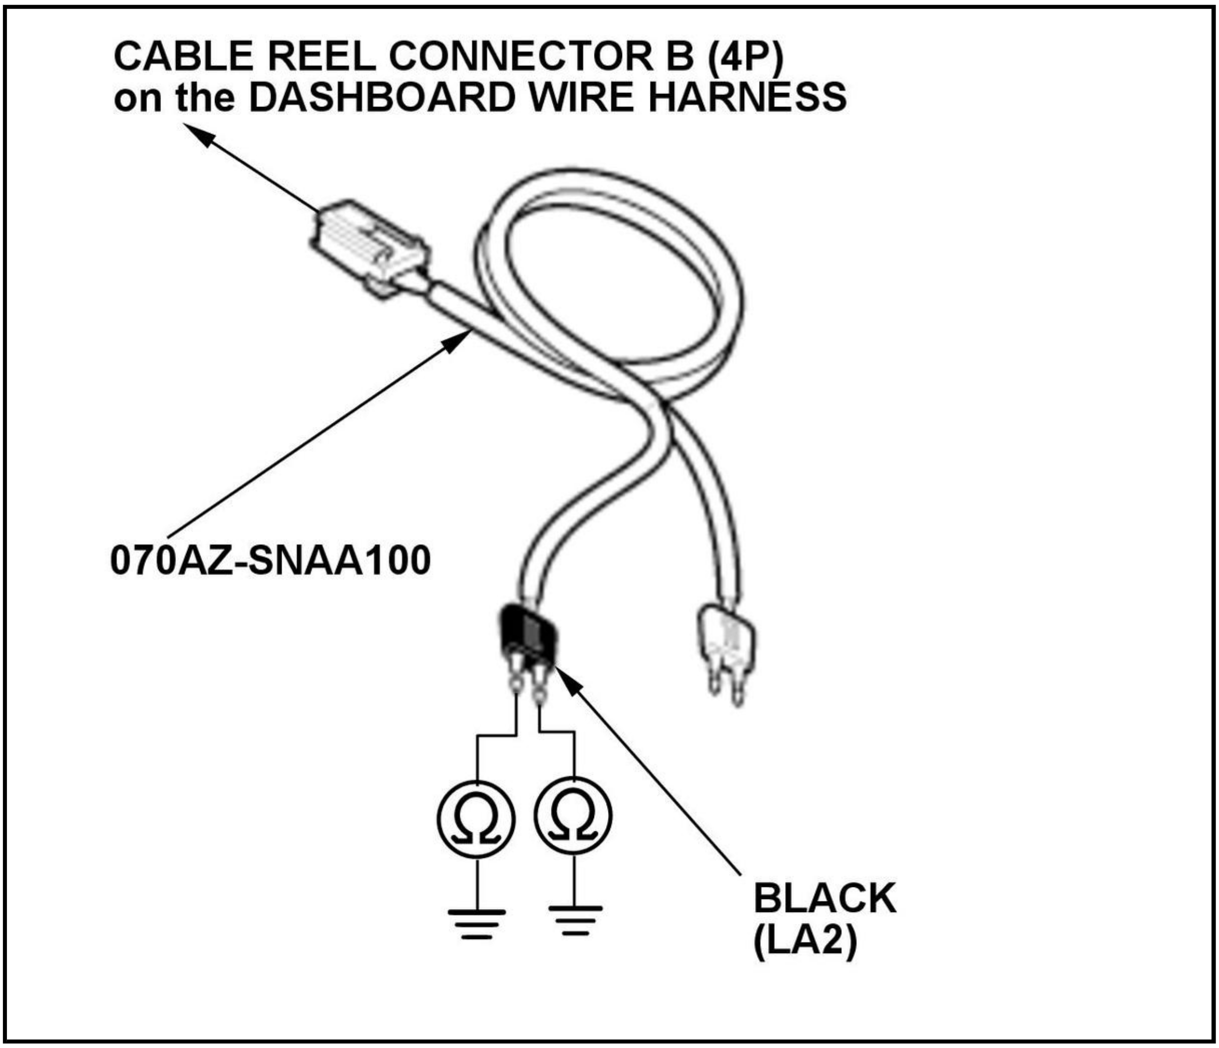
-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
Test point 1	SRS simulator lead J black terminal
Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The LA2+ and LA2- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to ground in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0002-12

DTC B0002-12 : Short to Power in the Driver's Airbag Second Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0002-12 Short to power in the driver's airbag second inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0002-12 Short to power in the driver's airbag second inflator	B

   Is DTC B0002-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

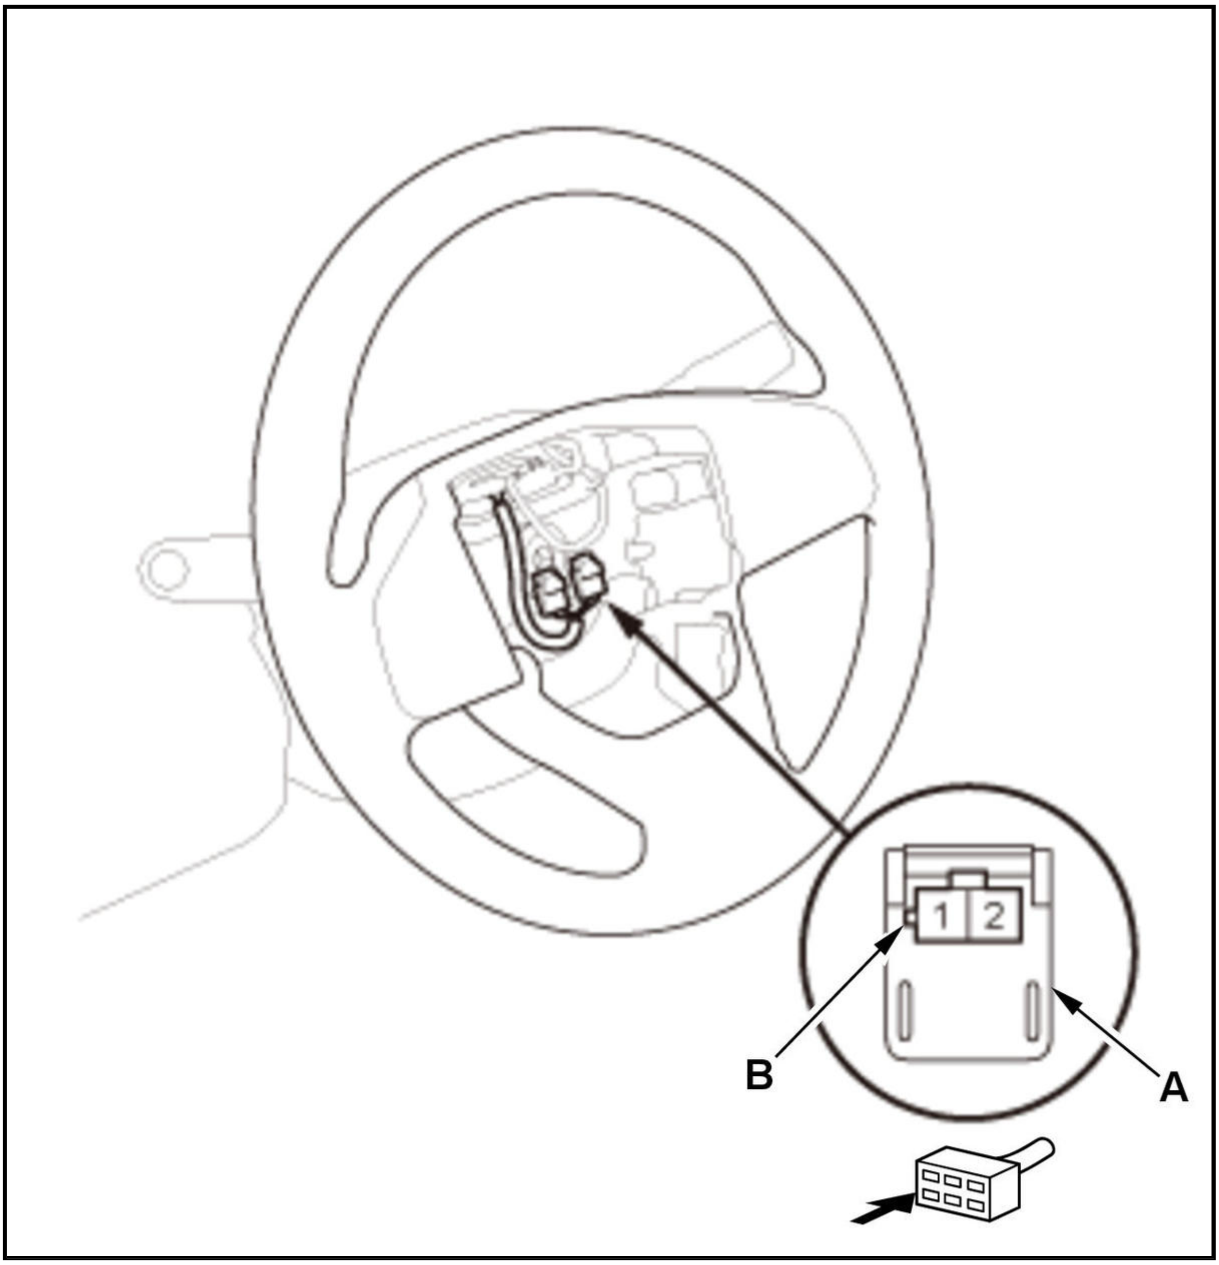
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

Driver's airbag second inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag second inflator 2P connector (A) that has a guide tab (B) on the left side of the No. 1 terminal as shown.



-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0002-12 Short to power in the driver's airbag second inflator	B

Is DTC B0002-12 indicated?

YES

Go to step 3.

NO

Short to power in the driver's airbag second inflator; **replace the driver's airbag** , then clear the DTC.

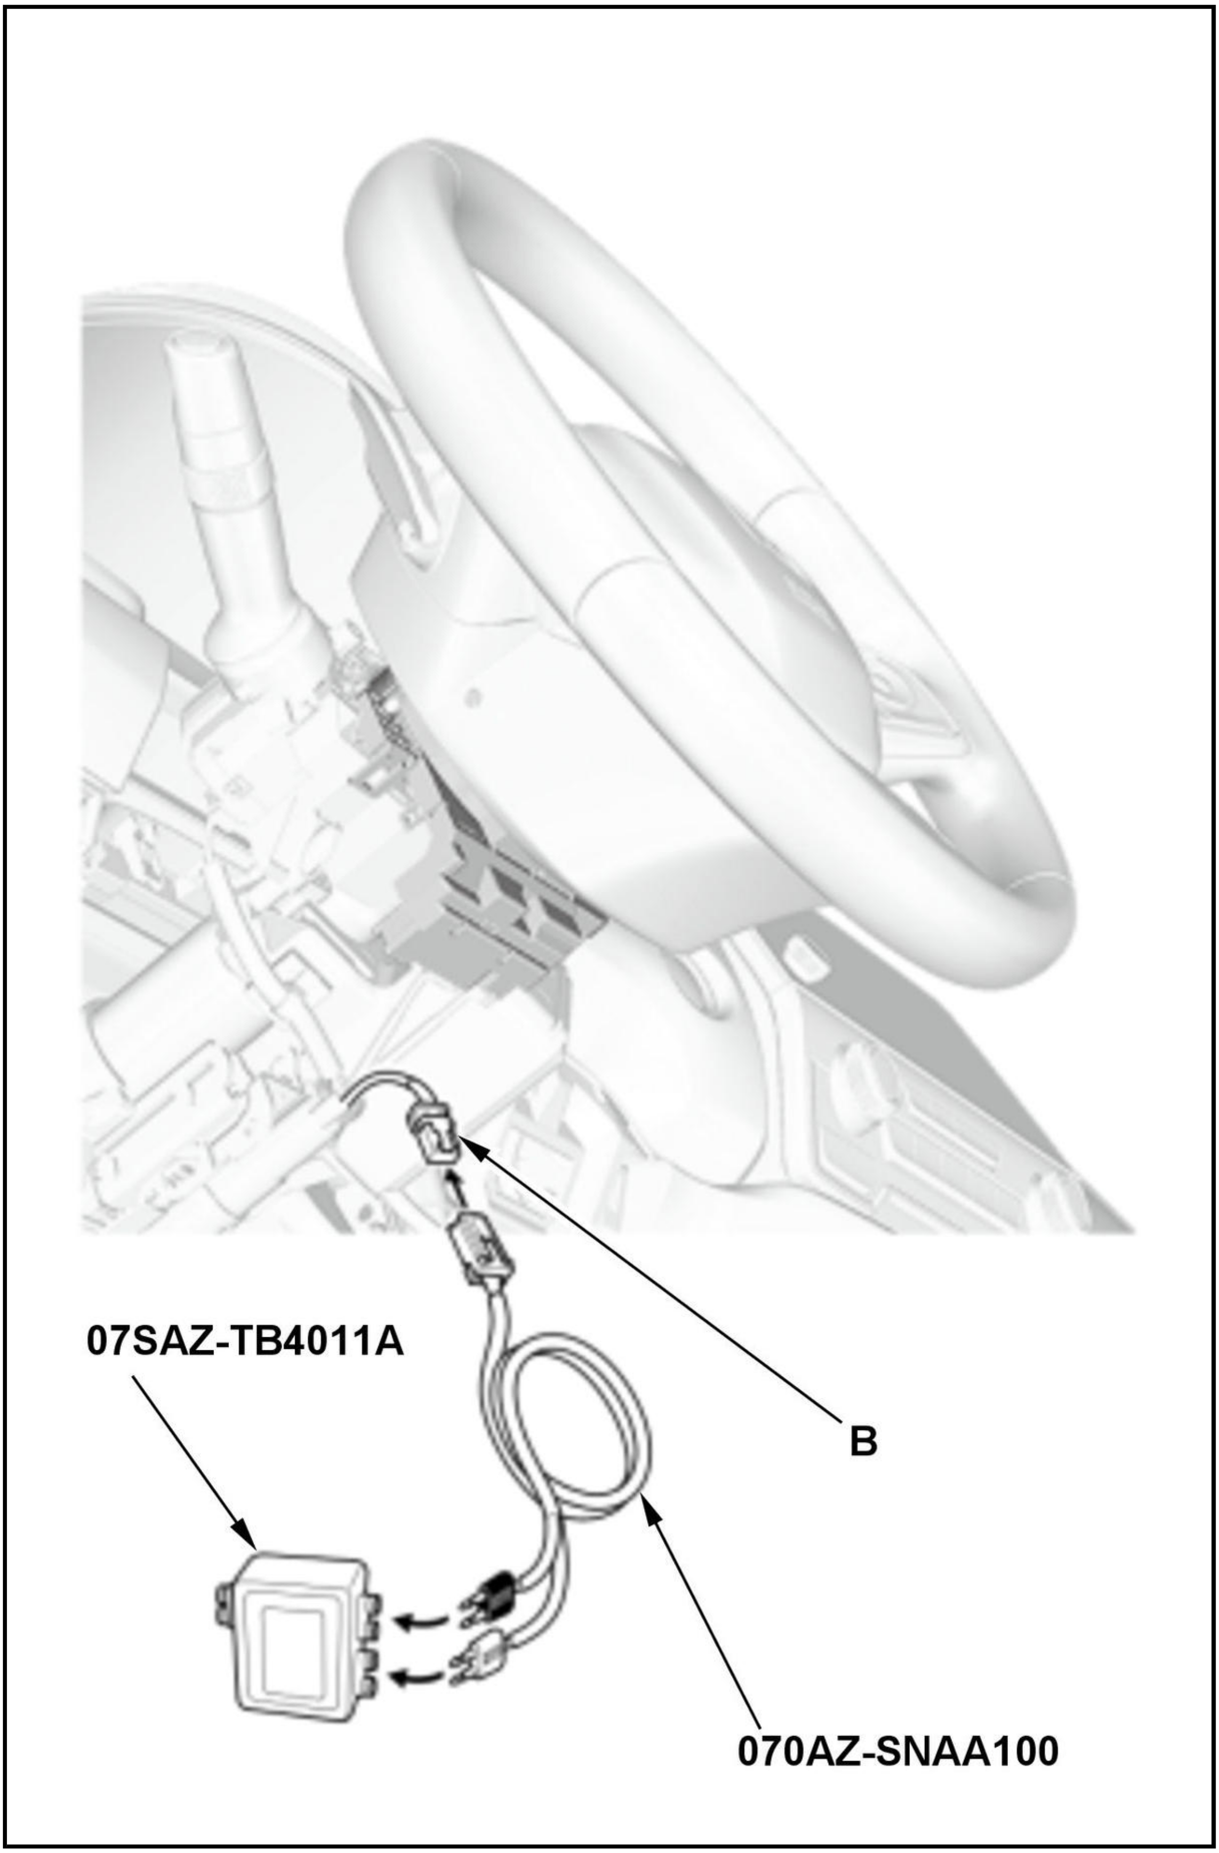
3. Cable reel check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the column covers** .

-4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0002-12 Short to power in the driver's airbag second inflator	B

Is DTC B0002-12 indicated?

YES

Go to step 4.

NO

Short to power in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA2+, LA2- lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector A (39P)

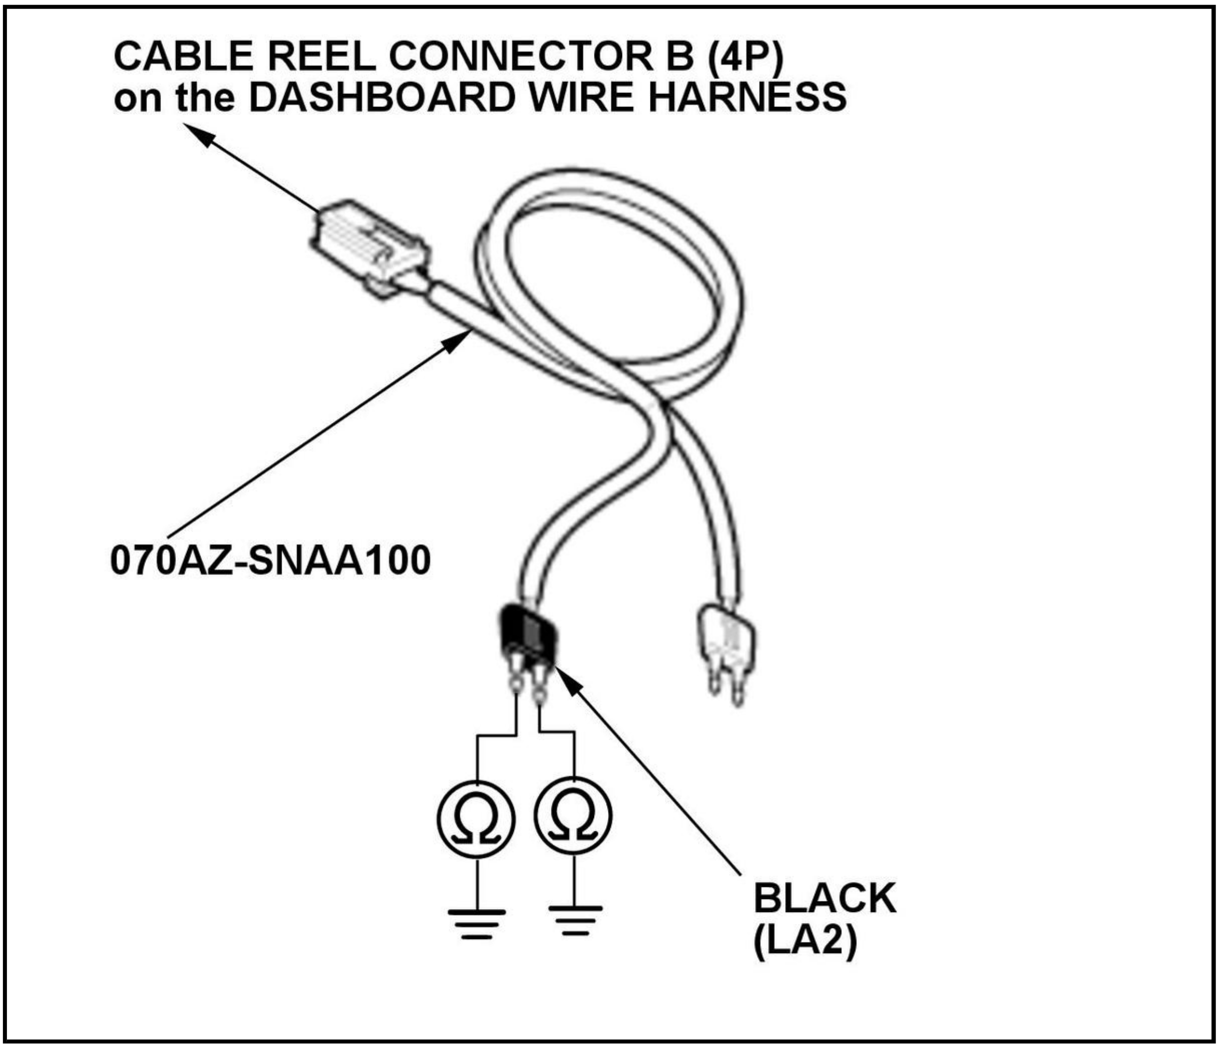
-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
Test point 1	SRS simulator lead J black terminal
Test point 2	Body ground



Is there 0.2 V or less?

YES

The LA2+ and LA2- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to power in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0002-13

DTC B0002-13 : Open or Increased Resistance in the Driver's Airbag Second Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0002-13 Open or increased resistance in the driver's airbag second inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0002-13 Open or increased resistance in the driver's airbag second inflator	B

   Is DTC B0002-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

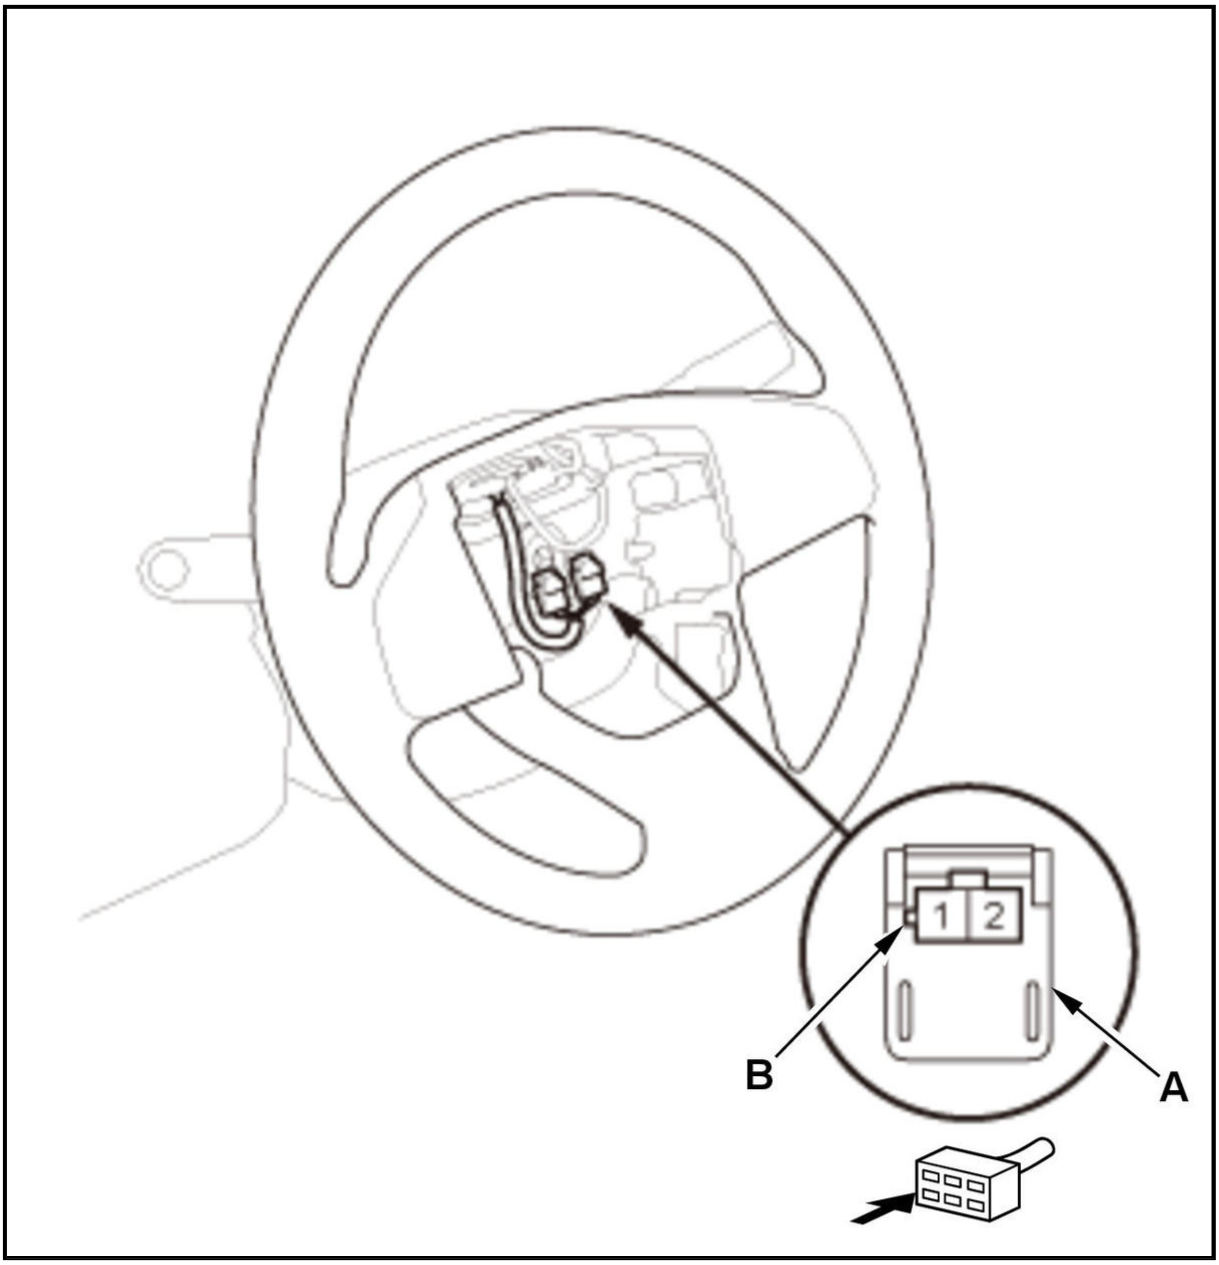
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

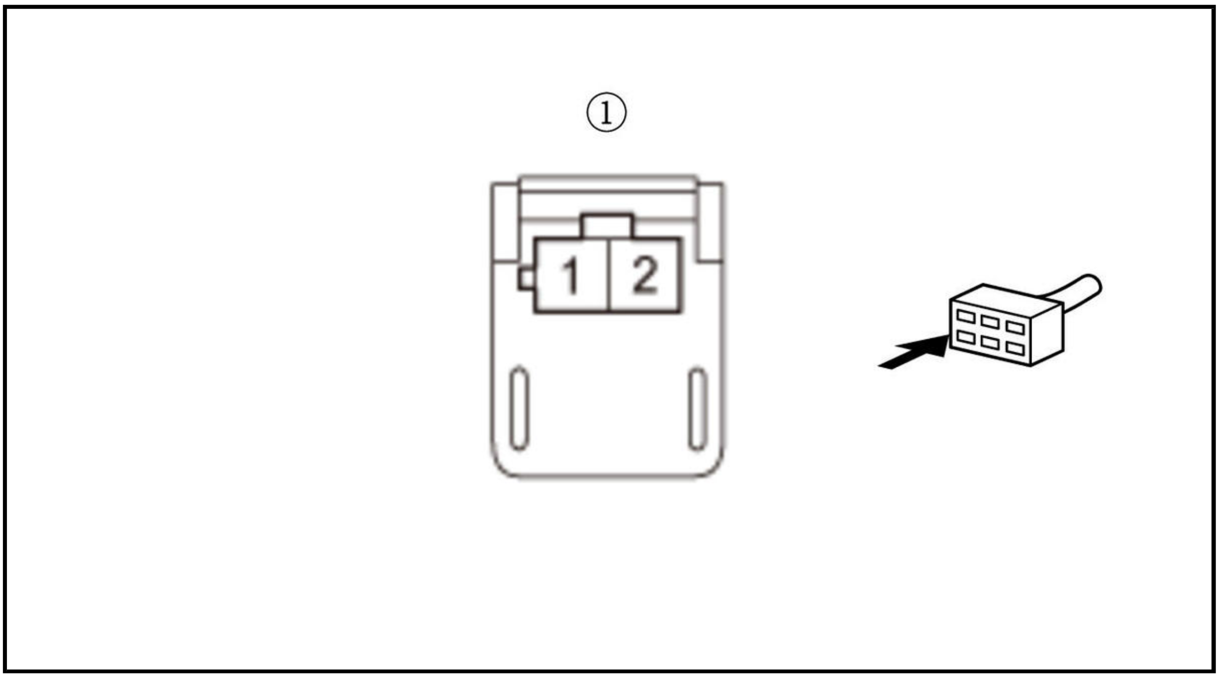
Driver's airbag second inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag second inflator 2P connector (A) that has a guide tab (B) on the left side of the No. 1 terminal as shown.



-5. Connect terminals A and B with a jumper wire.

Terminal A	Driver's airbag second inflator 2P connector (female terminals) No. 1 (on the cable reel harness): ①
Terminal B	Driver's airbag second inflator 2P connector (female terminals) No. 2 (on the cable reel harness): ①



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0002-13 Open or increased resistance in the driver's airbag second inflator	B

Is DTC B0002-13 indicated?

YES

Go to step 3.

NO

Open in the driver's airbag second inflator; **replace the driver's airbag** , then clear the DTC.

3. Cable reel check

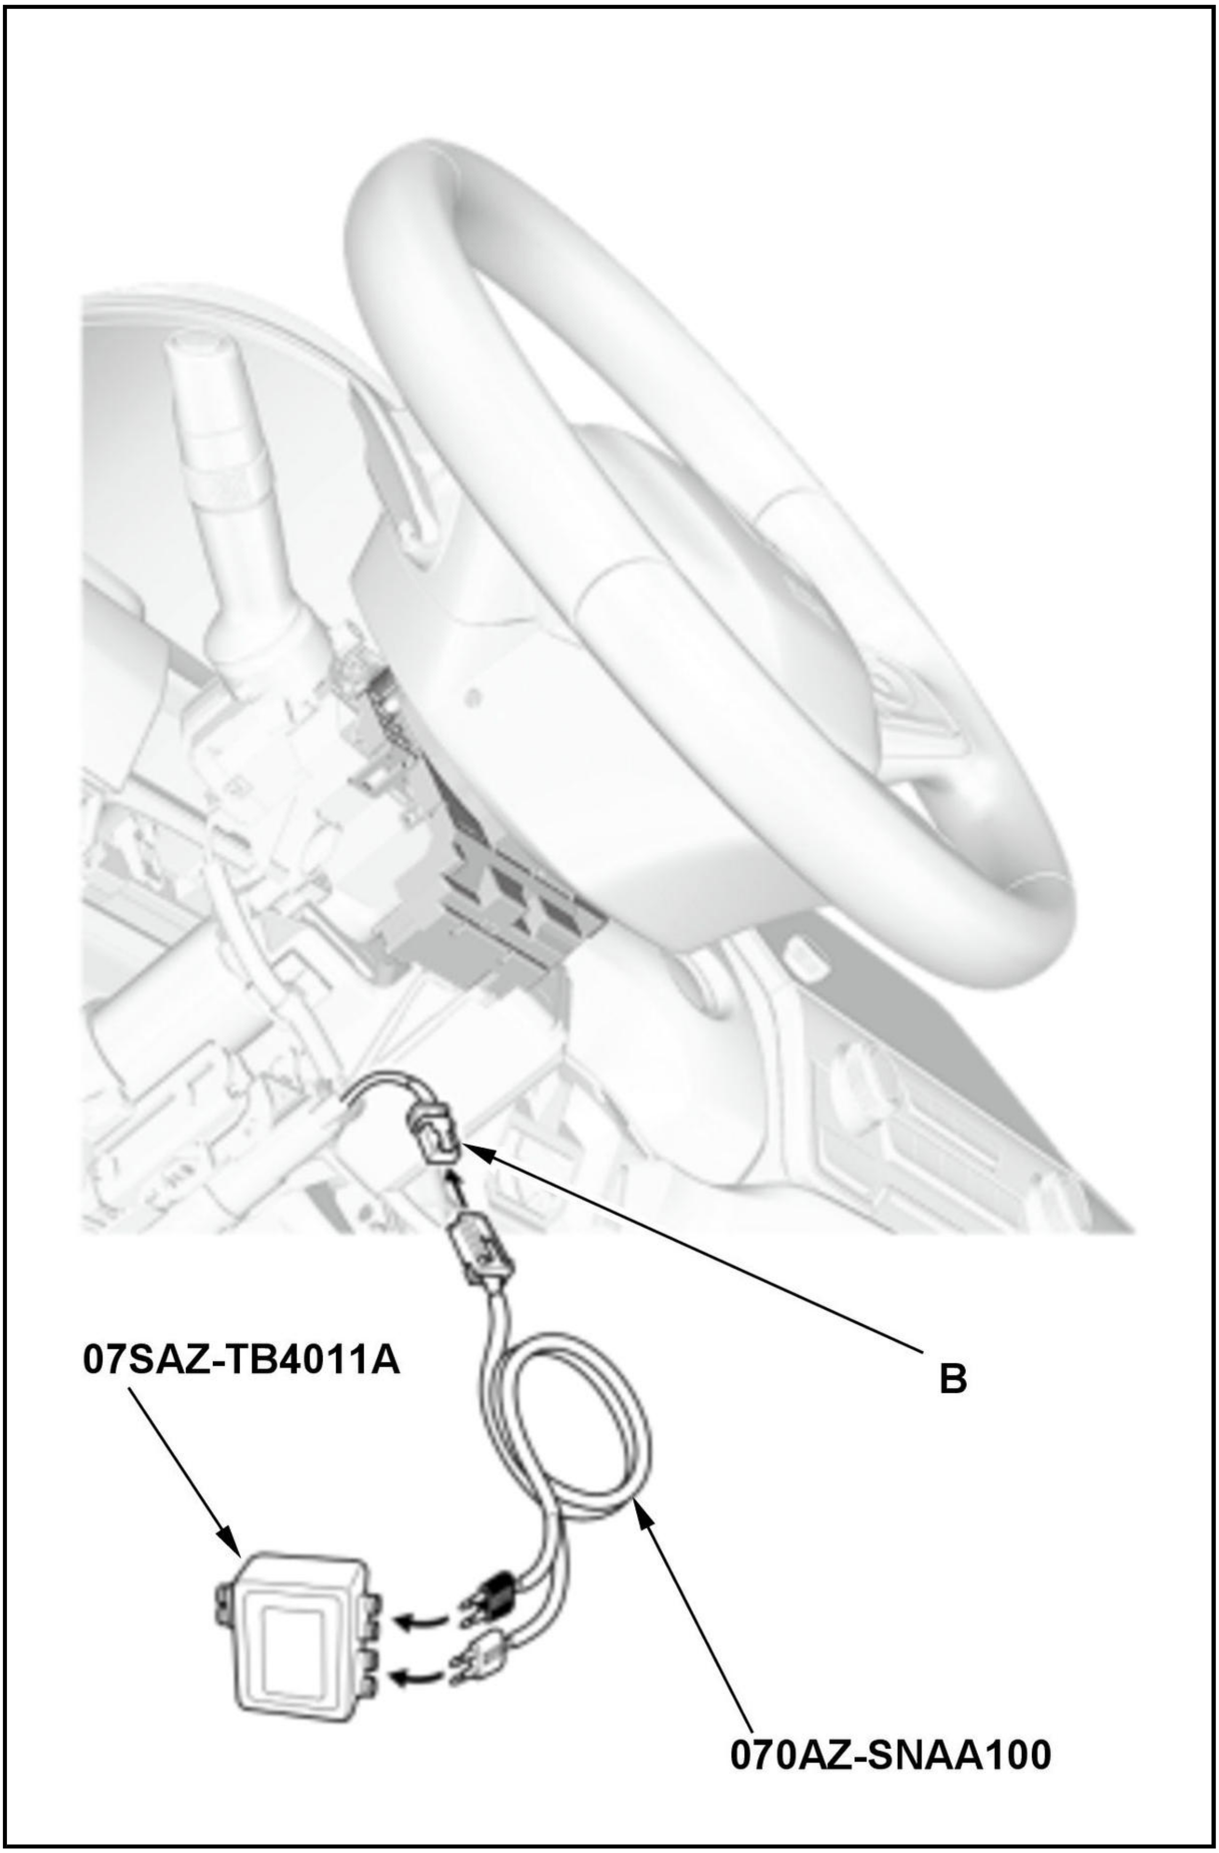
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the driver's airbag second inflator 2P connector on the cable reel harness.

-4. **Remove the column covers** .

-5. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-6. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-7. Reconnect the negative cable to the 12 volt battery.

-8. Clear the DTCs with the HDS.

-9. Turn the vehicle to the ON mode, then wait for 10 seconds.

-10.

Check for DTCs with the HDS.

DTC Description	DTC
B0002-13 Open or increased resistance in the driver's airbag second inflator	B

Is DTC B0002-13 indicated?

YES

Go to step 4.

NO

Open in the cable reel; **replace the cable reel** , then clear the DTC.

4. Open wire check (LA2+, LA2- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

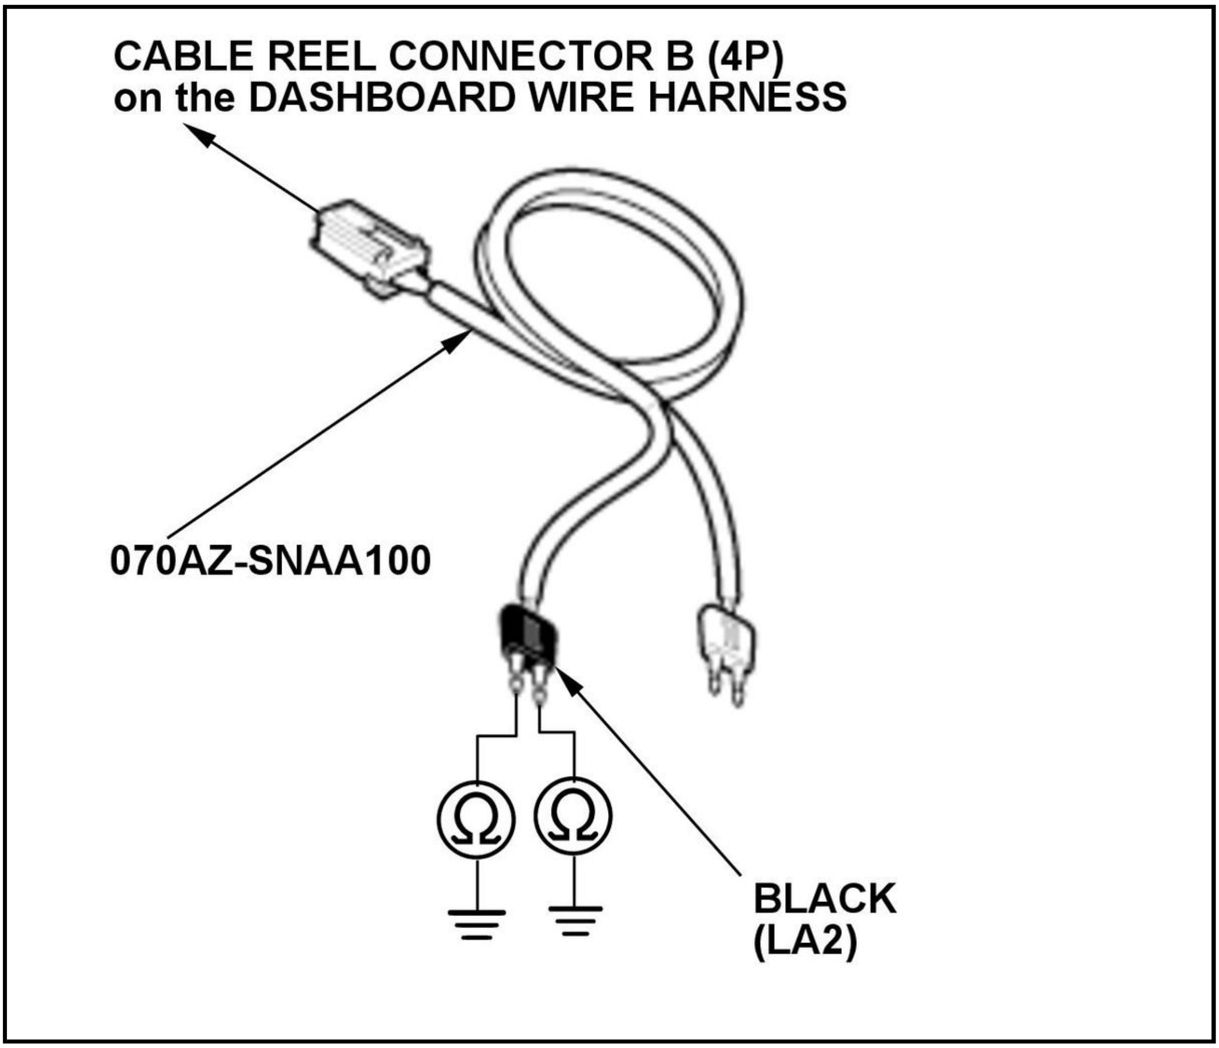
-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
Test point	SRS simulator lead J black terminal



CABLE REEL CONNECTOR B (4P)
on the DASHBOARD WIRE HARNESS
070AZ-SNAA100
BLACK
(LA2)

Is there 1.0 Ω or less?

YES

The LA2+ and LA2- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

NO

Open or increased resistance in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0002-1A

DTC B0002-1A : Decreased Resistance in the Driver's Airbag Second Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead J 070AZ-SNAA100

SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0002-1A Decreased resistance in the driver's airbag second inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0002-1A Decreased resistance in the driver's airbag second inflator	B

   Is DTC B0002-1A indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

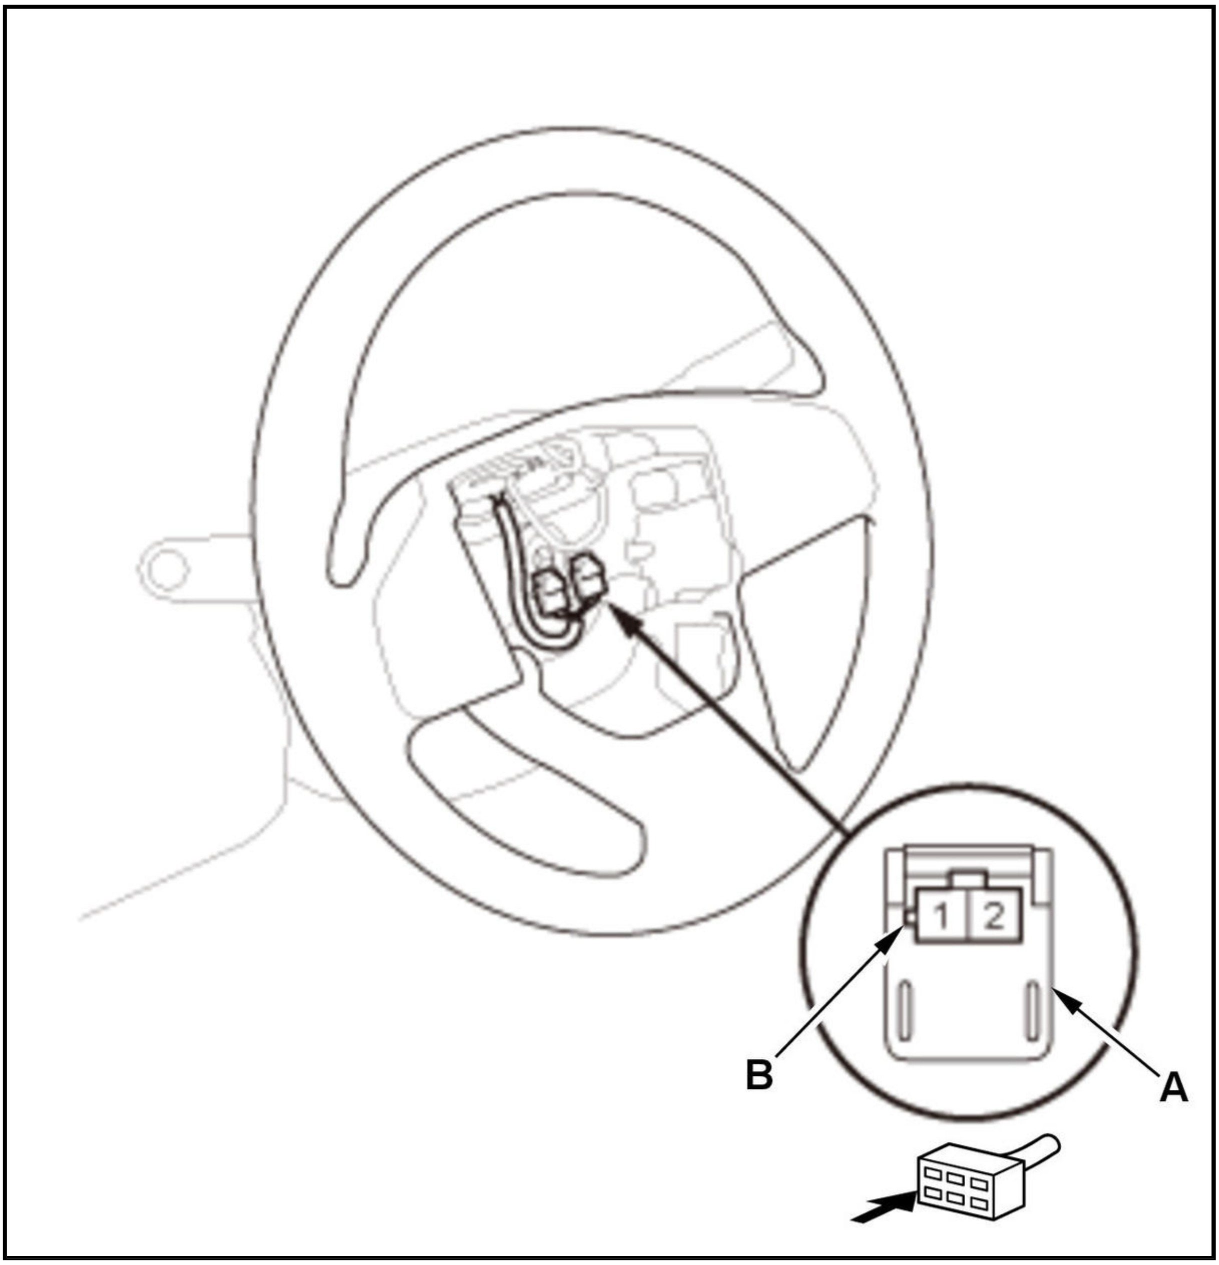
   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the driver's airbag** .

   -4. Disconnect the following connector.

Driver's airbag second inflator 2P connector (on the cable reel harness)

   NOTE: Make sure to work with the driver's airbag second inflator 2P connector (A) that has a guide tab (B) on the left side of the No. 1 terminal as shown.



-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0002-1A Decreased resistance in the driver's airbag second inflator	B

Is DTC B0002-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the driver's airbag second inflator; **replace the driver's airbag** , then clear the DTC.

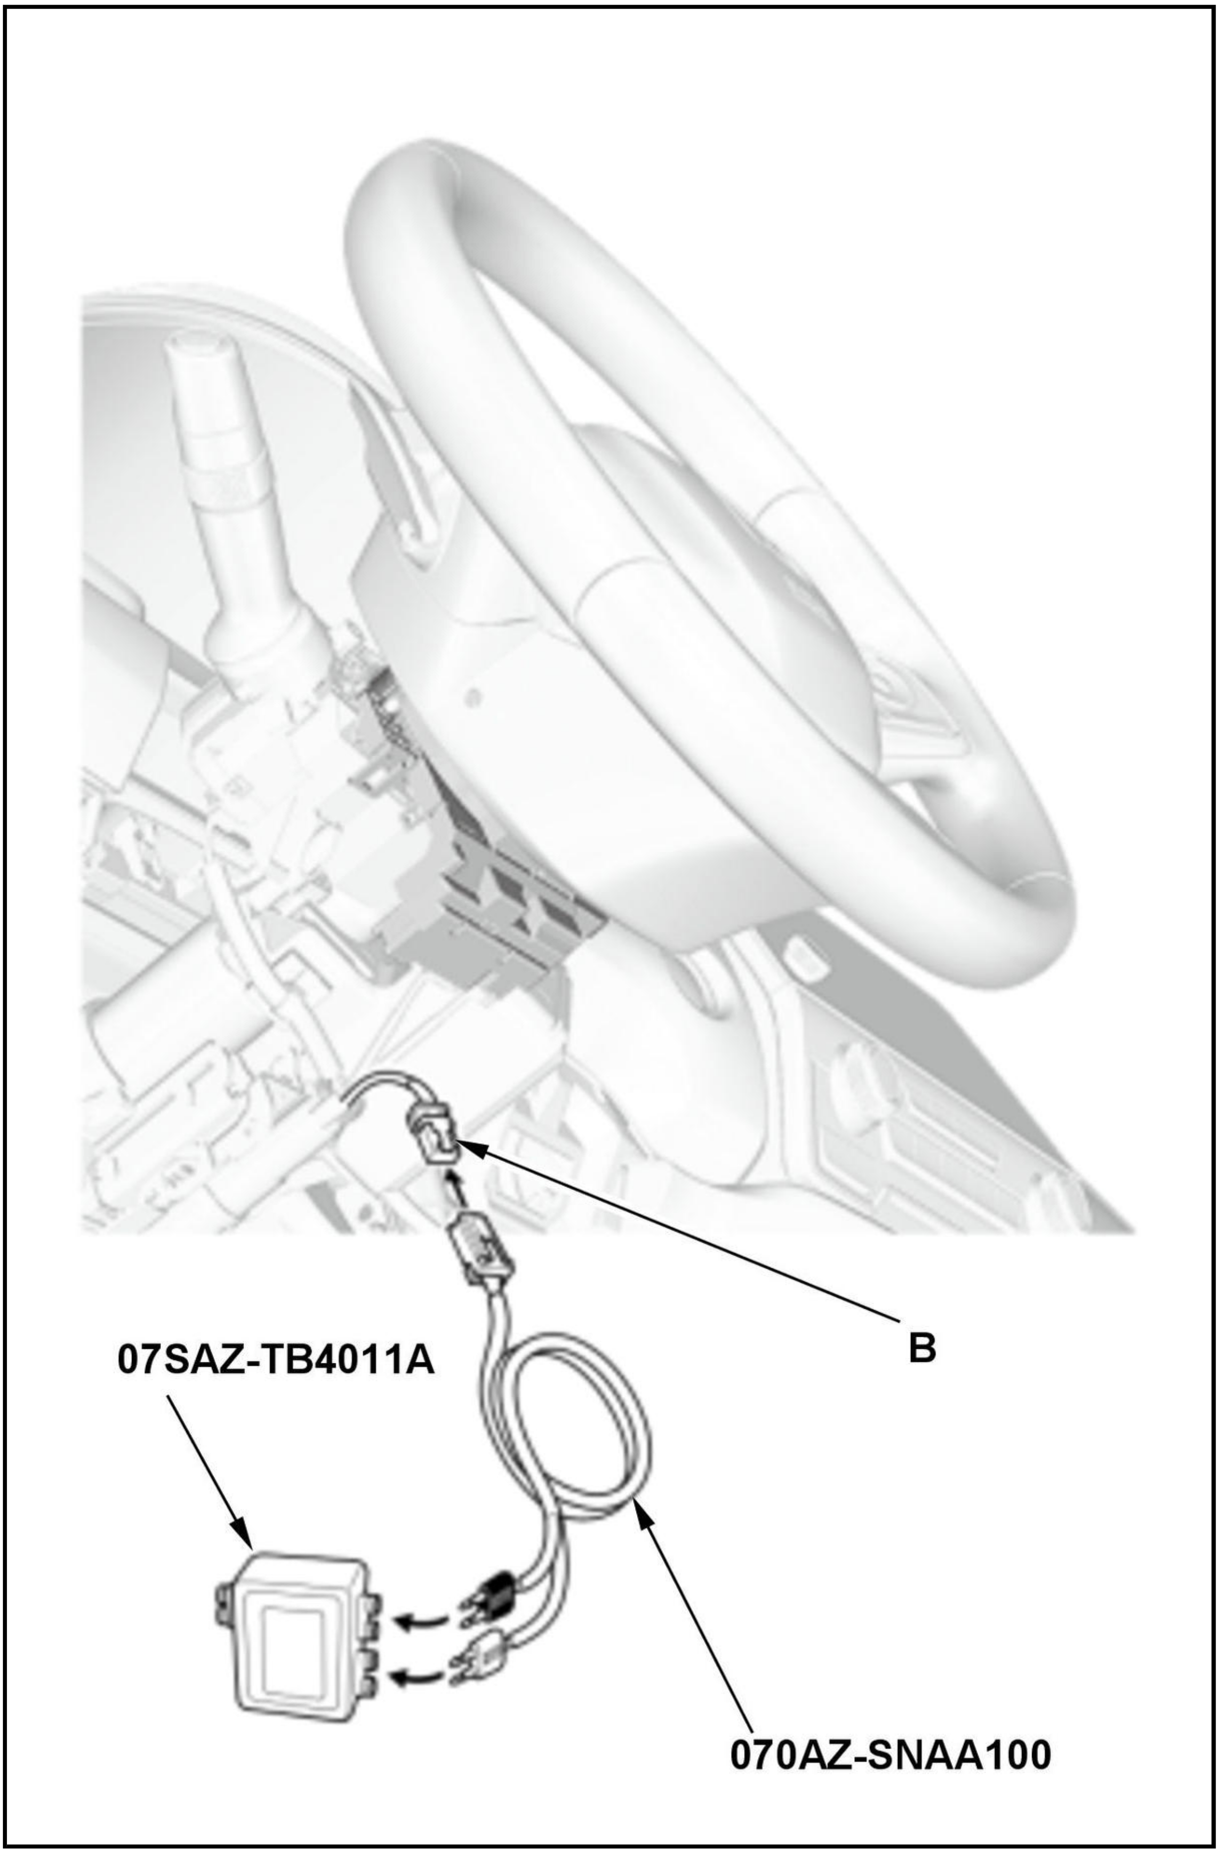
3. Cable reel check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the column covers** .

-4. Disconnect cable reel connector B (4P) on the dashboard wire harness.



07SAZ-TB4011A
B
070AZ-SNAA100

-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to cable reel connector B (4P) on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0002-1A Decreased resistance in the driver's airbag second inflator	B

Is DTC B0002-1A indicated?

YES

Go to step 4.

NO

Short to another wire in the cable reel; **replace the cable reel** , then clear the DTC.

4. Shorted wire check (LA2+ line to LA2- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

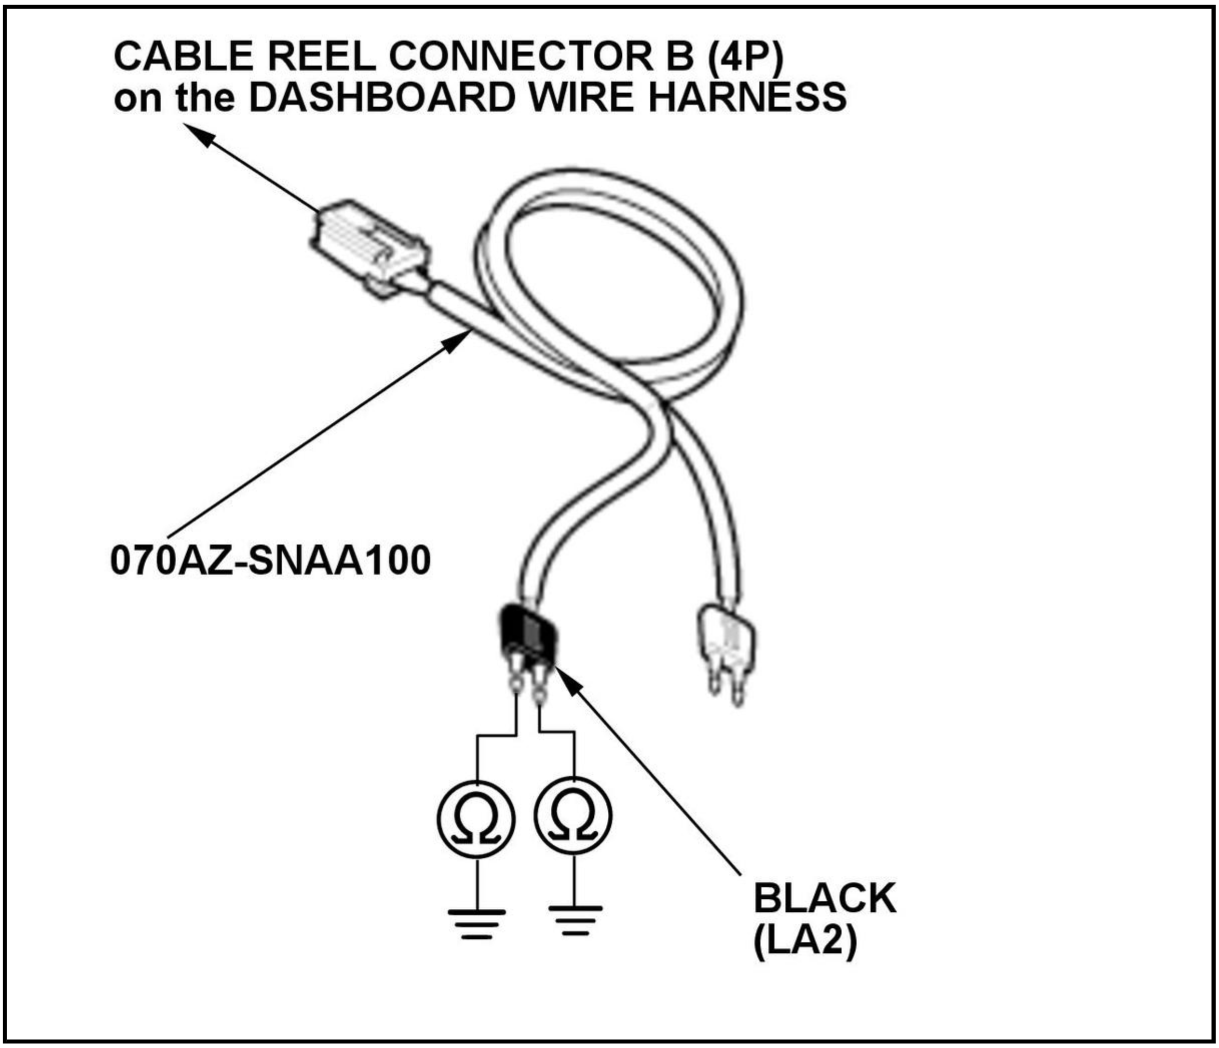
SRS unit connector A (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from cable reel connector B (4P) on the dashboard wire harness.

-5. **Connect the SRS short canceller to SRS unit connector A (39P) terminals No. 10 and No. 11**.

-6. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): connected to SRS simulator lead J
	SRS unit connector A (39P) No. 10 and No. 11: connected to SRS short canceller
Test point	SRS simulator lead J black terminal



Is there an open circuit, or at least 1 MΩ?

YES

The LA2+ and LA2- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to another wire in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0002-2B

DTC B0002-2B : Short to Another Wire Harness in the Driver's Airbag Second Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0002-2B Short to another wire harness in the driver's airbag second inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0002-2B Short to another wire harness in the driver's airbag second inflator	B

Is DTC B0002-2B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the driver's side airbag inflator	B
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the front passenger's side airbag inflator	B
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B

DTC Description	DTC
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0001-2B, B0010-2B, B0011-2B, B0020-2B, B0021-2B, B0028-2B, B0029-2B, B0070-2B, B0072-2B, B0079-2B, B007A-2B or B0082-2B indicated with DTC B0002-2B?

YES

Go to step 3.

NO

Go to step 4.

3. Shorted wire check (LA2 lines to another line)

-1. Turn the vehicle to the OFF (LOCK) mode.

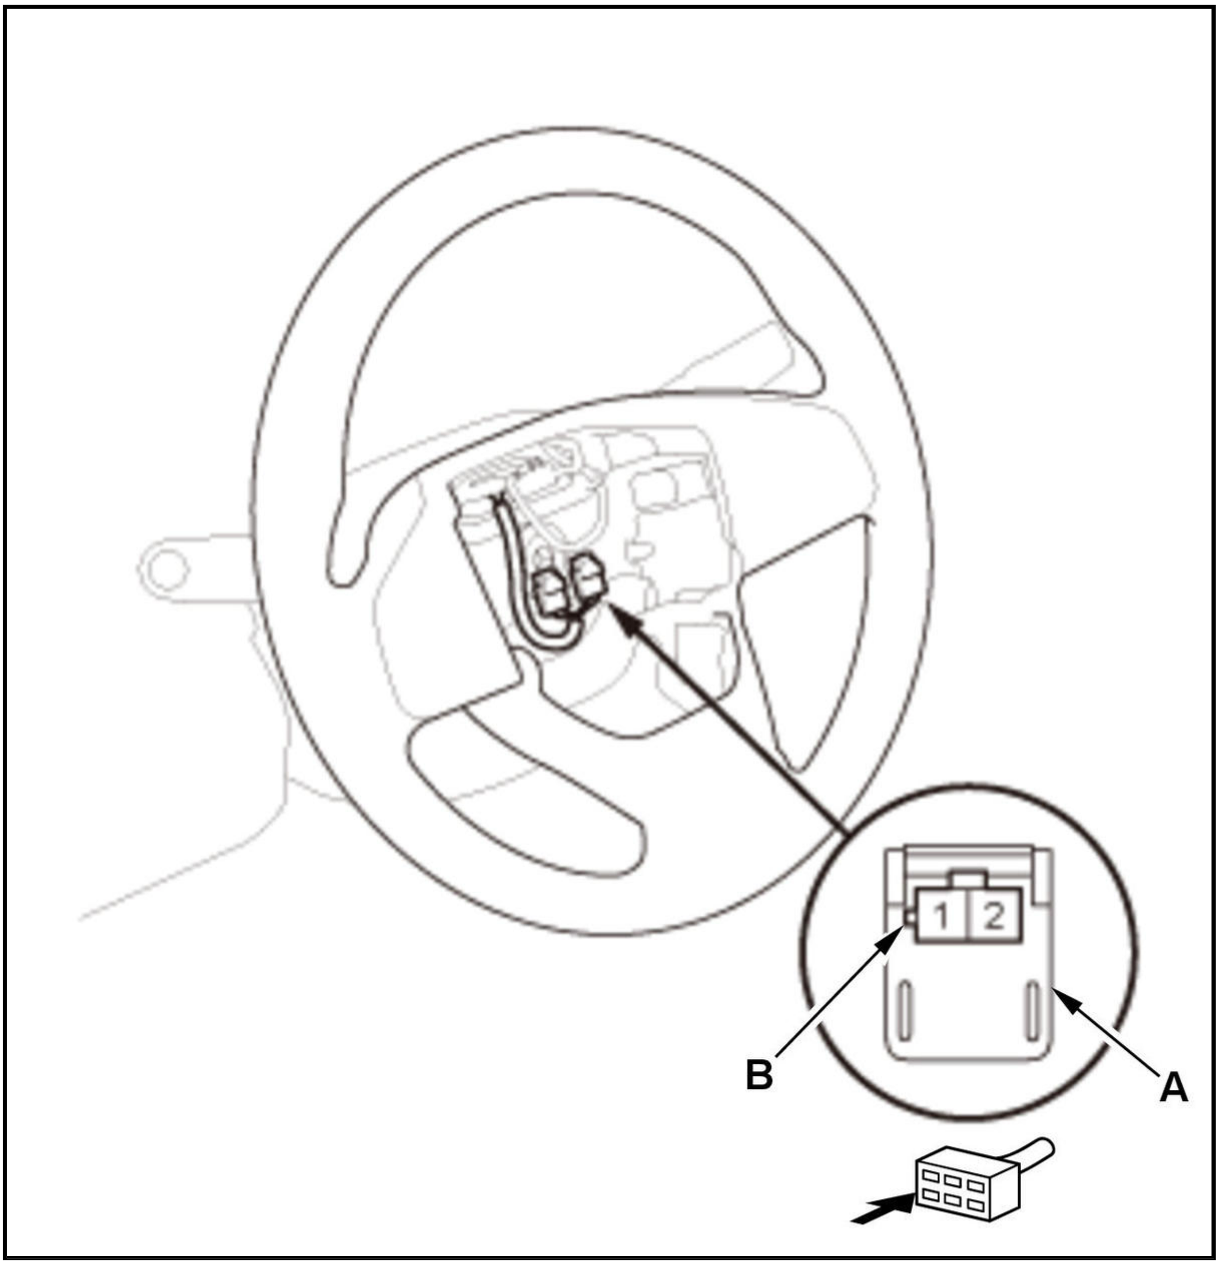
-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the driver's airbag** .

-4. Disconnect the following connectors.

SRS unit connector A (39P)
SRS unit connector B (39P)
Driver's airbag second inflator 2P connector (on the cable reel harness)
Inflator connectors which are assigned to 2B codes listed on HDS

NOTE: Make sure to work with the driver's airbag second inflator 2P connector (A) that has a guide tab (B) on the left side of the No. 1 terminal as shown.



-5. Measure the resistance between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	SRS unit connector B (39P): disconnected
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

	SRS unit connector A (39P) No. 11	SRS unit connector A (39P) No. 3

Is there 1 MΩ or more?

YES

The LA2 wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

NO

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

4. Shorted wire check (LA1+ line to LA2+ line, LA1- line to LA2- line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the driver's airbag** .

-4. Disconnect the following connector.

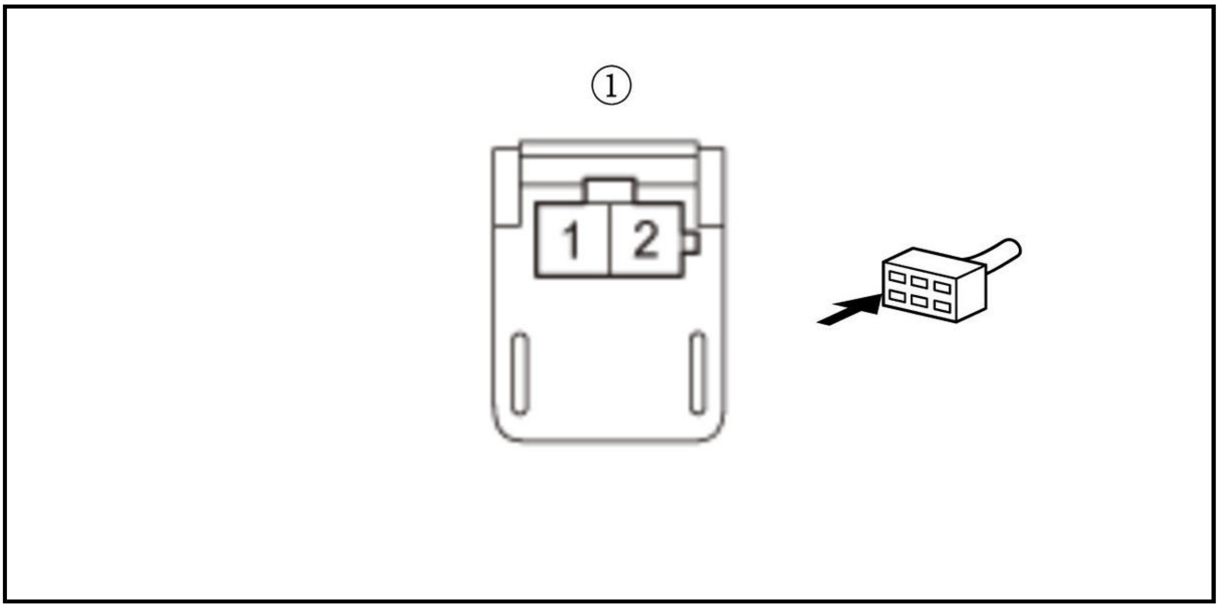
Driver's airbag first inflator 2P connector (on the cable reel harness)
Driver's airbag second inflator 2P connector (on the cable reel harness)

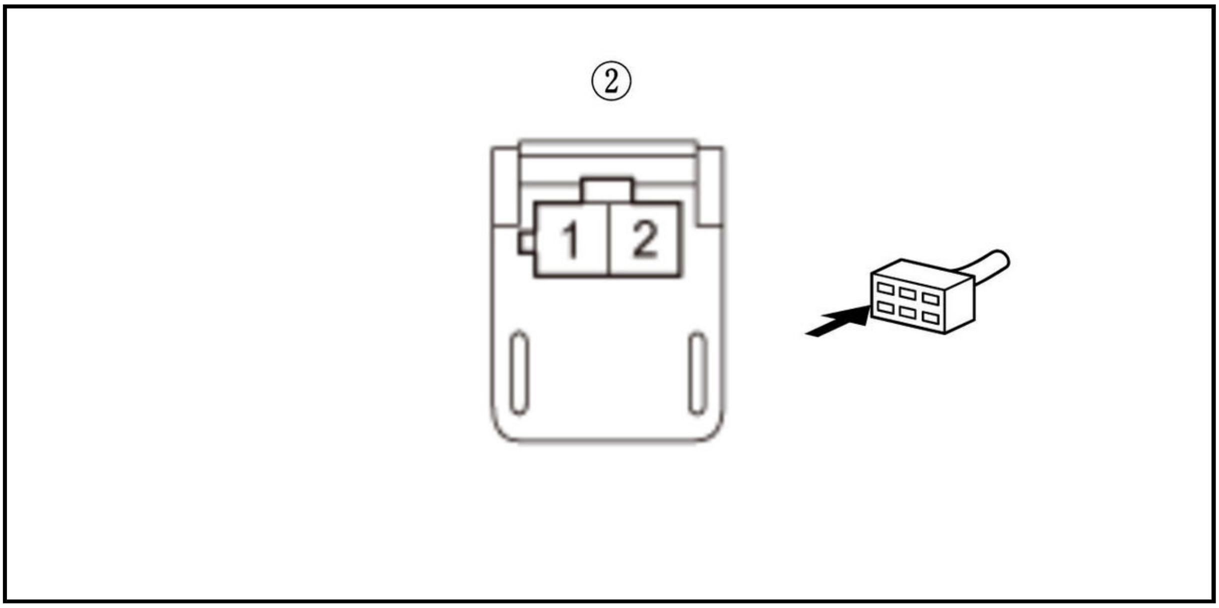
-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
Test point 1	Driver's airbag first inflator 2P connector No. 2 (on the cable reel harness) ①

Test point 2	Driver's airbag second inflator 2P connector No. 2 (on the cable reel harness) ②

Test point 1	Driver's airbag first inflator 2P connector No. 1 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 1 (on the cable reel harness) ②





Is there 1 MΩ or more?

YES

The LA1+, LA1-, LA2+, and LA2- wires are OK. Faulty driver's airbag second inflator; **replace the driver's airbag** , then clear the DTC.

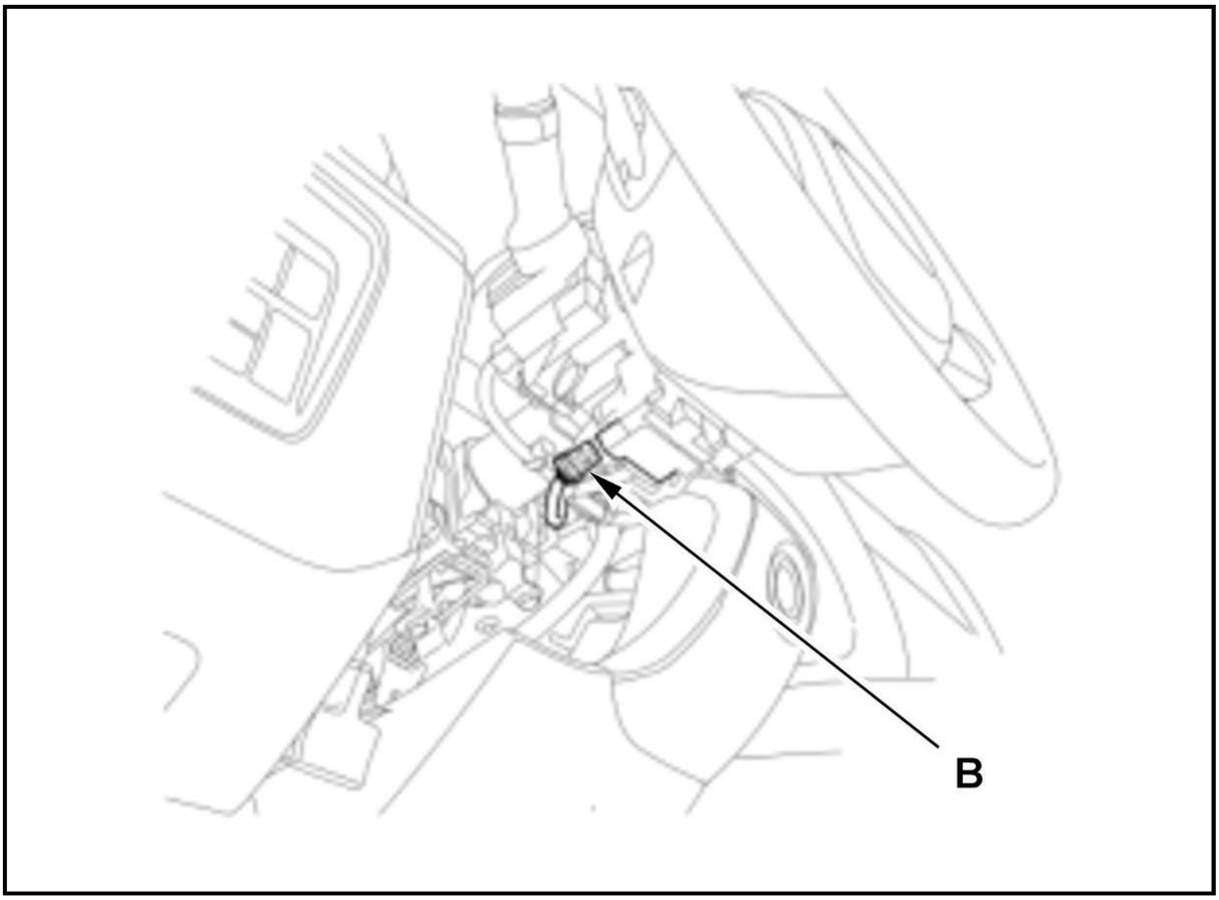
NO

Go to step 5.

5. Shorted wire check (LA1+ line to LA2+ line, LA1- line to LA2- line) 2

-1. **Remove the column covers** .

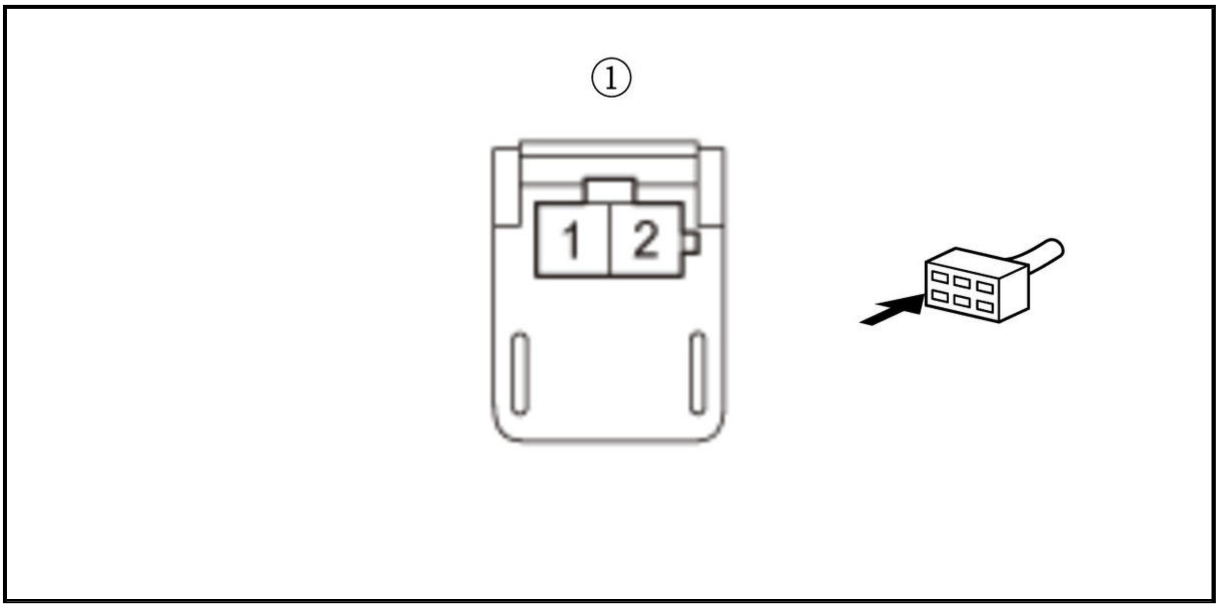
-2. Disconnect cable reel connector B (4P) on the dashboard wire harness.

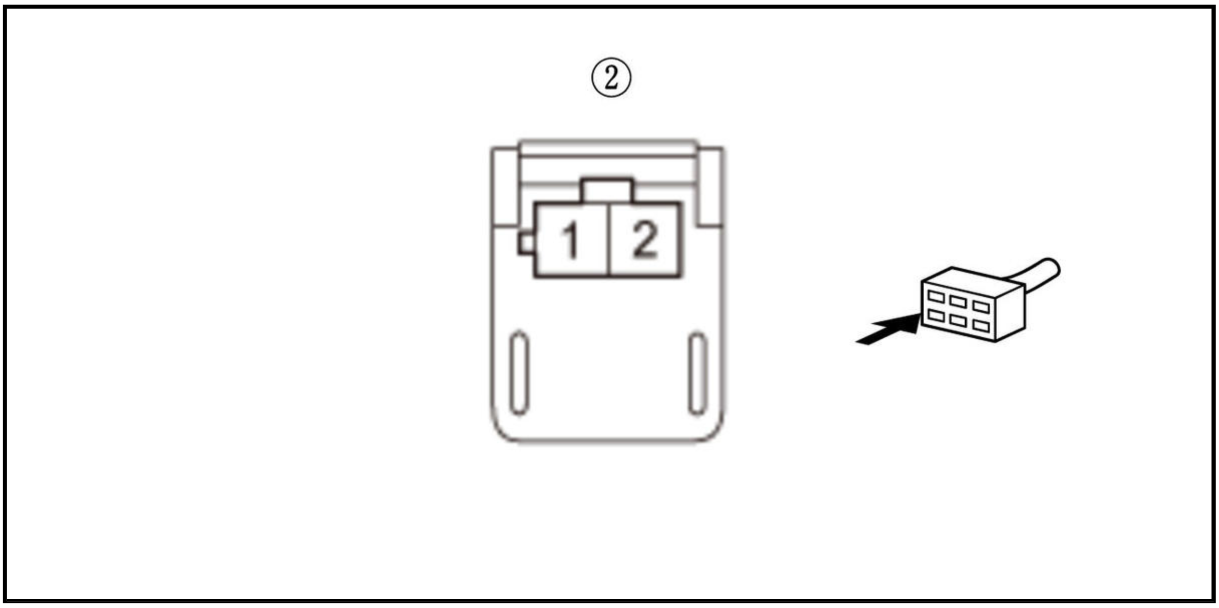


-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected
Test point 1	Driver's airbag first inflator 2P connector No. 2 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 2 (on the cable reel harness) ②

Test point 1	Driver's airbag first inflator 2P connector No. 1 (on the cable reel harness) ①
Test point 2	Driver's airbag second inflator 2P connector No. 1 (on the cable reel harness) ②





Is there 1 MΩ or more?

YES

Go to step 6.

NO

Short to another wire in the cable reel; replace the cable reel , then clear the DTC.

6. Shorted wire check (LA1+ line to LA2+ line, LA1- line to LA2- line) 3

-1. Disconnect the following connectors.

SRS unit connector A (39P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Driver's airbag first inflator 2P connector (on the cable reel harness): disconnected
	Driver's airbag second inflator 2P connector (on the cable reel harness): disconnected
	Cable reel connector B (4P) (on the dashboard wire harness): disconnected

Test point 1	SRS unit connector A (39P) No. 9
Test point 2	SRS unit connector A (39P) No. 10

Test point 1	SRS unit connector A (39P) No. 8
Test point 2	SRS unit connector A (39P) No. 11

Is there 1 MΩ or more?

YES

The LA1+, LA1-, LA2+, and LA2- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness.

NO

Short to another wire in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B0010-11, B0011-11

DTC B0010-11 : Short to Ground in the Front Passenger's Airbag First Inflator

DTC B0011-11 : Short to Ground in the Front Passenger's Airbag Second Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead J 070AZ-SNAA100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0010-11 Short to ground in the front passenger's airbag first inflator	B
B0011-11 Short to ground in the front passenger's airbag second inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0010-11 Short to ground in the front passenger's airbag first inflator	B

DTC Description	DTC
B0011-11 Short to ground in the front passenger's airbag second inflator	B

Is DTC B0010-11 or B0011-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

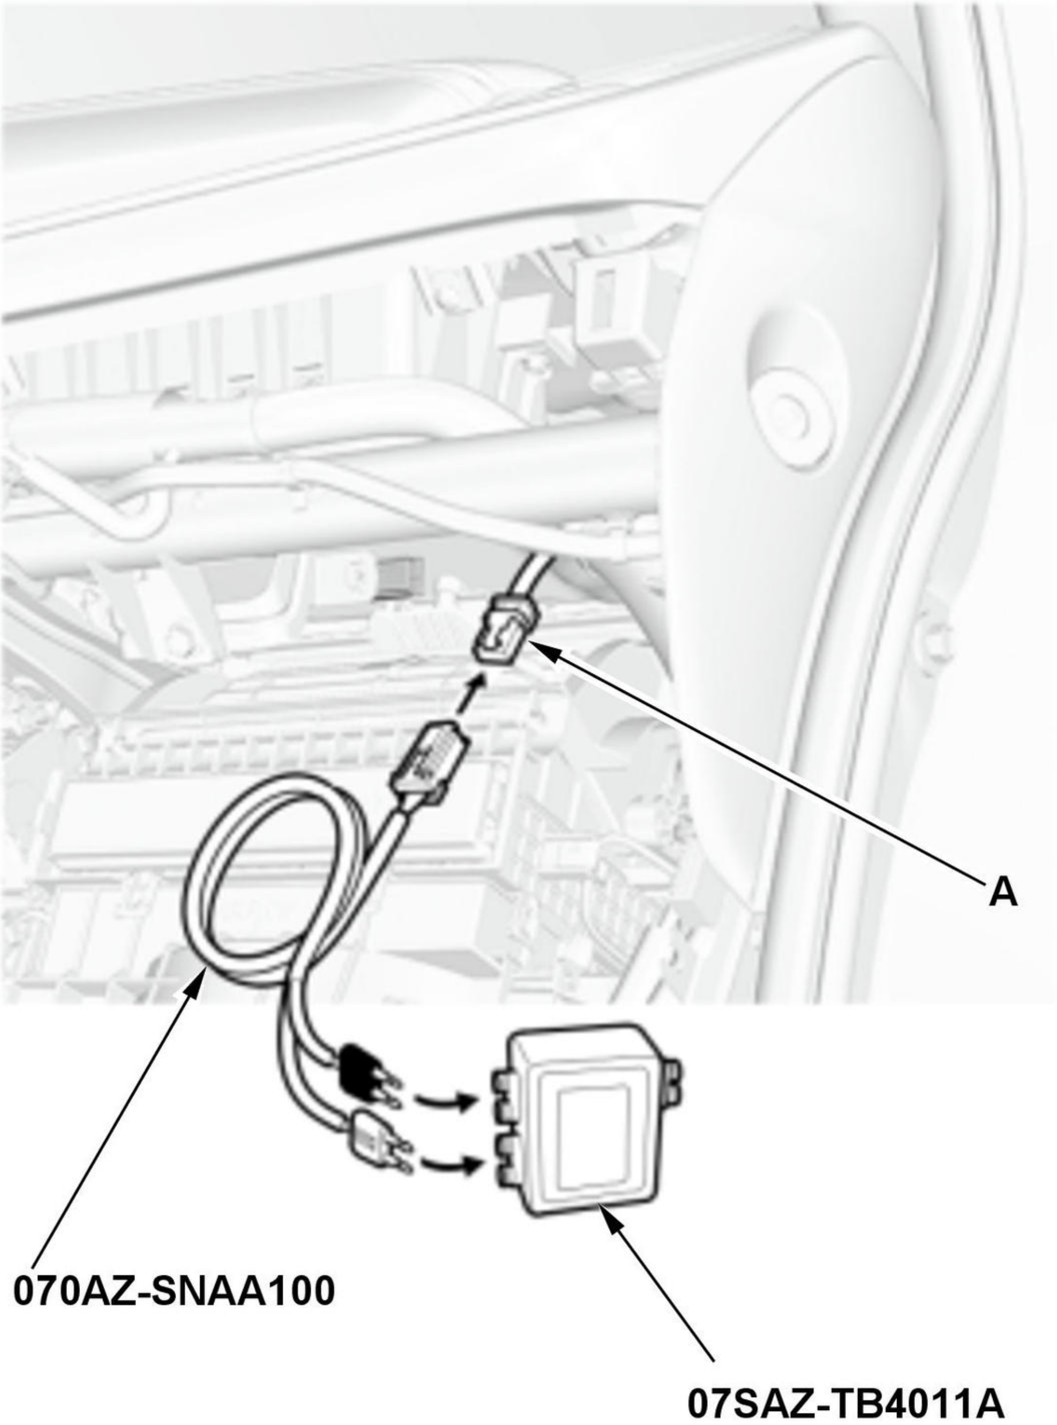
2. Front passenger's airbag inflator check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the glove box** .

-4. Disconnect the front passenger's airbag inflator 4P connector (A) on the dashboard wire harness.



-5. Connect the terminals of SRS simulator lead J to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead J to the front passenger's airbag inflator 4P connector on the dashboard wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0010-11 Short to ground in the front passenger's airbag first inflator	B
B0011-11 Short to ground in the front passenger's airbag second inflator	B

Is DTC B0010-11 or B0011-11 indicated?

YES

Go to step 3.

NO

Short to ground in the front passenger's airbag first or second inflator; **replace the front passenger's airbag** , then clear the DTC.

3. Shorted wire check (RA1+, RA1-, RA2+, RA2- lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the following connector.

SRS unit connector A (39P)

   -4. Disconnect the SRS inflator simulator from SRS simulator lead J. Do not disconnect SRS simulator lead J from the front passenger's airbag inflator 4P connector on the dashboard wire harness.

   -5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's airbag inflator 4P connector (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
	Front passenger's airbag inflator 4P connector (on the dashboard wire harness): connected to SRS simulator lead J
Test point 1	SRS simulator lead J black terminal
Test point 2	Body ground

Test point 2	Body ground

DRIVER'S SIDE AIRBAG INFLATOR 4P CONNECTOR on the FLOOR WIRE HARNESS
070AZ-SNA0300
BLACK (LSA)
Ω
Ω

Is there an open circuit, or at least 1 MΩ?

YES

The LSA+ and LSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the floor wire harness.

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0020-12

DTC B0020-12 : Short to Power in the Driver's Side Airbag Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead L 070AZ-SNA0300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information, and 12 Volt Battery Terminal Disconnection and Reconnection .

DTC Description	DTC
B0020-12 Short to power in the driver's side airbag inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0020-12 Short to power in the driver's side airbag inflator	B

   Is DTC B0020-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

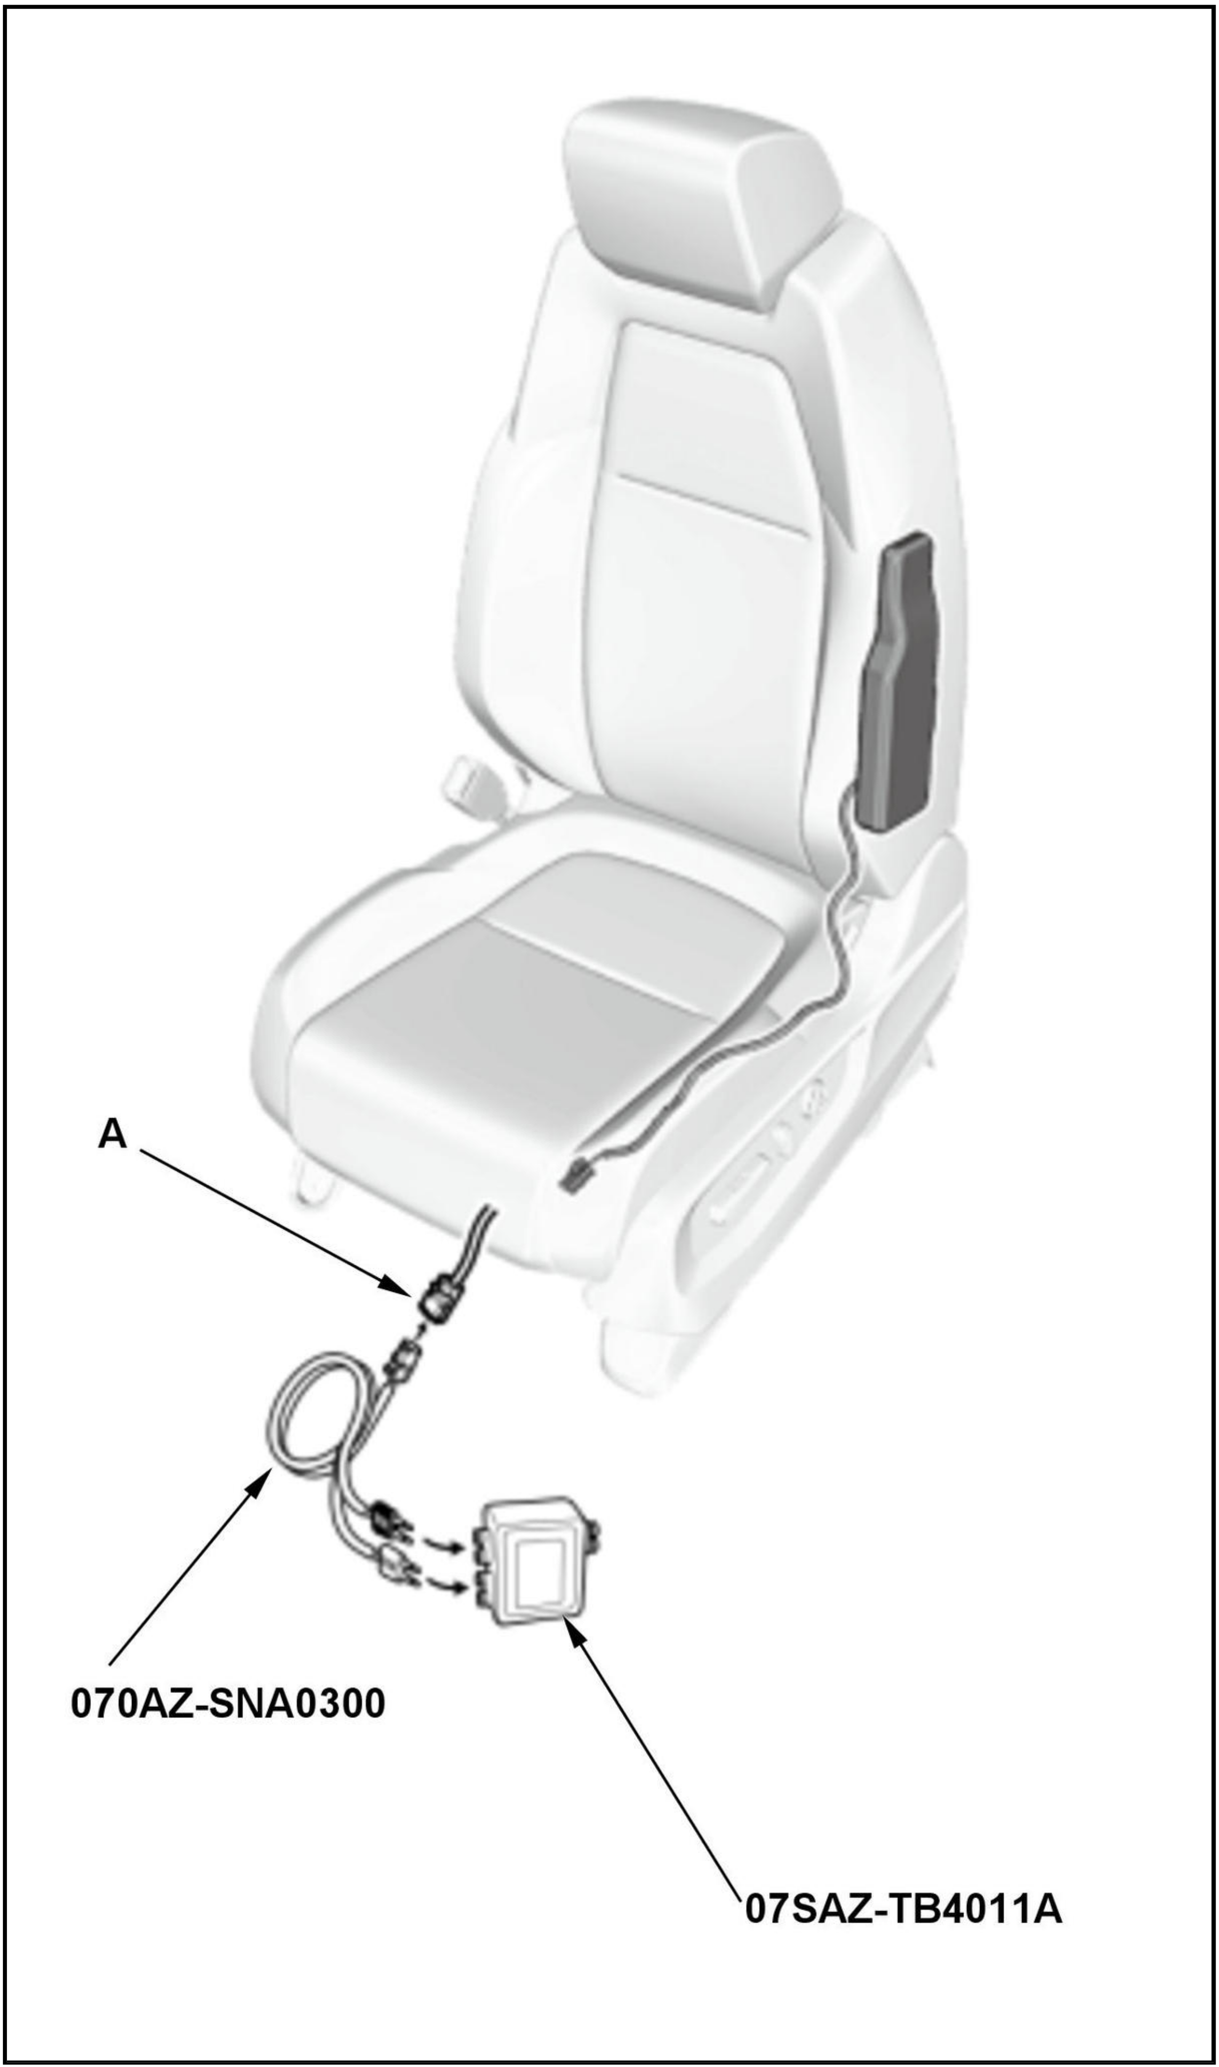
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's side airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the driver's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the driver's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0020-12 Short to power in the driver's side airbag inflator	B

Is DTC B0020-12 indicated?

YES

Go to step 3.

NO

Short to power in the driver's side airbag inflator; **replace the driver's side airbag** , then clear the DTC.

3. Shorted wire check (LSA+, LSA- lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

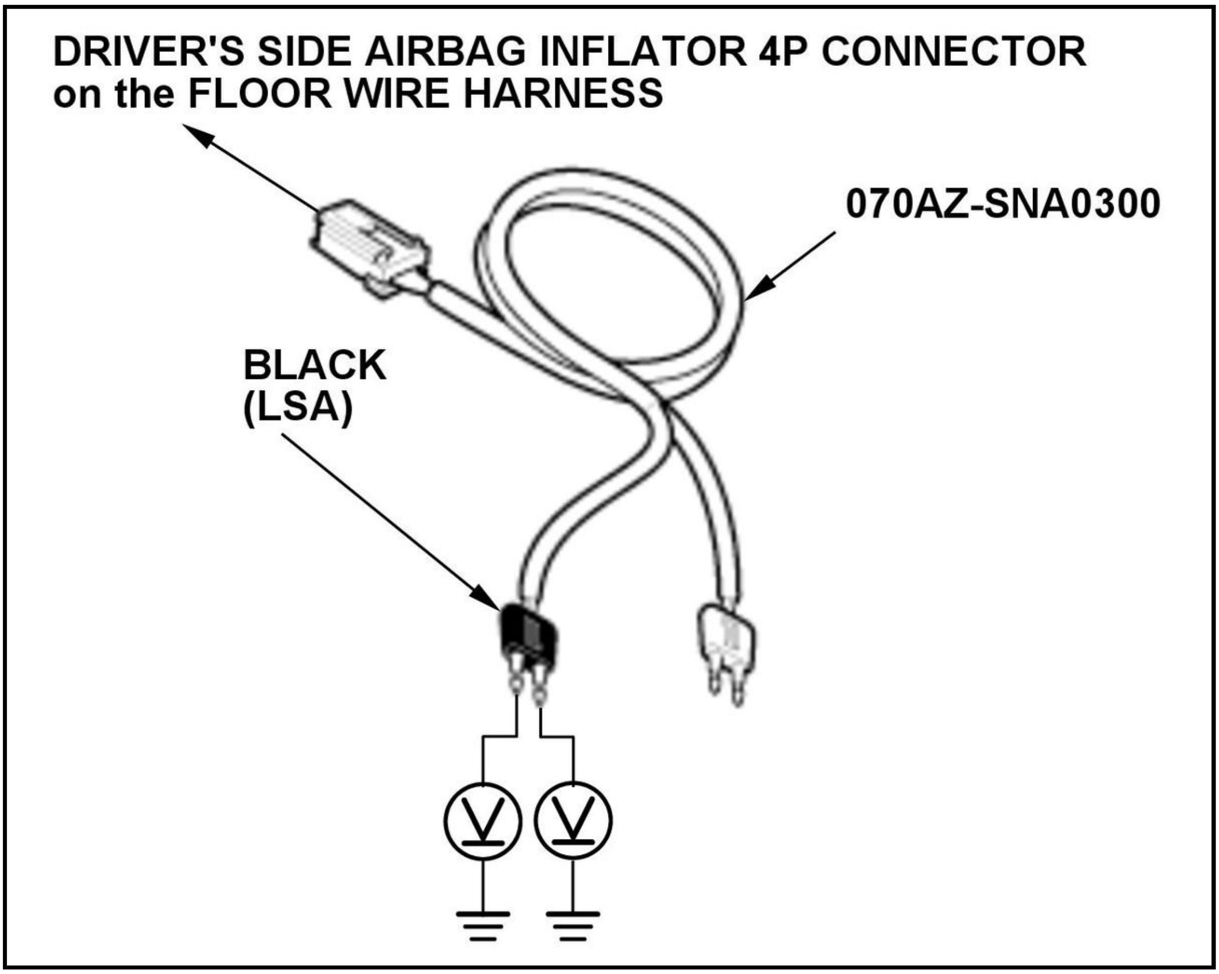
-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the driver's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Driver's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Driver's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
Test point 1	SRS simulator lead L black terminal
Test point 2	Body ground



DRIVER'S SIDE AIRBAG INFLATOR 4P CONNECTOR on the FLOOR WIRE HARNESS
070AZ-SNA0300
BLACK (LSA)

Is there 0.2 V or less?

YES

The LSA+ and LSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the floor wire harness.

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0020-13

DTC B0020-13 : Open or Increased Resistance in the Driver's Side Airbag Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead L 070AZ-SNA0300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information, and 12 Volt Battery Terminal Disconnection and Reconnection .

DTC Description	DTC
B0020-13 Open or increased resistance in the driver's side airbag inflator	B

DTC (SRS)

1. Problem verification

    -1. Clear the DTCs with the HDS.

    -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

    -3. Check for DTCs with the HDS.

DTC Description	DTC
B0020-13 Open or increased resistance in the driver's side airbag inflator	B

    Is DTC B0020-13 indicated?

    YES

    The failure is duplicated. Go to step 2.

    NO

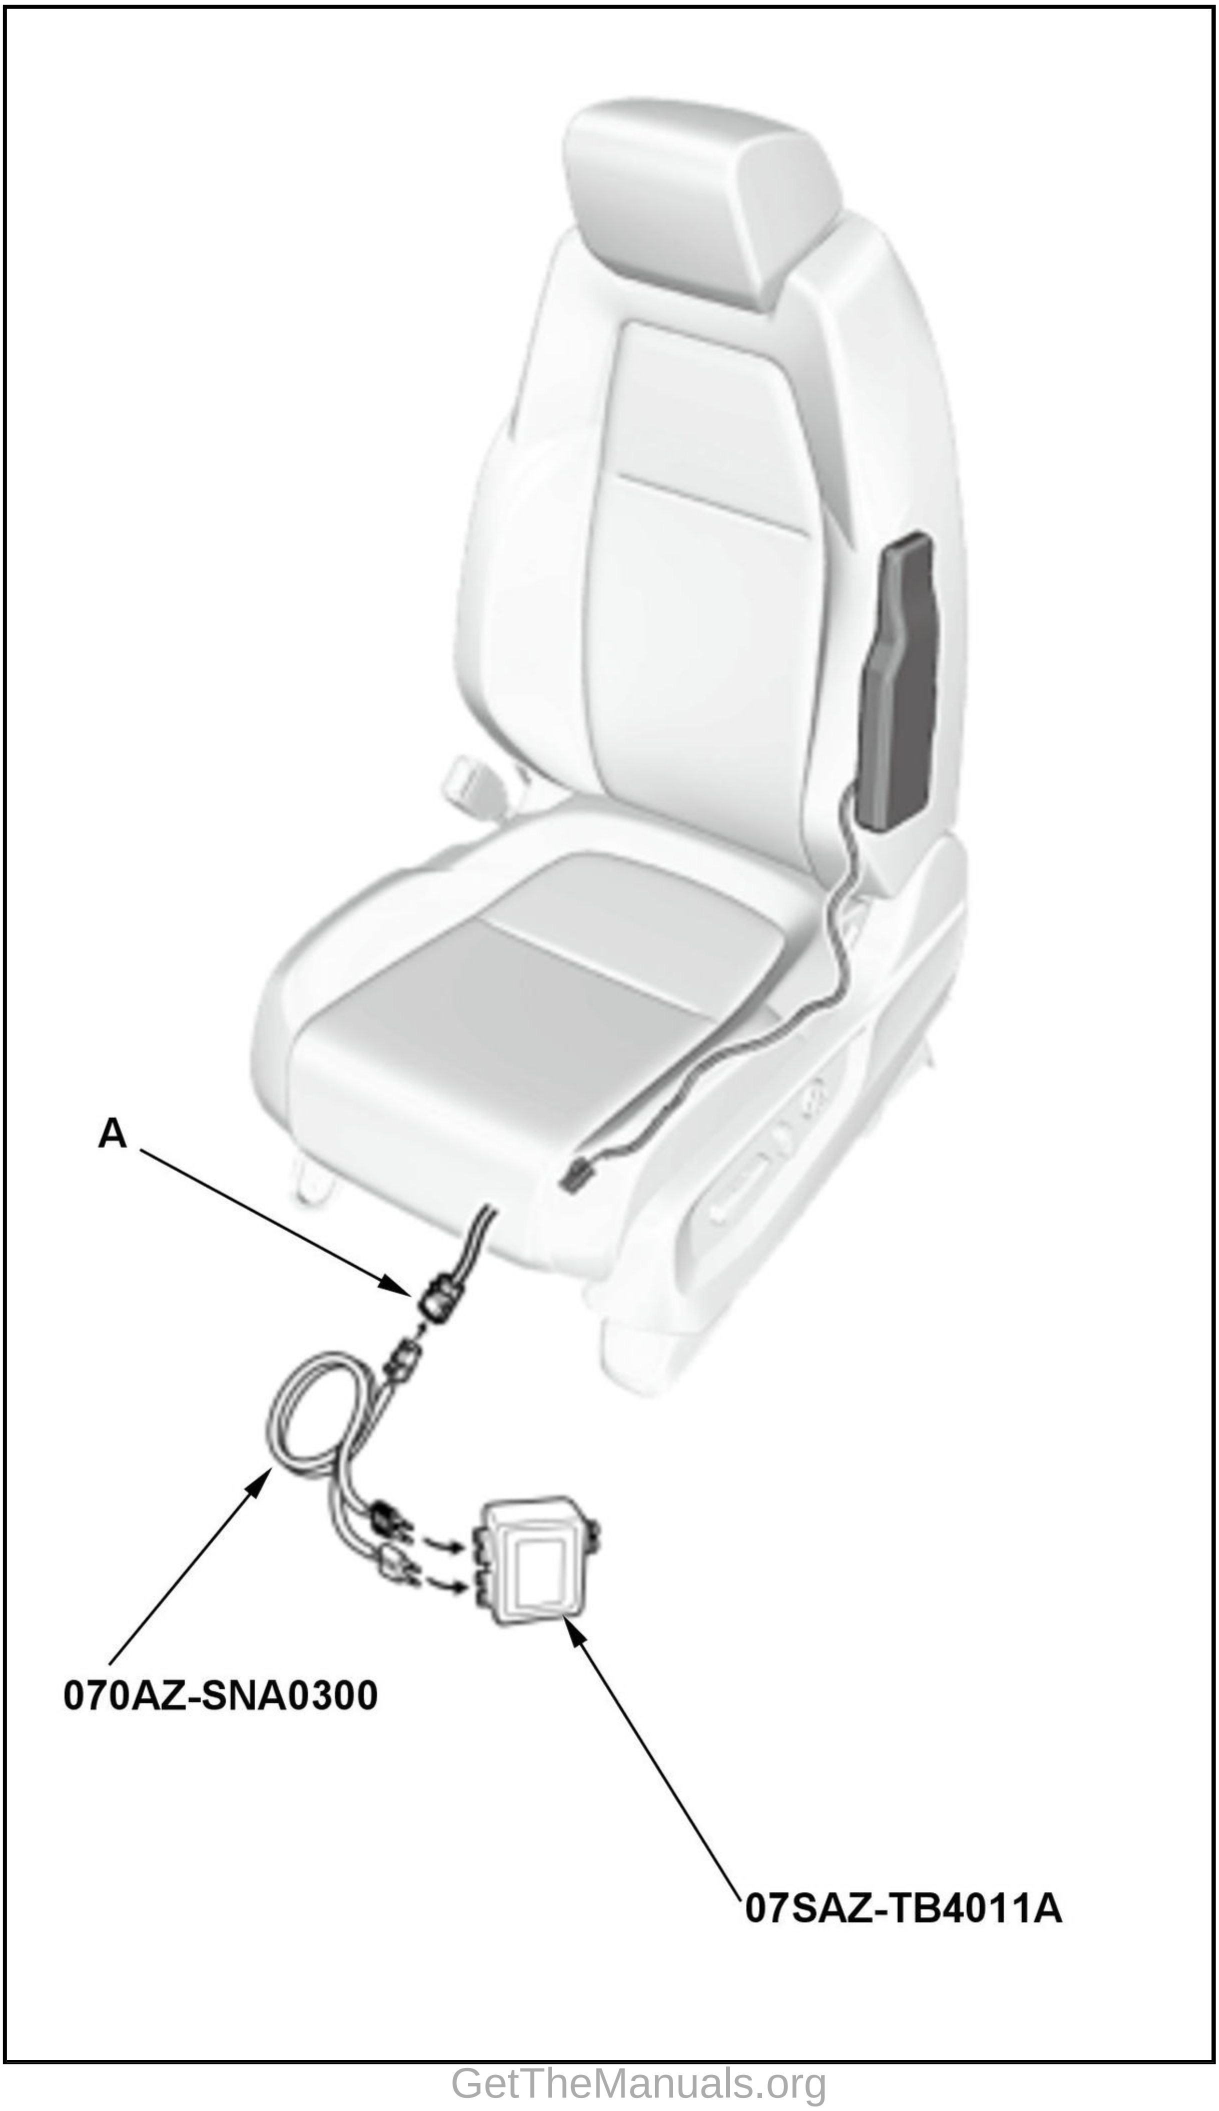
    Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's side airbag inflator check

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

    -3. Disconnect the driver's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the driver's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0020-13 Open or increased resistance in the driver's side airbag inflator	B

Is DTC B0020-13 indicated?

YES

Go to step 3.

NO

Open in the driver's side airbag inflator; **replace the driver's side airbag** , then clear the DTC.

3. Open wire check (LSA+, LSA- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

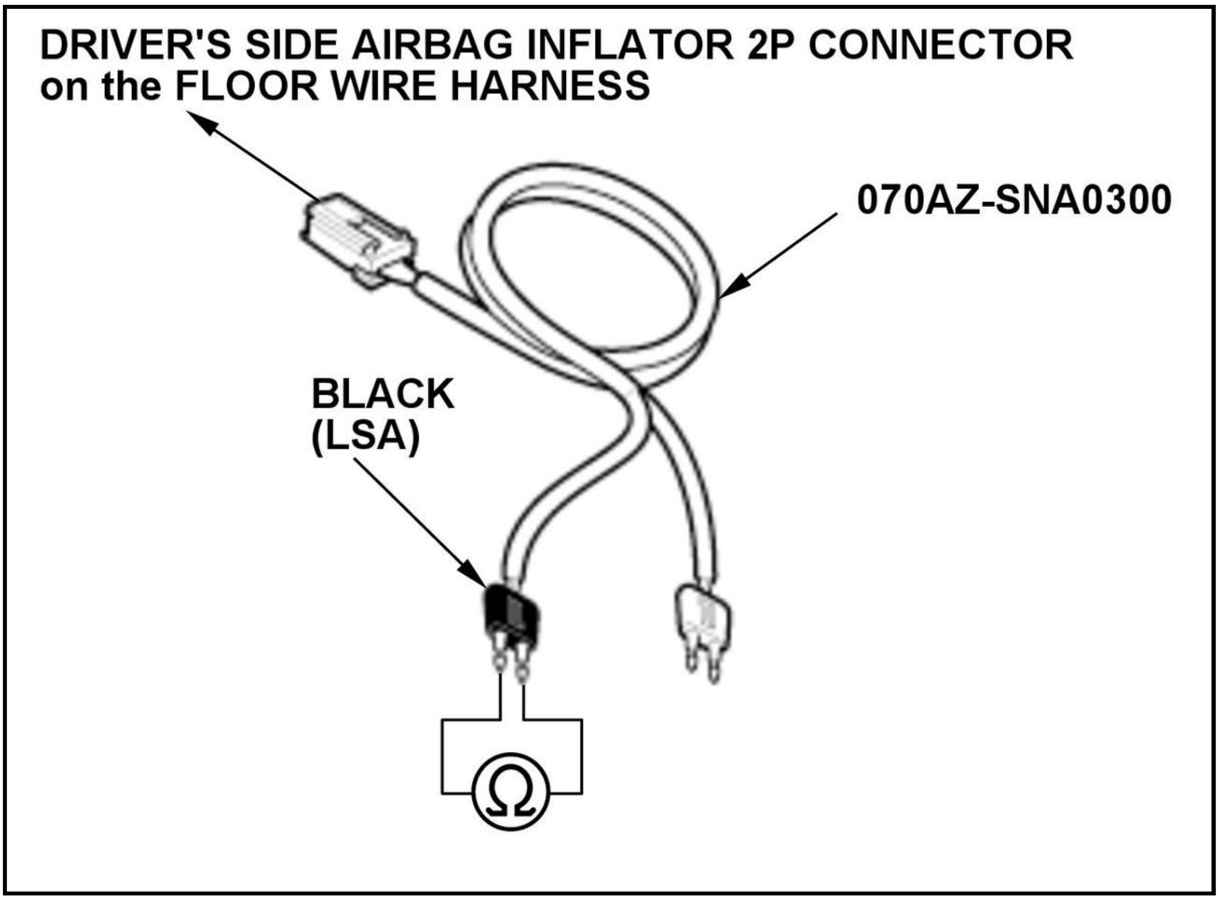
-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the driver's side airbag inflator 2P connector on the floor wire harness.

-5. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Driver's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
Test point	SRS simulator lead L black terminal



DRIVER'S SIDE AIRBAG INFLATOR 2P CONNECTOR on the FLOOR WIRE HARNESS
070AZ-SNA0300
BLACK (LSA)
Ω

Is there 1.0 Ω or less?

YES

The LSA+ and LSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0020-1A, B0020-2B

DTC B0020-1A : Decreased Resistance in the Driver's Side Airbag Inflator

DTC B0020-2B : Short to Another Wire Harness in the Driver's Side Airbag Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead L 070AZ-SNA0300

SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0020-1A Decreased resistance in the driver's side airbag inflator	B
B0020-2B Short to another wire harness in the driver's side airbag inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0020-1A Decreased resistance in the driver's side airbag inflator	B
B0020-2B Short to another wire harness in the driver's side airbag inflator	B

   Is DTC B0020-1A or B0020-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

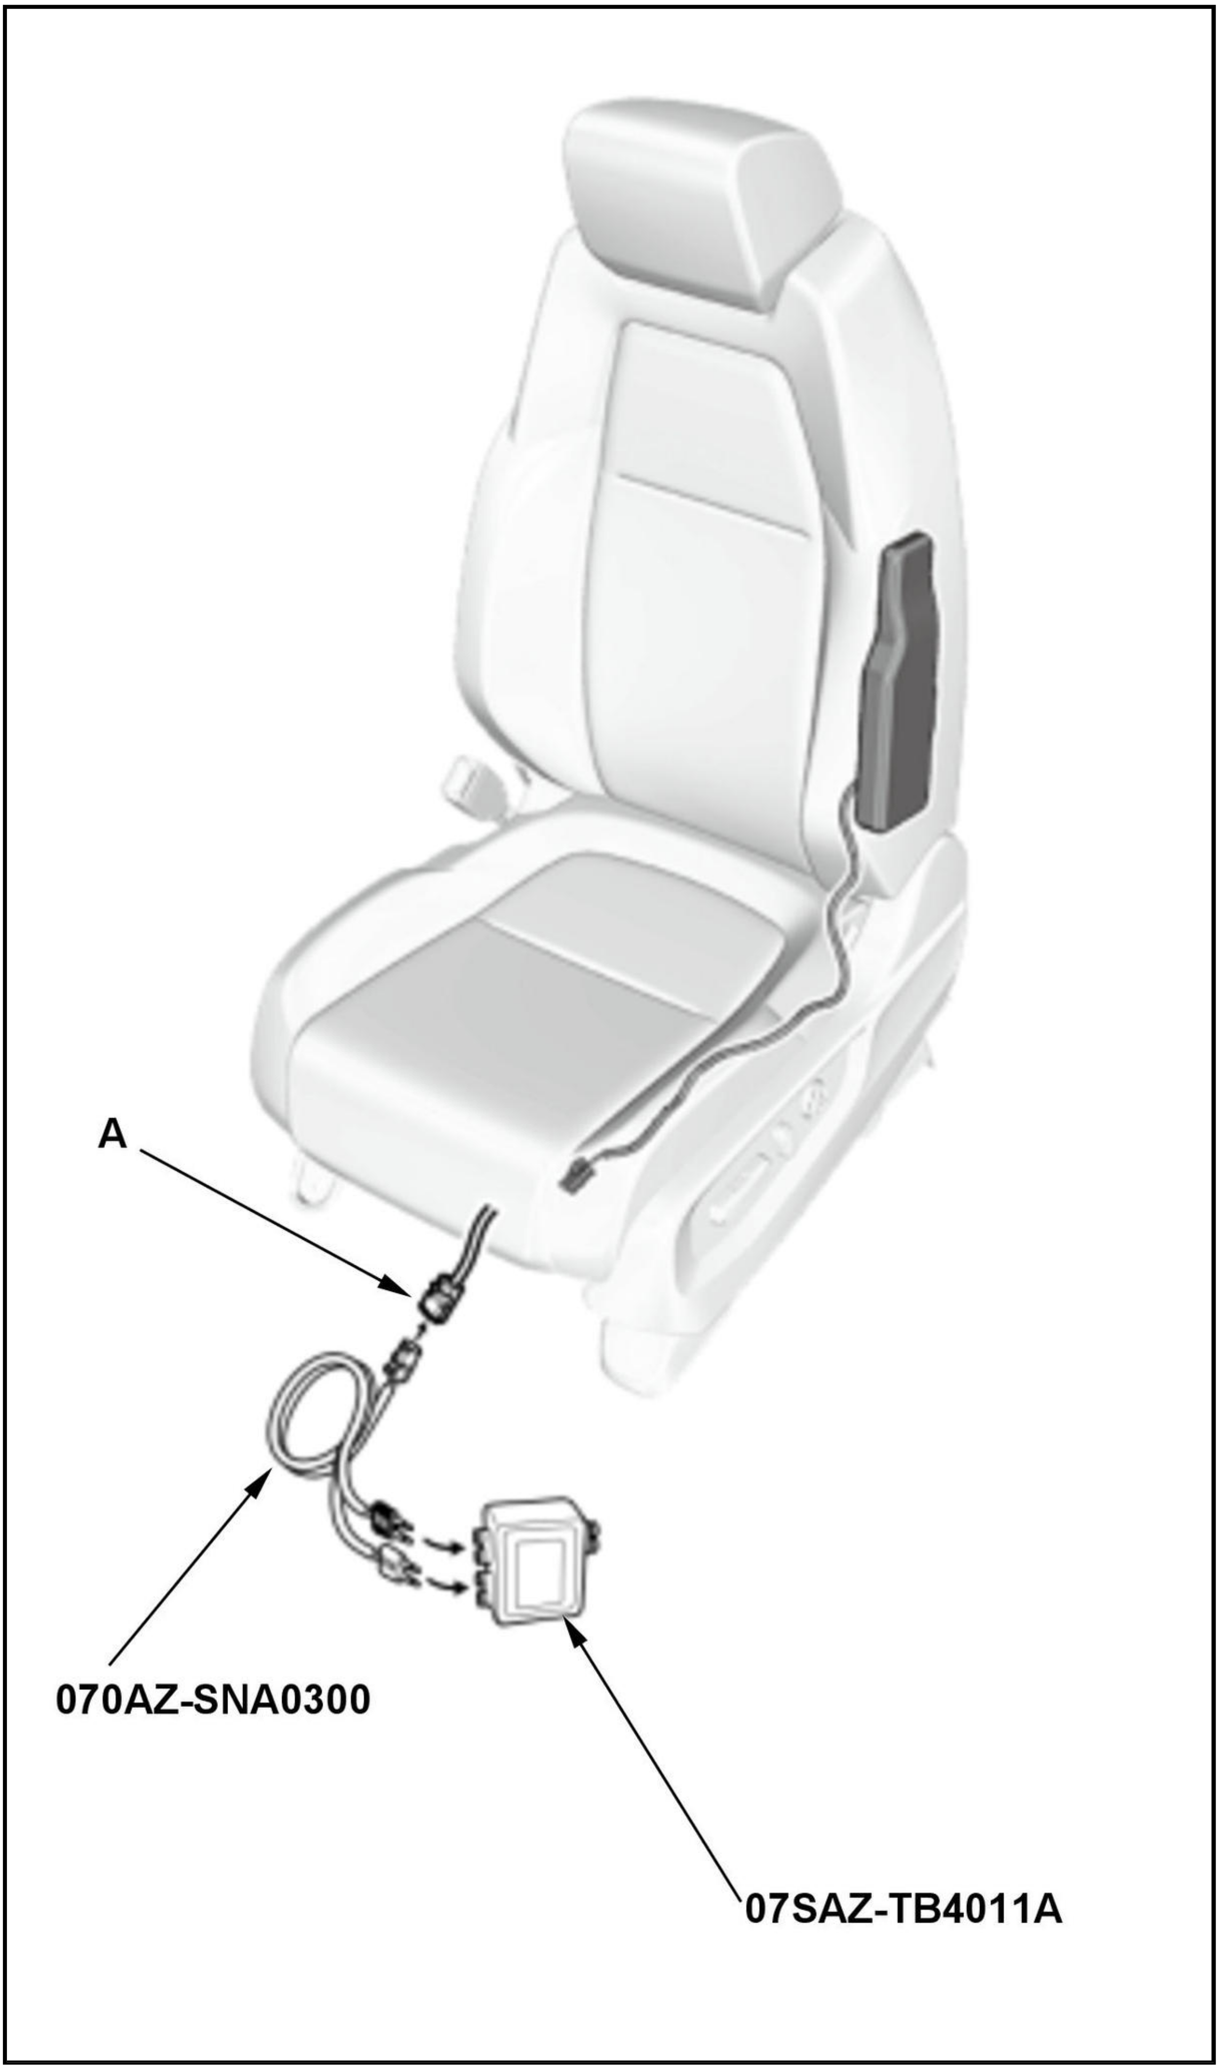
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's side airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the driver's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the driver's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0020-1A Decreased resistance in the driver's side airbag inflator	B
B0020-2B Short to another wire harness in the driver's side airbag inflator	B

Is DTC B0020-1A or B0020-2B indicated?

YES

Go to step 3.

NO

Short to another wire in the driver's side airbag inflator; **replace the driver's side airbag** , then clear the DTC.

3. Shorted wire check (LSA+ line to LSA- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

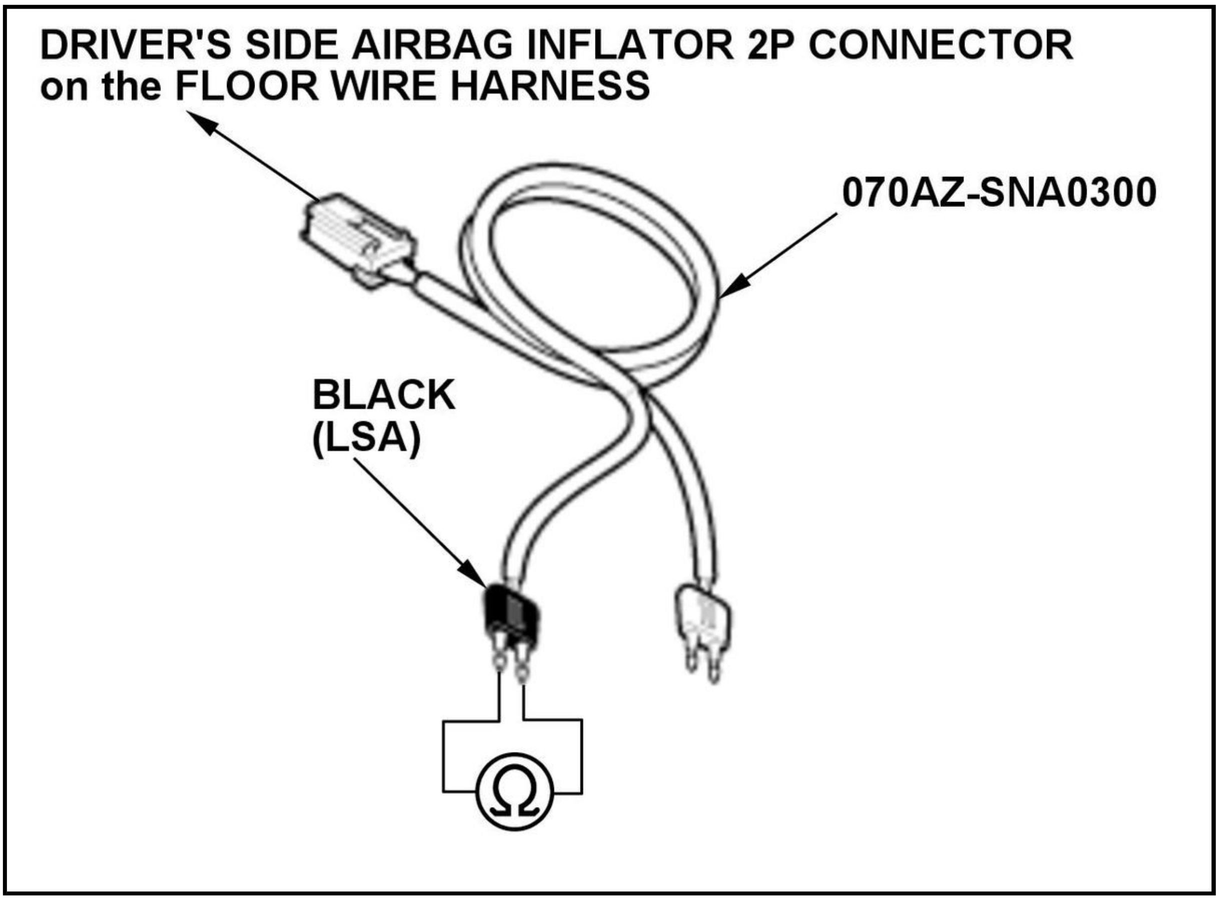
SRS unit connector B (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the driver's side airbag inflator 2P connector on the floor wire harness.

-5. **Connect the SRS short canceller to SRS unit connector B (39P) terminals No. 5 and No. 6**.

-6. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Driver's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Driver's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
	SRS unit connector B (39P) No. 5 and No. 6: connected to SRS short canceller
Test point	SRS simulator lead L black terminal



DRIVER'S SIDE AIRBAG INFLATOR 2P CONNECTOR on the FLOOR WIRE HARNESS
070AZ-SNA0300
BLACK (LSA)
Ω

Is there an open circuit, or at least 1 MΩ?

YES

The LSA+ and LSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0021-11

DTC B0021-11 : Short to Ground in the Left Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0021-11 Short to ground in the left side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0021-11 Short to ground in the left side curtain airbag first inflator	B

Is DTC B0021-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (LCA+, LCA- lines) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the headliner** .

-4. Disconnect the following connector.

Left side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0021-11 Short to ground in the left side curtain airbag first inflator	B

Is DTC B0021-11 indicated?

YES

Go to step 3.

NO

Short to ground in the left side curtain airbag inflator; **replace the left side curtain airbag** , then clear the DTC.

3. Shorted wire check (LCA+, LCA- lines) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Left side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 9**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 10**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The LCA+ and LCA- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0021-12

DTC B0021-12 : Short to Power in the Left Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0021-12 Short to power in the left side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0021-12 Short to power in the left side curtain airbag first inflator	B

Is DTC B0021-12 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (LCA+, LCA- lines to power) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the headliner** .

-4. Disconnect the following connector.

Left side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0021-12 Short to power in the left side curtain airbag first inflator	B

Is DTC B0021-12 indicated?

YES

Go to step 3.

NO

Short to power in the left side curtain airbag inflator; **replace the left side curtain airbag** , then clear the DTC.

3. Shorted wire check (LCA+, LCA- lines to power) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Left side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 9**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 10**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The LCA+ and LCA- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0021-13

DTC B0021-13 : Open or Increased Resistance in the Left Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0021-13 Open or increased resistance in the left side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0021-13 Open or increased resistance in the left side curtain airbag first inflator	B

Is DTC B0021-13 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Left side curtain airbag inflator check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

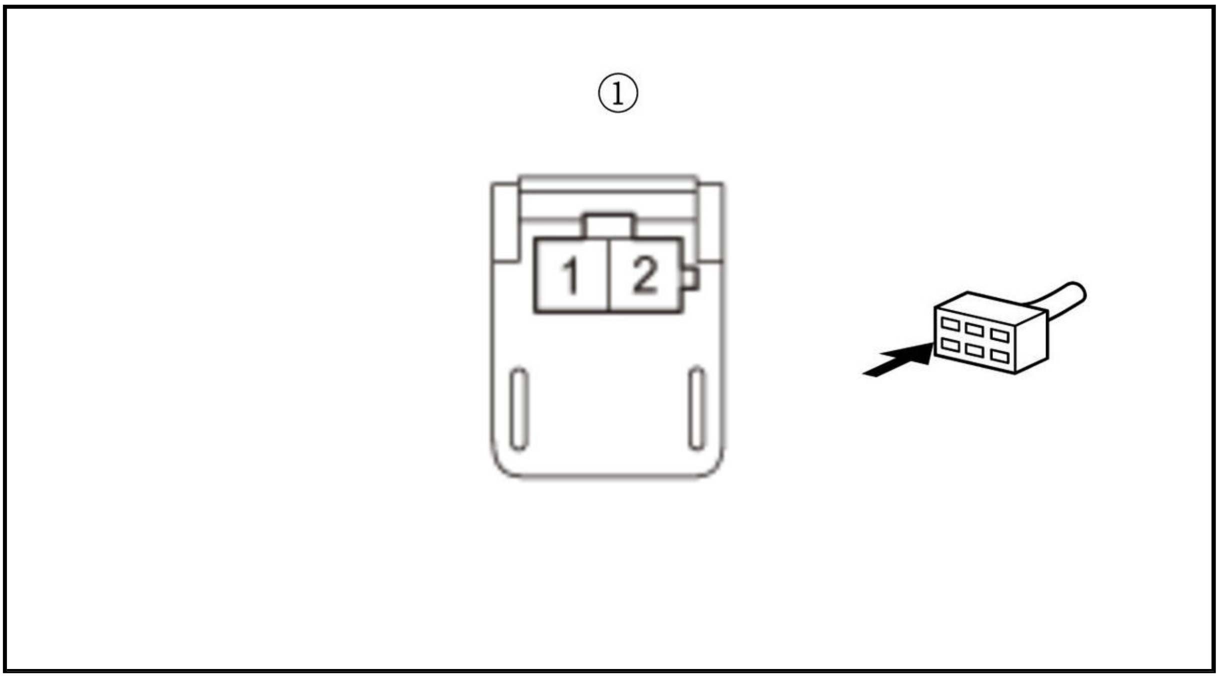
-3. **Remove the headliner** .

-4. Disconnect the following connector.

Left side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Connect terminals A and B with a jumper wire.

Terminal A	Left side curtain airbag inflator 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Terminal B	Left side curtain airbag inflator 2P connector (female terminals) No. 2 (on the floor wire harness): ①



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0021-13 Open or increased resistance in the left side curtain airbag first inflator	B

Is DTC B0021-13 indicated?

YES

Go to step 3.

NO

Open in the left side curtain airbag inflator; **replace the left side curtain airbag** , then clear the DTC.

3. Open wire check (LCA+, LCA- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the left side curtain airbag inflator 2P connector on the floor wire harness.

-4. Disconnect the following connector.

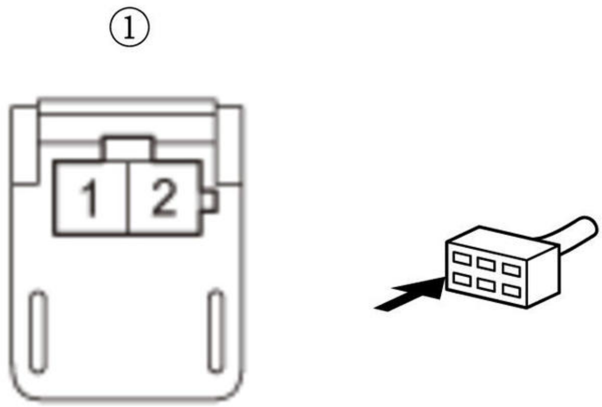
SRS unit connector B (39P)

-5. Connect terminals A and B with a jumper wire.

Terminal A	**SRS unit connector B (39P) No. 9**
Terminal B	**SRS unit connector B (39P) No. 10**

-6. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Left side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	SRS unit connector B (39P) terminals No. 9 and No. 10: jumped
Test point 1	Left side curtain airbag inflator 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Left side curtain airbag inflator 2P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there 1.0 Ω or less?

YES

The LCA+ and LCA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service

information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0021-1A

DTC B0021-1A : Decreased Resistance in the Left Side Curtain Airbag First Inflator

Special Tools Required

SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0021-1A Decreased resistance in the left side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0021-1A Decreased resistance in the left side curtain airbag first inflator	B

   Is DTC B0021-1A indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Left side curtain airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the headliner** .

   -4. Disconnect the following connector.

Left side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0021-1A Decreased resistance in the left side curtain airbag first inflator	B

Is DTC B0021-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the left side curtain airbag inflator; **replace the left side curtain airbag** , then clear the DTC.

3. Shorted wire check (LCA+ line to LCA- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. **Connect the SRS short canceller to SRS unit connector B (39P) terminals No. 9 and No. 10**.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Left side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	SRS unit connector B (39P) No. 9 and No. 10: connected to SRS short canceller
Test point 1	**SRS unit connector B (39P) No. 9**
Test point 2	**SRS unit connector B (39P) No. 10**

Is there an open circuit, or at least 1 MΩ?

YES

The LCA+ and LCA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0021-2B

DTC B0021-2B : Short to Another Wire Harness in the Left Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B

   Is DTC B0021-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the driver's side airbag inflator	B
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the front passenger's side airbag inflator	B

DTC Description	DTC
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0001-2B, B0002-2B, B0010-2B, B0011-2B, B0020-2B, B0028-2B, B0029-2B, B0070-2B, B0072-2B, B0079-2B, B007A-2B or B0082-2B indicated with DTC B0021-2B?

YES

Go to step 3.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

3. Shorted wire check (LCA lines to another line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the headliner** .

-4. Disconnect the following connectors.

SRS unit connector A (39P)
SRS unit connector B (39P)
Left side curtain airbag inflator 2P connector (on the floor wire harness)
Inflator connectors which are assigned to 2B codes listed on HDS

-5. Measure the resistance between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	SRS unit connector B (39P): disconnected
	Left side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

DTC	Test point 1	Test point 2
	From terminal	To terminal
B0001-2B	SRS unit connector B (39P) No. 9	SRS unit connector A (39P) No. 9

	SRS unit connector B (39P) No. 10	SRS unit connector A (39P) No. 3

Is there 1 MΩ or more?

YES

The LCA wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

NO

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

DTC B0028-11

DTC B0028-11 : Short to Ground in the Front Passenger's Side Airbag Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead L 070AZ-SNA0300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0028-11 Short to ground in the front passenger's side airbag inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0028-11 Short to ground in the front passenger's side airbag inflator	B

   Is DTC B0028-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

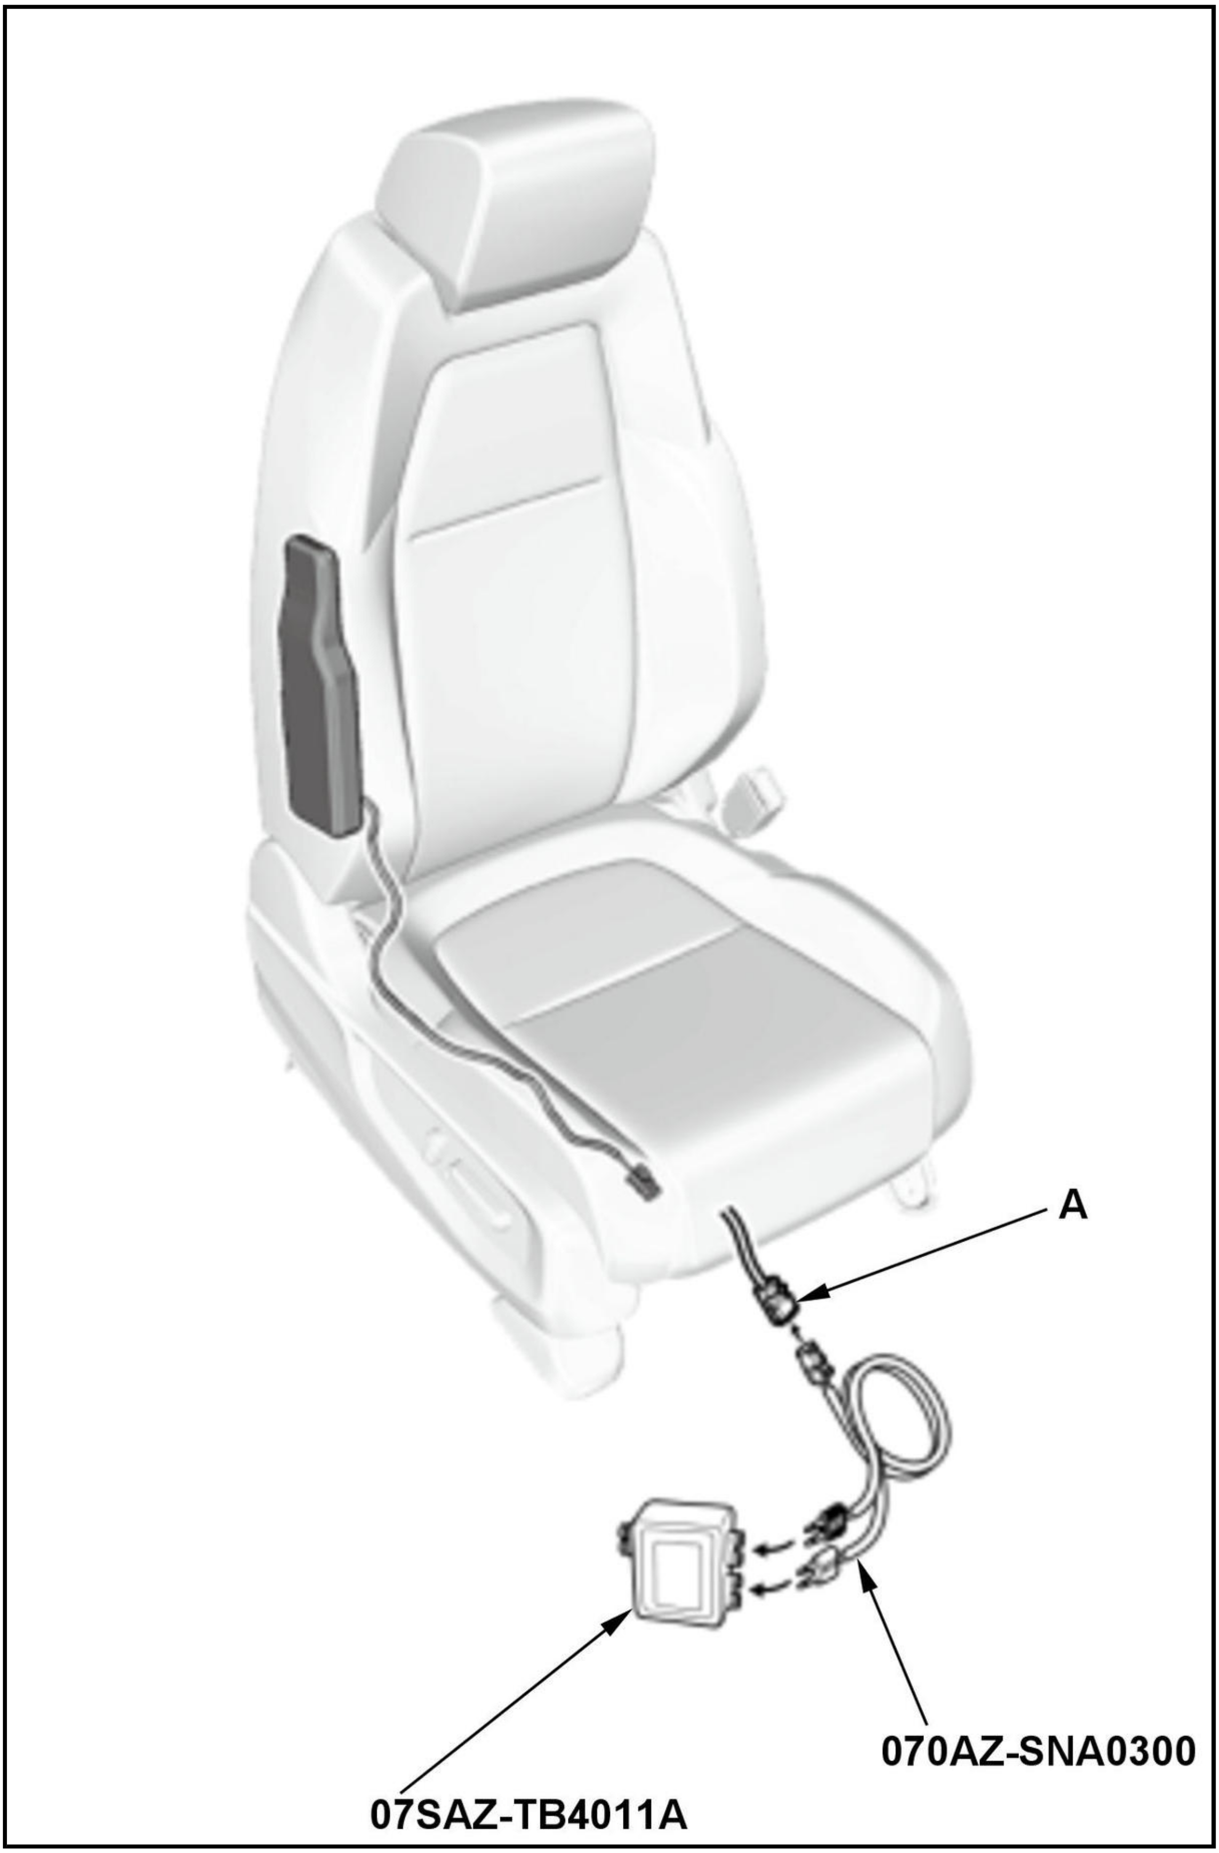
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's side airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the front passenger's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0028-11 Short to ground in the front passenger's side airbag inflator	B

Is DTC B0028-11 indicated?

YES

Go to step 3.

NO

Short to ground in the front passenger's side airbag inflator; **replace the front passenger's side airbag** , then clear the DTC.

3. Shorted wire check (RSA+, RSA- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

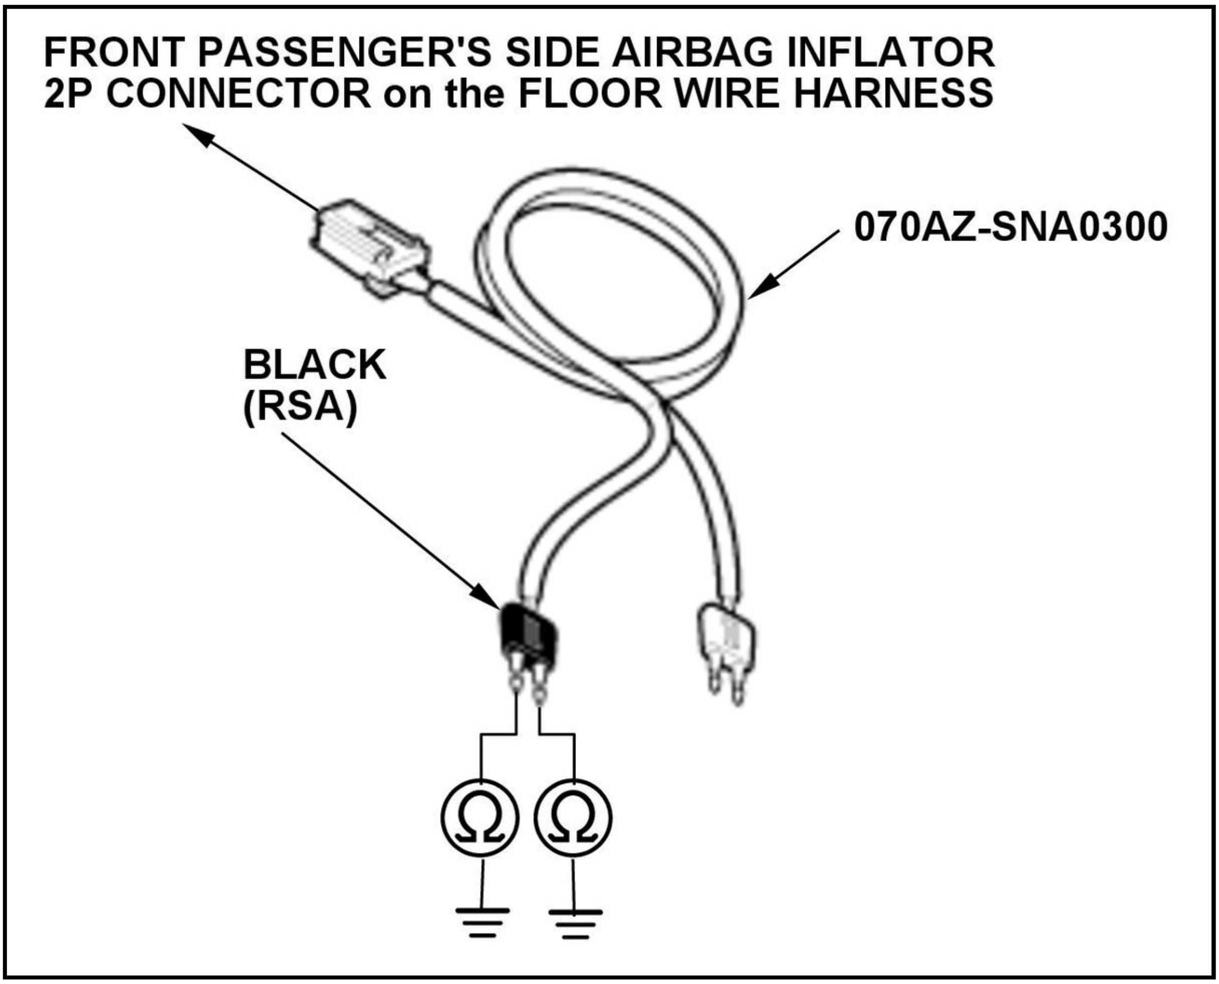
-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
Test point 1	SRS simulator lead L black terminal
Test point 2	Body ground



FRONT PASSENGER'S SIDE AIRBAG INFLATOR
2P CONNECTOR on the FLOOR WIRE HARNESS
070AZ-SNA0300
BLACK
(RSA)
Ω
Ω

Is there an open circuit, or at least 1 MΩ?

YES

The RSA+ and RSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0028-12

DTC B0028-12 : Short to Power in the Front Passenger's Side Airbag Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead L 070AZ-SNA0300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0028-12 Short to power in the front passenger's side airbag inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0028-12 Short to power in the front passenger's side airbag inflator	B

   Is DTC B0028-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

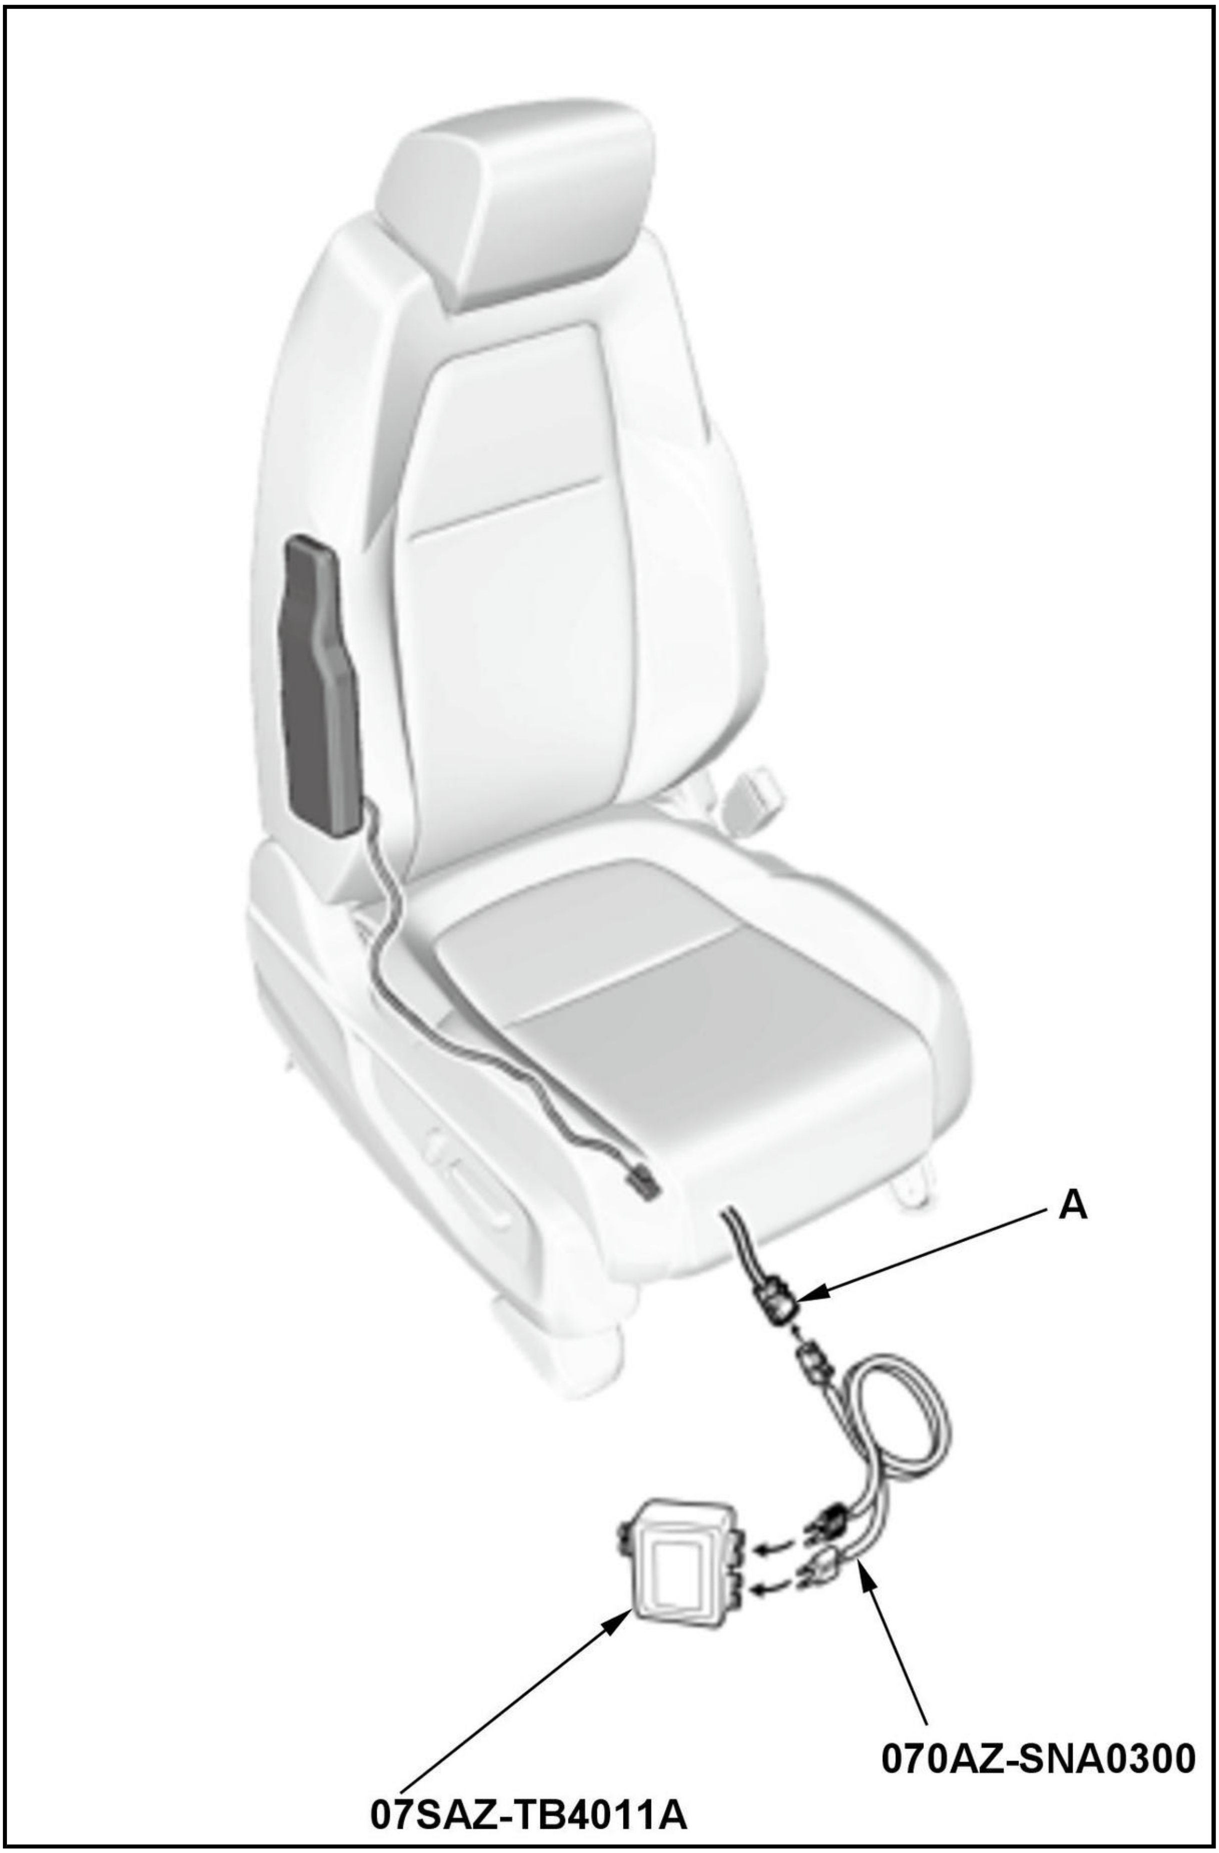
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's side airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the front passenger's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0028-12 Short to power in the front passenger's side airbag inflator	B

Is DTC B0028-12 indicated?

YES

Go to step 3.

NO

Short to power in the front passenger's side airbag inflator; **replace the front passenger's side airbag** , then clear the DTC.

3. Shorted wire check (RSA+, RSA- lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
Test point 1	SRS simulator lead L black terminal
Test point 2	Body ground

DTC Description	DTC
B0028-13 Open or increased resistance in the front passenger's side airbag inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0028-13 Open or increased resistance in the front passenger's side airbag inflator	B

   Is DTC B0028-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

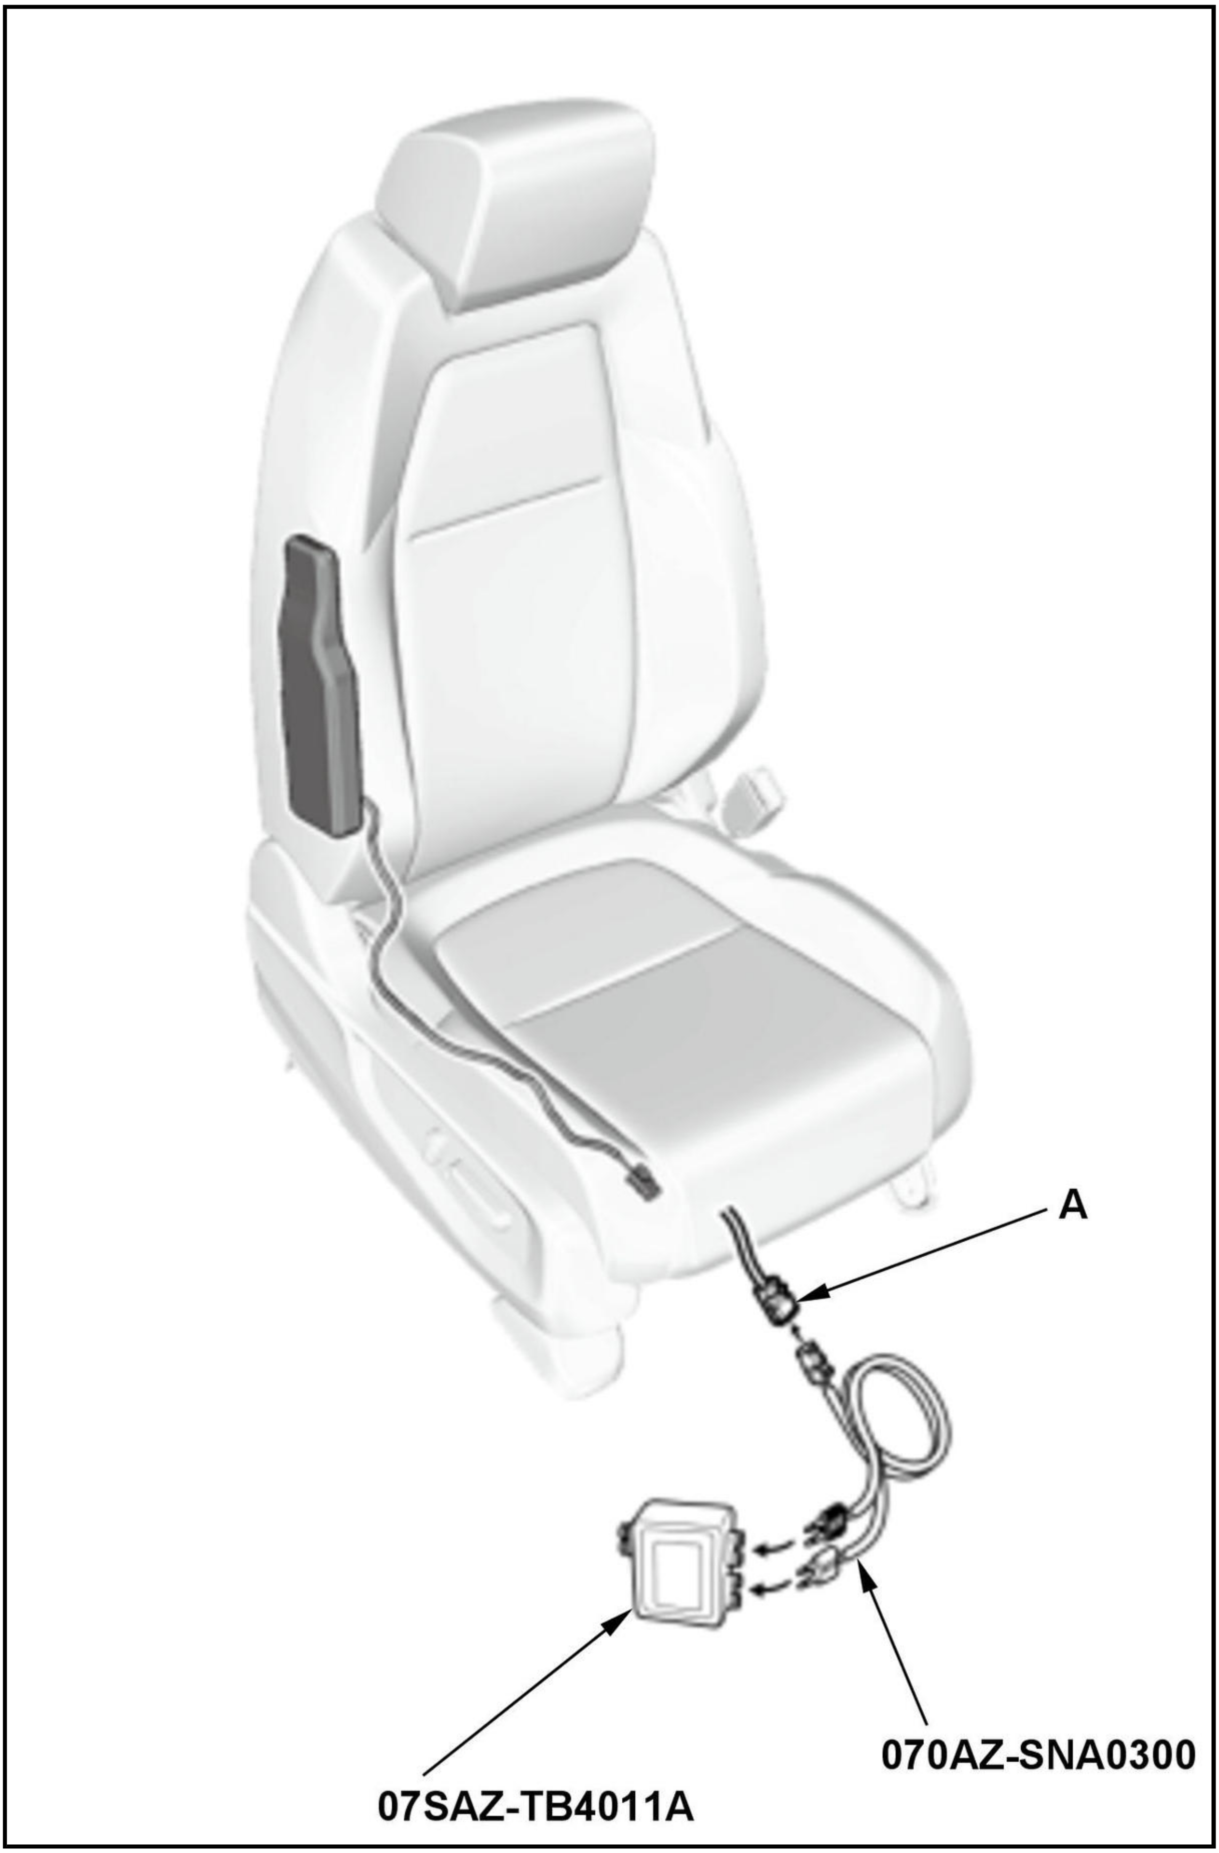
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's side airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the front passenger's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0028-13 Open or increased resistance in the front passenger's side airbag inflator	B

Is DTC B0028-13 indicated?

YES

Go to step 3.

NO

Open in the front passenger's side airbag inflator; **replace the front passenger's side airbag** , then clear the DTC.

3. Open wire check (RSA+, RSA- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

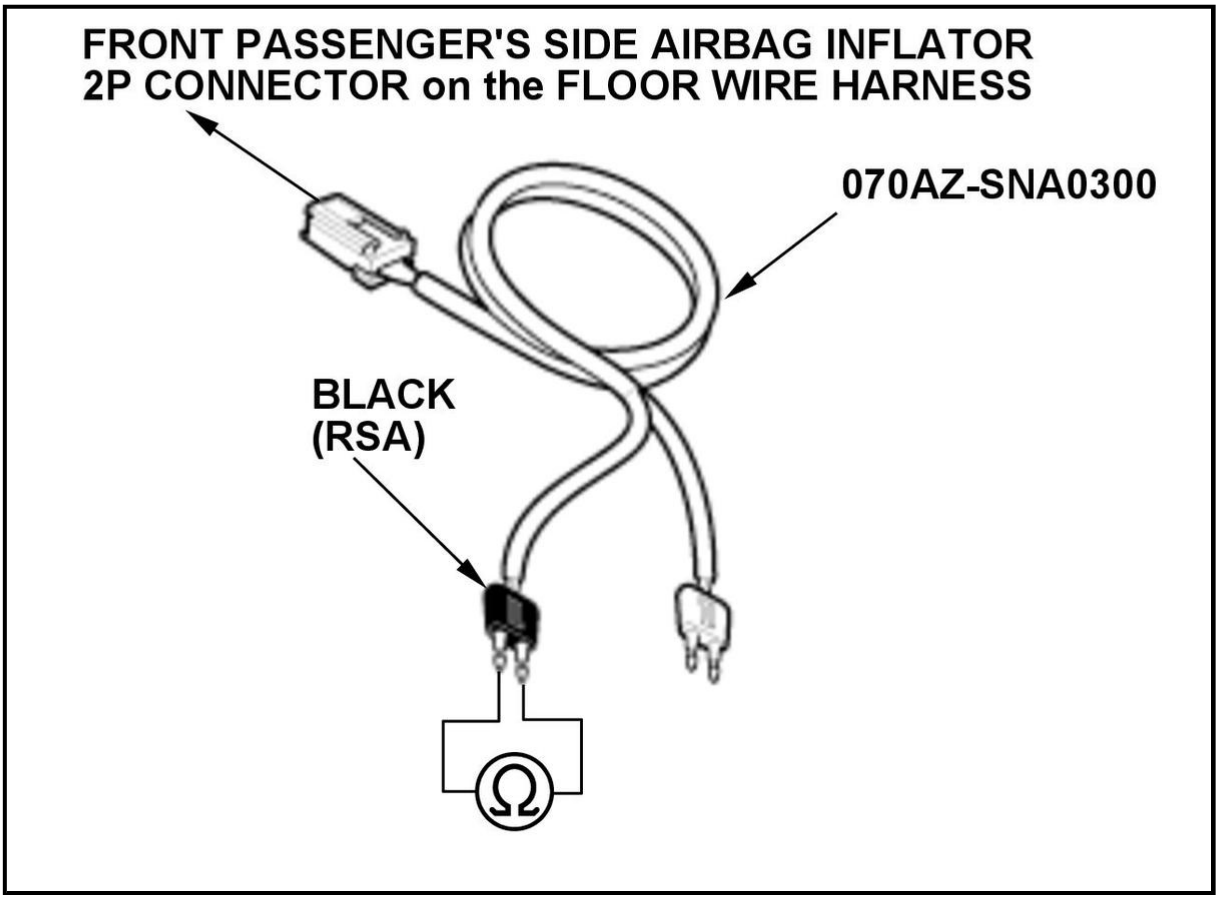
-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
Test point	SRS simulator lead L black terminal



FRONT PASSENGER'S SIDE AIRBAG INFLATOR
2P CONNECTOR on the FLOOR WIRE HARNESS
070AZ-SNA0300
BLACK
(RSA)
Ω

Is there 1.0 Ω or less?

YES

The RSA+ and RSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0028-1A, B0028-2B

DTC B0028-1A : Decreased Resistance in the Front Passenger's Side Airbag Inflator

DTC B0028-2B : Short to Another Wire Harness in the Front Passenger's Side Airbag Inflator

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Short Canceller 070AZ-SAA0100

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0028-1A Decreased Resistance in the front passenger's side airbag inflator	B
B0028-2B Short to another wire in the front passenger's side airbag inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0028-1A Decreased Resistance in the front passenger's side airbag inflator	B
B0028-2B Short to another wire in the front passenger's side airbag inflator	B

   Is DTC B0028-1A or B0028-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

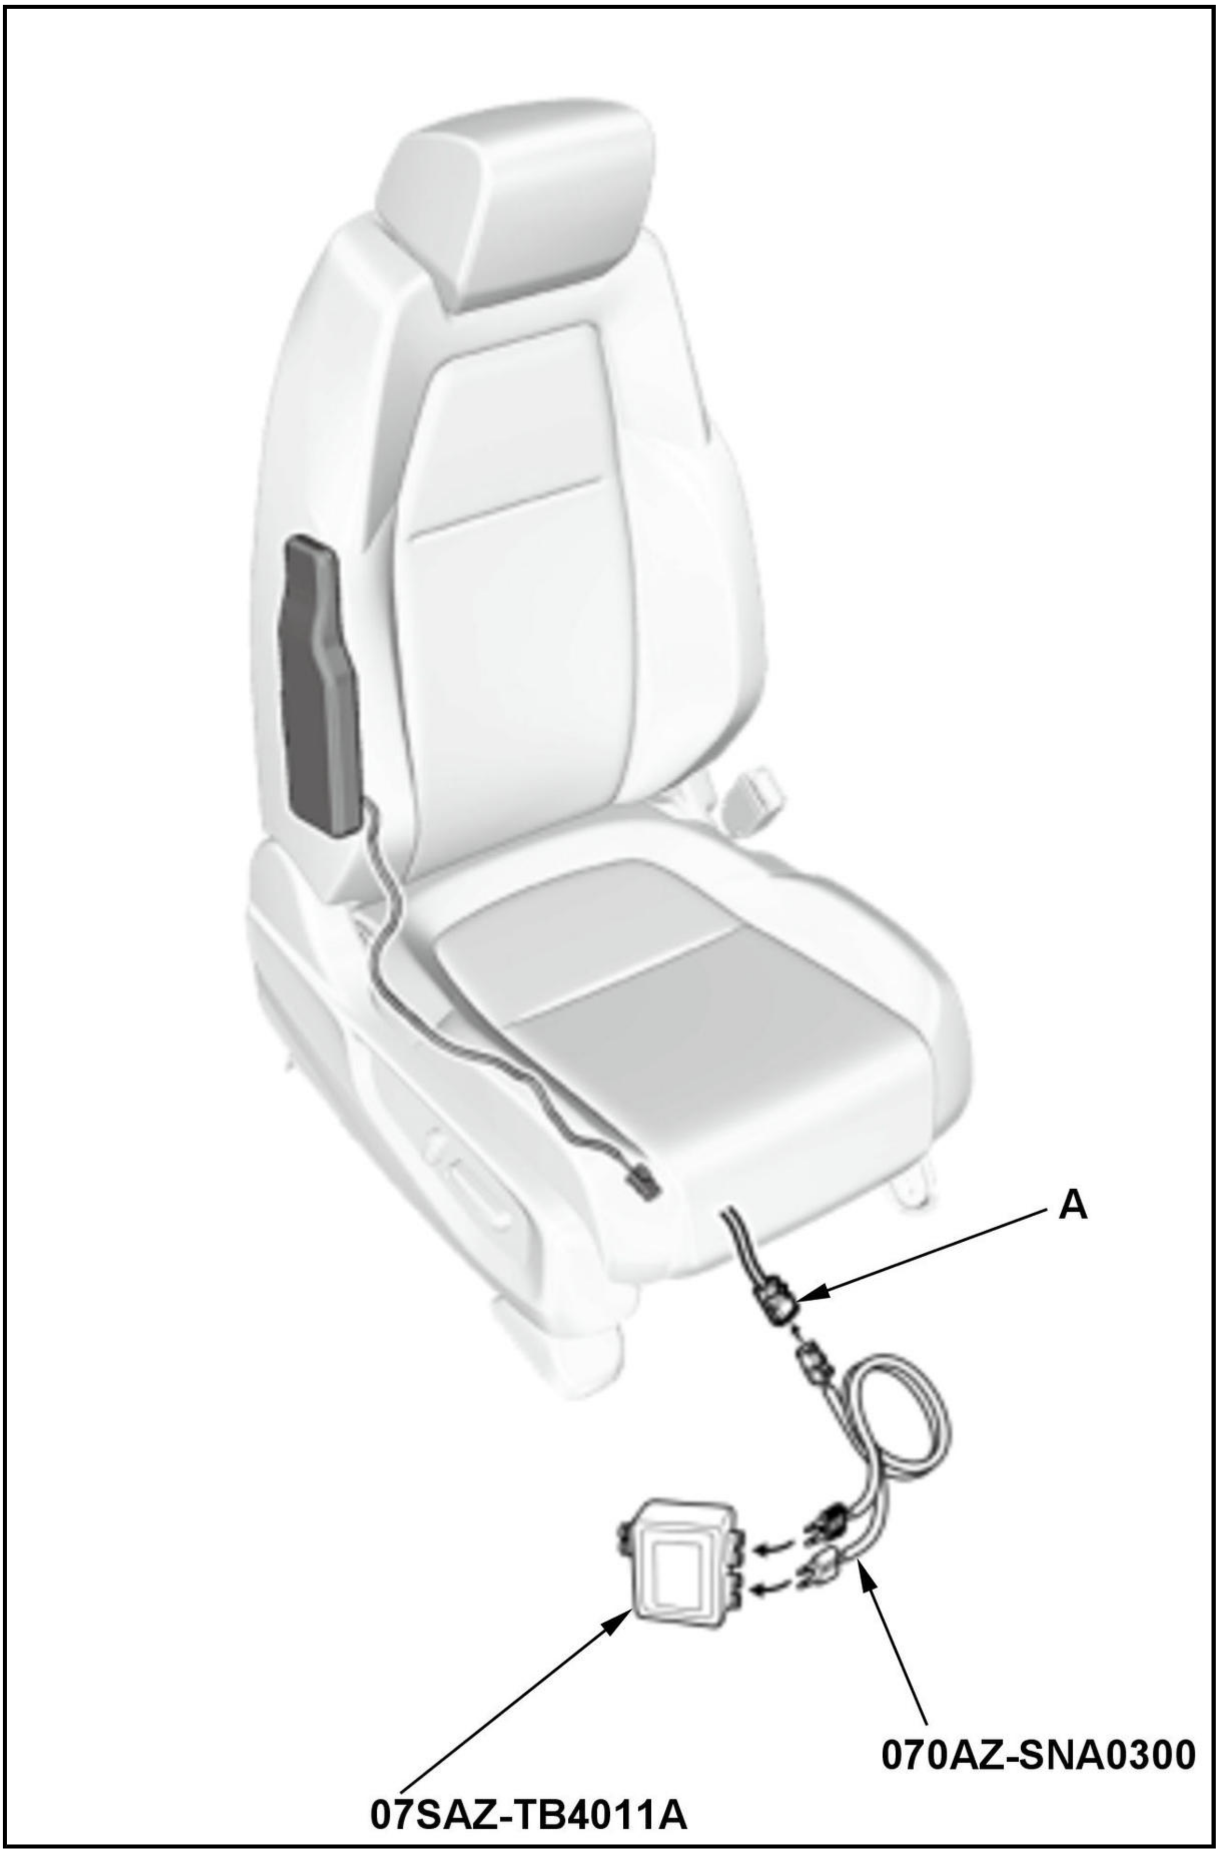
   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's side airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the front passenger's side airbag inflator 2P connector (A) on the floor wire harness.



A
070AZ-SNA0300
07SAZ-TB4011A

-4. Connect the terminals of SRS simulator lead L to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead L to the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0028-1A Decreased Resistance in the front passenger's side airbag inflator	B
B0028-2B Short to another wire in the front passenger's side airbag inflator	B

Is DTC B0028-1A or B0028-2B indicated?

YES

Go to step 3.

NO

Short to another wire in the front passenger's side airbag inflator; **replace the front passenger's side airbag** , then clear the DTC.

3. Shorted wire check (RSA+ line to RSA- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

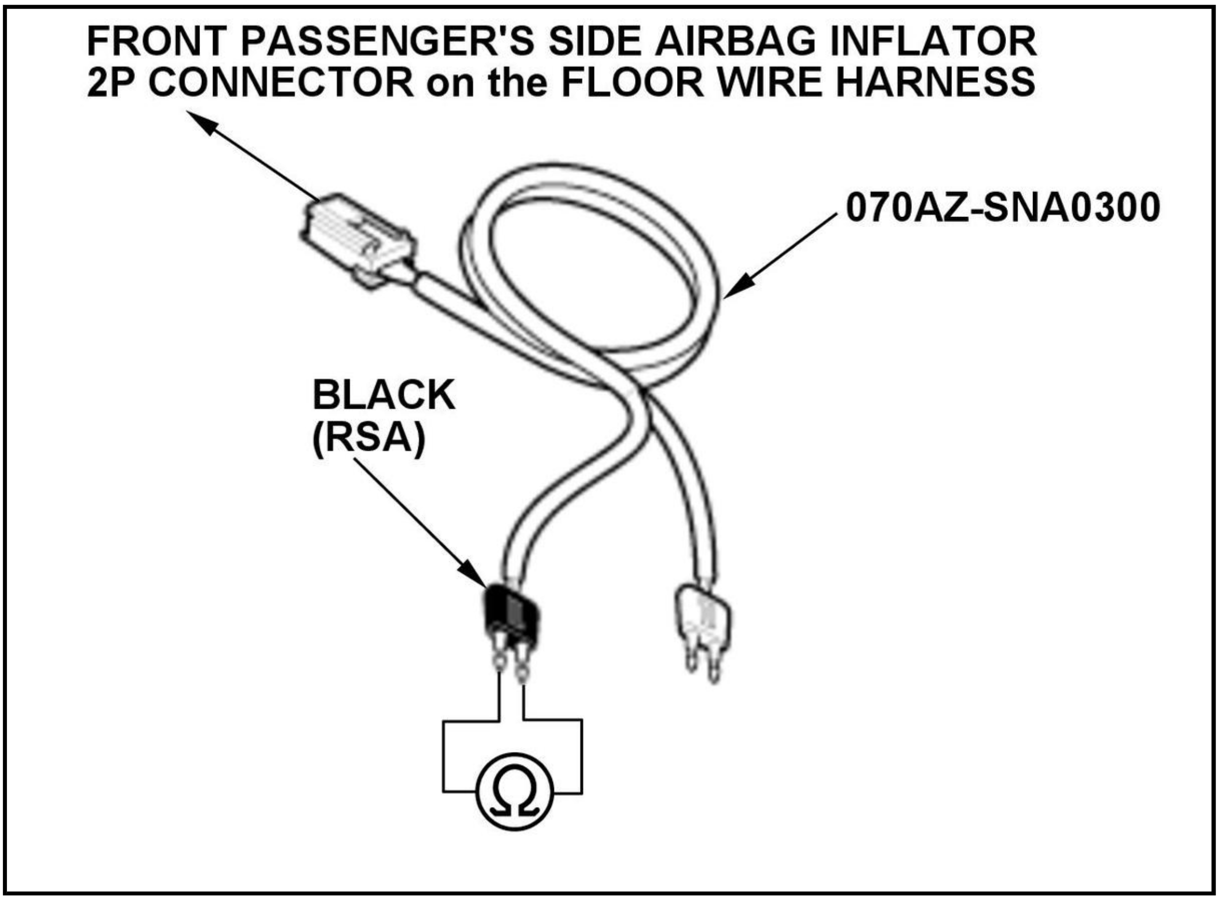
SRS unit connector B (39P)

-4. Disconnect the SRS inflator simulator from SRS simulator lead L. Do not disconnect SRS simulator lead L from the front passenger's side airbag inflator 2P connector on the floor wire harness.

-5. **Connect the SRS short canceller to SRS unit connector B (39P) terminals No. 3 and No. 4**.

-6. Measure the resistance of the test point.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Front passenger's side airbag inflator 2P connector (on the floor wire harness): connected to SRS simulator lead L
	SRS unit connector B (39P) No. 3 and No. 4: connected to SRS short canceller
Test point	SRS simulator lead L black terminal



FRONT PASSENGER'S SIDE AIRBAG INFLATOR

The RSA+ and RSA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0029-11

DTC B0029-11 : Short to Ground in the Right Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0029-11 Short to ground in the right side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0029-11 Short to ground in the right side curtain airbag first inflator	B

Is DTC B0029-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (RCA+, RCA- lines) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the headliner** .

-4. Disconnect the following connector.

Right side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0029-11 Short to ground in the right side curtain airbag first inflator	B

Is DTC B0029-11 indicated?

YES

Go to step 3.

NO

Short to ground in the right side curtain airbag inflator; **replace the right side curtain** , then clear the DTC.

3. Shorted wire check (RCA+, RCA- lines) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 7**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 8**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The RCA+ and RCA- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0029-12

DTC B0029-12 : Short to Power in the Right Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0029-12 Short to power in the right side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0029-12 Short to power in the right side curtain airbag first inflator	B

Is DTC B0029-12 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (RCA+, RCA- lines to power) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the headliner** .

-4. Disconnect the following connector.

Right side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0029-12 Short to power in the right side curtain airbag first inflator	B

Is DTC B0029-12 indicated?

YES

Go to step 3.

NO

Short to power in the right side curtain airbag inflator; **replace the right side curtain airbag** , then clear the DTC.

3. Shorted wire check (RCA+, RCA- lines to power) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Right side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 7**
Test point 2	Body ground

Test point 1	SRS unit connector B (39P) No. 8
Test point 2	Body ground

Is there 0.2 V or less?

YES

The RCA+ and RCA- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit .

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0029-13

DTC B0029-13 : Open or Increased Resistance in the Right Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0029-13 Open or increased resistance in the right side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0029-13 Open or increased resistance in the right side curtain airbag first inflator	B

Is DTC B0029-13 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Right side curtain airbag inflator check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

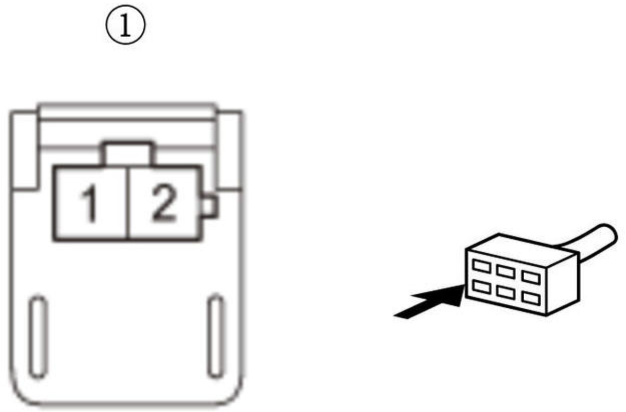
-3. **Remove the headliner** .

-4. Disconnect the following connector.

Right side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Connect terminals A and B with a jumper wire.

Terminal A	Right side curtain airbag inflator 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Terminal B	Right side curtain airbag inflator 2P connector (female terminals) No. 2 (on the floor wire harness): ①



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0029-13 Open or increased resistance in the right side curtain airbag first inflator	B

Is DTC B0029-13 indicated?

YES

Go to step 3.

NO

Open in the right side curtain airbag inflator; **replace the right side curtain airbag** , then clear the DTC.

3. Open wire check (RCA+, RCA- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the right side curtain airbag inflator 2P connector on the floor wire harness.

-4. Disconnect the following connector.

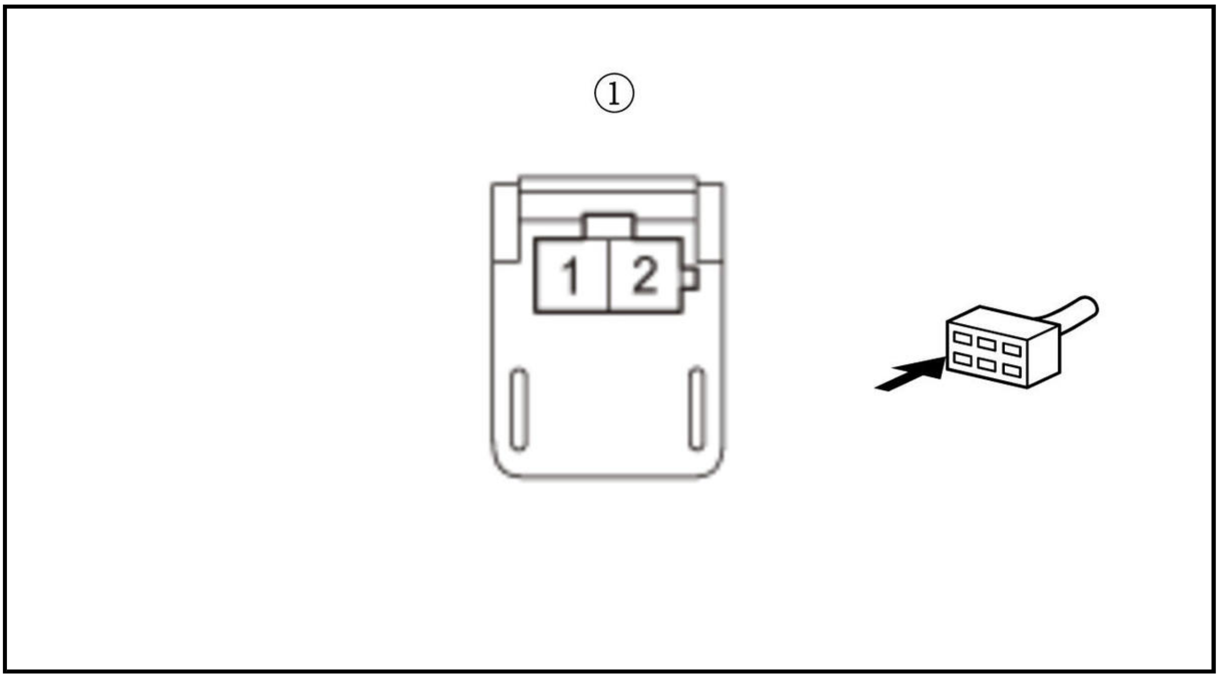
SRS unit connector B (39P)

-5. Connect terminals A and B with a jumper wire.

Terminal A	**SRS unit connector B (39P) No. 7**
Terminal B	**SRS unit connector B (39P) No. 8**

-6. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Right side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	SRS unit connector B (39P) terminals No. 7 and No. 8: jumped
Test point 1	Right side curtain airbag inflator 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Right side curtain airbag inflator 2P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there 1.0 Ω or less?

YES

The RCA+ and RCA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service

information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0029-1A

DTC B0029-1A : Decreased Resistance in the Right Side Curtain Airbag First Inflator

Special Tools Required

SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0029-1A Decreased resistance in the right side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0029-1A Decreased resistance in the right side curtain airbag first inflator	B

   Is DTC B0029-1A indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Right side curtain airbag inflator check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the headliner** .

   -4. Disconnect the following connector.

Right side curtain airbag inflator 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0029-1A Decreased resistance in the right side curtain airbag first inflator	B

Is DTC B0029-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the right side curtain airbag inflator; **replace the right side curtain airbag** , then clear the DTC.

3. Shorted wire check (RCA+ line to RCA- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. **Connect the SRS short canceller to SRS unit connector B (39P) terminals No. 7 and No. 8**.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Right side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	SRS unit connector B (39P) No. 7 and No. 8: connected to SRS short canceller
Test point 1	**SRS unit connector B (39P) No. 7**
Test point 2	**SRS unit connector B (39P) No. 8**

Is there an open circuit, or at least 1 MΩ?

YES

The RCA+ and RCA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0029-2B

DTC B0029-2B : Short to Another Wire Harness in the Right Side Curtain Airbag First Inflator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B

   Is DTC B0029-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

   -1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the driver's side airbag inflator	B
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the front passenger's side airbag inflator	B

DTC Description	DTC
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0001-2B, B0002-2B, B0010-2B, B0011-2B, B0020-2B, B0021-2B, B0028-2B, B0070-2B, B0072-2B, B0079-2B, B007A-2B or B0082-2B indicated with DTC B0029-2B?

YES

Go to step 3.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

3. Shorted wire check (RCA lines to another line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the headliner** .

-4. Disconnect the following connectors.

SRS unit connector A (39P)
SRS unit connector B (39P)
Right side curtain airbag inflator 2P connector (on the floor wire harness)
Inflator connectors which are assigned to 2B codes listed on HDS

-5. Measure the resistance between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	SRS unit connector B (39P): disconnected
	Right side curtain airbag inflator 2P connector (on the floor wire harness): disconnected
	Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

DTC	Test point 1	Test point 2
	From terminal	To terminal
B0001-2B	SRS unit connector B (39P) No. 8	SRS unit connector A (39P) No. 9
	SRS unit connector B (39P) No. 7	SRS unit connector A (39P) No. 8
B0002-2B	SRS unit connector B (39P) No. 8	SRS unit connector A (39P) No. 10
	SRS unit connector B (39P) No. 7	SRS unit connector A (39P) No. 11
B0010-2B	SRS unit connector B (39P) No. 8	SRS unit connector A (39P) No. 5
	SRS unit connector B (39P) No. 7	SRS unit connector A (39P) No. 4
B0011-2B	SRS unit connector B (39P) No. 8	SRS unit connector A (39P) No. 6
	SRS unit connector B (39P) No. 7	SRS unit connector A (39P) No. 7
B0020-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 5
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 6
B0021-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 9
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 10
B0028-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 4
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 3
B0070-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 20
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 21
B0072-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 19
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 18
B0079-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 24
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 25
B007A-2B	SRS unit connector B (39P) No. 8	SRS unit connector B (39P) No. 23
	SRS unit connector B (39P) No. 7	SRS unit connector B (39P) No. 22

DTC	Test point 1	Test point 2
	From terminal	To terminal
B0082-2B	SRS unit connector B (39P) No. 8	SRS unit connector A (39P) No. 2
	SRS unit connector B (39P) No. 7	SRS unit connector A (39P) No. 3

Is there 1 MΩ or more?

YES

The RCA wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

NO

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

DTC B0050-11, B0050-2B

DTC B0050-11 : Short or Decreased Resistance in the Driver's Seat Belt Buckle Switch

DTC B0050-2B : Short to Another Wire Harness in the Driver's Seat Belt Buckle Switch

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information**.

DTC Description	DTC
B0050-11 Short or decreased resistance in the driver's seat belt buckle switch	B
B0050-2B Short to another wire harness in the driver's seat belt buckle switch	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds. Buckle and unbuckle the driver's seat belt several times.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0050-11 Short or decreased resistance in the driver's seat belt buckle switch	B
B0050-2B Short to another wire harness in the driver's seat belt buckle switch	B

   Is DTC B0050-11 or B0050-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

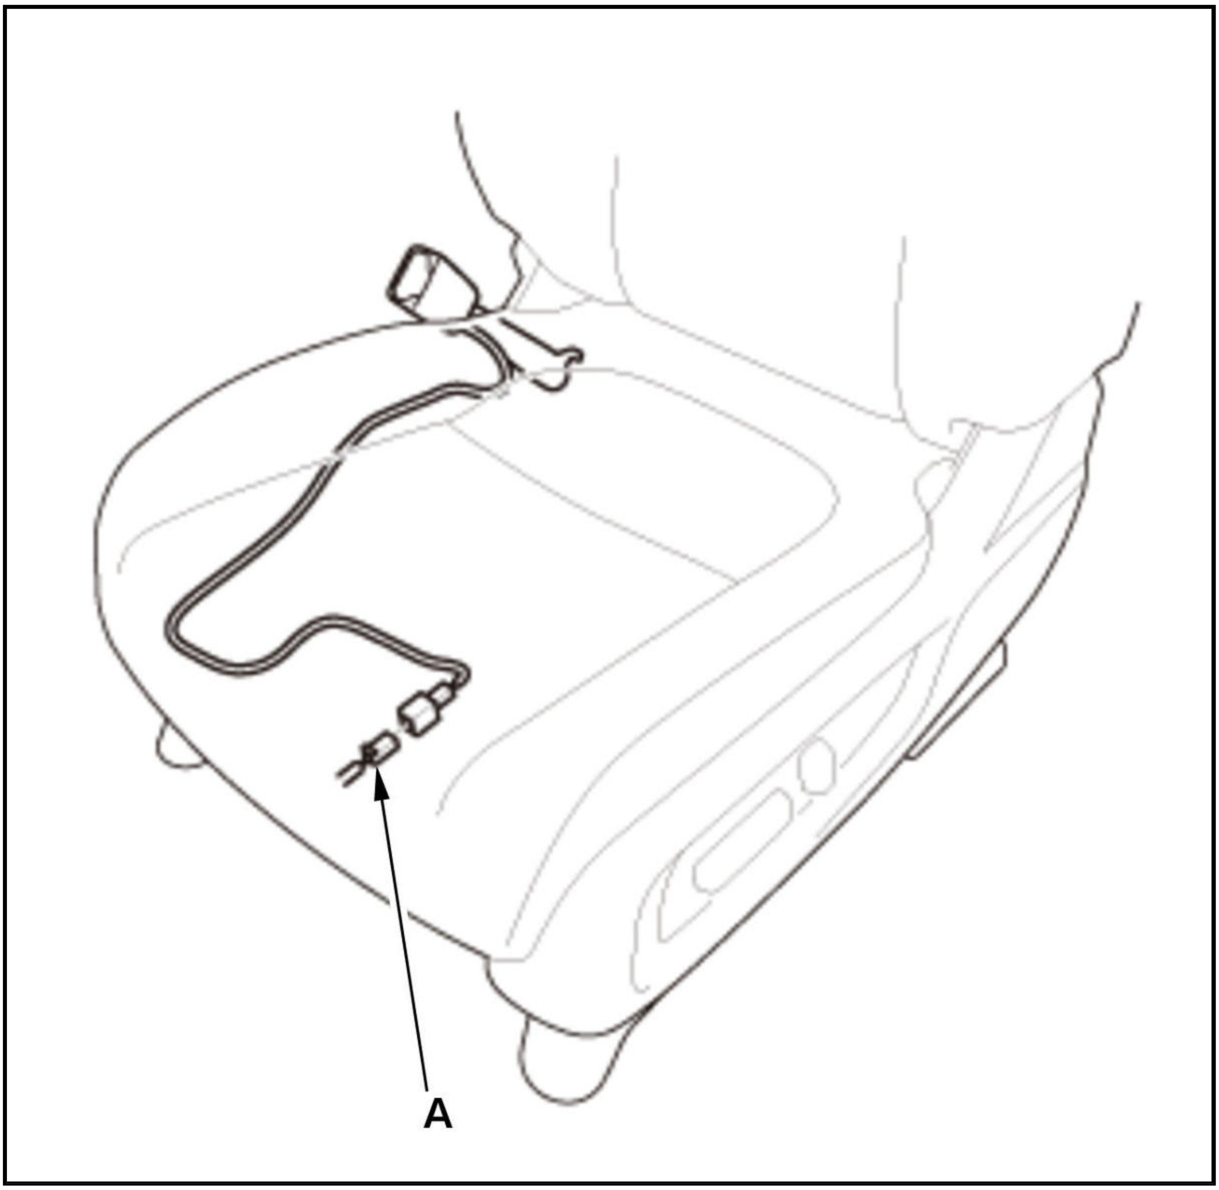
   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's seat belt buckle switch check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the driver's seat belt buckle switch 2P connector (A) on the floor wire harness.



-3. Clear the DTCs with the HDS.

-4. Turn the vehicle to the ON mode, then wait for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B0050-11 Short or decreased resistance in the driver's seat belt buckle switch	B
B0050-2B Short to another wire harness in the driver's seat belt buckle switch	B

Is DTC B0050-11 or B0050-2B indicated?

YES

Short in the floor wire harness; replace the floor wire harness, then clear the DTC.

NO

Faulty driver's seat belt buckle switch; **replace the driver's seat belt buckle assembly** , then clear the DTC.

DTC B0050-13

DTC B0050-13 : Open or Increased Resistance in the Driver's Seat Belt Buckle Switch

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information**.

DTC Description	DTC
B0050-13 Open or increased resistance in the driver's seat belt buckle switch	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds. Buckle and unbuckle the driver's seat belt several times.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0050-13 Open or increased resistance in the driver's seat belt buckle switch	B

   Is DTC B0050-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

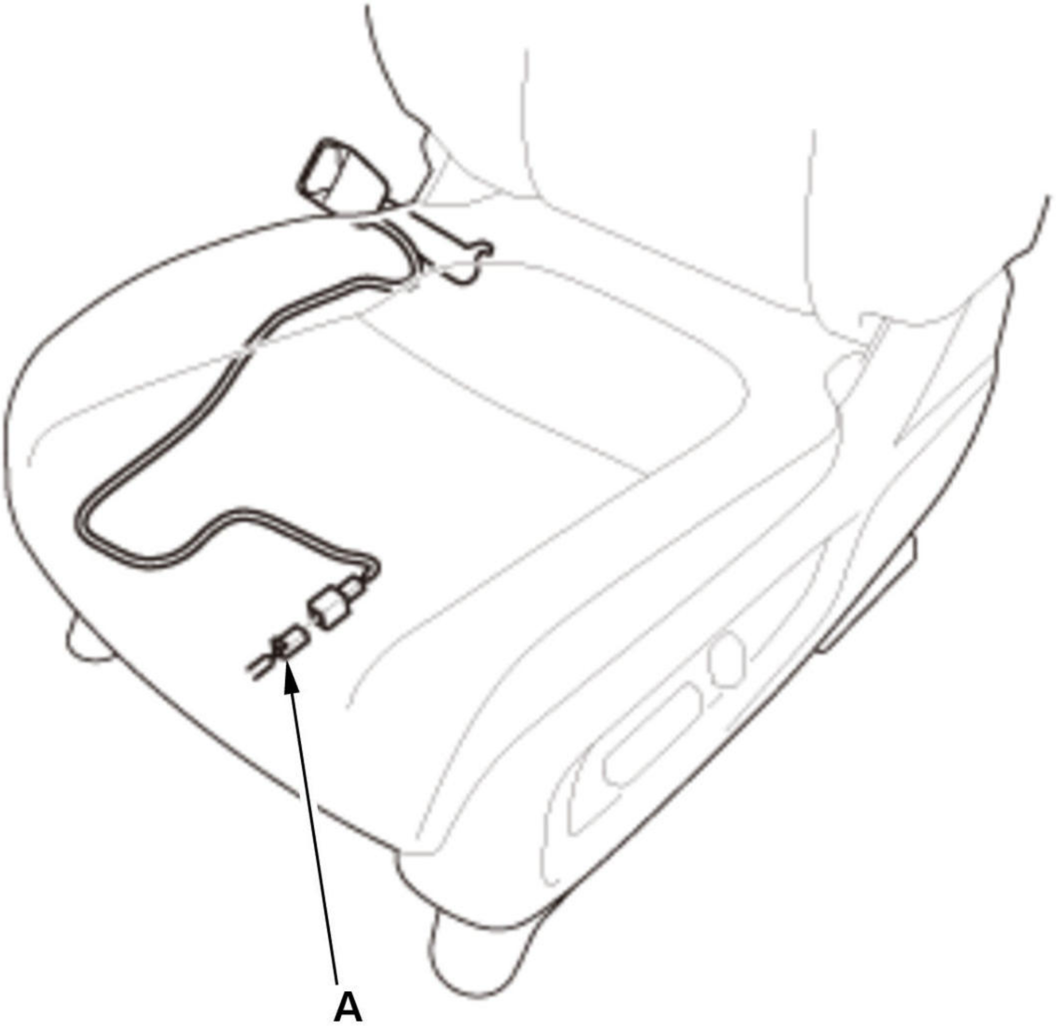
   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's seat belt buckle switch check

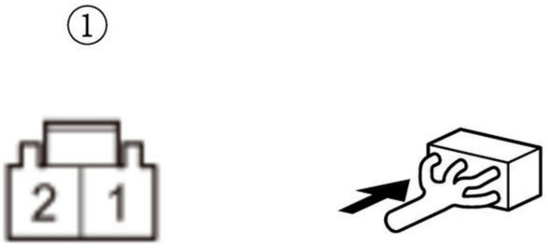
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the driver's seat belt buckle switch 2P connector (A) on the floor wire harness.



-3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's seat belt buckle switch 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Terminal B	Driver's seat belt buckle switch 2P connector (female terminals) No. 2 (on the floor wire harness): ①



-4. Turn the vehicle to the ON mode, then wait for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B0050-11 Short or decreased resistance in the driver's seat belt buckle switch	B

Is DTC B0050-11 indicated?

YES

Faulty driver's seat belt buckle switch; **replace the driver's seat belt buckle assembly** , then clear the DTC.

NO

Go to step 3.

3. Open wire check (FLBC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

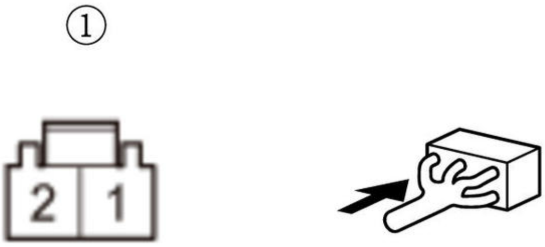
-3. Remove the jumper wire from the driver's seat belt buckle switch 2P connector on the floor wire harness.

-4. Disconnect the following connector.

SRS unit connector B (39P)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat belt buckle switch 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	Driver's seat belt buckle switch 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	**SRS unit connector B (39P) No. 29**



Is there 1.0 Ω or less?

YES

The FLBC wire is OK. Go to step 4.

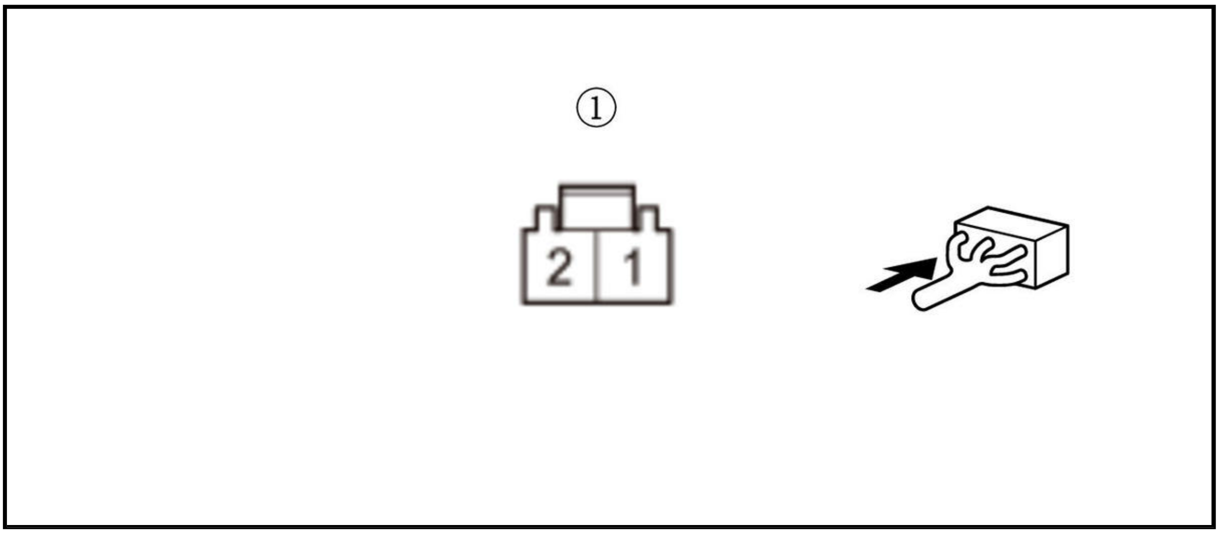
NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

4. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat belt buckle switch 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	Driver's seat belt buckle switch 2P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; check for a poor ground at G501. If the ground is OK, replace the floor wire harness, then clear the DTC.

DTC B0052-11, B0052-2B

DTC B0052-11 : Short or Decreased Resistance in the Front Passenger's Seat Belt Buckle Switch

DTC B0052-2B : Short to Another Wire Harness in the Front Passenger's Seat Belt Buckle Switch

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information**.

DTC Description	DTC
B0052-11 Short or decreased resistance in the front passenger's seat belt buckle switch	B
B0052-2B Short to another wire harness in the front passenger's seat belt buckle switch	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds. Buckle and unbuckle the front passenger's seat belt several times.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0052-11 Short or decreased resistance in the front passenger's seat belt buckle switch	B
B0052-2B Short to another wire harness in the front passenger's seat belt buckle switch	B

   Is DTC B0052-11 or B0052-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

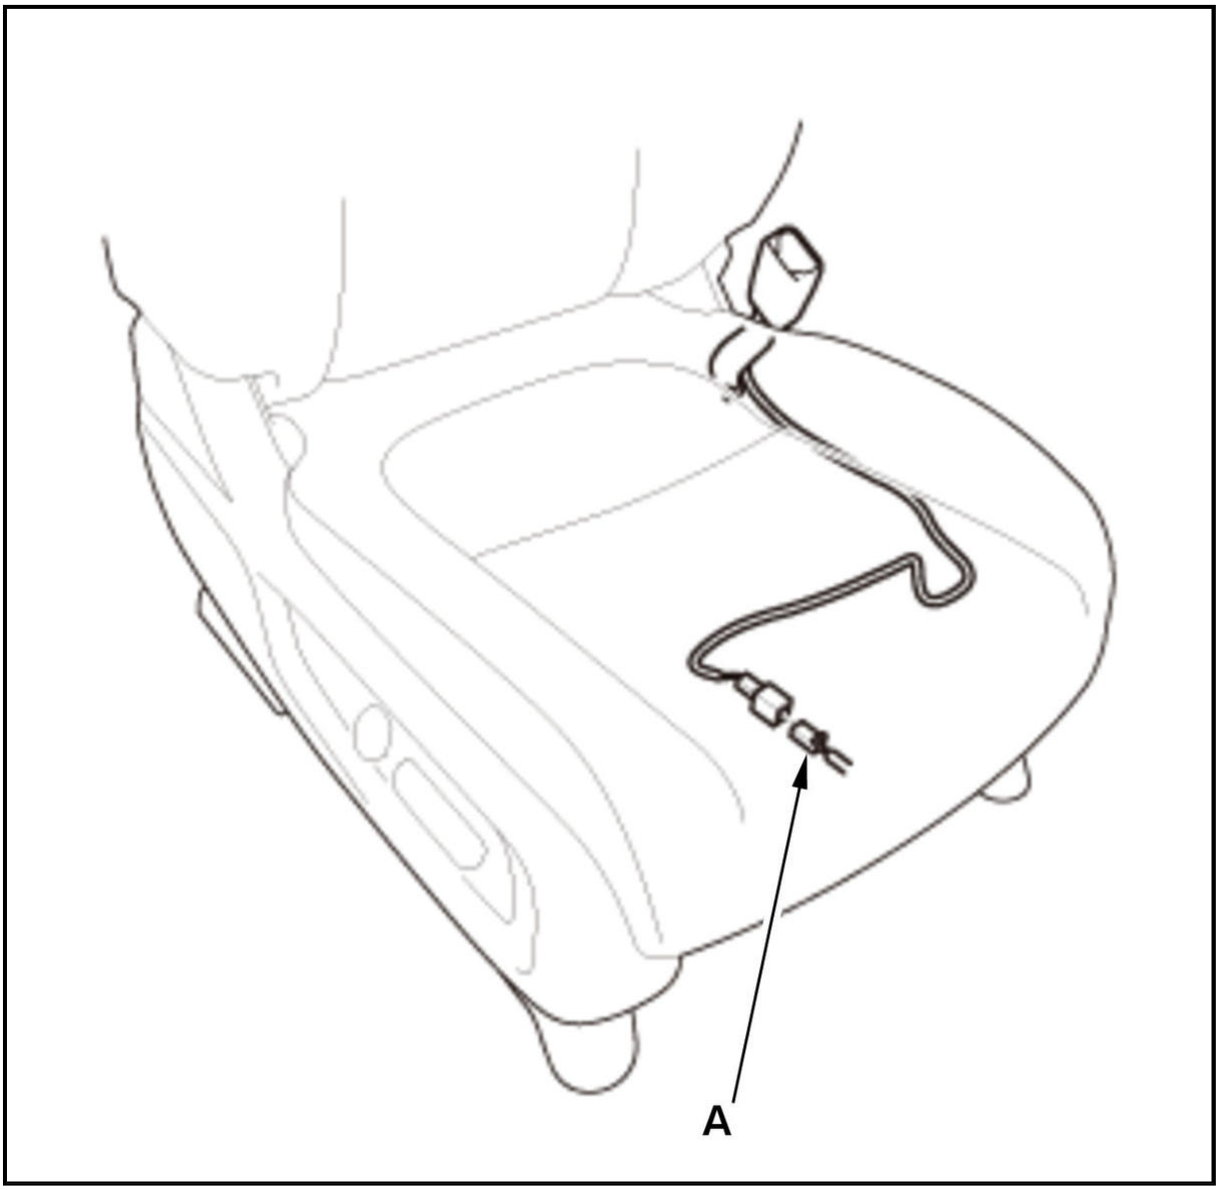
   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's seat belt buckle switch check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the front passenger's seat belt buckle switch 2P connector (A) on the floor wire harness.



-3. Clear the DTCs with the HDS.

-4. Turn the vehicle to the ON mode, then wait for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B0052-11 Short or decreased resistance in the front passenger's seat belt buckle switch	B
B0052-2B Short to another wire harness in the front passenger's seat belt buckle switch	B

Is DTC B0052-11 or B0052-2B indicated?

YES

Short in the floor wire harness; replace the floor wire harness, then clear the DTC.

NO

Faulty front passenger's seat belt buckle switch; **replace the front passenger's seat belt buckle assembly** , then clear the DTC.

DTC B0052-13

DTC B0052-13 : Open or Increased Resistance in the Front Passenger's Seat Belt Buckle Switch

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information**.

DTC Description	DTC
B0052-13 Open or increased resistance in the front passenger's seat belt buckle switch	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds. Buckle and unbuckle the front passenger's seat belt several times.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0052-13 Open or increased resistance in the front passenger's seat belt buckle switch	B

   Is DTC B0052-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

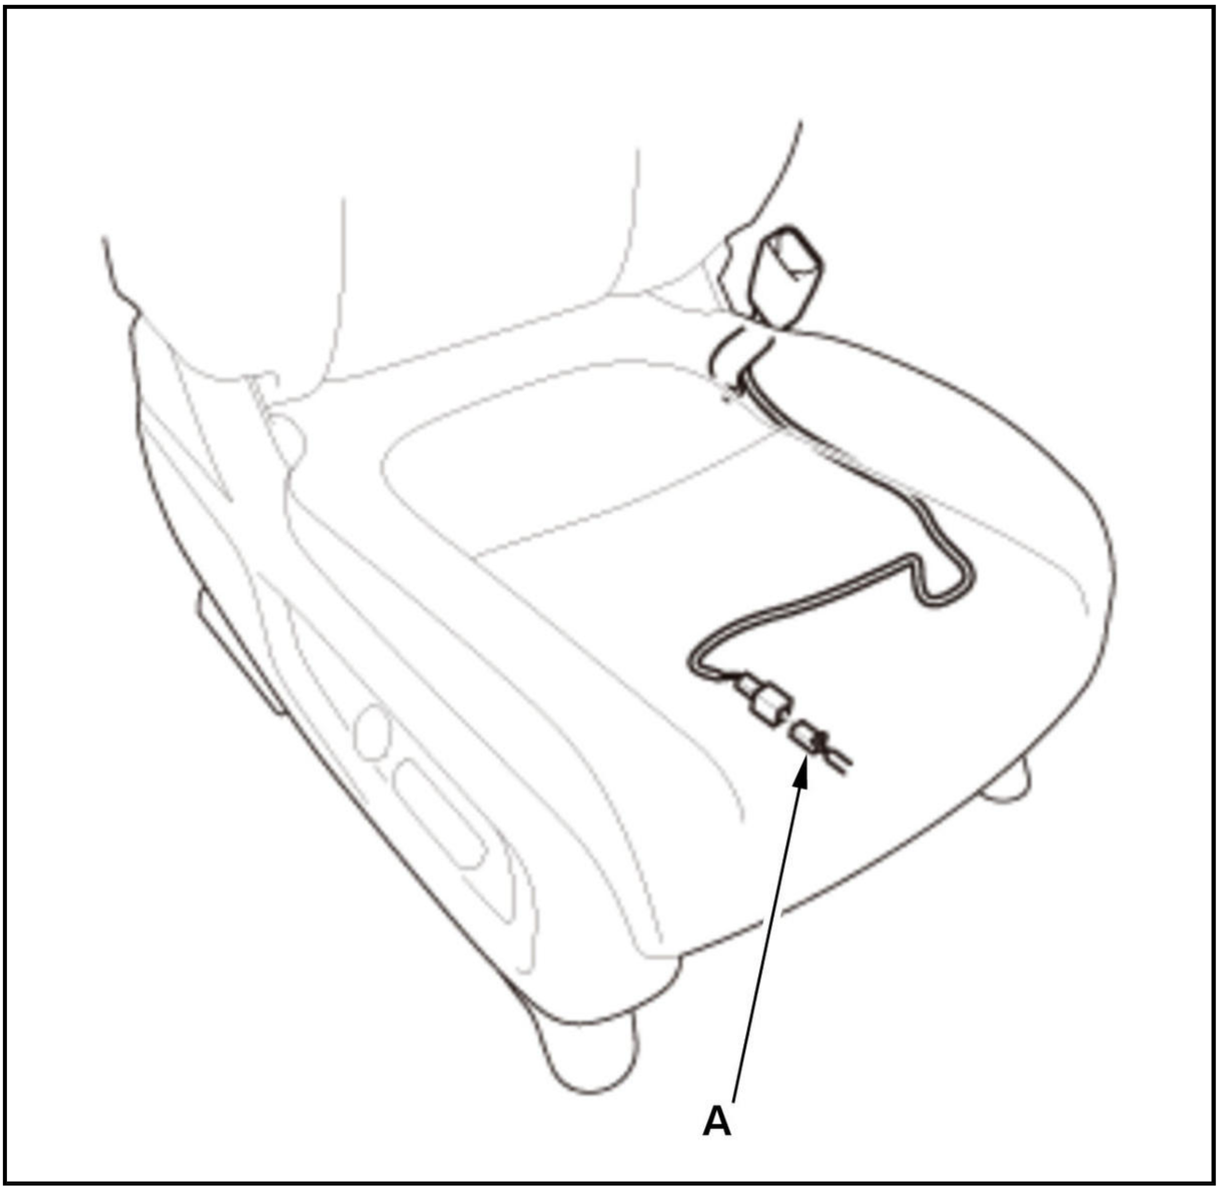
   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's seat belt buckle switch check

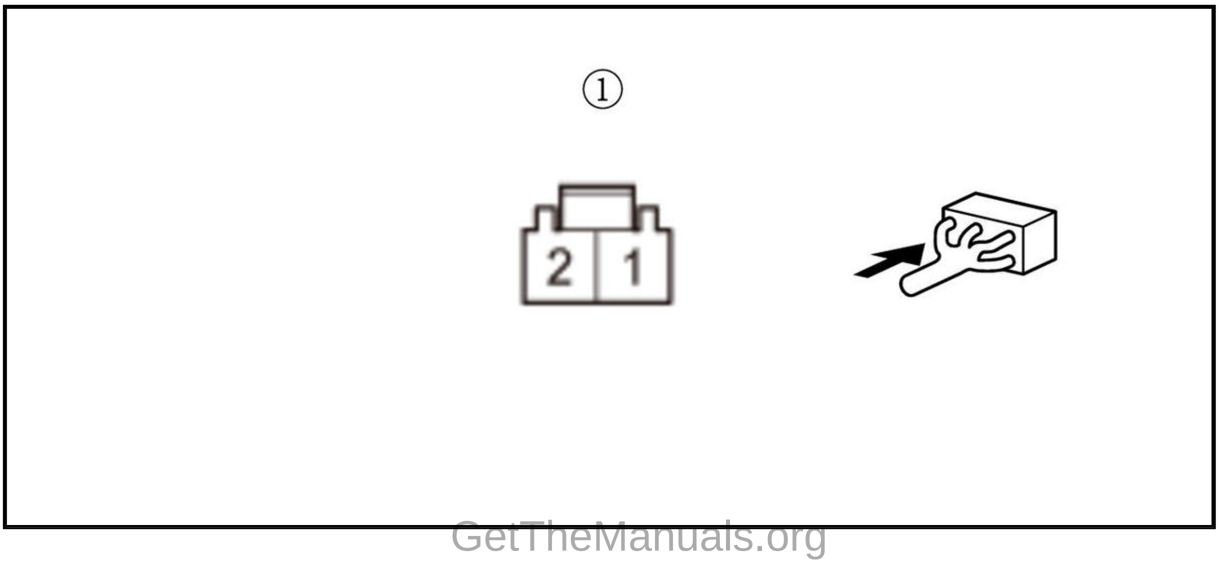
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the front passenger's seat belt buckle switch 2P connector (A) on the floor wire harness.



-3. Connect terminals A and B with a jumper wire.

Terminal A	Front passenger's seat belt buckle switch 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Terminal B	Front passenger's seat belt buckle switch 2P connector (female terminals) No. 2 (on the floor wire harness): ①



-4. Turn the vehicle to the ON mode, then wait for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B0052-11 Short or decreased resistance in the front passenger's seat belt buckle switch	B

Is DTC B0052-11 indicated?

YES

Faulty front passenger's seat belt buckle switch; **replace the front passenger's seat belt buckle assembly** , then clear the DTC.

NO

Go to step 3.

3. Open wire check (FRBC line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

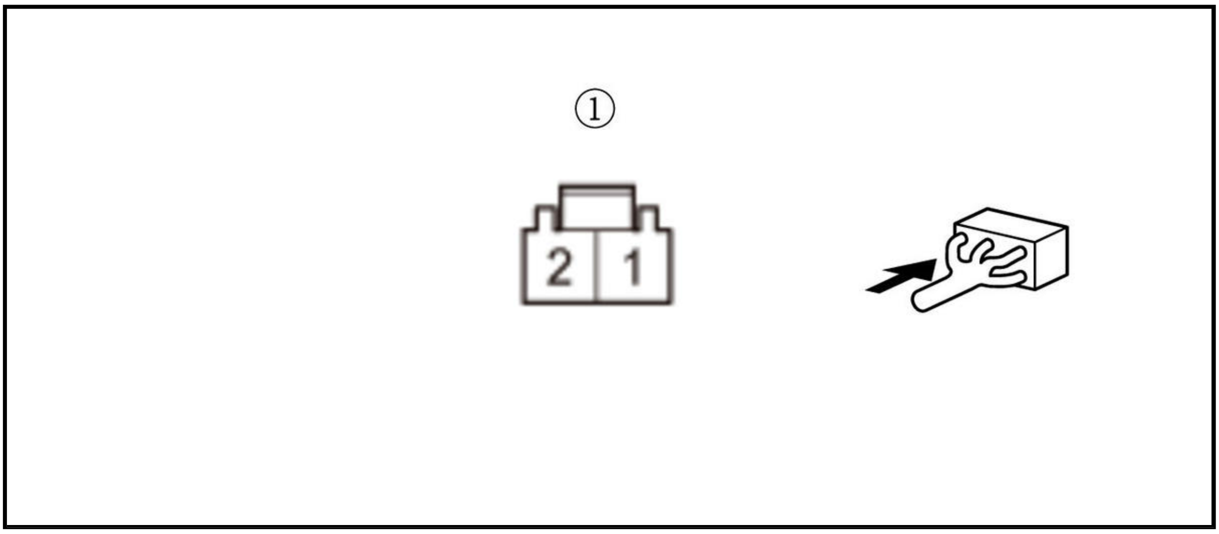
-3. Remove the jumper wire from the front passenger's seat belt buckle switch 2P connector on the floor wire harness.

-4. Disconnect the following connector.

SRS unit connector B (39P)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's seat belt buckle switch 2P connector (on the front passenger's seat wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	Front passenger's seat belt buckle switch 2P connector (female terminals) No. 1 (on the front passenger's seat wire harness): ①
Test point 2	**SRS unit connector B (39P) No. 27**



Is there 1.0 Ω or less?

YES

The FRBC wire is OK. Go to step 4.

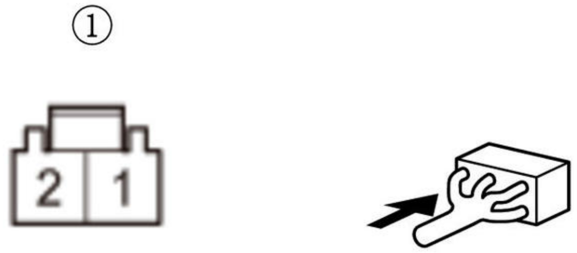
NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

4. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's seat belt buckle switch 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	Front passenger's seat belt buckle switch 2P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; check for a poor ground at G502. If the ground is OK, replace the floor wire harness, then clear the DTC.

DTC B0070-11

DTC B0070-11 : Short to Ground in the Driver's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information**, and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0070-11 Short to ground in the driver's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0070-11 Short to ground in the driver's seat belt tensioner	B

   Is DTC B0070-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (LRP+, LRP- lines) 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the left side B-pillar lower trim** .

   -4. Disconnect the following connector.

Driver's seat belt tensioner 2P connector (on the floor wire harness)

   -5. Reconnect the negative cable to the 12 volt battery.

   -6. Turn the vehicle to the ON mode, then clear the DTC.

   -7. Check for DTCs with the HDS.

DTC Description	DTC
B0070-11 Short to ground in the driver's seat belt tensioner	B

   Is DTC B0070-11 indicated?

   YES

Go to step 3.

NO

Short to ground in the driver's seat belt tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Shorted wire check (LRP+, LRP- lines) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Driver's seat belt tensioner 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 20**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 21**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The LRP+ and LRP- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC TROUBLESHOOTING

DTC B0070-12

DTC B0070-12 : Short to Power in the Driver's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0070-12 Short to power in the driver's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0070-12 Short to power in the driver's seat belt tensioner	B

Is DTC B0070-12 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (LRP+, LRP- lines to power) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the left side B-pillar lower trim** .

-4. Disconnect the following connector.

Driver's seat belt tensioner 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0070-12 Short to power in the driver's seat belt tensioner	B

Is DTC B0070-12 indicated?

YES

Go to step 3.

NO

Short to power in the driver's seat belt tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Shorted wire check (LRP+, LRP- lines to power) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Driver's seat belt tensioner 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 20**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 21**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The LRP+ and LRP- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0070-13

DTC B0070-13 : Open or Increased Resistance in the Driver's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0070-13 Open or increased resistance in the driver's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0070-13 Open or increased resistance in the driver's seat belt tensioner	B

   Is DTC B0070-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's seat belt tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

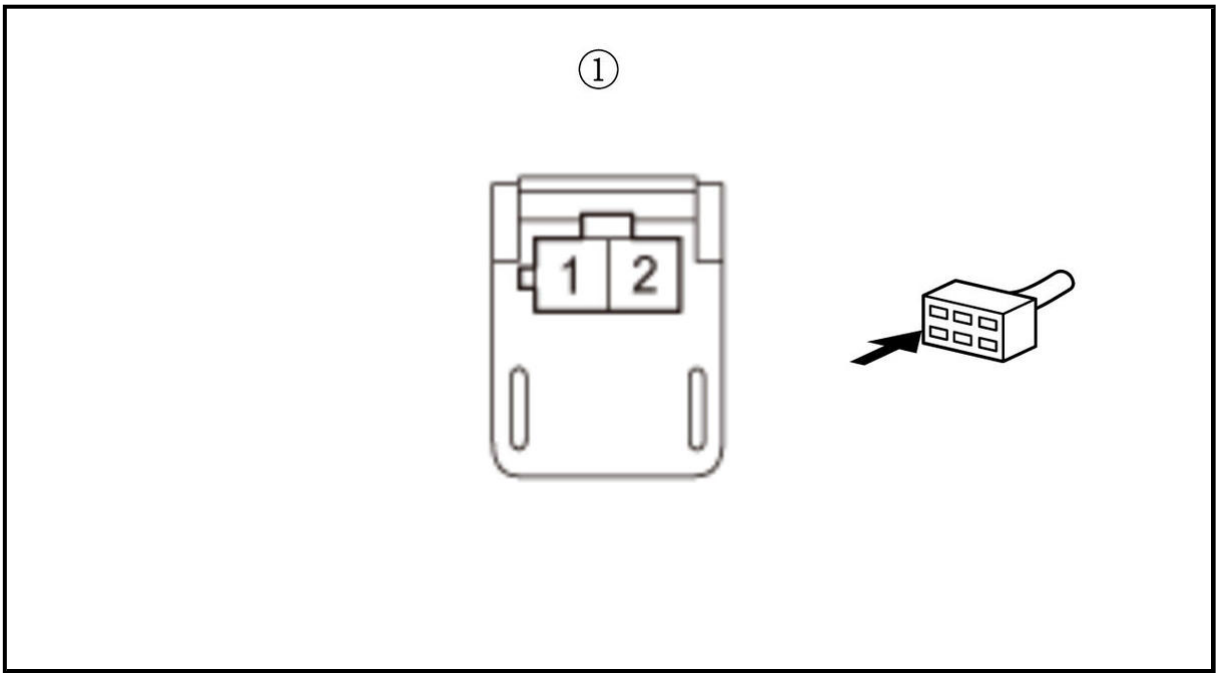
   -3. **Remove the left side B-pillar lower trim** .

   -4. Disconnect the following connector.

Driver's seat belt tensioner 2P connector (on the floor wire harness)

   -5. Connect terminals A and B with a jumper wire.

Terminal A	Driver's seat belt tensioner 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Terminal B	Driver's seat belt tensioner 2P connector (female terminals) No. 2 (on the floor wire harness): ①



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0070-13 Open or increased resistance in the driver's seat belt tensioner	B

Is DTC B0070-13 indicated?

YES

Go to step 3.

NO

Open in the driver's seat belt tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Open wire check (LRP+, LRP- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the driver's seat belt tensioner 2P connector on the floor wire harness.

-4. Disconnect the following connector.

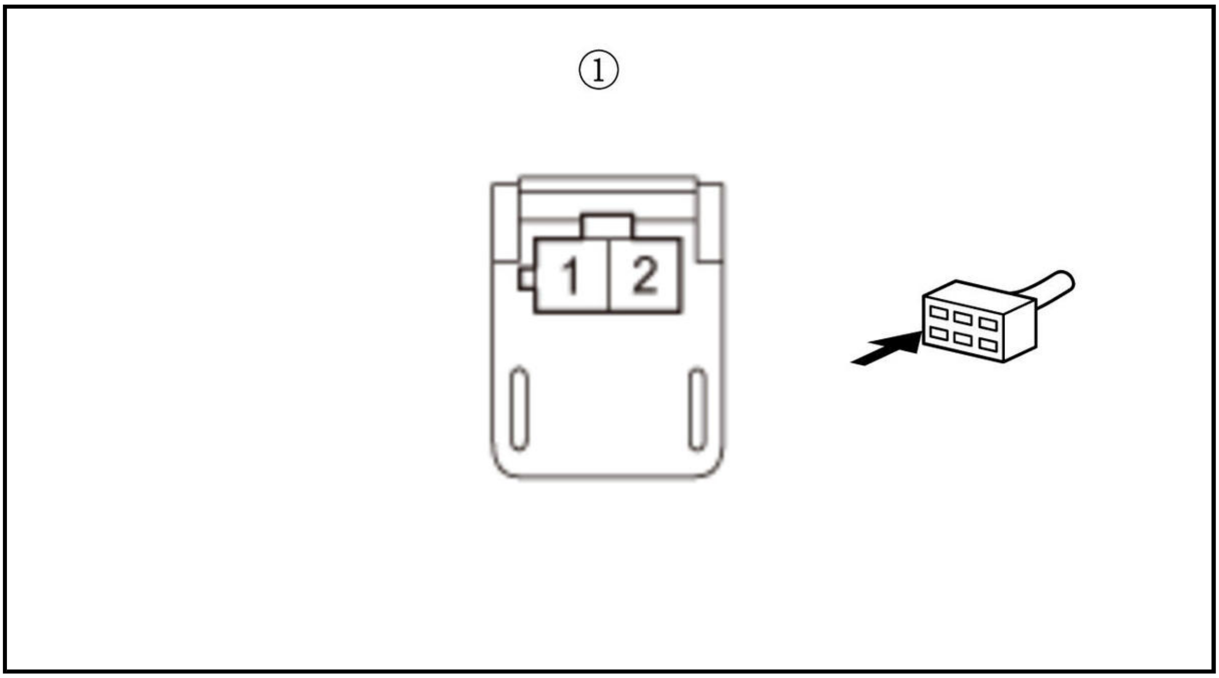
SRS unit connector B (39P)

-5. Connect terminals A and B with a jumper wire.

Terminal A	**SRS unit connector B (39P) No. 20**
Terminal B	**SRS unit connector B (39P) No. 21**

-6. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's seat belt tensioner 2P connector (on the floor wire harness): disconnected SRS unit connector B (39P): disconnected SRS unit connector B (39P) terminals No. 20 and No. 21: jumped
Test point 1	Driver's seat belt tensioner 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Driver's seat belt tensioner 2P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there 1.0 Ω or less?

YES

The LRP+ and LRP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0070-1A

DTC B0070-1A : Decreased Resistance in the Driver's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0070-1A Decreased resistance in the driver's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0070-1A Decreased resistance in the driver's seat belt tensioner	B

Is DTC B0070-1A indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's seat belt tensioner check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the left side B-pillar lower trim** .

-4. Disconnect the following connector.

Driver's seat belt tensioner 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0070-1A Decreased resistance in the driver's seat belt tensioner	B

Is DTC B0070-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the driver's seat belt tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Shorted wire check (LRP+ line to LRP- line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the following connector.

SRS unit connector B (39P)

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat belt tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 20**
Test point 2	**SRS unit connector B (39P) No. 21**

   Is there an open circuit, or at least 1 MΩ?

   YES

   The LRP+ and LRP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

   NO

   Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0070-2B

DTC B0070-2B : Short to Another Wire Harness in the Driver's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B

Is DTC B0070-2B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the driver's side airbag inflator	B
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the front passenger's side airbag inflator	B
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0001-2B, B0002-2B, B0010-2B, B0011-2B, B0020-2B, B0021-2B, B0028-2B, B0029-2B, B0072-2B, B0079-2B, B007A-2B or B0082-2B indicated with DTC B0070-2B?

YES

Go to step 3.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

3. Shorted wire check (LRP lines to another line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the left side B-pillar lower trim** .

-4. Disconnect the following connectors.

SRS unit connector A (39P)
SRS unit connector B (39P)
Driver's seat belt tensioner 2P connector (on the floor wire harness)
Inflator connectors which are assigned to 2B codes listed on HDS

-5. Measure the resistance between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	SRS unit connector B (39P): disconnected
	Driver's seat belt tensioner 2P connector (on the floor wire harness): disconnected
	Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

DTC	Test point 1	Test point 2
	From terminal	To terminal
B0001-2B	**SRS unit connector B (39P) No. 20**	**SRS unit connector A (39P) No. 9**
	SRS unit connector B (39P) No. 21	**SRS unit connector A (39P) No. 8**
B0002-2B	**SRS unit connector B (39P) No. 20**	**SRS unit connector A (39P) No. 10**
	SRS unit connector B (39P) No. 21	**SRS unit connector A (39P) No. 11**
B0010-2B	**SRS unit connector B (39P) No. 20**	**SRS unit connector A (39P) No. 5**

B0028-2B	**SRS unit connector B (39P) No. 20**	**SRS unit connector B (39P) No. 4**
	SRS unit connector B (39P) No. 21	**SRS unit connector B (39P) No. 3**
B0029-2B	**SRS unit connector B (39P) No. 20**	**SRS unit connector B (39P) No. 8**
	SRS unit connector B (39P) No. 21	**SRS unit connector B (39P) No. 7**
B0072-2B	**SRS unit connector B (39P) No. 20**	**SRS unit connector B (39P) No. 19**
	SRS unit connector B (39P) No. 21	**SRS unit connector B (39P) No. 18**
B0079-2B	**SRS unit connector B (39P) No. 20**	**SRS unit connector B (39P) No. 24**
	SRS unit connector B (39P) No. 21	**SRS unit connector B (39P) No. 25**
B007A-2B	**SRS unit connector B (39P) No. 20**	**SRS unit connector B (39P) No. 23**
	SRS unit connector B (39P) No. 21	**SRS unit connector B (39P) No. 22**
B0082-2B	**SRS unit connector B (39P) No. 20**	**SRS unit connector A (39P) No. 2**
	SRS unit connector B (39P) No. 21	**SRS unit connector A (39P) No. 3**

Is there 1 MΩ or more?

YES

The LRP wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

NO

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

DTC B0072-11

DTC B0072-11 : Short to Ground in the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0072-11 Short to ground in the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0072-11 Short to ground in the front passenger's seat belt tensioner	B

   Is DTC B0072-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (RRP+, RRP- lines) 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the right side B-pillar lower trim** .

   -4. Disconnect the following connector.

Front passenger's seat belt tensioner 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0072-11 Short to ground in the front passenger's seat belt tensioner	B

Is DTC B0072-11 indicated?

NO

Go to step 3.

YES

Short to ground in the front passenger's seat belt tensioner; **replace the front passenger's seat belt** , then clear the DTC.

3. Shorted wire check (RRP+, RRP- lines) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's seat belt tensioner 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 18**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 19**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The RRP+ and RRP- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0072-12

DTC B0072-12 : Short to Power in the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0072-12 Short to power in the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0072-12 Short to power in the front passenger's seat belt tensioner	B

Is DTC B0072-12 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (RRP+, RRP- lines to power) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the right side B-pillar lower trim** .

-4. Disconnect the following connector.

Front passenger's seat belt tensioner 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode, then clear the DTC.

-7. Check for DTCs with the HDS.

DTC Description	DTC
B0072-12 Short to power in the front passenger's seat belt tensioner	B

Is DTC B0072-12 indicated?

NO

Go to step 3.

YES

Short to power in the front passenger's seat belt tensioner; **replace the front passenger's seat belt** , then clear the DTC.

3. Shorted wire check (RRP+, RRP- lines to power) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Front passenger's seat belt tensioner 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 18**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 19**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The RRP+ and RRP- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0072-13

DTC B0072-13 : Open or Increased Resistance in the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0072-13 Open or increased resistance in the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0072-13 Open or increased resistance in the front passenger's seat belt tensioner	B

   Is DTC B0072-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's seat belt tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

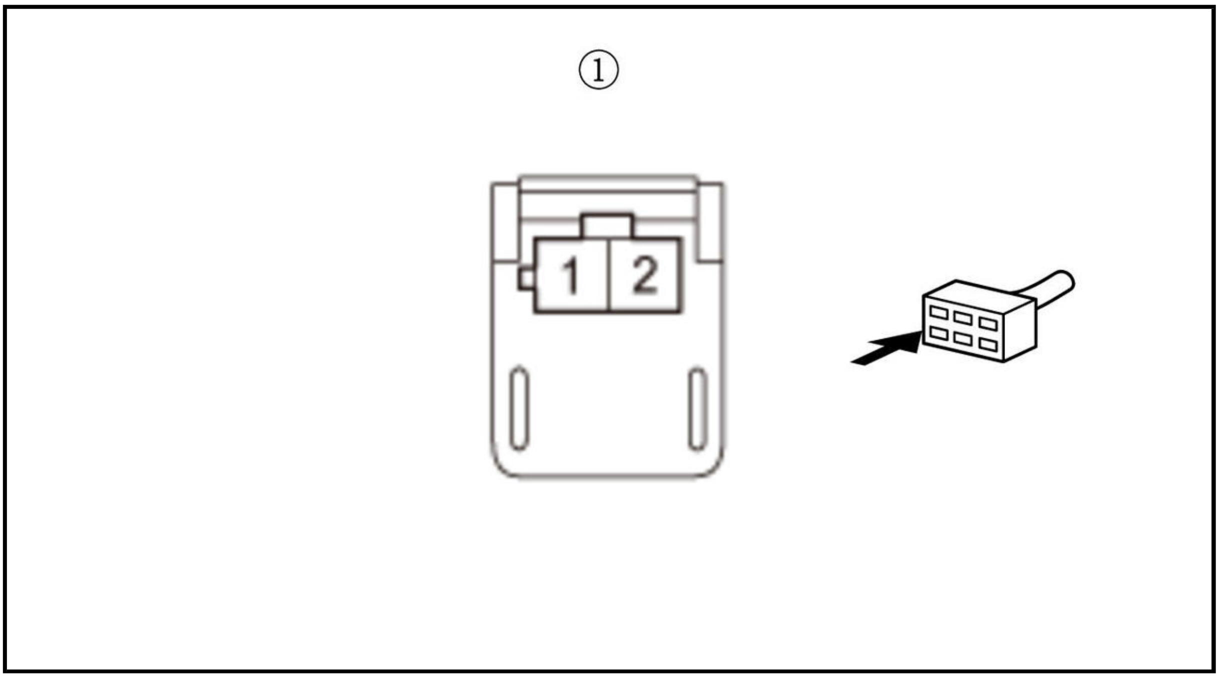
   -3. **Remove the right side B-pillar lower trim** .

   -4. Disconnect the following connector.

Front passenger's seat belt tensioner 2P connector (on the floor wire harness)

   -5. Connect terminals A and B with a jumper wire.

Terminal A	Front passenger's seat belt tensioner 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Terminal B	Front passenger's seat belt tensioner 2P connector (female terminals) No. 2 (on the floor wire harness): ①



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0072-13 Open or increased resistance in the front passenger's seat belt tensioner	B

Is DTC B0072-13 indicated?

YES

Go to step 3.

NO

Open in the front passenger's seat belt tensioner; **replace the front passenger's seat belt** , then clear the DTC.

3. Open wire check (RRP+, RRP- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the front passenger's seat belt tensioner 2P connector on the floor wire harness.

-4. Disconnect the following connector.

SRS unit connector B (39P)

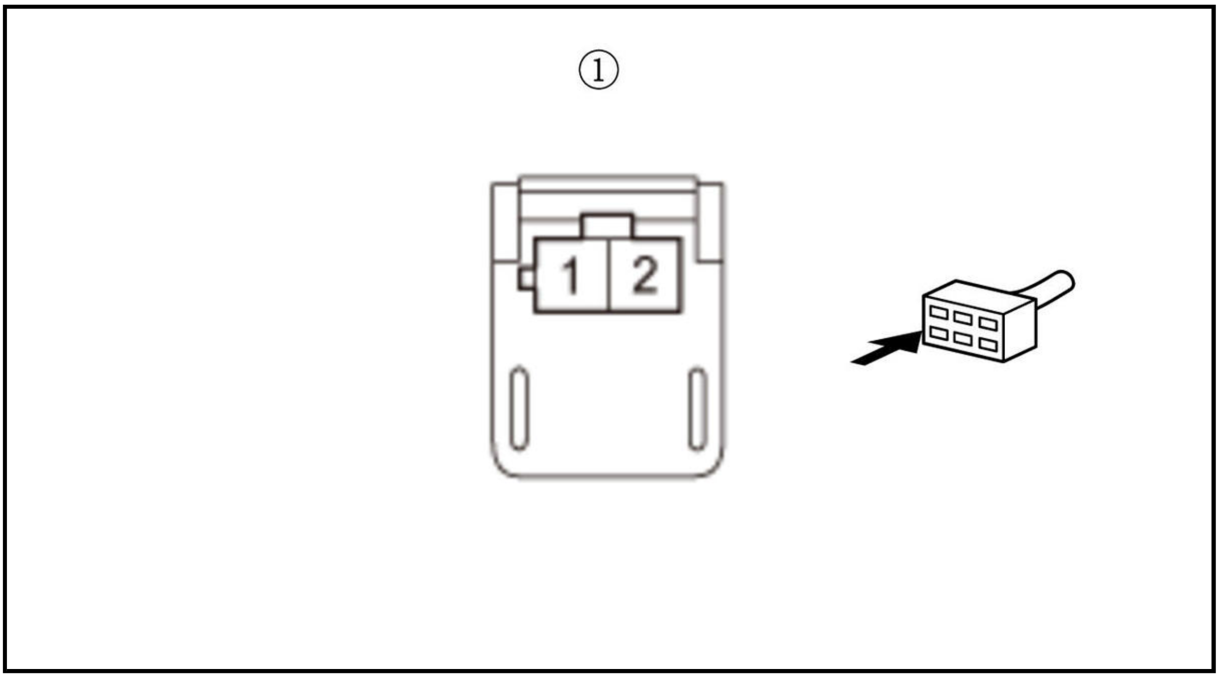
-5. Connect terminals A and B with a jumper wire.

Terminal A	**SRS unit connector B (39P) No. 18**

Terminal B	SRS unit connector B (39P) No. 19

-6. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's seat belt tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	SRS unit connector B (39P) terminals No. 18 and No. 19: jumped
Test point 1	Front passenger's belt tensioner 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Front passenger's seat belt tensioner 2P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there 1.0 Ω or less?

YES

The RRP+ and RRP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0072-1A

DTC B0072-1A : Decreased Resistance in the Front Passenger's Seat Belt Tensioner

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0072-1A Decreased resistance in the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0072-1A Decreased resistance in the front passenger's seat belt tensioner	B

   Is DTC B0072-1A indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Front passenger's seat belt tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the right side B-pillar lower trim** .

   -4. Disconnect the following connector.

Front passenger's seat belt tensioner 2P connector (on the floor wire harness)

   -5. Reconnect the negative cable to the 12 volt battery.

   -6. Clear the DTCs with the HDS.

   -7. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -8. Check for DTCs with the HDS.

DTC Description	DTC
B0072-1A Decreased resistance in the front passenger's seat belt tensioner	B

   Is DTC B0072-1A indicated?

   YES

   Go to step 3.

NO

Short to another wire in the front passenger's seat belt tensioner; **replace the front passenger's seat belt** , then clear the DTC.

3. Shorted wire check (RRP+ line to RRP- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's seat belt tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 18**
Test point 2	**SRS unit connector B (39P) No. 19**

Is there an open circuit, or at least 1 MΩ?

YES

The RRP+ and RRP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0072-2B

DTC B0072-2B : Short to Another Wire Harness in the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B

Is DTC B0072-2B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the driver's side airbag inflator	B
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the front passenger's side airbag inflator	B
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0001-2B, B0002-2B, B0010-2B, B0011-2B, B0020-2B, B0021-2B, B0028-2B, B0029-2B, B0070-2B, B0079-2B, B007A-2B or B0082-2B indicated with DTC B0072-2B?

YES

Go to step 3.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

3. Shorted wire check (RRP lines to another line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the right side B-pillar lower trim** .

-4. Disconnect the following connectors.

SRS unit connector A (39P)
SRS unit connector B (39P)
Front passenger's seat belt tensioner 2P connector (on the floor wire harness)
Inflator connectors which are assigned to 2B codes listed on HDS

-5. Measure the resistance between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	SRS unit connector B (39P): disconnected
	Front passenger's seat belt tensioner 2P connector (on the floor wire harness): disconnected
	Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

DTC	**Test point 1**	**Test point 2**
	From terminal	**To terminal**
B0001-2B	**SRS unit connector B (39P) No. 19**	**SRS unit connector A (39P) No. 9**

	SRS unit connector B (39P) No. 18	**SRS unit connector B (39P) No. 10**
B0028-2B	**SRS unit connector B (39P) No. 19**	**SRS unit connector B (39P) No. 4**
	SRS unit connector B (39P) No. 18	**SRS unit connector B (39P) No. 3**
B0029-2B	**SRS unit connector B (39P) No. 19**	**SRS unit connector B (39P) No. 8**
	SRS unit connector B (39P) No. 18	**SRS unit connector B (39P) No. 7**
B0070-2B	**SRS unit connector B (39P) No. 19**	**SRS unit connector B (39P) No. 20**
	SRS unit connector B (39P) No. 18	**SRS unit connector B (39P) No. 21**
B0079-2B	**SRS unit connector B (39P) No. 19**	**SRS unit connector B (39P) No. 24**
	SRS unit connector B (39P) No. 18	**SRS unit connector B (39P) No. 25**
B007A-2B	**SRS unit connector B (39P) No. 19**	**SRS unit connector B (39P) No. 23**
	SRS unit connector B (39P) No. 18	**SRS unit connector B (39P) No. 22**

DTC	Test point 1	Test point 2
	From terminal	To terminal
B0082-2B	SRS unit connector B (39P) No. 19	SRS unit connector A (39P) No. 2
	SRS unit connector B (39P) No. 18	SRS unit connector A (39P) No. 3

Is there 1 MΩ or more?

YES

The RRP wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

NO

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

DTC B0079-11

DTC B0079-11 : Short to Ground in the Driver's Seat Belt Outer Lap Tensioner

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0079-11 Short to ground in the driver's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0079-11 Short to ground in the driver's seat belt outer lap tensioner	B

Is DTC B0079-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

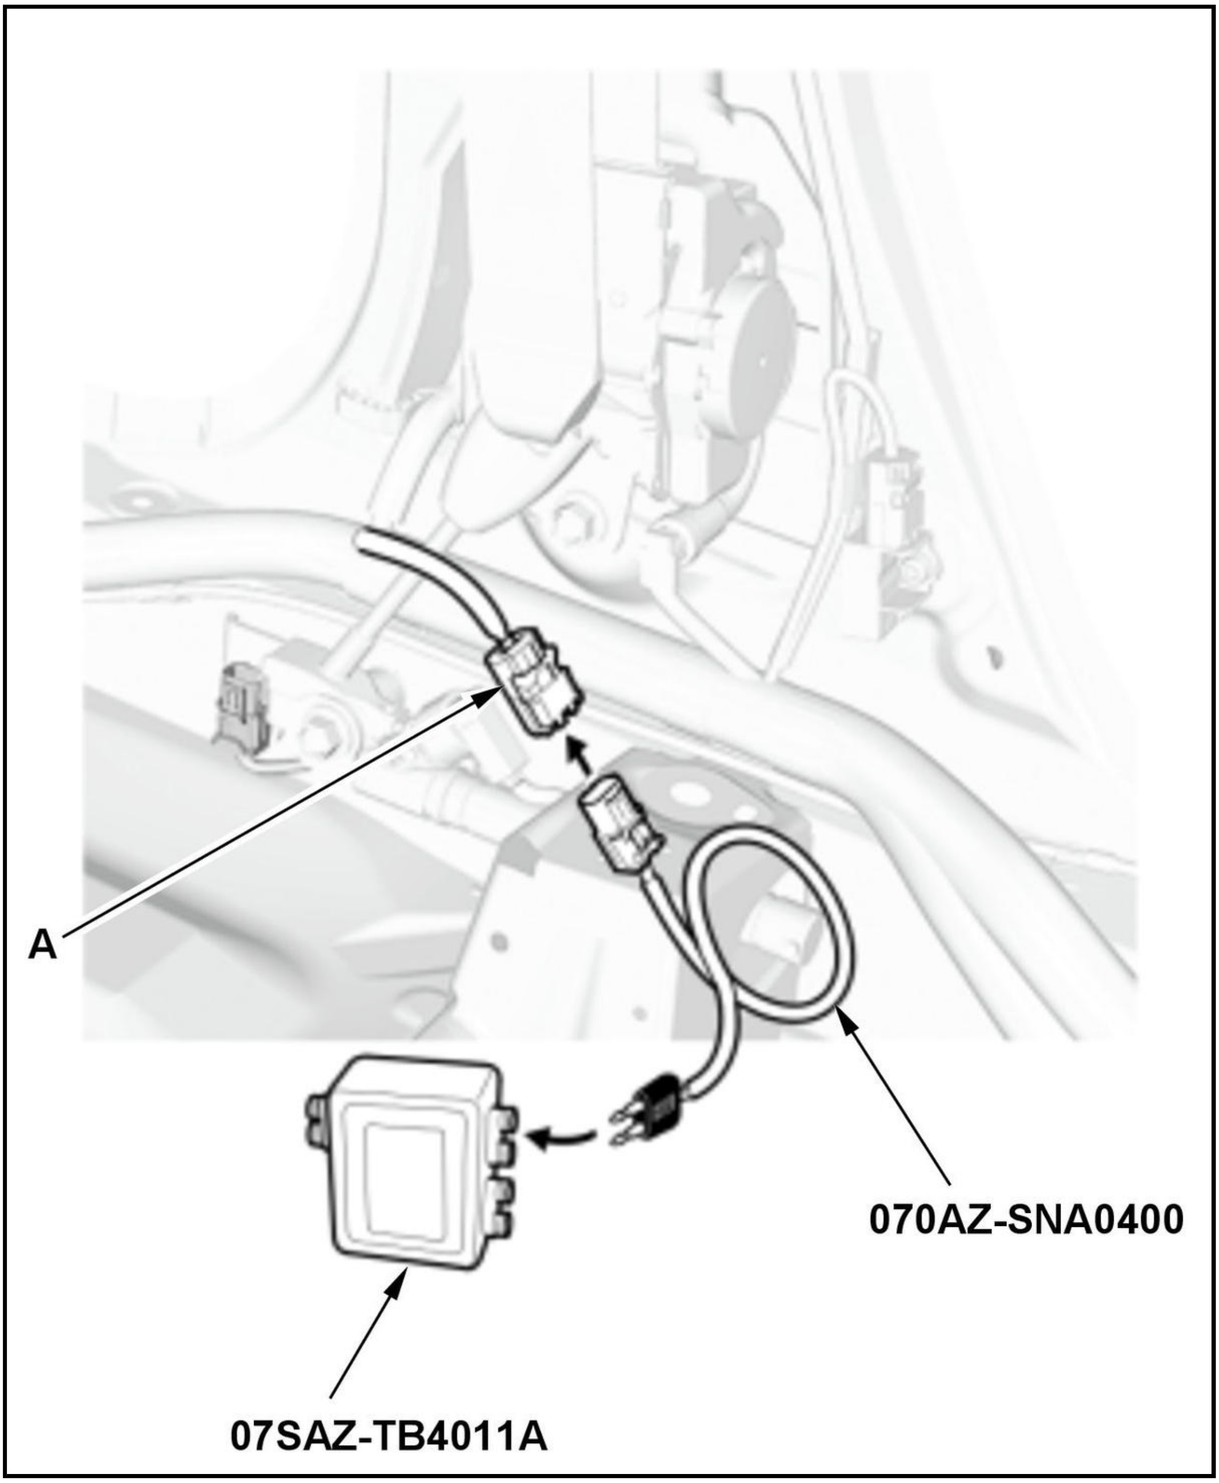
2. Driver's seat belt outer lap tensioner check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the left side B-pillar lower trim cover** .

-4. Disconnect the driver's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-5. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0079-11 Short to ground in the driver's seat belt outer lap tensioner	B

Is DTC B0079-11 indicated?

YES

Go to step 3.

NO

Short to ground in the driver's seat belt outer lap tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Shorted wire check (LLP+, LLP- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect SRS simulator lead M from the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 24**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 25**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The LLP+ and LLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service

information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0079-12

DTC B0079-12 : Short to Power in the Driver's Seat Belt Outer Lap Tensioner

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0079-12 Short to power in the driver's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0079-12 Short to power in the driver's seat belt outer lap tensioner	B

   Is DTC B0079-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

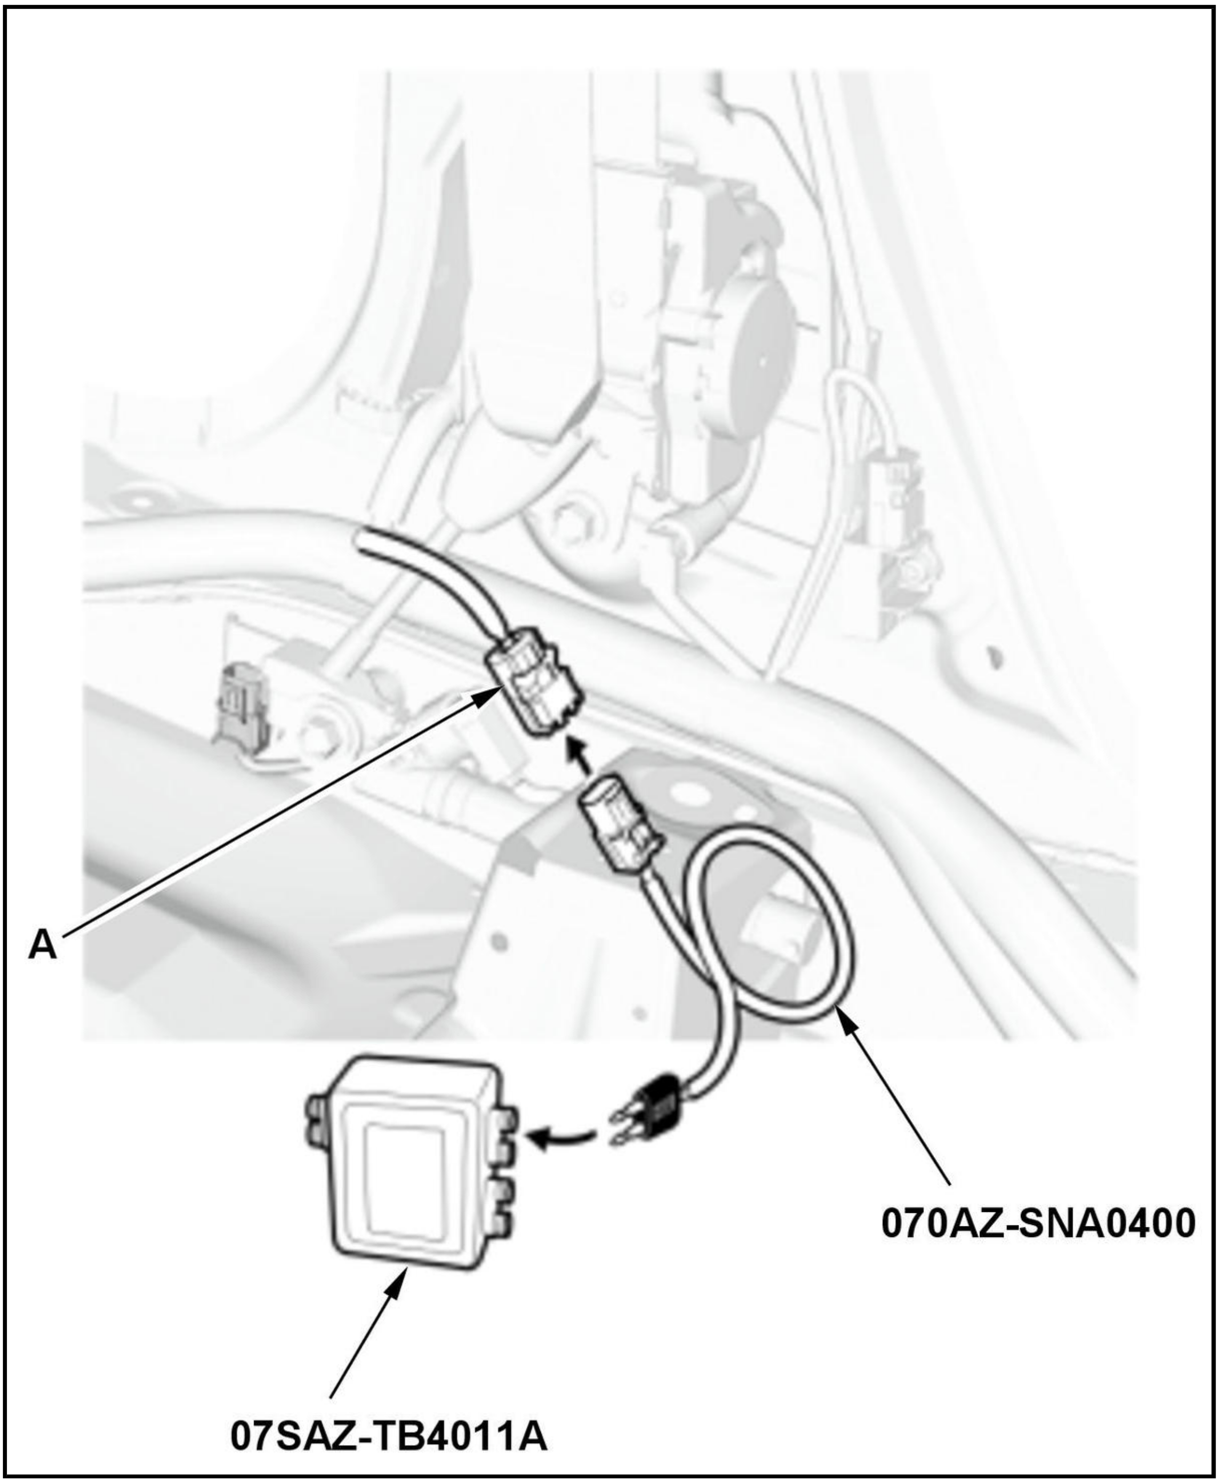
2. Driver's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the left side B-pillar lower trim cover** .

-4. Disconnect the driver's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-5. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0079-12 Short to power in the driver's seat belt outer lap tensioner	B

Is DTC B0079-12 indicated?

YES

Go to step 3.

NO

Short to power in the driver's seat belt outer lap tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Shorted wire check (LLP+, LLP- lines to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect SRS simulator lead M from the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Driver's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 24**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 25**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The LLP+ and LLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0079-13

DTC B0079-13 : Open or Increased Resistance in the Driver's Seat Belt Outer Lap Tensioner

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0079-13 Open or increased resistance in the driver's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0079-13 Open or increased resistance in the driver's seat belt outer lap tensioner	B

   Is DTC B0079-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

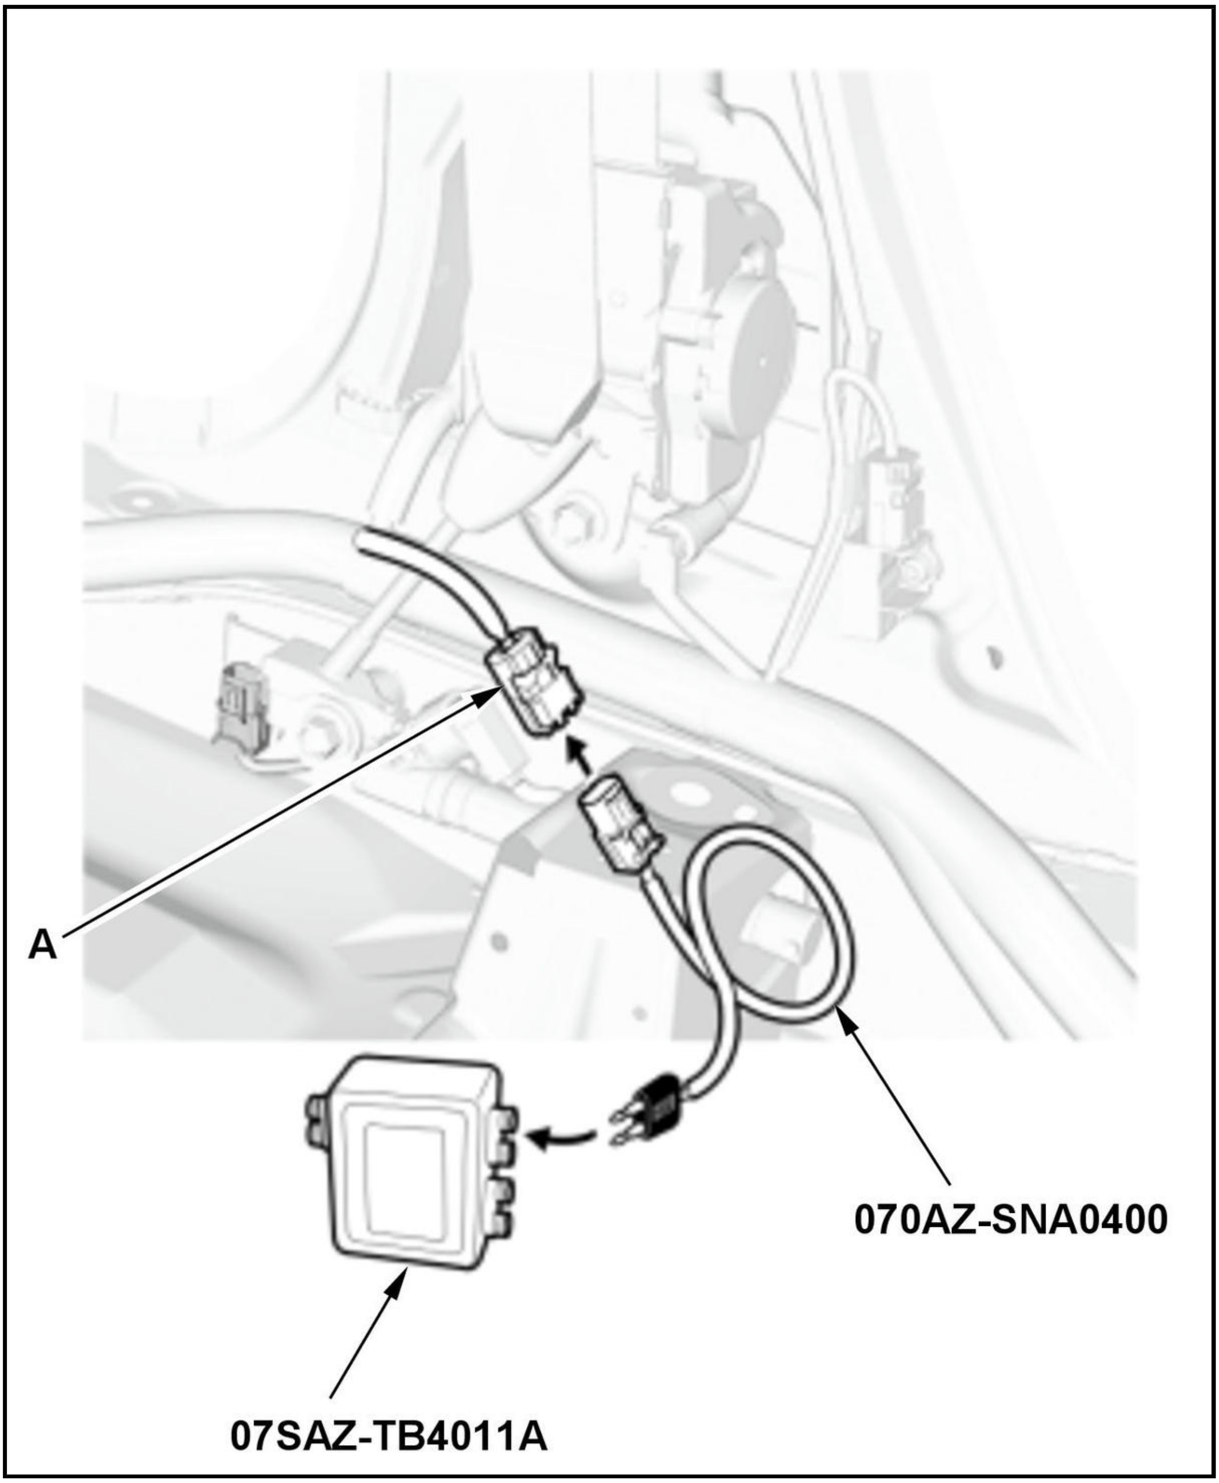
2. Driver's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the left side B-pillar lower trim cover** .

   -4. Disconnect the driver's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-5. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0079-13 Open or increased resistance in the driver's seat belt outer lap tensioner	B

Is DTC B0079-13 indicated?

YES

Go to step 3.

NO

Open in the driver's seat belt outer lap tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Open wire check (LLP+, LLP- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Driver's seat belt outer lap tensioner 2P connector (on the floor wire harness): connected to SRS simulator lead M
Test point 1	**SRS unit connector B (39P) No. 24**
Test point 2	**SRS unit connector B (39P) No. 25**

Is there 2.0-3.0 Ω?

YES

The LLP+ and LLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0079-1A, B0079-2B

DTC B0079-1A : Decreased Resistance in the Driver's Seat Belt Outer Lap Tensioner

DTC B0079-2B : Short to Another Wire Harness in the Driver's Seat Belt Outer Lap Tensioner

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0079-1A Decreased resistance in the driver's seat belt outer lap tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0079-1A Decreased resistance in the driver's seat belt outer lap tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B

   Is DTC B0079-1A or B0079-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

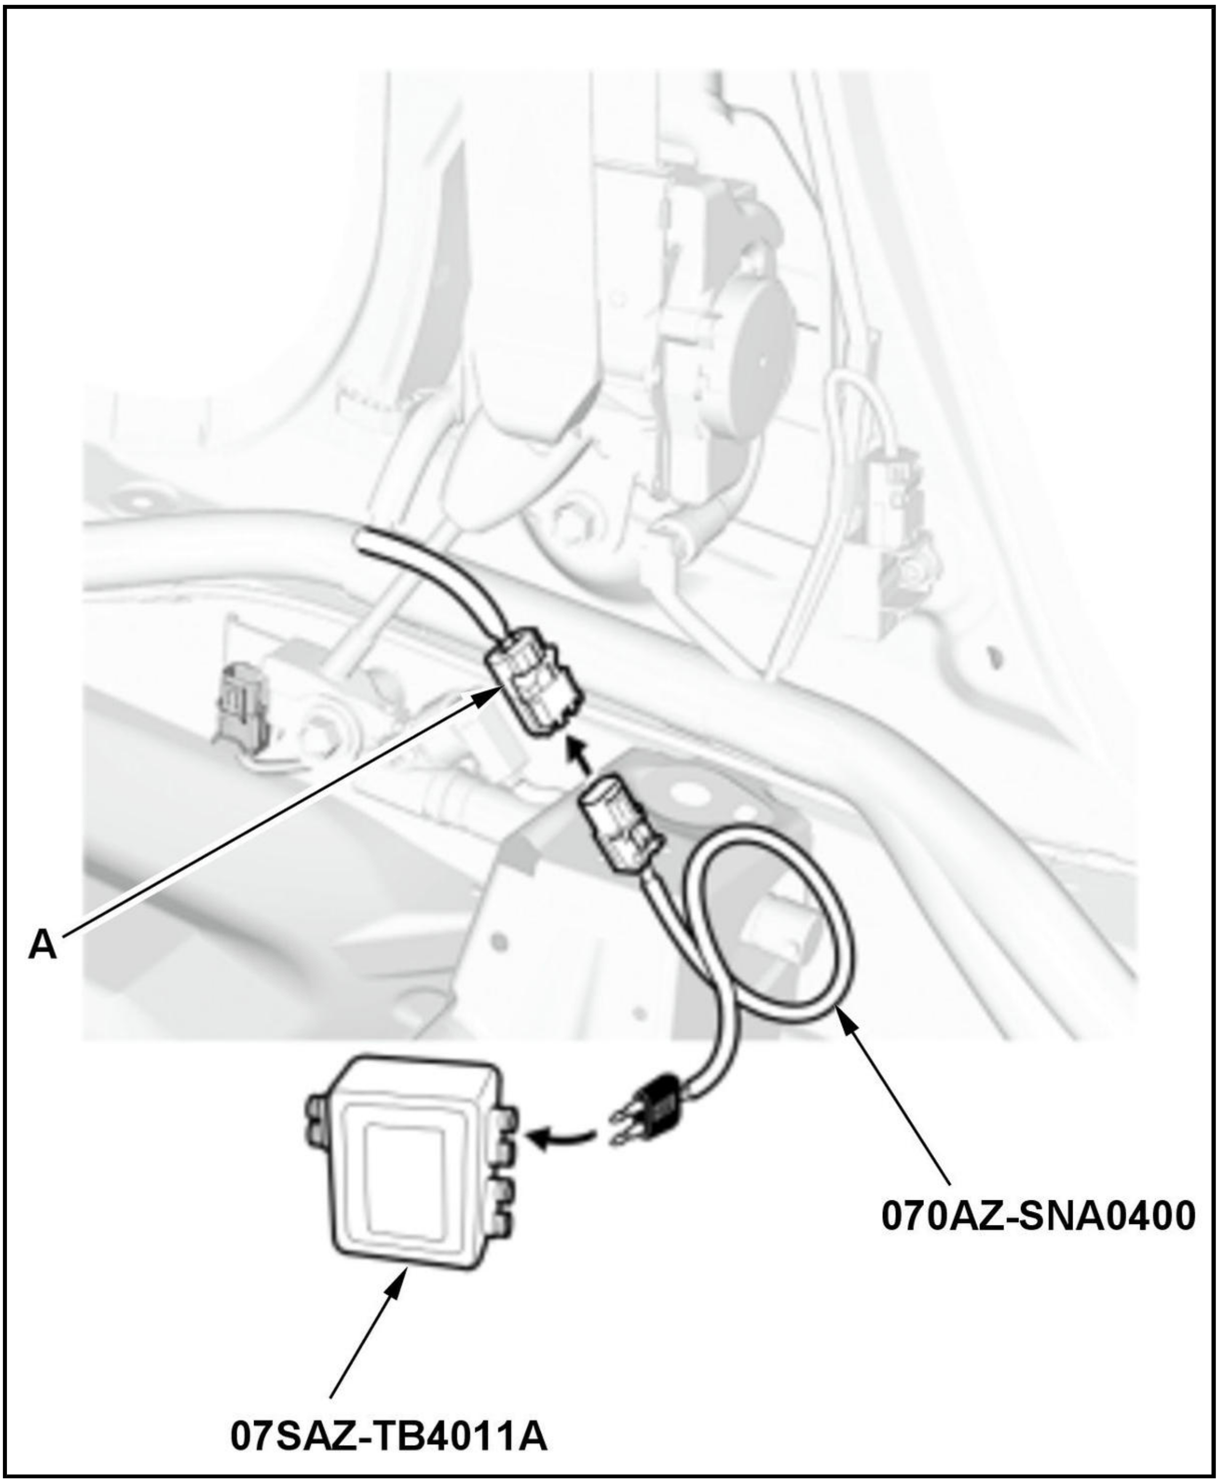
2. Driver's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the left side B-pillar lower trim cover** .

   -4. Disconnect the driver's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-5. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0079-1A Decreased resistance in the driver's seat belt outer lap tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B

Is DTC B0079-1A or B0079-2B indicated?

YES

Go to step 3.

NO

Short to another wire in the driver's seat belt outer lap tensioner; **replace the driver's seat belt** , then clear the DTC.

3. Shorted wire check (LLP+ line to LLP- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect SRS simulator lead M from the driver's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 24**
Test point 2	**SRS unit connector B (39P) No. 25**

Is there an open circuit, or at least 1 MΩ?

YES

The LLP+ and LLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B007A-11

DTC B007A-11 : Short to Ground in the Front Passenger's Seat Belt Outer Lap Tensioner

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number**

and were properly installed .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B007A-11 Short to ground in the front passenger's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B007A-11 Short to ground in the front passenger's seat belt outer lap tensioner	B

   Is DTC B007A-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

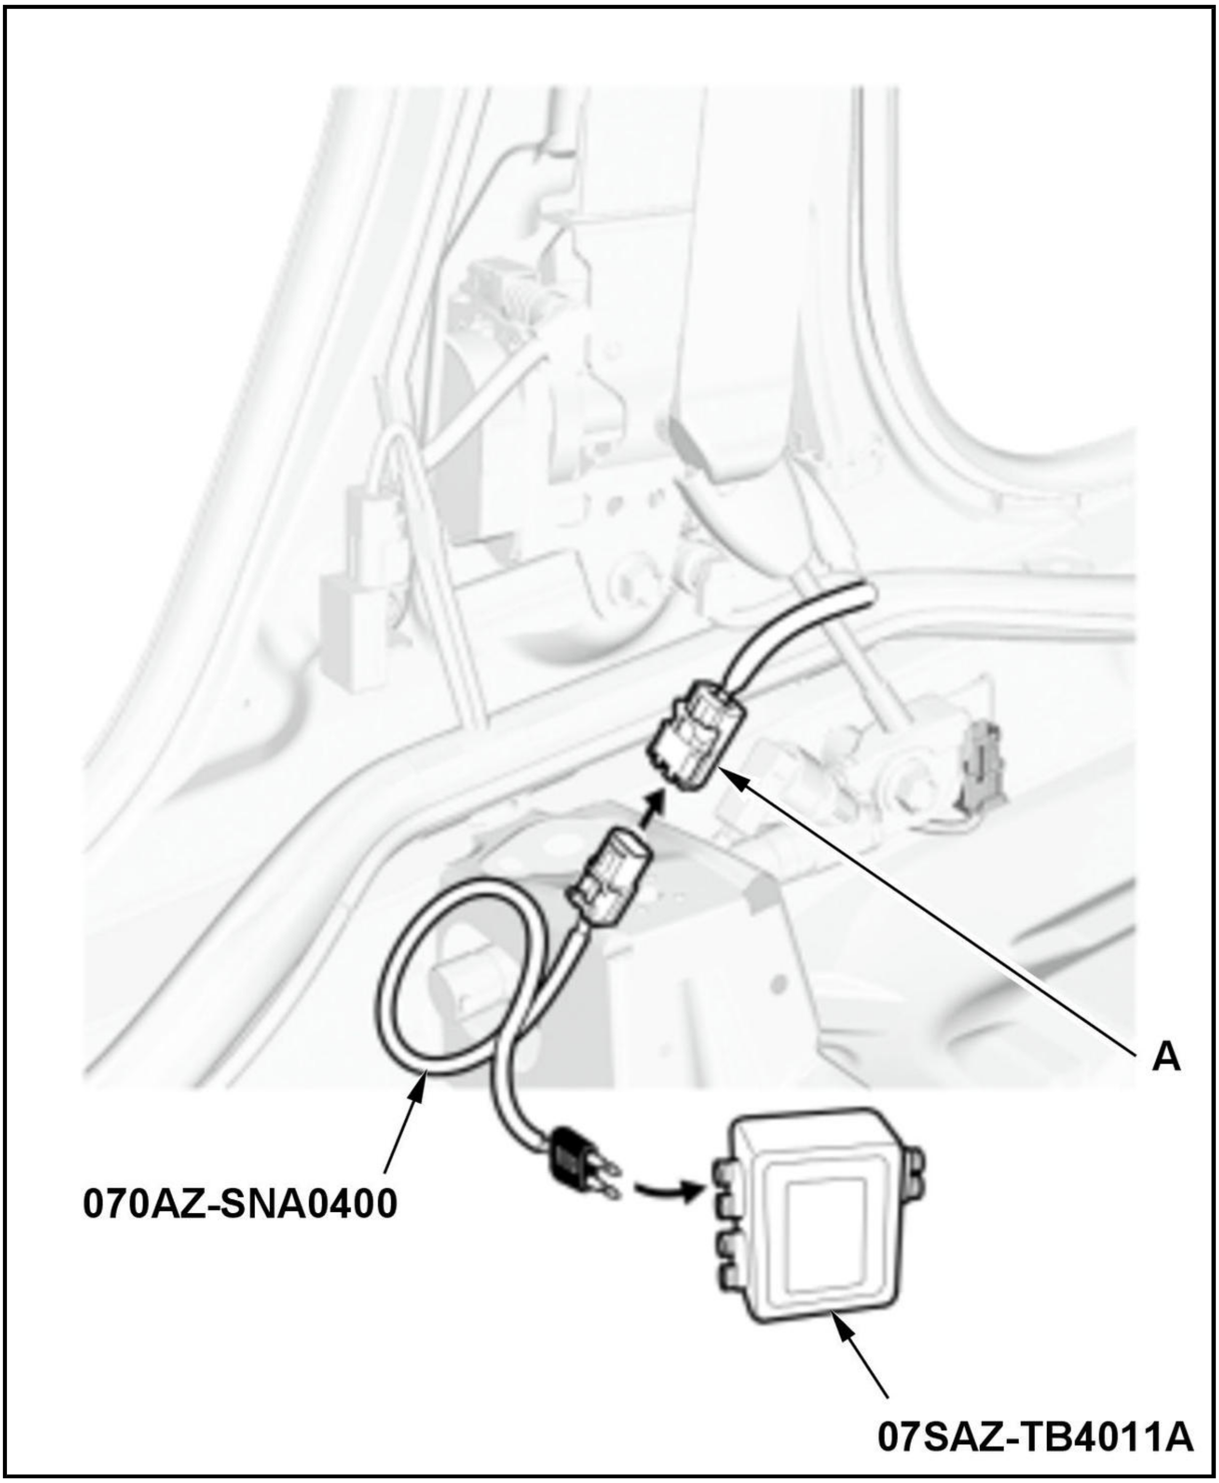
2. Front passenger's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the right side B-pillar lower trim cover** .

   -4. Disconnect the front passenger's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-5. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B007A-11 Short to ground in the front passenger's seat belt outer lap tensioner	B

Is DTC B007A-11 indicated?

YES

Go to step 3.

NO

Short to ground in the front passenger's seat belt outer lap tensioner; **replace the front passenger's seat belt** , then clear the DTC.

3. Shorted wire check (RLP+, RLP- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect SRS simulator lead M from the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 22**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 23**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The RLP+ and RLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B007A-12

DTC B007A-12 : Short to Power in the Front Passenger's Seat Belt Outer Lap Tensioner

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B007A-12 Short to power in the front passenger's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B007A-12 Short to power in the front passenger's seat belt outer lap tensioner	B

   Is DTC B007A-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

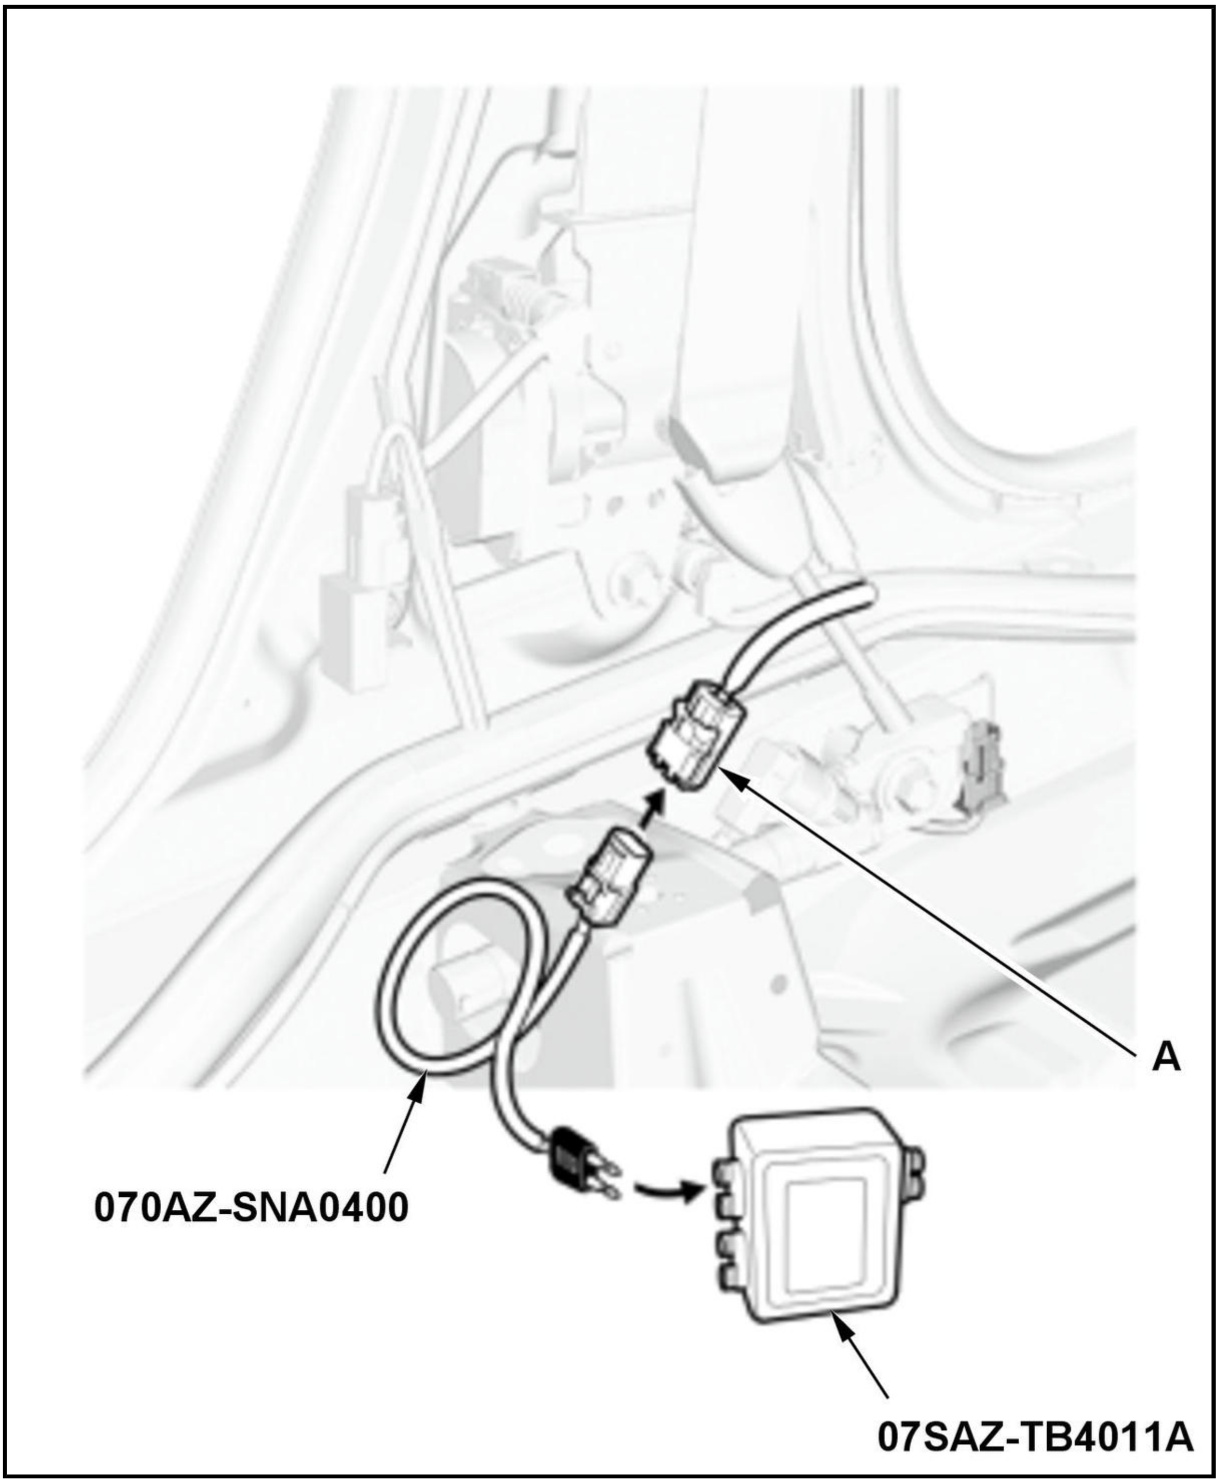
2. Front passenger's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the right side B-pillar lower trim cover** .

   -4. Disconnect the front passenger's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-5. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B007A-12 Short to power in the front passenger's seat belt outer lap tensioner	B

Is DTC B007A-12 indicated?

YES

Go to step 3.

NO

Short to power in the front passenger's seat belt outer lap tensioner; **replace the front passenger's seat belt** , then clear the DTC.

3. Shorted wire check (RLP+, RLP- lines to power)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Disconnect SRS simulator lead M from the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

-5. Reconnect the negative cable to the 12 volt battery.

-6. Turn the vehicle to the ON mode.

-7. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Front passenger's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 22**
Test point 2	Body ground

Test point 1	**SRS unit connector B (39P) No. 23**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The RLP+ and RLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B007A-13

DTC B007A-13 : Open or Increased Resistance in the Front Passenger's Seat Belt Outer Lap Tensioner

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B007A-13 Open or increased resistance in the front passenger's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B007A-13 Open or increased resistance in the front passenger's seat belt outer lap tensioner	B

   Is DTC B007A-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

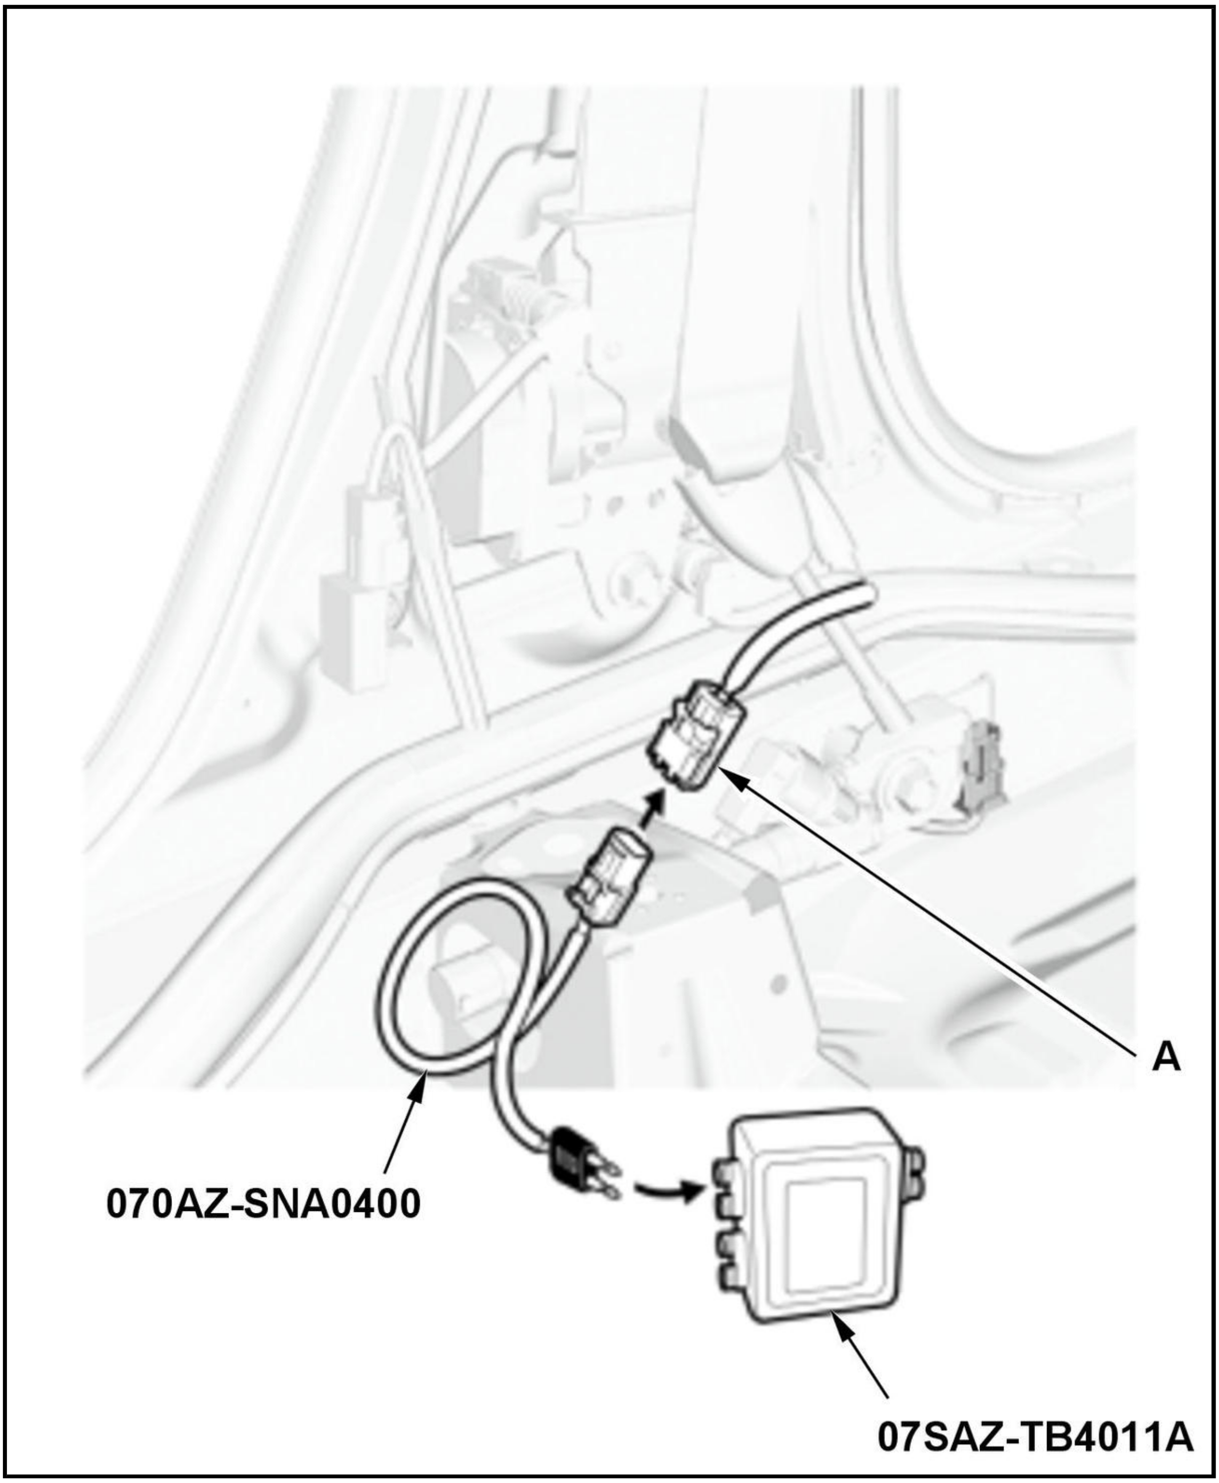
2. Front passenger's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the right side B-pillar lower trim cover** .

   -4. Disconnect the front passenger's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-5. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B007A-13 Open or increased resistance in the front passenger's seat belt outer lap tensioner	B

Is DTC B007A-13 indicated?

YES

Go to step 3.

NO

Open in the front passenger's seat belt outer lap tensioner; **replace the front passenger's seat belt** , then clear the DTC.

3. Open wire check (RLP+, RLP- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Front passenger's seat belt outer lap tensioner 2P connector (on the floor wire harness): connected to SRS simulator lead M
Test point 1	**SRS unit connector B (39P) No. 22**
Test point 2	**SRS unit connector B (39P) No. 23**

Is there 2.0-3.0 Ω?

YES

The RLP+ and RLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B007A-1A, B007A-2B

DTC B007A-1A : Decreased Resistance in the Front Passenger's Seat Belt Outer Lap Tensioner

DTC B007A-2B : Short to Another Wire Harness in the Front Passenger's Seat Belt Outer Lap Tensioner

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead M 070AZ-SNA0400

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B007A-1A Decreased resistance in the front passenger's seat belt outer lap tensioner	B
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B007A-1A Decreased resistance in the front passenger's seat belt outer lap tensioner	B
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B

   Is DTC B007A-1A or B007A-2B indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

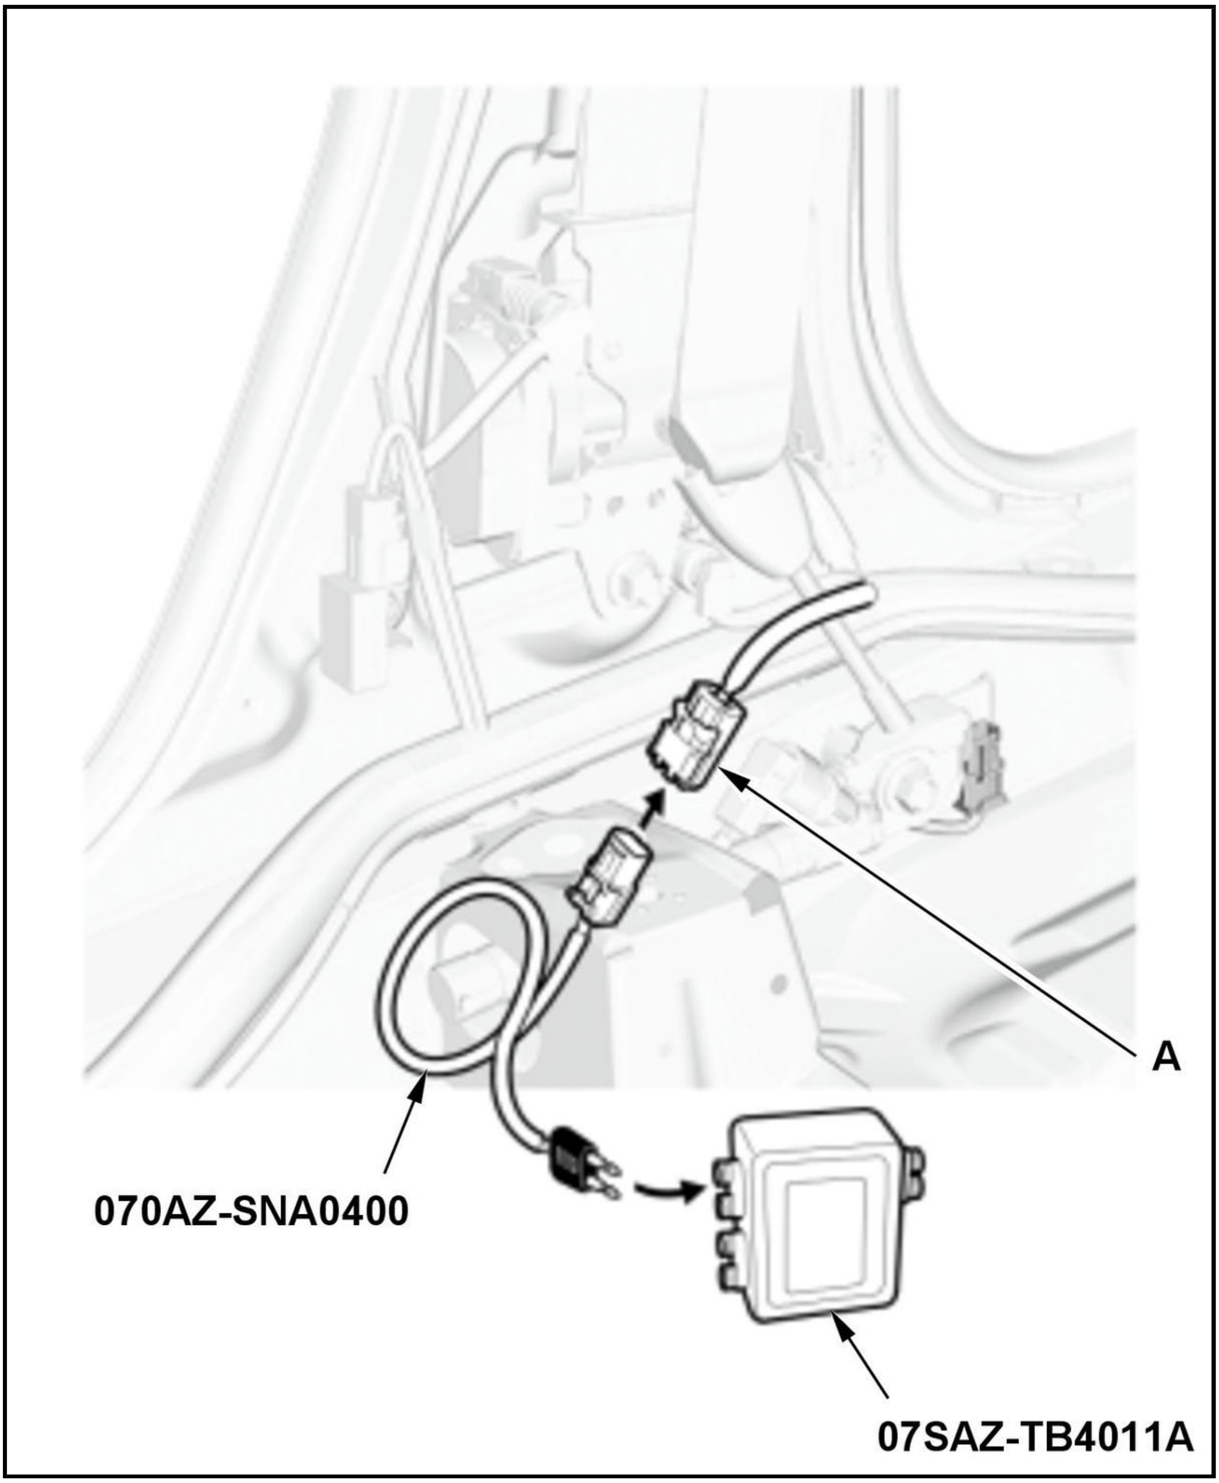
2. Front passenger's seat belt outer lap tensioner check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the right side B-pillar lower trim cover** .

   -4. Disconnect the front passenger's seat belt outer lap tensioner 2P connector (A) on the floor wire harness.



-5. Connect the terminals of SRS simulator lead M to the SRS inflator simulator (2 Ω connectors), then connect SRS simulator lead M to the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B007A-1A Decreased resistance in the front passenger's seat belt outer lap tensioner	B

DTC Description	DTC
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B

Is DTC B007A-1A or B007A-2B indicated?

YES

Go to step 3.

NO

Short to another wire in the front passenger's seat belt outer lap tensioner; **replace the front passenger's seat belt** , then clear the DTC.

3. Shorted wire check (RLP+ line to RLP- line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the following connector.

SRS unit connector B (39P)

   -4. Disconnect SRS simulator lead M from the front passenger's seat belt outer lap tensioner 2P connector on the floor wire harness.

   -5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Front passenger's seat belt outer lap tensioner 2P connector (on the floor wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 22**
Test point 2	**SRS unit connector B (39P) No. 23**

Is there an open circuit, or at least 1 MΩ?

YES

The RLP+ and RLP- wires are OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0082-11

DTC B0082-11 : Short to Ground in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number**

and were properly installed .

- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0082-11 Short to ground in the selectable energy absorption device of the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0082-11 Short to ground in the selectable energy absorption device of the front passenger's seat belt tensioner	B

   Is DTC B0082-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (RVEA+, RVEA- lines) 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the right side B-pillar lower trim** .

   -4. Disconnect the following connector.

Selectable energy absorption device 2P connector (on the floor wire harness)

   -5. Reconnect the negative cable to the 12 volt battery.

   -6. Turn the vehicle to the ON mode, then clear the DTC.

   -7. Check for DTCs with the HDS.

DTC Description	DTC
B0082-11 Short to ground in the selectable energy absorption device of the front passenger's seat belt tensioner	B

   Is DTC B0082-11 indicated?

   NO

Go to step 3.

YES

Short to ground in the selectable energy absorption device; replace the front passenger's seat belt , then clear the DTC.

3. Shorted wire check (RVEA+, RVEA- lines) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Selectable energy absorption device 2P connector (on the floor wire harness): disconnected
Test point 1	SRS unit connector A (39P) No. 2
Test point 2	Body ground

Test point 1	SRS unit connector A (39P) No. 3
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The RVEA+ and RVEA- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit .

NO

Short to ground in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0082-12

DTC B0082-12 : Short to Power in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and 12 Volt Battery Terminal Disconnection and Reconnection .

DTC Description	DTC
B0082-12 Short to power in the selectable energy absorption device of the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0082-12 Short to power in the selectable energy absorption device of the front passenger's seat belt tensioner	B

   Is DTC B082-12 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (RVEA+, RVEA- lines to power) 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. **Remove the right side B-pillar lower trim** .

   -4. Disconnect the following connector.

Selectable energy absorption device 2P connector (on the floor wire harness)

   -5. Reconnect the negative cable to the 12 volt battery.

   -6. Turn the vehicle to the ON mode, then clear the DTC.

   -7. Check for DTCs with the HDS.

DTC Description	DTC
B0082-12 Short to power in the selectable energy absorption device of the front passenger's seat belt tensioner	B

   Is DTC B082-12 indicated?

   NO

   Go to step 3.

   YES

   Short to power in the selectable energy absorption device; **replace the front passenger's seat belt** , then clear the DTC.

3. Shorted wire check (RVEA+, RVEA- lines to power) 2

   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector A (39P): disconnected
	Selectable energy absorption device 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 2**
Test point 2	Body ground

Test point 1	**SRS unit connector A (39P) No. 3**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The RVEA+ and RVEA- wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to power in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0082-13

DTC B0082-13 : Open or Increased Resistance in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0082-13 Open or increased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0082-13 Open or increased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0082-13 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Selectable energy absorption device check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

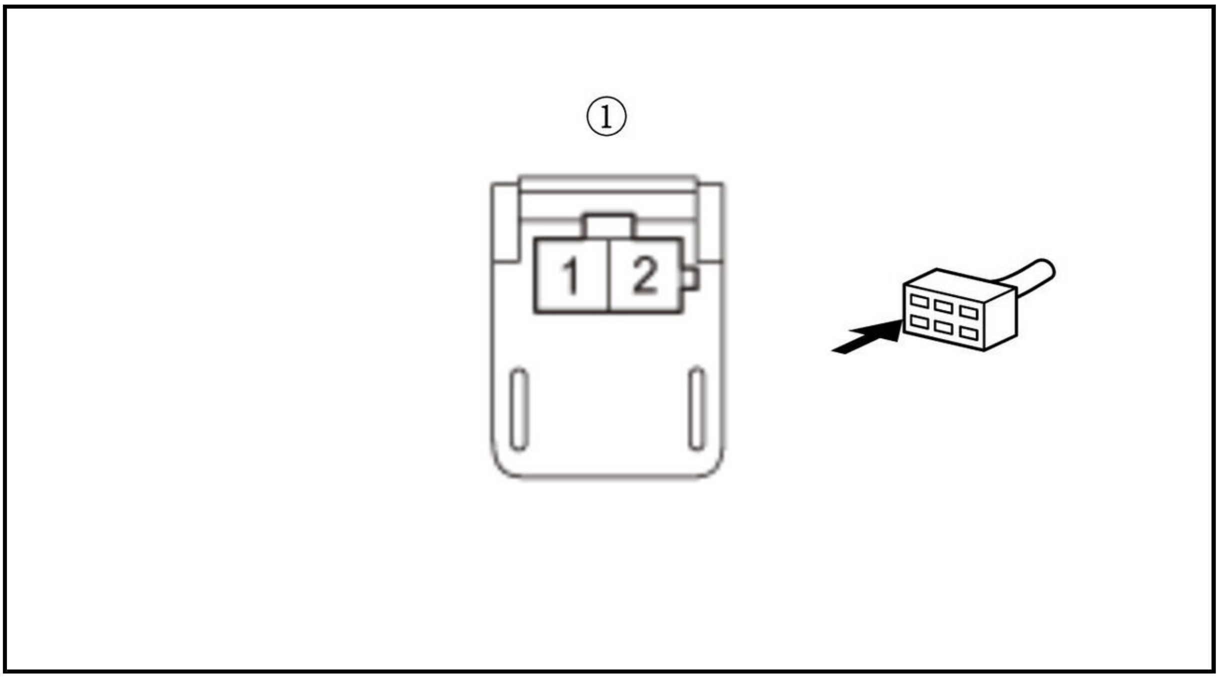
-3. **Remove the right side B-pillar lower trim** .

-4. Disconnect the following connector.

Selectable energy absorption device 2P connector (on the floor wire harness)

-5. Connect terminals A and B with a jumper wire.

Terminal A	Selectable energy absorption device 2P connector No. 1 (on the floor wire harness)
Terminal B	Selectable energy absorption device 2P connector No. 2 (on the floor wire harness)



-6. Reconnect the negative cable to the 12 volt battery.

-7. Clear the DTCs with the HDS.

-8. Turn the vehicle to the ON mode, then wait for 10 seconds.

-9. Check for DTCs with the HDS.

DTC Description	DTC
B0082-13 Open or increased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0082-13 indicated?

YES

Go to step 3.

NO

Open in the selectable energy absorption device; **replace the front passenger's seat belt** , then clear the DTC.

3. Open wire check (RVEA+, RVEA- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Remove the jumper wire from the selectable energy absorption device 2P connector on the floor wire harness.

-4. Disconnect the following connector.

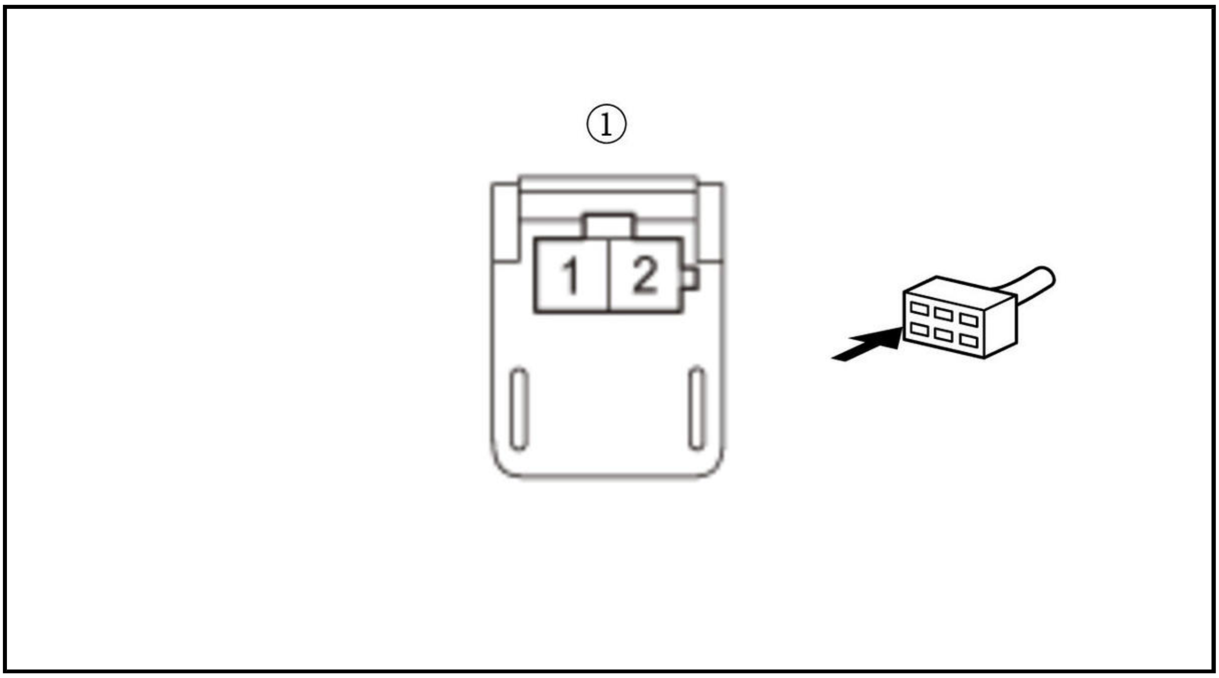
SRS unit connector A (39P)

-5. Connect terminals A and B with a jumper wire.

Terminal A	**SRS unit connector A (39P) No. 2**
Terminal B	**SRS unit connector A (39P) No. 3**

-6. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Selectable energy absorption device 2P connector (on the floor wire harness): disconnected
	SRS unit connector A (39P): disconnected
	SRS unit connector A (39P) terminals No. 2 and No. 3: jumped
Test point 1	Selectable energy absorption device 2P connector No. 1 (on the floor wire harness)
Test point 2	Selectable energy absorption device 2P connector No. 2 (on the floor wire harness)



Is there 1.0 Ω or less?

YES

The RVEA+ and RVEA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Open in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0082-1A

DTC B0082-1A : Decreased Resistance in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

Special Tools Required

SRS Short Canceller 070AZ-SAA0100

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0082-1A Decreased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0082-1A Decreased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0082-1A indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Selectable energy absorption device check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the right side B-pillar lower trim** .

-4. Disconnect the following connector.

Selectable energy absorption device 2P connector (on the floor wire harness)

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0082-1A Decreased resistance in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0082-1A indicated?

YES

Go to step 3.

NO

Short to another wire in the selectable energy absorption device; **replace the front passenger's seat belt** , then clear the DTC.

3. Shorted wire check (RVEA+ line to RVEA- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector A (39P)

-4. **Connect the SRS short canceller to SRS unit connector A (39P) terminals No. 2 and No. 3** .

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Selectable energy absorption device 2P connector (on the floor wire harness): disconnected
	SRS unit connector A (39P): disconnected
	SRS unit connector A (39P) No. 2 and No. 3: connected to SRS short canceller
Test point 1	**SRS unit connector A (39P) No. 2**
Test point 2	**SRS unit connector A (39P) No. 3**

Is there an open circuit, or at least 1 MΩ?

YES

The RVEA+ and RVEA- wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit. Check the connection; if the connection is OK, **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

DTC B0082-2B

DTC B0082-2B : Short to Another Wire Harness in the Selectable Energy Absorption Device of the Front Passenger's Seat Belt Tensioner

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0082-2B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. DTC check

-1. Check for DTCs with the HDS.

DTC Description	DTC
B0001-2B Short to another wire harness in the driver's airbag first inflator	B
B0002-2B Short to another wire harness in the driver's airbag second inflator	B
B0010-2B Short to another wire harness in the front passenger's airbag first inflator	B
B0011-2B Short to another wire harness in the front passenger's airbag second inflator	B
B0020-2B Short to another wire harness in the driver's side airbag inflator	B
B0021-2B Short to another wire harness in the left side curtain airbag first inflator	B
B0028-2B Short to another wire harness in the front passenger's side airbag inflator	B
B0029-2B Short to another wire harness in the right side curtain airbag first inflator	B
B0070-2B Short to another wire harness in the driver's seat belt tensioner	B
B0072-2B Short to another wire harness in the front passenger's seat belt tensioner	B
B0079-2B Short to another wire harness in the driver's seat belt outer lap tensioner	B
B007A-2B Short to another wire harness in the front passenger's seat belt outer lap tensioner	B
B0082-2B Short to another wire harness in the selectable energy absorption device of the front passenger's seat belt tensioner	B

Is DTC B0001-2B, B0002-2B, B0010-2B, B0011-2B, B0020-2B, B0021-2B, B0028-2B, B0029-2B, B0070-2B, B0072-2B, B0079-2B or B007A-2B indicated with DTC B0082-2B?

YES

Go to step 3.

NO

Short to another wire in the floor wire harness; replace the floor wire harness, then clear the DTC.

3. Shorted wire check (RVEA lines to another line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. **Remove the right side B-pillar lower trim** .

-4. Disconnect the following connectors.

SRS unit connector A (39P)
SRS unit connector B (39P)
Selectable energy absorption device 2P connector (on the floor wire harness)
Inflator connectors which are assigned to 2B codes listed on HDS

-5. Measure the resistance between test points 1 and 2 of SRS unit connector A (39P) and B (39P) according to table.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	SRS unit connector B (39P): disconnected
	Selectable energy absorption device 2P connector (on the floor wire harness): disconnected
	Inflator connectors which are assigned to 2B codes listed on HDS: disconnected

DTC	Test point 1	Test point 2
	From terminal	To terminal
B0001-2B	**SRS unit connector A (39P) No. 2**	**SRS unit connector A (39P) No. 9**

	SRS unit connector A (39P) No. 3	**SRS unit connector B (39P) No. 18**
B0079-2B	**SRS unit connector A (39P) No. 2**	**SRS unit connector B (39P) No. 24**
	SRS unit connector A (39P) No. 3	**SRS unit connector B (39P) No. 25**

DTC	Test point 1	Test point 2
	From terminal	To terminal
B007A-2B	**SRS unit connector A (39P) No. 2**	**SRS unit connector B (39P) No. 23**
	SRS unit connector A (39P) No. 3	**SRS unit connector B (39P) No. 22**

Is there 1 MΩ or more?

YES

The RVEA wires are OK. Faulty SRS unit or poor connection at SRS unit connector A (39P) and the SRS unit, or SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the dashboard wire harness or the floor wire harness.

NO

Short to another wire in the dashboard wire harness or the floor wire harness; replace the faulty harness, then clear the DTC.

DTC B0090-4A, B0090-92

DTC B0090-4A, B0090-92 : Internal Failure of the Left Front Impact Sensor

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0090-4A Internal failure of the left front impact sensor	B
B0090-92 Internal failure of the left front impact sensor	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0090-4A Internal failure of the left front impact sensor	B
B0090-92 Internal failure of the left front impact sensor	B

Is DTC B0090-4A or B0090-92 indicated?

YES

The failure is duplicated. **Replace the left front impact sensor** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B0090-87

DTC B0090-87 : No Signal From the Left Front Impact Sensor

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead L 070AZ-SNA0300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0090-87 No signal from the left front impact sensor	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0090-87 No signal from the left front impact sensor	B

   Is DTC B0090-87 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Connector connection check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following connections.

SRS unit connector A (39P)
Left front impact sensor 2P connector (on the engine compartment wire harness)
Connector between the SRS unit and the left front impact sensor

   Are the connectors OK?

   YES

   Go to step 4.

NO

Go to step 3.

3. System check

-1. Reset the loose connections that caused the problem in step 2.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B0090-87 No signal from the left front impact sensor	B

Is DTC B0090-87 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 4.

NO

The system is OK at this time.

4. Shorted wire check (LFS+ line to LFS- line)

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. Disconnect the following connectors.

SRS unit connector A (39P)
Left front impact sensor 2P connector (on the engine compartment wire harness)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Left front impact sensor 2P connector (on the engine compartment wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 31**
Test point 2	**SRS unit connector A (39P) No. 32**

Is there an open circuit, or at least 1 MΩ?

YES

The LFS+ and LFS- wires are not shorted. Go to step 5.

NO

Short to another wire in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

5. Shorted wire check (LFS+, LFS- lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Left front impact sensor 2P connector (on the engine compartment wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 31**
Test point 2	Body ground

Test point 1	**SRS unit connector A (39P) No. 32**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The LFS+ and LFS- wires are not shorted. Go to step 6.

NO

Short to ground in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

6. Shorted wire check (LFS+, LFS- lines to power)

-1. Reconnect the negative cable to the 12 volt battery.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector A (39P): disconnected
	Left front impact sensor 2P connector (on the engine compartment wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 31**
Test point 2	Body ground

Test point 1	**SRS unit connector A (39P) No. 32**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The LFS+ and LFS- wires are not shorted to power. Go to step 7.

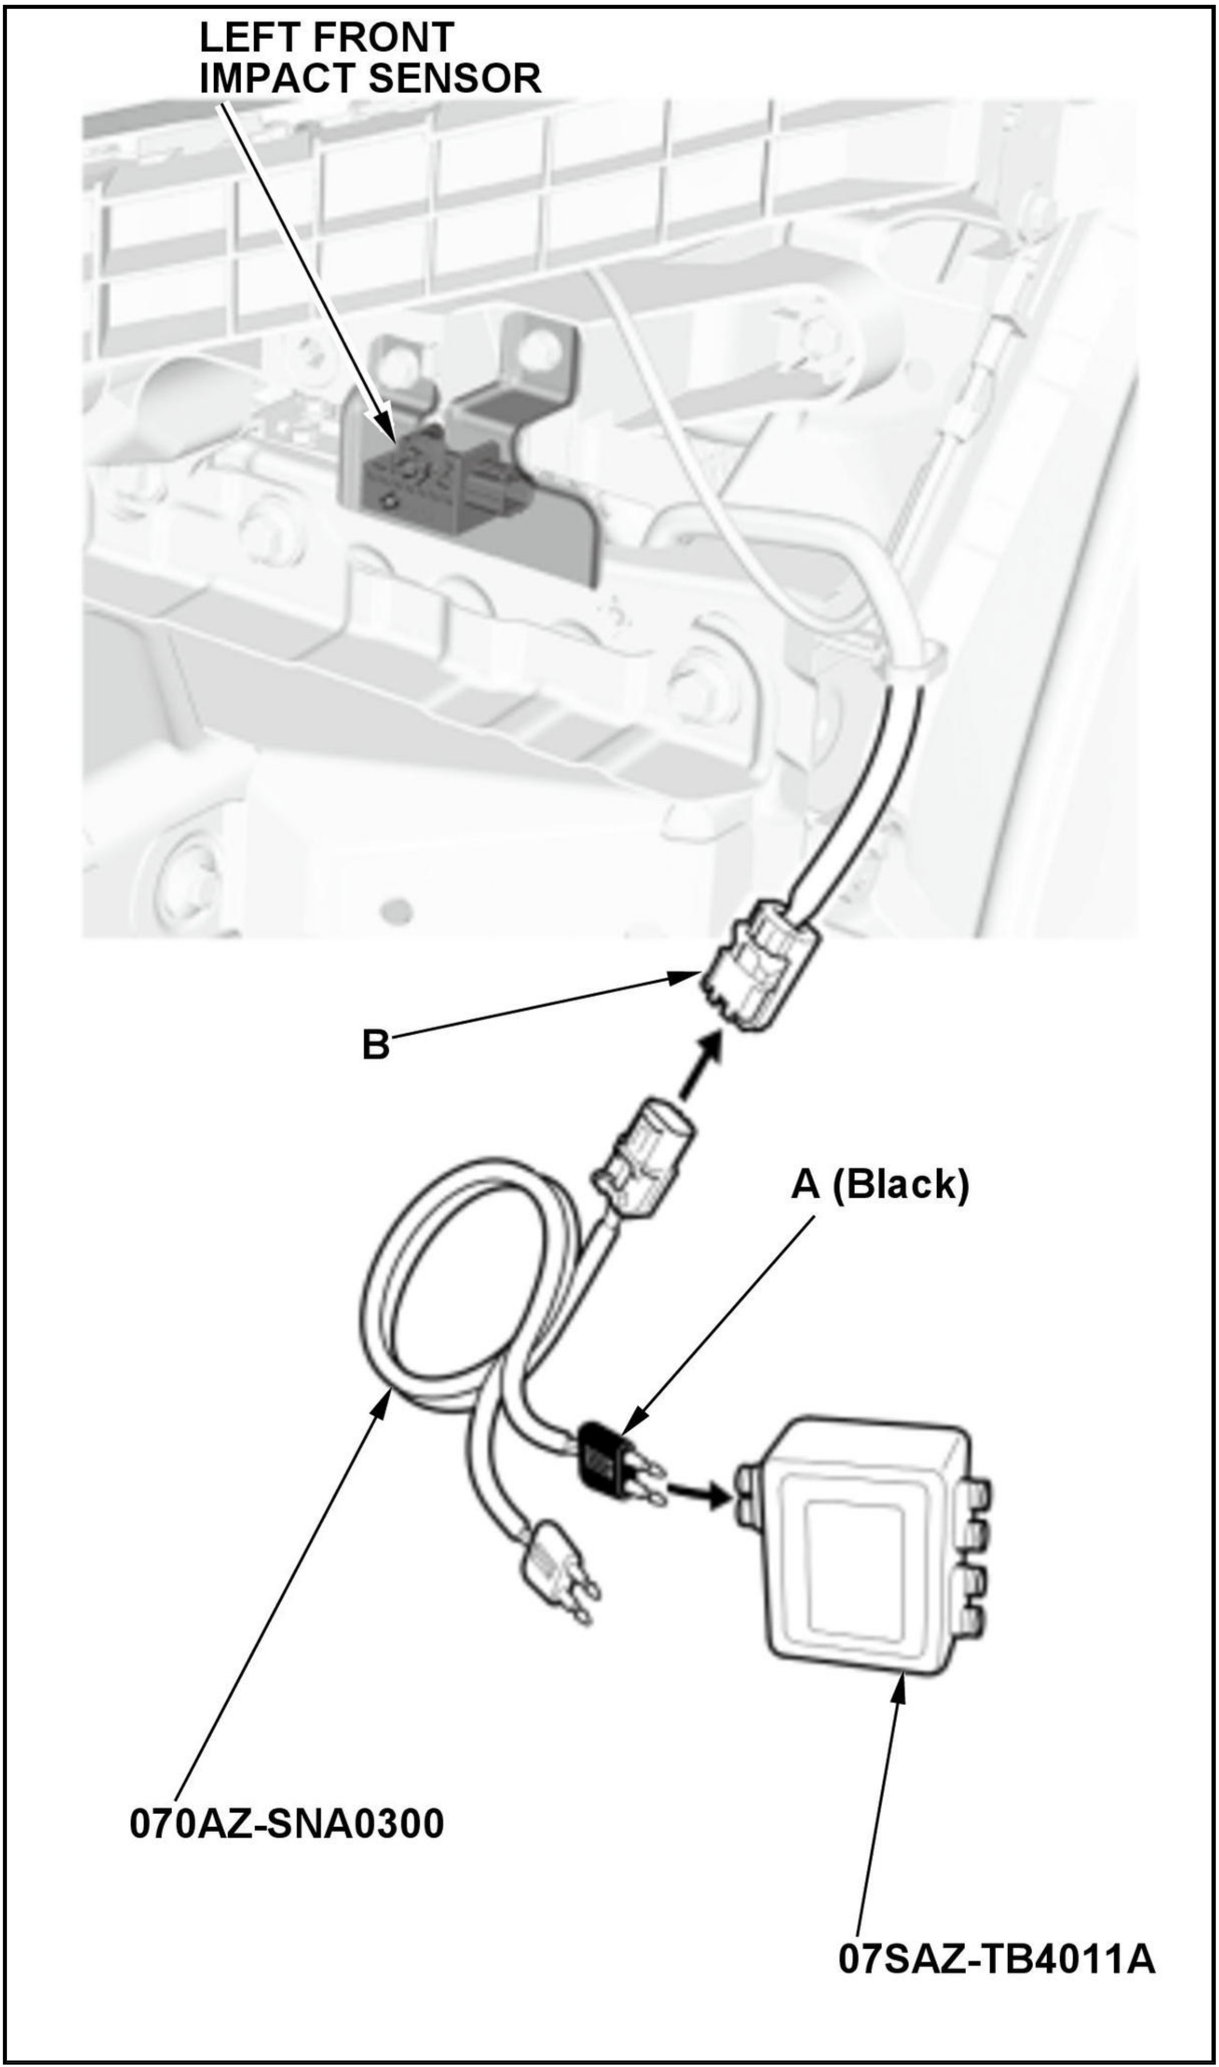
NO

Short to power in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

7. Open wire check (LFS+, LFS- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Connect the black terminal (A) of SRS simulator lead L to the SRS inflator simulator (jumper connector), then connect SRS simulator lead L to the left front impact sensor 2P connector (B) on the engine compartment wire harness.



LEFT FRONT
IMPACT SENSOR
B
A (Black)
070AZ-SNA0300
07SAZ-TB4011A

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Left front impact sensor 2P connector (on the engine compartment wire harness): disconnected
	Left front impact sensor 2P connector (on the engine compartment wire harness): connected to SRS simulator lead L
Test point 1	**SRS unit connector A (39P) No. 31**
Test point 2	**SRS unit connector A (39P) No. 32**

Is there 1.0 Ω or less?

YES

The LFS+ and LFS- wires are OK. **Replace the left front impact sensor** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

DTC B0091-4A, B0091-92

DTC B0091-4A, B0091-92 : Internal Failure of the Left Side Impact Sensor (first)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0091-4A Internal failure of the left side impact sensor (first)	B
B0091-92 Internal failure of the left side impact sensor (first)	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0091-4A Internal failure of the left side impact sensor (first)	B
B0091-92 Internal failure of the left side impact sensor (first)	B

Is DTC B0091-4A or B0091-92 indicated?

YES

The failure is duplicated. **Replace the left side impact sensor (first)** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B0091-87, B0092-87

DTC B0091-87 : No Signal From the Left Side Impact Sensor (first)

DTC B0092-87 : No Signal From the Left Side Impact Sensor (second)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0091-87 No signal from the left side impact sensor (first)	B
B0092-87 No signal from the left side impact sensor (second)	B

DTC (SRS)

1. DTC check

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0091-4A Internal failure of the left side impact sensor (first)	B
B0091-87 No signal from the left side impact sensor (first)	B
B0091-92 Internal failure of the left side impact sensor (first)	B
B0092-4A Internal failure of the left side impact sensor (second)	B
B0092-87 No signal from the left side impact sensor (second)	B
B0092-92 Internal failure of the left side impact sensor (second)	B

Are DTCs indicated?

DTC B0091-87

Go to step 2.

DTC B0092-87

Go to step 10.

DTC B0091-4A or B0091-92

Replace the left side impact sensor (first) , then clear the DTC.

DTC B0092-4A or B0092-92

Replace the left side impact sensor (second) , then clear the DTC.

NO DTC

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Harness visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for damage on the floor wire harness that side impact sensor is connected to.

Is the floor wire harness OK?

YES

Go to step 3.

NO

Replace the floor wire harness, then clear the DTC, and retest.

3. Connector connection check

-1. Check the following connections.

SRS unit connector B (39P)
Left side impact sensor (first) 4P connector (on the floor wire harness)
Left side impact sensor (second) 2P connector (on the floor wire harness)

Are the connectors OK?

YES

Go to step 5.

NO

Go to step 4.

4. System check

-1. Reset the loose connections that caused the problem in step 3.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B0091-87 No signal from the left side impact sensor (first)	B

Is DTC B0091-87 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 5.

NO

The system is OK at this time.

5. Left side impact sensor (first) substituting

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. **Substitute a known-good left side impact sensor (first)** .

-3. Reconnect the negative cable to the 12 volt battery.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the ON mode, then wait for 10 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B0091-87 No signal from the left side impact sensor (first)	B

Is DTC B0091-87 indicated?

YES

Go to step 6.

NO

Replace the left side impact sensor (first) , then clear the DTC.

6. Shorted wire check (LS1+ line to LS1- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Return the left side impact sensor (first) which was replaced.

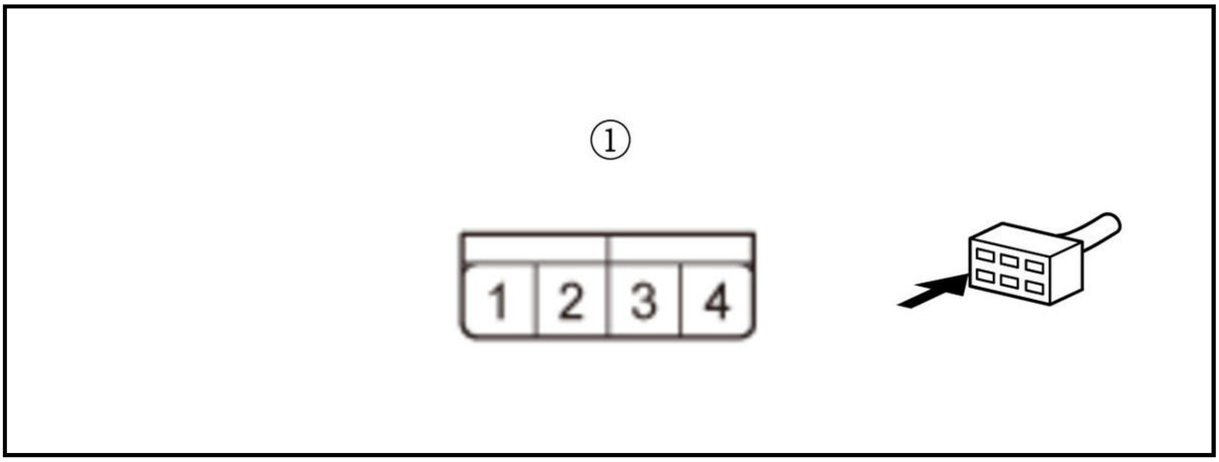
-4. Disconnect the following connectors.

SRS unit connector B (39P)
Left side impact sensor (first) 4P connector (on the floor wire harness)
Left side impact sensor (second) 2P connector (on the floor wire harness)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①

Test point 2	Left side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①



Is there an open circuit, or at least 1 MΩ?

YES

The LS1+ and LS1- wires are not shorted. Go to step 7.

NO

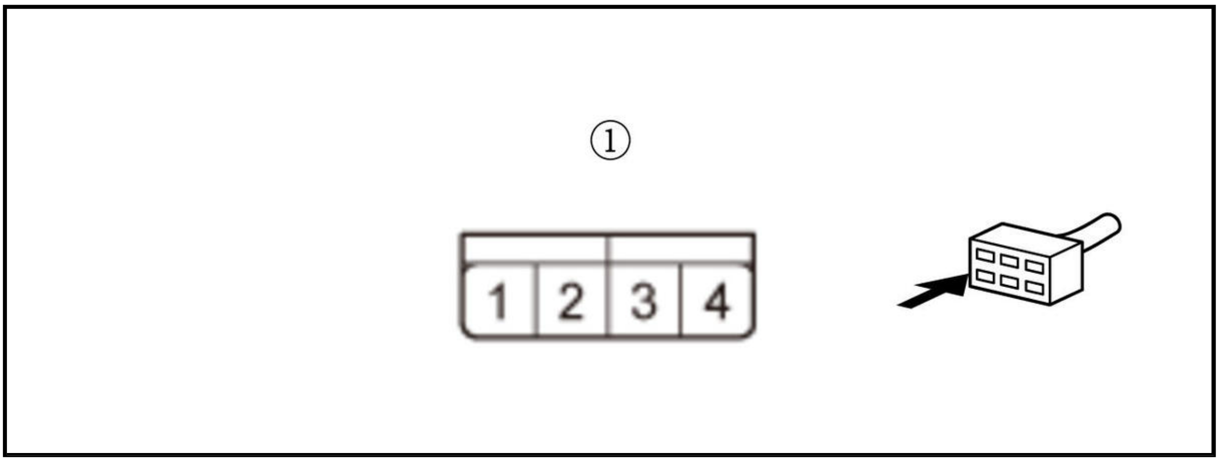
Short to another wire in the floor wire harness between the SRS unit and the left side impact sensor (first); replace the floor wire harness, then clear the DTC.

7. Shorted wire check (LS1+, LS1- lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①
Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The LS1+ and LS1- wires are not shorted. Go to step 8.

NO

Short to ground in the floor wire harness between the SRS unit and the left side impact sensor (first); replace the floor wire harness, then clear the DTC.

8. Shorted wire check (LS1+, LS1- lines to power)

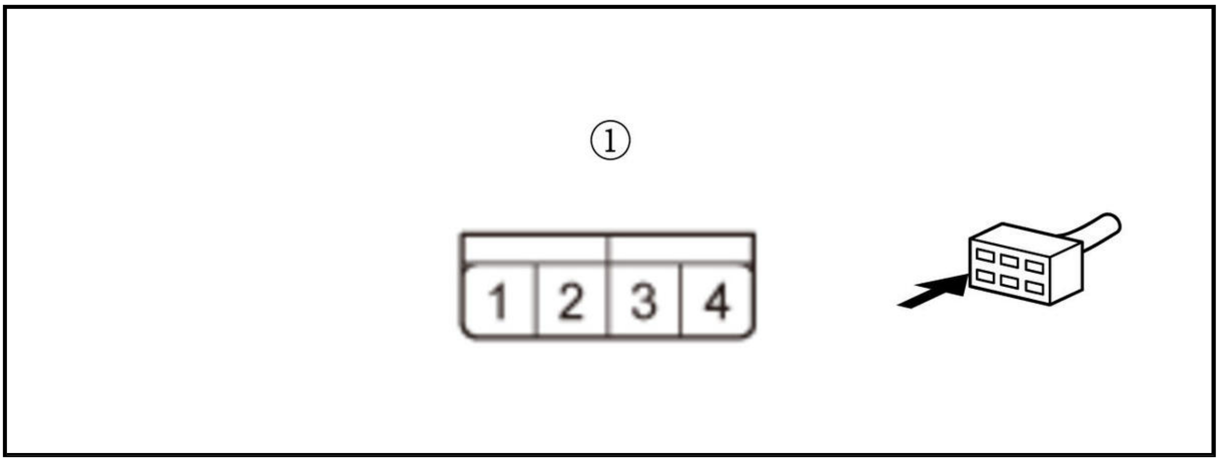
-1. Reconnect the negative cable to the 12 volt battery.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①
Test point 2	Body ground



Is there 0.2 V or less?

YES

The LS1+ and LS1- wires are not shorted to power. Go to step 9.

NO

Short to power in the floor wire harness between the SRS unit and the left side impact sensor (first); replace the floor wire harness, then clear the DTC.

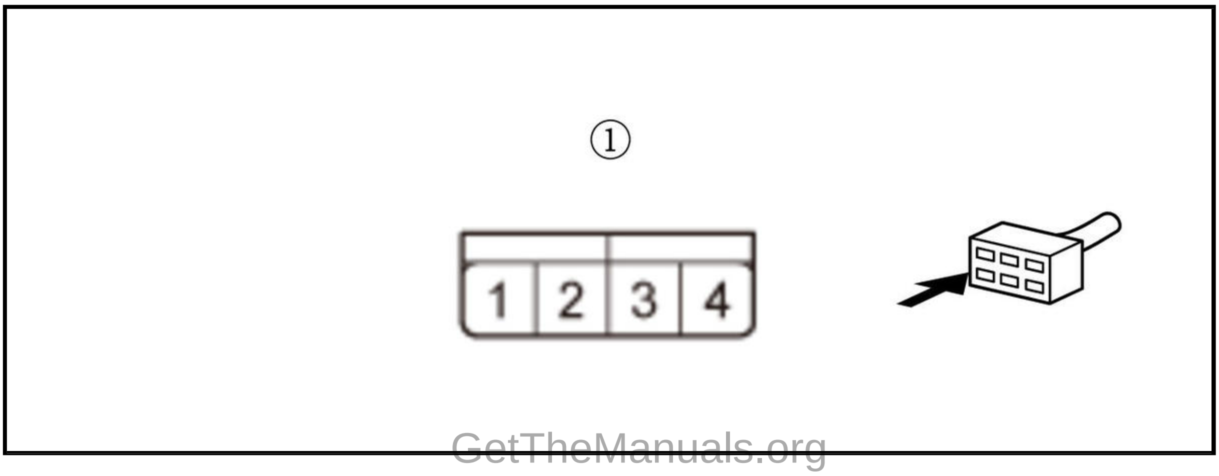
9. Open wire check (LS1+, LS1- lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	SRS unit connector B (39P) No. 38
Test point 2	Left side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①

Test point 1	SRS unit connector B (39P) No. 39
Test point 2	Left side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there 1.0 Ω or less?

YES

The LS1+ and LS1- wires are OK. Disconnect and reconnect the connector, and then check the DTC again. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the floor wire harness between the SRS unit and the left side impact sensor (first); replace the floor wire harness, then clear the DTC.

10. Harness visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check for damage on the floor wire harness that side impact sensor is connected to.

Is the floor wire harness OK?

YES

Go to step 11.

NO

Replace the floor wire harness, then clear the DTC, and retest.

11. Connector connection check

-1. Check the following connections.

SRS unit connector B (39P)
Left side impact sensor (first) 4P connector (on the floor wire harness)

Left side impact sensor (second) 2P connector (on the floor wire harness)

Are the connectors OK?

YES

Go to step 13.

NO

Go to step 12.

12. System check

-1. Reset the loose connections that caused the problem in step 11.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B0092-87 No signal from the left side impact sensor (second)	B

Is DTC B0092-87 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 13.

NO

The system is OK at this time.

13. Left side impact sensor (second) substituting

    -1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

    -2. **Substitute a known-good left side impact sensor (second)** .

    -3. Reconnect the negative cable to the 12 volt battery.

    -4. Clear the DTCs with the HDS.

    -5. Turn the vehicle to the ON mode, then wait for 10 seconds.

    -6. Check for DTCs with the HDS.

DTC Description	DTC
B0092-87 No signal from the left side impact sensor (second)	B

Is DTC B0092-87 indicated?

YES

Go to step 14.

NO

Replace the left side impact sensor (second) , then clear the DTC.

14. Left side impact sensor (first) substituting

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

    -3. Return the left side impact sensor (second) which was replaced.

    -4. **Substitute a known-good left side impact sensor (first)** .

    -5. Reconnect the negative cable to the 12 volt battery.

    -6. Clear the DTCs with the HDS.

    -7. Turn the vehicle to the ON mode, then wait for 10 seconds.

    -8. Check for DTCs with the HDS.

DTC Description	DTC
B0092-87 No signal from the left side impact sensor (second)	B

Is DTC B0092-87 indicated?

YES

Go to step 15.

NO

Replace the left side impact sensor (first) , then clear the DTC.

15. Shorted wire check (LS2+ line to LS2- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

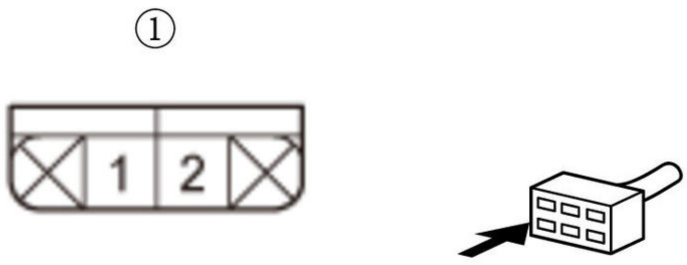
-3. Return the left side impact sensor (first) which was replaced.

-4. Disconnect the following connectors.

SRS unit connector B (39P)
Left side impact sensor (first) 4P connector (on the floor wire harness)
Left side impact sensor (second) 2P connector (on the floor wire harness)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Left side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there an open circuit, or at least 1 MΩ?

YES

The LS2+ and LS2- wires are not shorted. Go to step 16.

NO

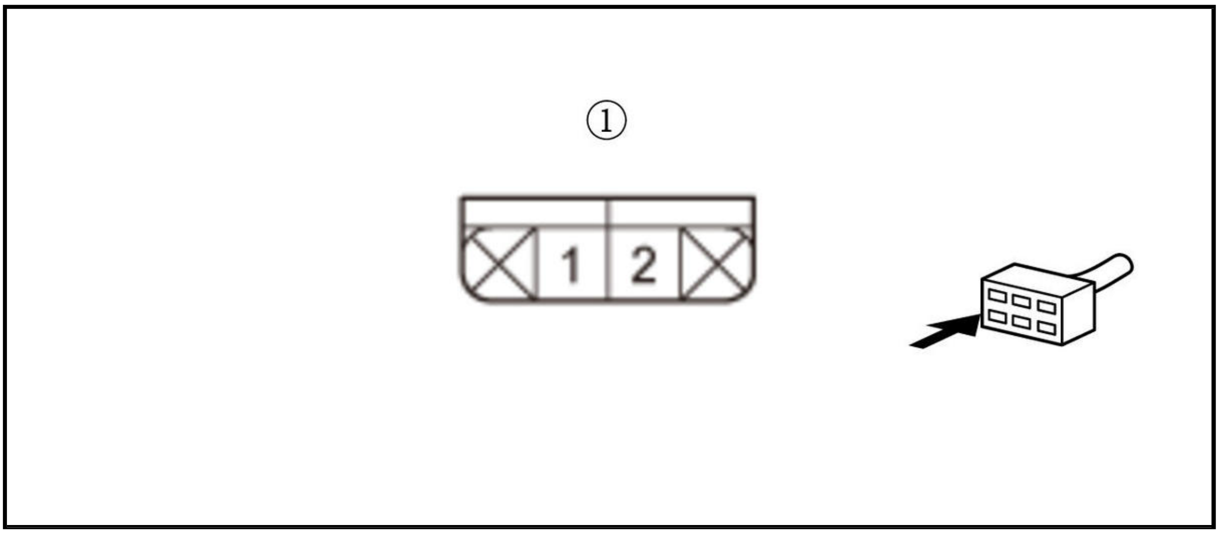
Short to another wire in the floor wire harness between the left side impact sensor (first) and the left side impact sensor (second); replace the floor wire harness, then clear the DTC.

16. Shorted wire check (LS2+, LS2- lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Left side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The LS2+ and LS2- wires are not shorted. Go to step 17.

NO

Short to ground in the floor wire harness between the left side impact sensor (first) and the left side impact sensor (second); replace the floor wire harness, then clear the DTC.

17. Shorted wire check (LS2+, LS2- lines to power)

-1. Reconnect the negative cable to the 12 volt battery.

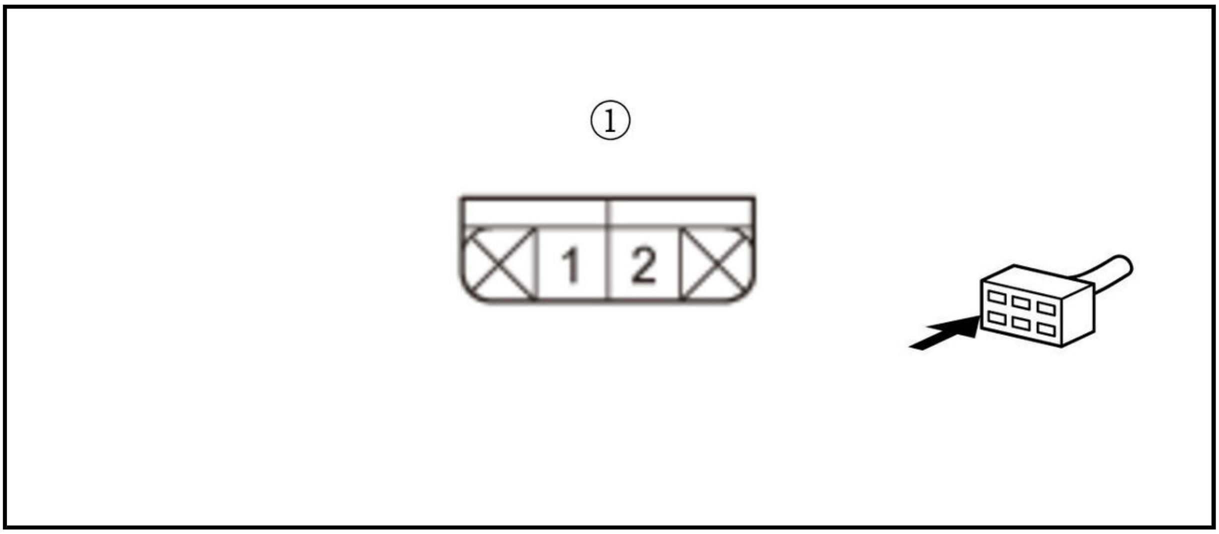
-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Left side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground



Is there 0.2 V or less?

YES

The LS2+ and LS2- wires are not shorted to power. Go to step 18.

NO

Short to power in the floor wire harness between the left side impact sensor (first) and the left side impact sensor (second); replace the floor wire harness, then clear the DTC.

18. Open wire check (LS2+, LS2- lines)

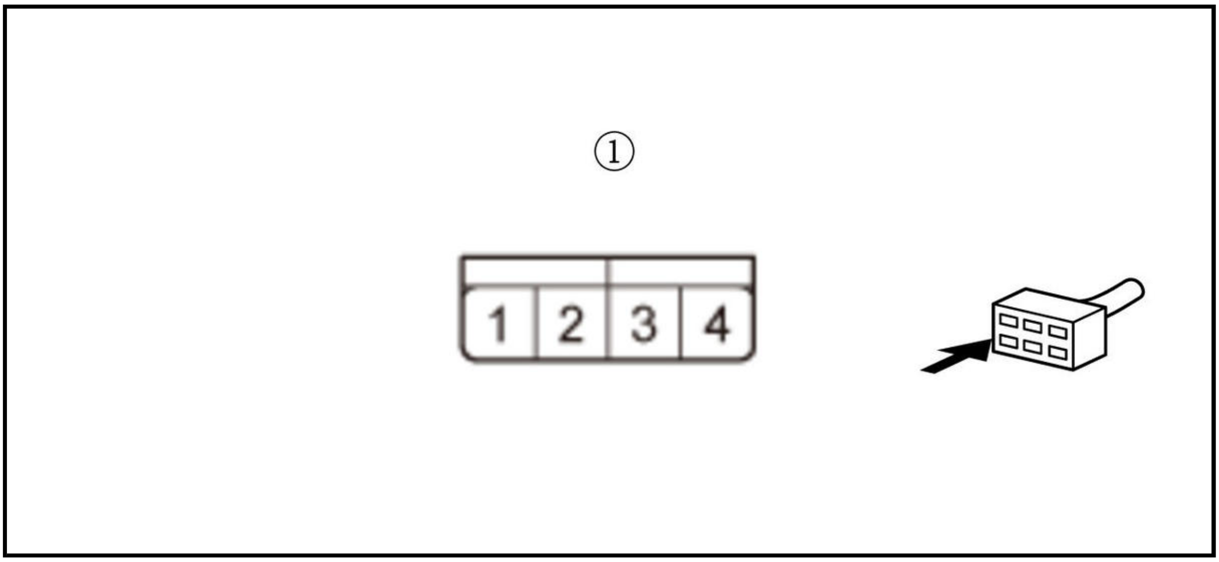
-1. Turn the vehicle to the OFF (LOCK) mode.

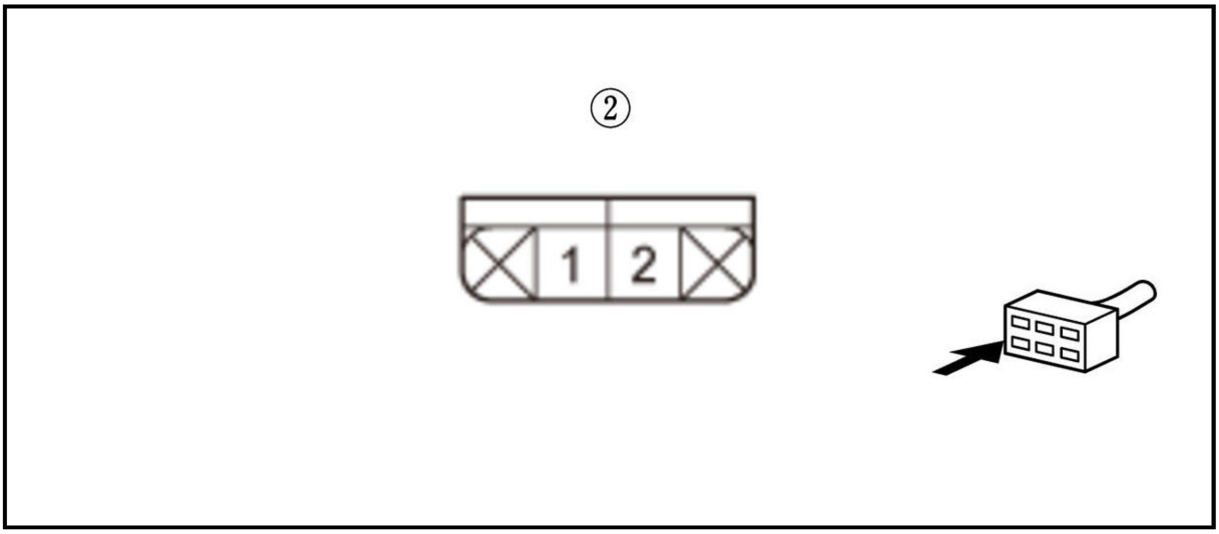
-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Left side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Left side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 1 (on the floor wire harness): ①

Test point 2	Left side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ②

Test point 1	Left side impact sensor (first) 4P connector (female terminals) No. 4 (on the floor wire harness): ①
Test point 2	Left side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ②





Is there 1.0 Ω or less?

YES

The LS2+ and LS2- wires are OK. Disconnect and reconnect the connector, and then check the DTC again. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the floor wire harness between the left side impact sensor (first) and the left side impact sensor (second); replace the floor wire harness, then clear the DTC.

DTC B0092-4A, B0092-92

DTC B0092-4A, B0092-92 : Internal Failure of the Left Side Impact Sensor (second)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0092-4A Internal failure of the left side impact sensor (second)	B
B0092-92 Internal failure of the left side impact sensor (second)	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0092-4A Internal failure of the left side impact sensor (second)	B
B0092-92 Internal failure of the left side impact sensor (second)	B

   Is DTC B0092-4A or B0092-92 indicated?

   YES

   The failure is duplicated. **Replace the left side impact sensor (second)** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B0095-4A, B0095-92

DTC B0095-4A, B0095-92 : Internal Failure of the Right Front Impact Sensor

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0095-4A Internal failure of the right front impact sensor	B
B0095-92 Internal failure of the right front impact sensor	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0095-4A Internal failure of the right front impact sensor	B
B0095-92 Internal failure of the right front impact sensor	B

   Is DTC B0095-4A or B0095-92 indicated?

   YES

   The failure is duplicated. **Replace the right front impact sensor** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B0095-87

DTC B0095-87 : No Signal From the Right Front Impact Sensor

Special Tools Required

SRS Inflator Simulator 07SAZ-TB4011A

SRS Simulator Lead L 070AZ-SNA0300

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0095-87 No signal from the right front impact sensor	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0095-87 No signal from the right front impact sensor	B

Is DTC B0095-87 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Connector connection check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following connections.

SRS unit connector A (39P)
Right front impact sensor 2P connector (on the engine compartment wire harness)
Connector between the SRS unit and the right front impact sensor

Are the connectors OK?

YES

Go to step 4.

NO

Go to step 3.

3. System check

-1. Reset the loose connections that caused the problem in step 2.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B0095-87 No signal from the right front impact sensor	B

Is DTC B0095-87 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 4.

NO

The system is OK at this time.

4. Shorted wire check (RFS+ line to RFS- line)

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. Disconnect the following connectors.

SRS unit connector A (39P)
Right front impact sensor 2P connector (on the engine compartment wire harness)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Right front impact sensor 2P connector (on the engine compartment wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 29**
Test point 2	**SRS unit connector A (39P) No. 30**

Is there an open circuit, or at least 1 MΩ?

YES

The RFS+ and RFS- wires are not shorted. Go to step 5.

NO

Short to another wire in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

5. Shorted wire check (RFS+, RFS- lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Right front impact sensor 2P connector (on the engine compartment wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 29**
Test point 2	Body ground

Test point 1	**SRS unit connector A (39P) No. 30**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The RFS+ and RFS- wires are not shorted. Go to step 6.

NO

Short to ground in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

6. Shorted wire check (RFS+, RFS- lines to power)

-1. Reconnect the negative cable to the 12 volt battery.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode SRS unit connector A (39P): disconnected Right front impact sensor 2P connector (on the engine compartment wire harness): disconnected
Test point 1	**SRS unit connector A (39P) No. 29**
Test point 2	Body ground

Test point 1	**SRS unit connector A (39P) No. 30**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The RFS+ and RFS- wires are not shorted to power. Go to step 7.

NO

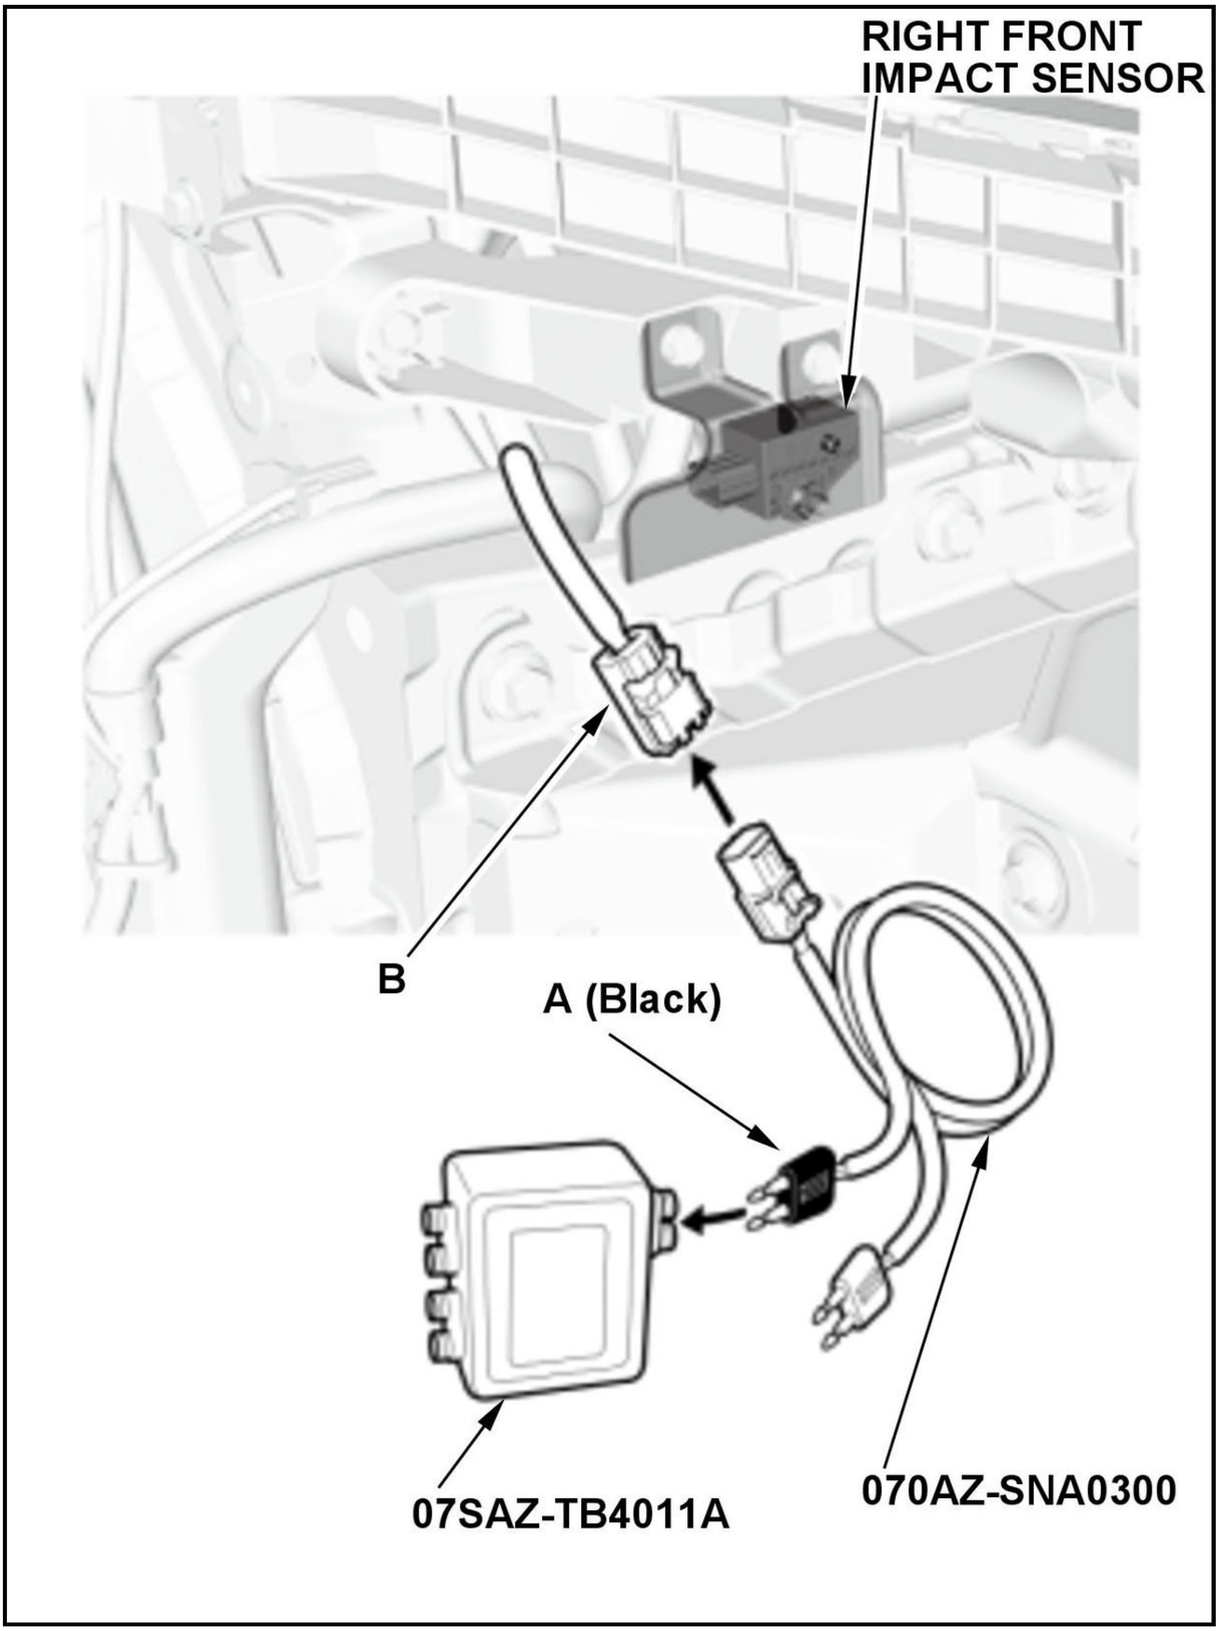
Short to power in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

7. Open wire check (RFS+, RFS- lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Connect the black terminal (A) of SRS simulator lead L to the SRS inflator simulator (jumper connector), then connect SRS simulator lead L to the right front impact sensor 2P connector (B) on the engine compartment wire harness.



RIGHT FRONT IMPACT SENSOR
B
A (Black)
07SAZ-TB4011A
070AZ-SNA0300

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector A (39P): disconnected
	Right front impact sensor 2P connector (on the engine compartment wire harness): disconnected
	Right front impact sensor 2P connector (on the engine compartment wire harness): connected to SRS simulator lead L
Test point 1	**SRS unit connector A (39P) No. 29**
Test point 2	**SRS unit connector A (39P) No. 30**

Is there 1.0 Ω or less?

YES

The RFS+ and RFS- wires are OK. **Replace the right front impact sensor** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the engine compartment wire harness or the dashboard wire harness; replace the faulty harness, then clear the DTC.

DTC B0096-4A, B0096-92

DTC B0096-4A, B0096-92 : Internal Failure of the Right Side Impact Sensor (first)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0096-4A Internal failure of the right side impact sensor (first)	B
B0096-92 Internal failure of the right side impact sensor (first)	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B0096-4A Internal failure of the right side impact sensor (first)	B
B0096-92 Internal failure of the right side impact sensor (first)	B

Is DTC B0096-4A or B0096-92 indicated?

YES

The failure is duplicated. **Replace the right side impact sensor (first)** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B0096-87, B0097-87

DTC B0096-87 : No Signal From the Right Side Impact Sensor (first)

DTC B0097-87 : No Signal From the Right Side Impact Sensor (second)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B0096-87 No signal from the right side impact sensor (first)	B
B0097-87 No signal from the right side impact sensor (second)	B

DTC (SRS)

1. DTC check

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0096-4A Internal failure of the right side impact sensor (first)	B
B0096-87 No signal from the right side impact sensor (first)	B
B0096-92 Internal failure of the right side impact sensor (first)	B
B0097-4A Internal failure of the right side impact sensor (second)	B
B0097-87 No signal from the right side impact sensor (second)	B
B0097-92 Internal failure of the right side impact sensor (second)	B

   Are DTCs indicated?

   DTC B0096-87

   Go to step 2.

   DTC B0097-87

   Go to step 10.

   DTC B0096-4A or B0096-92

   Replace the right side impact sensor (first) , then clear the DTC.

   DTC B0097-4A or B0097-92

   Replace the right side impact sensor (second) , then clear the DTC.

   NO DTC

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Harness visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the damage on the floor wire harness that side impact sensor is connected to.

Is the floor wire harness OK?

YES

Go to step 3.

NO

Replace the floor wire harness, then clear the DTC, and retest.

3. Connector connection check

-1. Check the following connections.

SRS unit connector B (39P)
Right side impact sensor (first) 4P connector (on the floor wire harness)
Right side impact sensor (second) 2P connector (on the floor wire harness)

Are the connectors OK?

YES

Go to step 5.

NO

Go to step 4.

4. System check

-1. Reset the loose connections that caused the problem in step 3.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B0096-87 No signal from the right side impact sensor (first)	B

Is DTC B0096-87 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 5.

NO

The system is OK at this time.

5. Right side impact sensor (first) substituting

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. **Substitute a known-good right side impact sensor (first)** .

-3. Reconnect the negative cable to the 12 volt battery.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the ON mode, then wait for 10 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B0096-87 No signal from the right side impact sensor (first)	B

Is DTC B0096-87 indicated?

YES

Go to step 6.

NO

Replace the right side impact sensor (first) , then clear the DTC.

6. Shorted wire check (RS1+ line to RS1- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

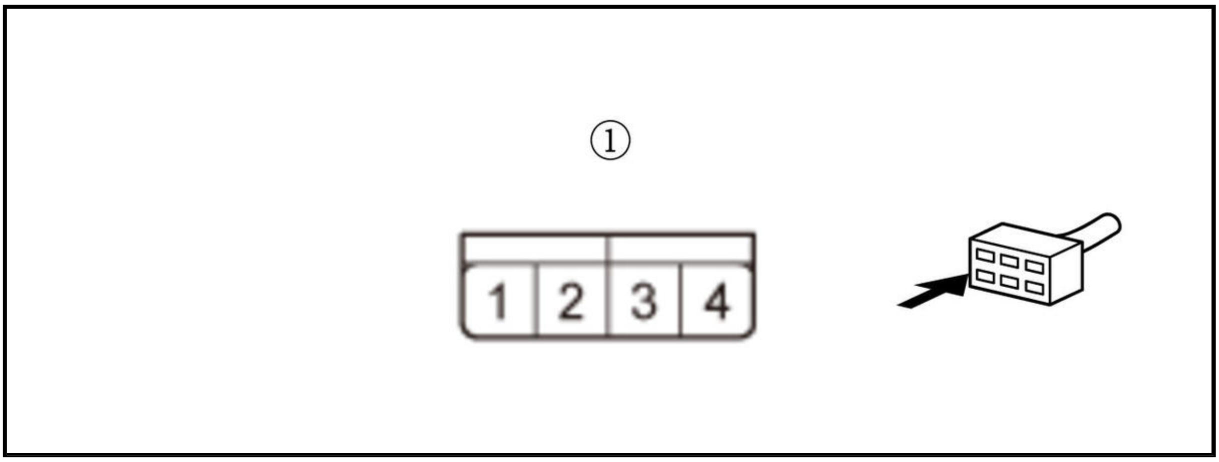
-3. Return the right side impact sensor (first) which was replaced.

-4. Disconnect the following connectors.

SRS unit connector B (39P)
Right side impact sensor (first) 4P connector (on the floor wire harness)
Right side impact sensor (second) 2P connector (on the floor wire harness)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Right side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①



Is there an open circuit, or at least 1 MΩ?

YES

The RS1+ and RS1- wires are not shorted. Go to step 7.

NO

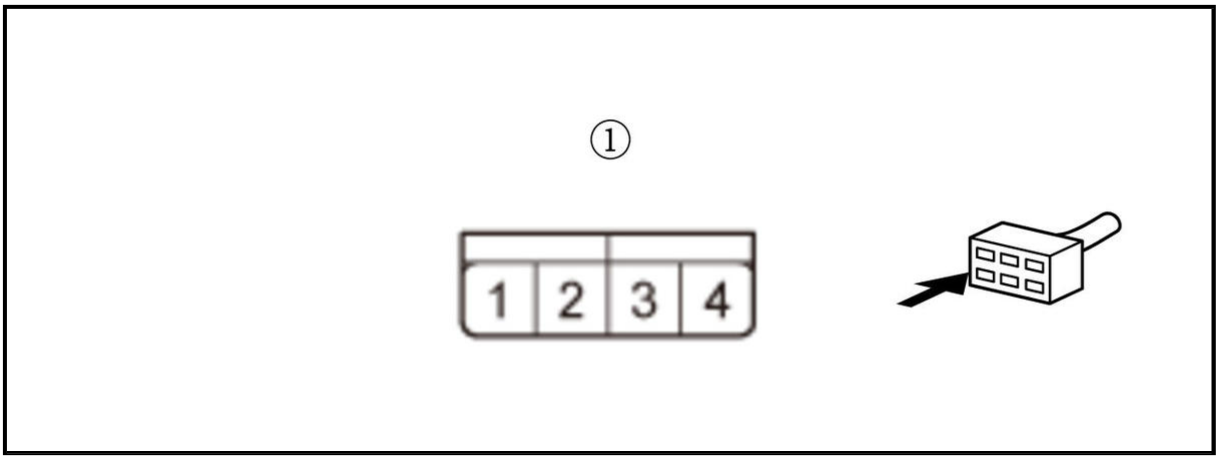
Short to another wire in the floor wire harness between the SRS unit and the right side impact sensor (first); replace the floor wire harness, then clear the DTC.

7. Shorted wire check (RS1+, RS1- lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①
Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The RS1+ and RS1- wires are not shorted. Go to step 8.

NO

Short to ground in the floor wire harness between the SRS unit and the right side impact sensor (first); replace the floor wire harness, then clear the DTC.

8. Shorted wire check (RS1+, RS1- lines to power)

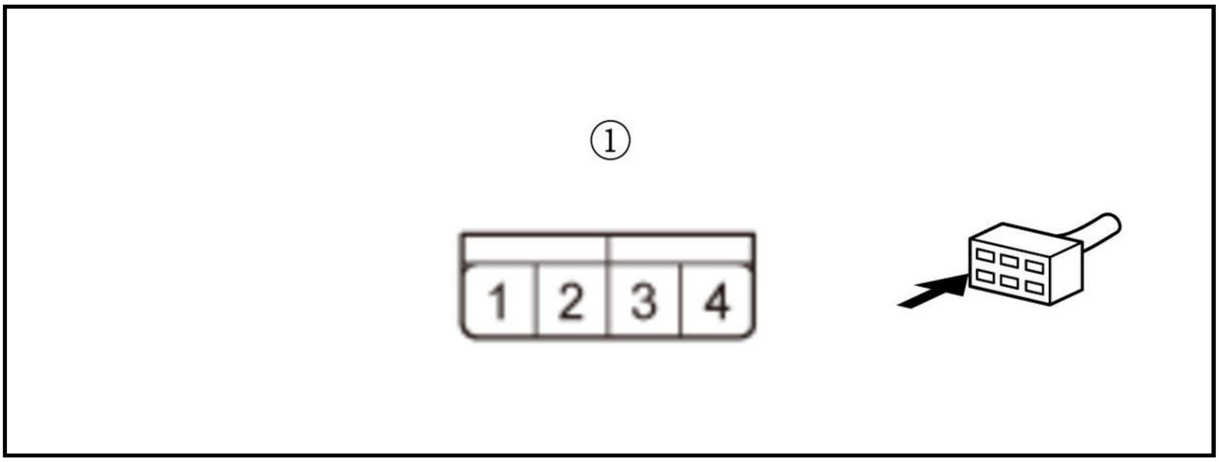
-1. Reconnect the negative cable to the 12 volt battery.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①
Test point 2	Body ground



Is there 0.2 V or less?

YES

The RS1+ and RS1- wires are not shorted to power. Go to step 9.

NO

Short to power in the floor wire harness between the SRS unit and the right side impact sensor (first); replace the floor wire harness, then clear the DTC.

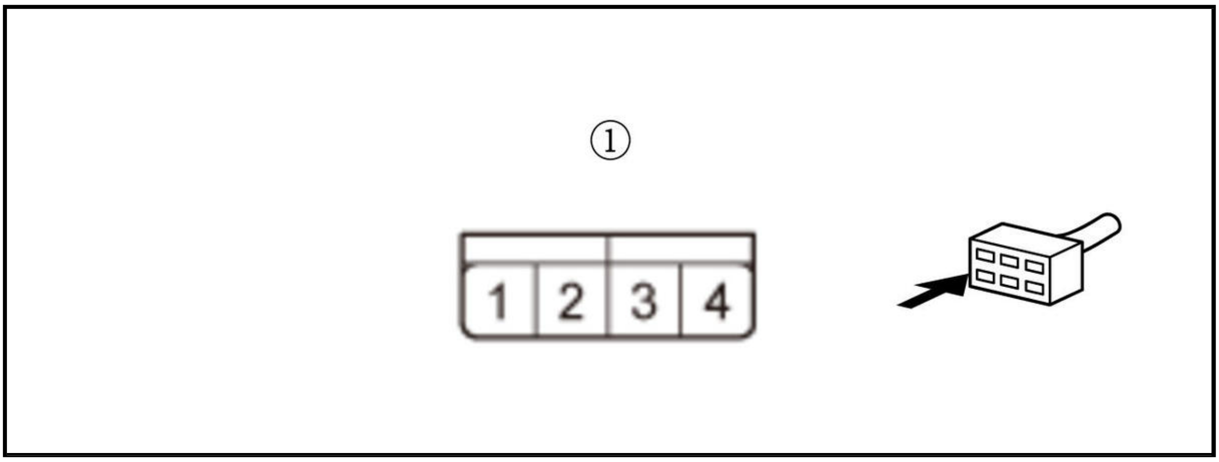
9. Open wire check (RS1+, RS1- lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 36**
Test point 2	Right side impact sensor (first) 4P connector (female terminals) No. 3 (on the floor wire harness): ①

Test point 1	**SRS unit connector B (39P) No. 37**
Test point 2	Right side impact sensor (first) 4P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there 1.0 Ω or less?

YES

The RS1+ and RS1- wires are OK. Disconnect and reconnect the connector, and then check the DTC again. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the floor wire harness between the SRS unit and the right side impact sensor (first); replace the floor wire harness, then clear the DTC.

10. Harness visual check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the damage on the floor wire harness that side impact sensor is connected to.

Is the floor wire harness OK?

YES

Go to step 11.

NO

Replace the floor wire harness, then clear the DTC, and retest.

11. Connector connection check

-1. Check the following connections.

SRS unit connector B (39P)
Right side impact sensor (first) 4P connector (on the floor wire harness)

Right side impact sensor (second) 2P connector (on the floor wire harness)

Are the connectors OK?

YES

Go to step 13.

NO

Go to step 12.

12. System check

-1. Reset the loose connections that caused the problem in step 11.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B0097-87 No signal from the right side impact sensor (second)	B

Is DTC B0097-87 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 13.

NO

The system is OK at this time.

13. Right side impact sensor (second) substituting

-1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-2. **Substitute a known-good right side impact sensor (second)** .

-3. Reconnect the negative cable to the 12 volt battery.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the ON mode, then wait for 10 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B0097-87 No signal from the right side impact sensor (second)	B

Is DTC B0097-87 indicated?

YES

Go to step 14.

NO

Replace the right side impact sensor (second) , then clear the DTC.

14. Right side impact sensor (first) substituting

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Return the right side impact sensor (second) which was replaced.

-4. **Substitute a known-good right side impact sensor (first)** .

-5. Reconnect the negative cable to the 12 volt battery.

-6. Clear the DTCs with the HDS.

-7. Turn the vehicle to the ON mode, then wait for 10 seconds.

-8. Check for DTCs with the HDS.

DTC Description	DTC
B0097-87 No signal from the right side impact sensor (second)	B

Is DTC B0097-87 indicated?

YES

Go to step 15.

NO

Replace the right side impact sensor (first) , then clear the DTC.

15. Shorted wire check (RS2+ line to RS2- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

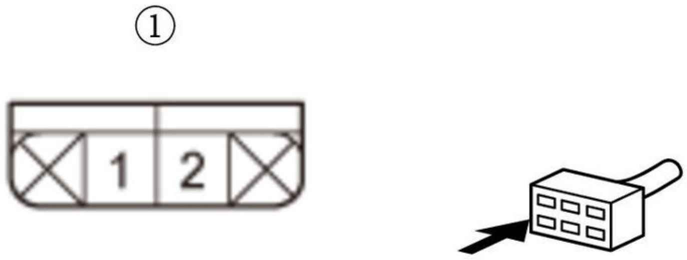
-3. Return the right side impact sensor (first) which was replaced.

-4. Disconnect the following connectors.

SRS unit connector B (39P)
Right side impact sensor (first) 4P connector (on the floor wire harness)
Right side impact sensor (second) 2P connector (on the floor wire harness)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Right side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ①



Is there an open circuit, or at least 1 MΩ?

YES

The RS2+ and RS2- wires are not shorted. Go to step 16.

NO

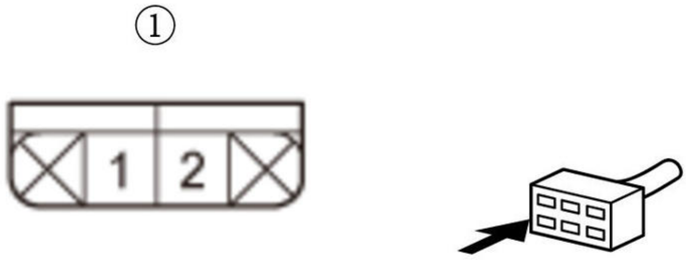
Short to another wire in the floor wire harness between the right side impact sensor (first) and the right side impact sensor (second); replace the floor wire harness, then clear the DTC.

16. Shorted wire check (RS2+, RS2- lines)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Right side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground



Is there an open circuit, or at least 1 MΩ?

YES

The RS2+ and RS2- wires are not shorted. Go to step 17.

NO

Short to ground in the floor wire harness between the right side impact sensor (first) and the right side impact sensor (second); replace the floor wire harness, then clear the DTC.

17. Shorted wire check (RS2+, RS2- lines to power)

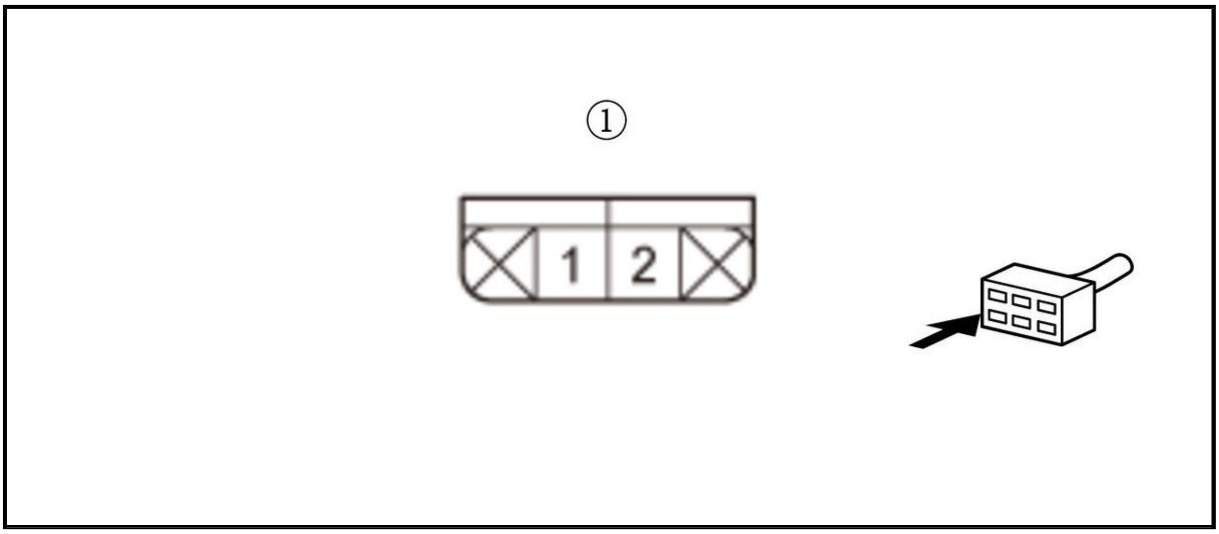
-1. Reconnect the negative cable to the 12 volt battery.

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Body ground

Test point 1	Right side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ①
Test point 2	Body ground



Is there 0.2 V or less?

YES

The RS2+ and RS2- wires are not shorted to power. Go to step 18.

NO

Short to power in the floor wire harness between the right side impact sensor (first) and the right side impact sensor (second); replace the floor wire harness, then clear the DTC.

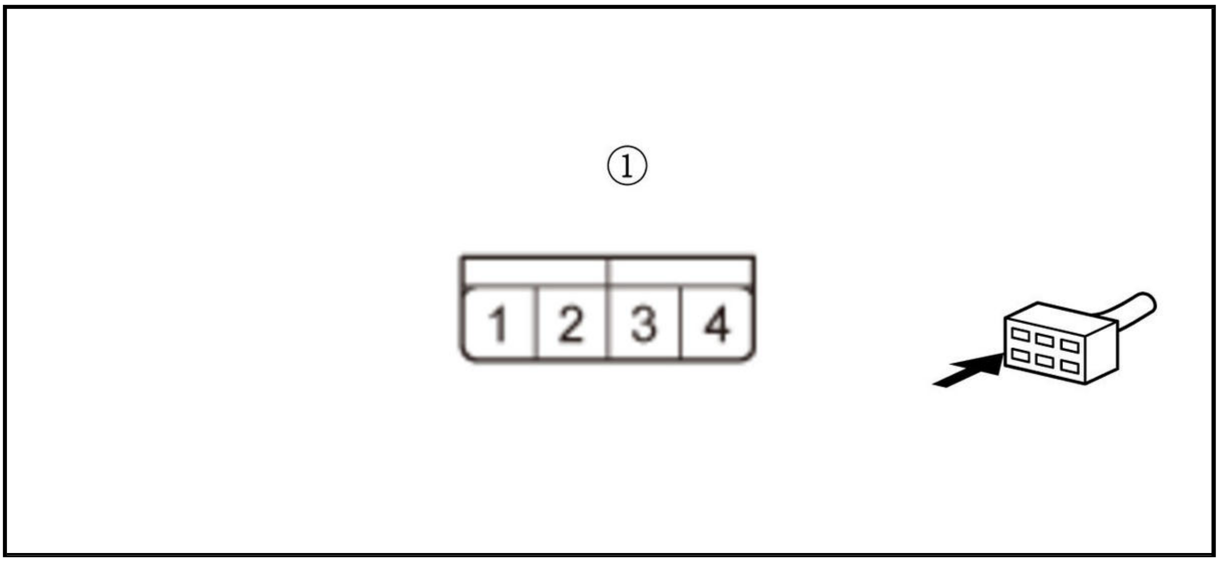
18. Open wire check (RS2+, RS2- lines)

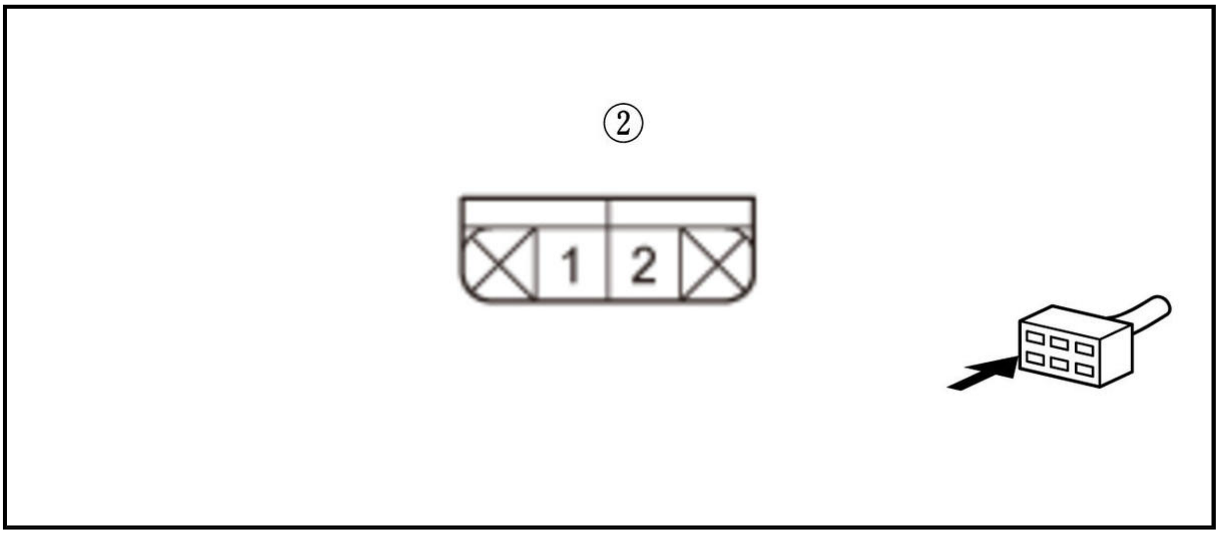
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Right side impact sensor (first) 4P connector (on the floor wire harness): disconnected
	Right side impact sensor (second) 2P connector (on the floor wire harness): disconnected
Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 1 (on the floor wire harness): ①
Test point 2	Right side impact sensor (second) 2P connector (female terminals) No. 2 (on the floor wire harness): ②

Test point 1	Right side impact sensor (first) 4P connector (female terminals) No. 4 (on the floor wire harness): ①
Test point 2	Right side impact sensor (second) 2P connector (female terminals) No. 1 (on the floor wire harness): ②





Is there 1.0 Ω or less?

YES

The RS2+ and RS2- wires are OK. Disconnect and reconnect the connector, and then check the DTC again. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the floor wire harness between the right side impact sensor (first) and the right side impact sensor (second); replace the floor wire harness, then clear the DTC.

DTC B0097-4A, B0097-92

DTC B0097-4A, B0097-92 : Internal Failure of the Right Side Impact Sensor (second)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B0097-4A Internal failure of the right side impact sensor (second)	B
B0097-92 Internal failure of the right side impact sensor (second)	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B0097-4A Internal failure of the right side impact sensor (second)	B
B0097-92 Internal failure of the right side impact sensor (second)	B

   Is DTC B0097-4A or B0097-92 indicated?

   YES

   The failure is duplicated. **Replace the right side impact sensor (second)** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B00A0-54

DTC B00A0-54 : Front Passenger's Weight Sensor not Calibrated

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B00A0-54 Front passenger's weight sensor not calibrated	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B00A0-54 Front passenger's weight sensor not calibrated	B

Is DTC B00A0-54 indicated?

YES

The failure is duplicated. **Do the front passenger's weight sensor initialization** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B00B5-11, B00B5-2B

DTC B00B5-11 : Short or Decreased Resistance in the Driver's Seat Position Sensor

DTC B00B5-2B : Short to Another Wire Harness in the Driver's Seat Position Sensor

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B00B5-11 Short or decreased resistance in the driver's seat position sensor	B
B00B5-2B Short to another wire harness in the driver's seat position sensor	B

DTC (SRS)

1. Problem verification

-1. Raise the driver's seat all the way up, and position all the way rearward.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B00B5-11 Short or decreased resistance in the driver's seat position sensor	B
B00B5-2B Short to another wire harness in the driver's seat position sensor	B

Is DTC B00B5-11 or DTC B00B5-2B indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Driver's seat position sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's seat position sensor 2P connector (on the driver's seat wire harness)

-3. Clear the DTCs with the HDS.

-4. Turn the vehicle to the ON mode, then wait for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC
B00B5-11 Short or decreased resistance in the driver's seat position sensor	B
B00B5-2B Short to another wire harness in the driver's seat position sensor	B

Is DTC B00B5-11 or DTC B00B5-2B indicated?

YES

Go to step 3.

NO

Replace the driver's seat position sensor , then clear the DTC.

3. Shorted wire check (SS+/SS+ SPS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connector.

SRS unit connector B (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat position sensor 2P connector (on the driver's seat wire harness): disconnected
	SRS unit connector B (39P): disconnected
Test point 1	**SRS unit connector B (39P) No. 11**

Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The SS+/SS+ SPS wire is OK. **Replace the driver's seat position sensor** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the floor wire harness or the driver's seat wire harness; replace the faulty harness, then clear the DTC.

DTC B00B5-13

DTC B00B5-13 : Open or Increased Resistance in the Driver's Seat Position Sensor

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B00B5-13 Open or increased resistance in the driver's seat position sensor	B

DTC (SRS)

1. Problem verification

   -1. Raise the driver's seat all the way up, and position all the way rearward.

   -2. Clear the DTCs with the HDS.

   -3. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -4. Check for DTCs with the HDS.

DTC Description	DTC
B00B5-13 Open or increased resistance in the driver's seat position sensor	B

   Is DTC B00B5-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Connector connection check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following connections.

SRS unit connector B (39P)
Driver's seat position sensor 2P connector (on the driver's seat wire harness)
Connector between the SRS unit and the driver's seat position sensor

   Are the connectors OK?

   YES

Go to step 4.

NO

Go to step 3.

3. System check

-1. Reset the loose connections that caused the problem in step 2.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B00B5-13 Open or increased resistance in the driver's seat position sensor	B

Is DTC B00B5-13 indicated?

YES

Turn the vehicle to the OFF (LOCK) mode, then go to step 4.

NO

The system is OK at this time.

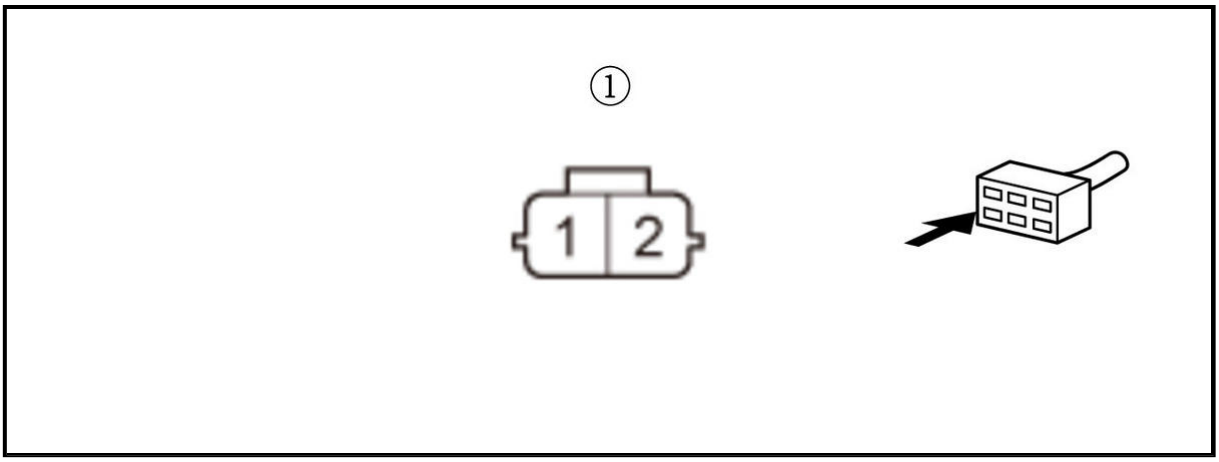
4. Open wire check (SS+/SS+ SPS, GND/GND SPS lines)

-1. Disconnect the following connector.

Driver's seat position sensor 2P connector (on the driver's seat wire harness)

-2. Connect terminals A and B with a jumper wire.

Terminal A	Driver's seat position sensor 2P connector (female terminals) No. 1 (on the driver's seat wire harness): ①
Terminal B	Driver's seat position sensor 2P connector (female terminals) No. 2 (on the driver's seat wire harness): ①



-3. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-4. Disconnect the following connector.

SRS unit connector B (39P)

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Driver's seat position sensor 2P connector (on the driver's seat wire harness): disconnected
	SRS unit connector B (39P): disconnected
	Driver's seat position sensor 2P connector terminals No. 1 and No. 2 (on the driver's seat wire harness): jumped
Test point 1	**SRS unit connector B (39P) No. 11**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The SS+/SS+ SPS and GND/GND SPS wires are OK. **Replace the driver's seat position sensor** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Open in the floor wire harness or the driver's seat wire harness; check for a poor ground at G501. If the ground is OK, replace the faulty harness, then clear the DTC.

DTC B00C0-16, B00C0-96, B00C2-16, B00C2-96

DTC B00C0-16, B00C0-96 : Internal Failure of the Front Passenger's Weight Sensor (front inner side)

DTC B00C2-16, B00C2-96 : Internal Failure of the Front Passenger's Weight Sensor (rear inner side)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .
- Before doing this troubleshooting procedure, **check the condition of the 12 volt battery** .
- If DTC U3000-49 stored, troubleshoot DTC U3000-49 before doing this troubleshooting procedure.

DTC Description	DTC
B00C0-16 Internal failure of the front passenger's weight sensor (front inner side)	B
B00C0-96 Internal failure of the front passenger's weight sensor (front inner side)	B
B00C2-16 Internal failure of the front passenger's weight sensor (rear inner side)	B
B00C2-96 Internal failure of the front passenger's weight sensor (rear inner side)	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B00C0-16 Internal failure of the front passenger's weight sensor (front inner side)	B
B00C0-96 Internal failure of the front passenger's weight sensor (front inner side)	B

DTC Description	DTC
B00C2-16 Internal failure of the front passenger's weight sensor (rear inner side)	B
B00C2-96 Internal failure of the front passenger's weight sensor (rear inner side)	B

Is DTC B00C0-16, B00C0-96, B00C2-16, or B00C2-96 indicated?

YES

The failure is duplicated. Faulty front passenger's weight sensor. **Replace the front passenger's weight sensors as an assembly** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B00C0-4A, B00C2-4A

DTC B00C0-4A : Different Supplier ID/Function ID of the Front Passenger's Weight Sensor (front inner side)

DTC B00C2-4A : Different Supplier ID/Function ID of the Front Passenger's Weight Sensor (rear inner side)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .
- If DTC U3000-49 is stored, troubleshoot DTC U3000-49 before doing this troubleshooting procedure.

DTC Description	DTC
B00C0-4A Different supplier ID/function ID of the front passenger's weight sensor (front inner side)	B
B00C2-4A Different supplier ID/function ID of the front passenger's weight sensor (rear inner side)	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B00C0-4A Different supplier ID/function ID of the front passenger's weight sensor (front inner side)	B
B00C2-4A Different supplier ID/function ID of the front passenger's weight sensor (rear inner side)	B

Is DTC B00C0-4A or B00C2-4A indicated?

YES

The failure is duplicated. Faulty front passenger's weight sensor. **Replace the front passenger's weight sensors as an assembly** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B00C0-54, B00C2-54

DTC B00C0-54 : Different Serial ID of the Front Passenger's Weight Sensor (front inner side)

DTC B00C2-54 : Different Serial ID of the Front Passenger's Weight Sensor (rear inner side)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .
- Those DTCs are stored when replace the front passenger's weight sensor and do not the front passenger's weight sensor initialization.

DTC Description	DTC
B00C0-54 Different serial ID of the front passenger's weight sensor (front inner side)	B
B00C2-54 Different serial ID of the front passenger's weight sensor (rear inner side)	B

DTC (SRS)

1. Problem verification

-1. **Do the front passenger's weight sensor initialization procedure** .

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
B00C0-54 Different serial ID of the front passenger's weight sensor (front inner side)	B
B00C2-54 Different serial ID of the front passenger's weight sensor (rear inner side)	B

Is DTC B00C0-54 or B00C2-54 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B00C0-87

DTC B00C0-87 : No Signal From the Front Passenger's Weight Sensor (front inner side)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B00C0-87 No signal from the front passenger's weight sensor (front inner side)	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B00C0-87 No signal from the front passenger's weight sensor (front inner side)	B

Is DTC B00C0-87 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Open wire check (SWS+/PWR SWS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

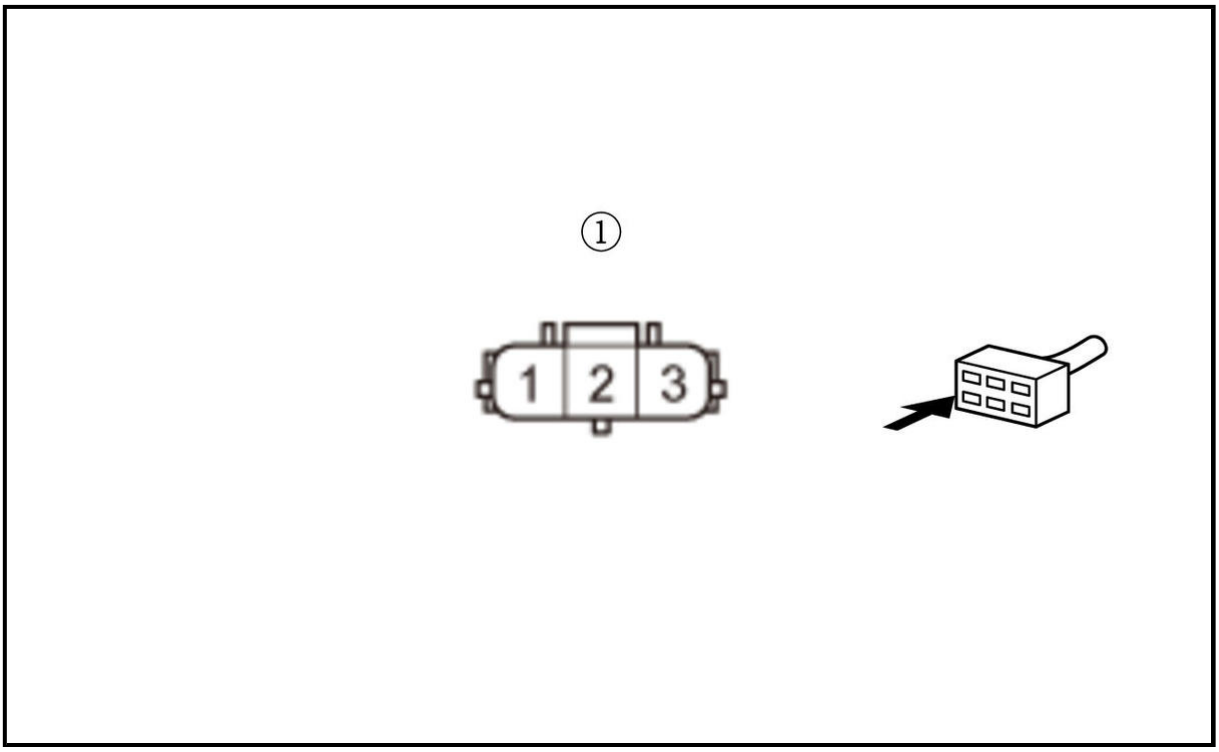
-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connectors.

SRS unit connector B (39P)
Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 26**
Test point 2	Front passenger's weight sensor (front inner side) 3P connector (female terminals) No. 1 (on the front passenger's seat wire harness): ①



Is there 1.0 Ω or less?

YES

The SWS+/PWR SWS wire is OK. Go to step 3.

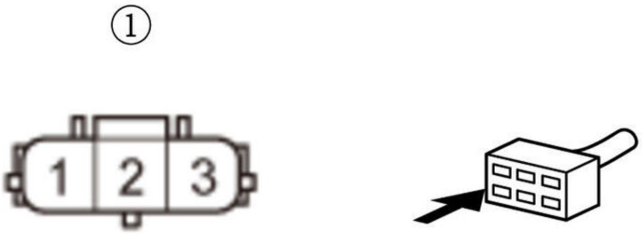
NO

Open in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

3. Open wire check (SWS-/GND SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 28**
Test point 2	Front passenger's weight sensor (front inner side) 3P connector (female terminals) No. 3 (on the front passenger's seat wire harness): ①



Is there 1.0 Ω or less?

YES

The SWS-/GND SWS wire is OK. Go to step 4.

NO

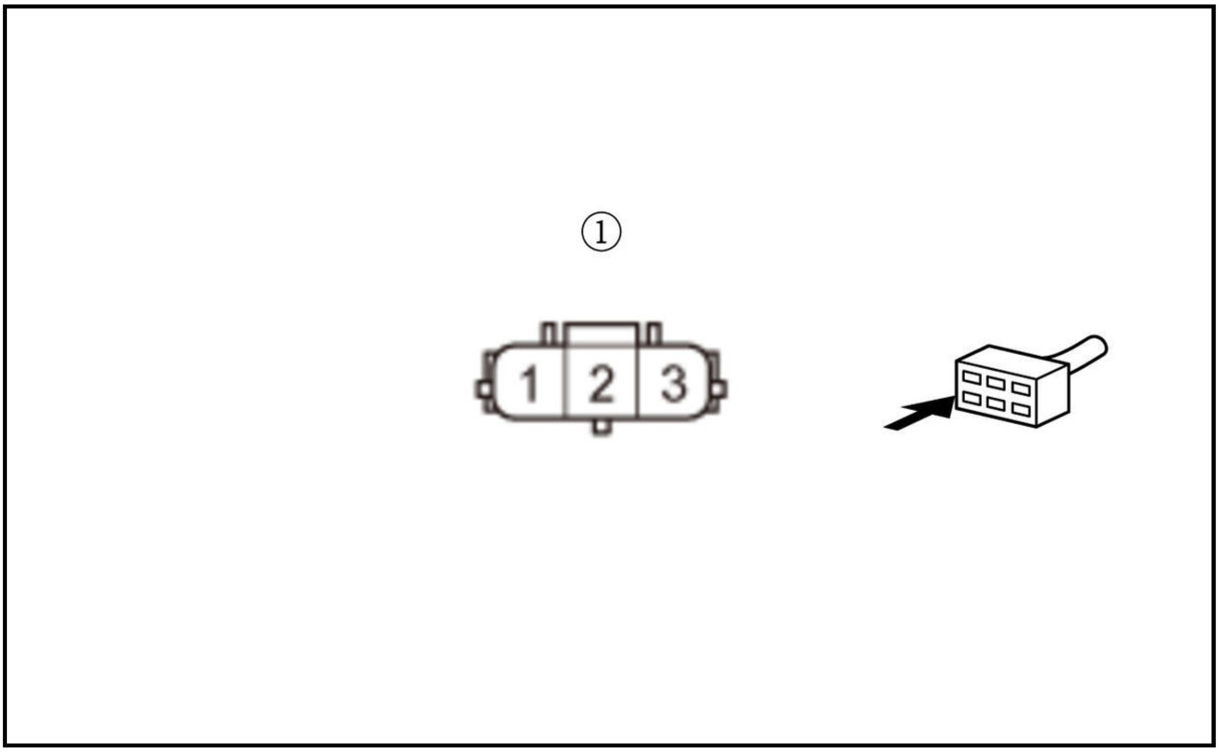
Open in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

4. Open wire check (SWSS/LIN SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 30**

Test point 2	Front passenger's weight sensor (front inner side) 3P connector (female terminals) No. 2 (on the front passenger's seat wire harness): ①



Is there 1.0 Ω or less?

YES

The SWSS/LIN SWS wire is not open. Go to step 5.

NO

Open in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

5. Shorted wire check (SWSS/LIN SWS line to power)

-1. Disconnect the following connector.

Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness)

-2. Reconnect the negative cable to the 12 volt battery.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 30**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The SWSS/LIN SWS wire is not shorted to power. Go to step 6.

NO

Short to power in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

6. Shorted wire check (SWSS/LIN SWS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 30**

Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The SWSS/LIN SWS wire is not shorted. Go to step 7.

NO

Short to ground in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

7. Shorted wire check (SWSS/LIN SWS line to SWS-/GND SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 30**
Test point 2	**SRS unit connector B (39P) No. 28**

Is there an open circuit, or at least 1 MΩ?

YES

The SWSS/LIN SWS and SWS-/GND SWS wires are not shorted. Go to step 8.

NO

Short to another wire in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

8. Shorted wire check (SWSS/LIN SWS line to SWS+/PWR SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode SRS unit connector B (39P): disconnected Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 30**
Test point 2	**SRS unit connector B (39P) No. 26**

Is there an open circuit, or at least 1 MΩ?

YES

The SWSS/LIN SWS and SWS+/PWR SWS wires are OK. Go to step 9.

NO

Short to another wire in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

9. Front passenger's weight sensor check

-1. **Substitute a known-good front passenger's weight sensors as an assembly** .

-2. Reconnect the following connectors.

SRS unit connector B (39P)
Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness)
Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness)

-3. Reconnect the negative cable to the 12 volt battery.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the ON mode, then wait for 10 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B00C0-87 No signal from the front passenger's weight sensor (front inner side)	B

Is DTC B00C0-87 indicated?

YES

The front passenger's weight sensor is OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or replace the SRS unit . If the DTC does not clear, replace the floor wire harness or the front passenger's seat wire harness.

NO

Faulty front passenger's weight sensor. Replace the front passenger's weight sensors as an assembly .

DTC B00C2-87

DTC B00C2-87 : No Signal From the Front Passenger's Weight Sensor (rear inner side)

NOTE:

- Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed .
- Before doing this troubleshooting procedure, review SRS Precautions and Procedures , General Troubleshooting Information , and 12 Volt Battery Terminal Disconnection and Reconnection .

DTC Description	DTC
B00C2-87 No signal from the front passenger's weight sensor (rear inner side)	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B00C2-87 No signal from the front passenger's weight sensor (rear inner side)	B

Is DTC B00C2-87 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Open wire check (SWS+/PWR SWS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

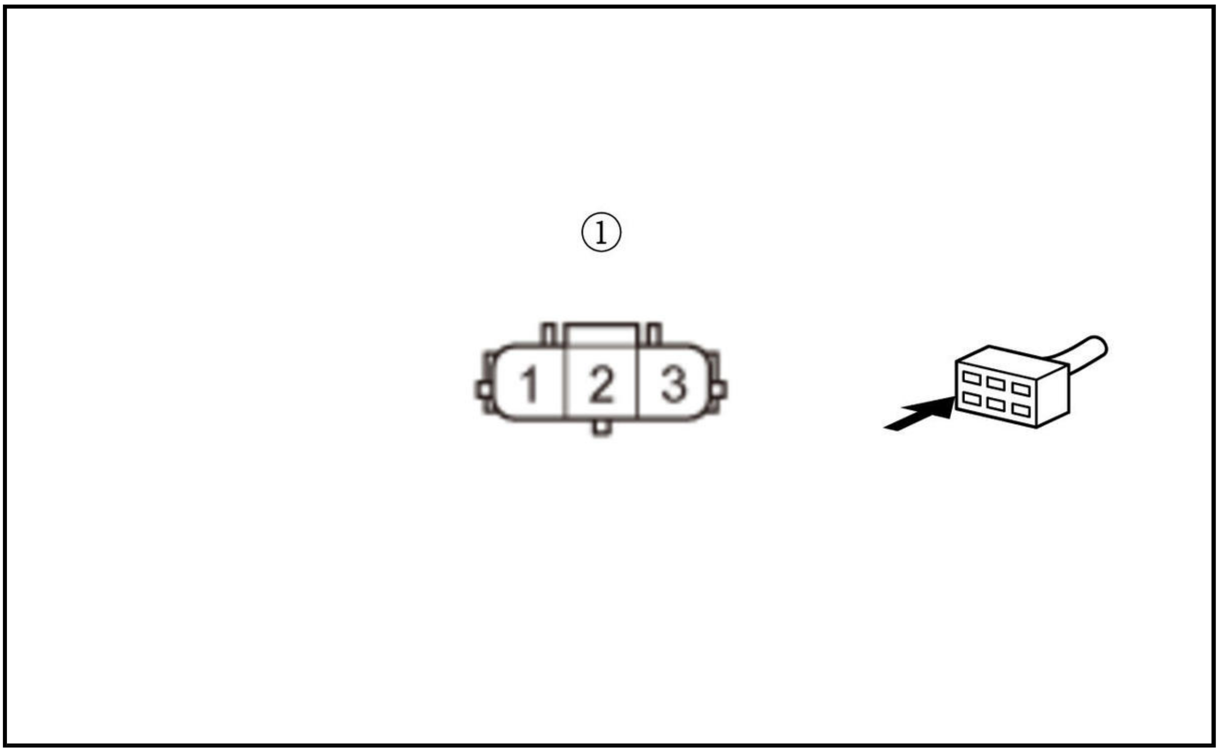
-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connectors.

SRS unit connector B (39P)
Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 26**
Test point 2	Front passenger's weight sensor (rear inner side) 3P connector (female terminals) No. 1 (on the front passenger's seat wire harness): ①



Is there 1.0 Ω or less?

YES

The SWS+/PWR SWS wire is OK. Go to step 3.

NO

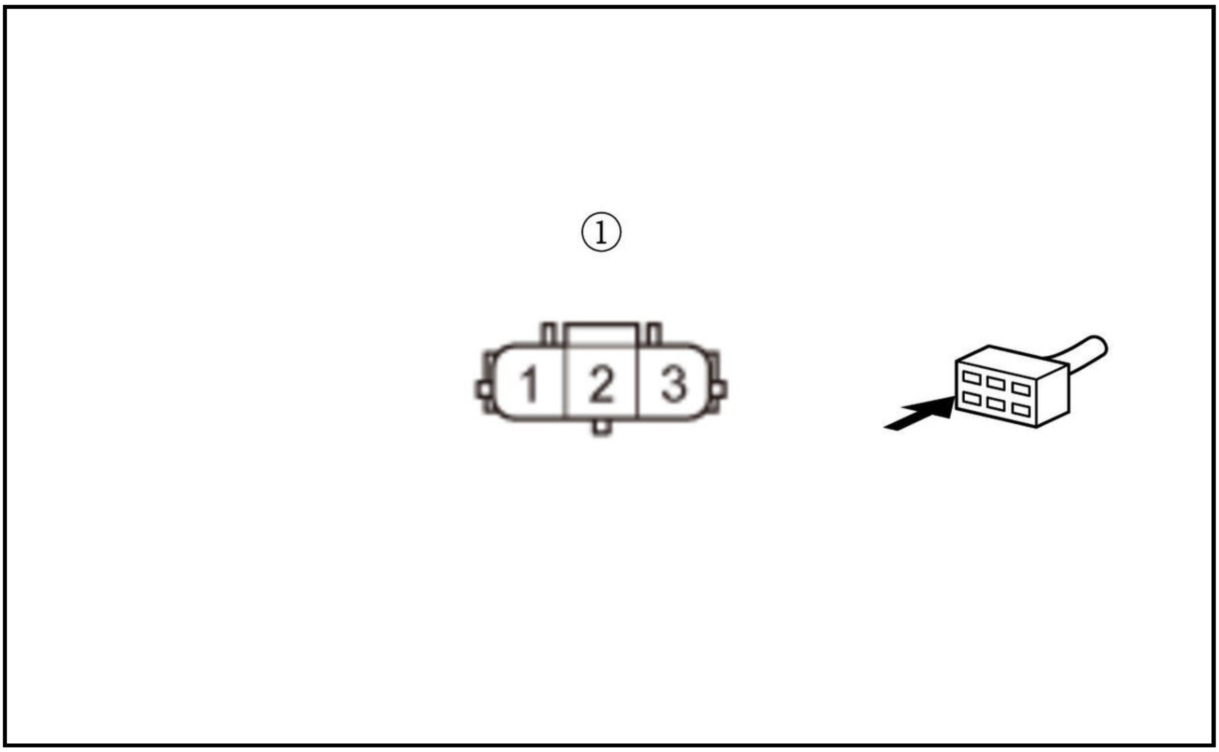
Open in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

3. Open wire check (SWS-/GND SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected

Test point 1	**SRS unit connector B (39P) No. 28**
Test point 2	Front passenger's weight sensor (rear inner side) 3P connector (female terminals) No. 3 (on the front passenger's seat wire harness): ①



Is there 1.0 Ω or less?

YES

The SWS-/GND SWS wire is OK. Go to step 4.

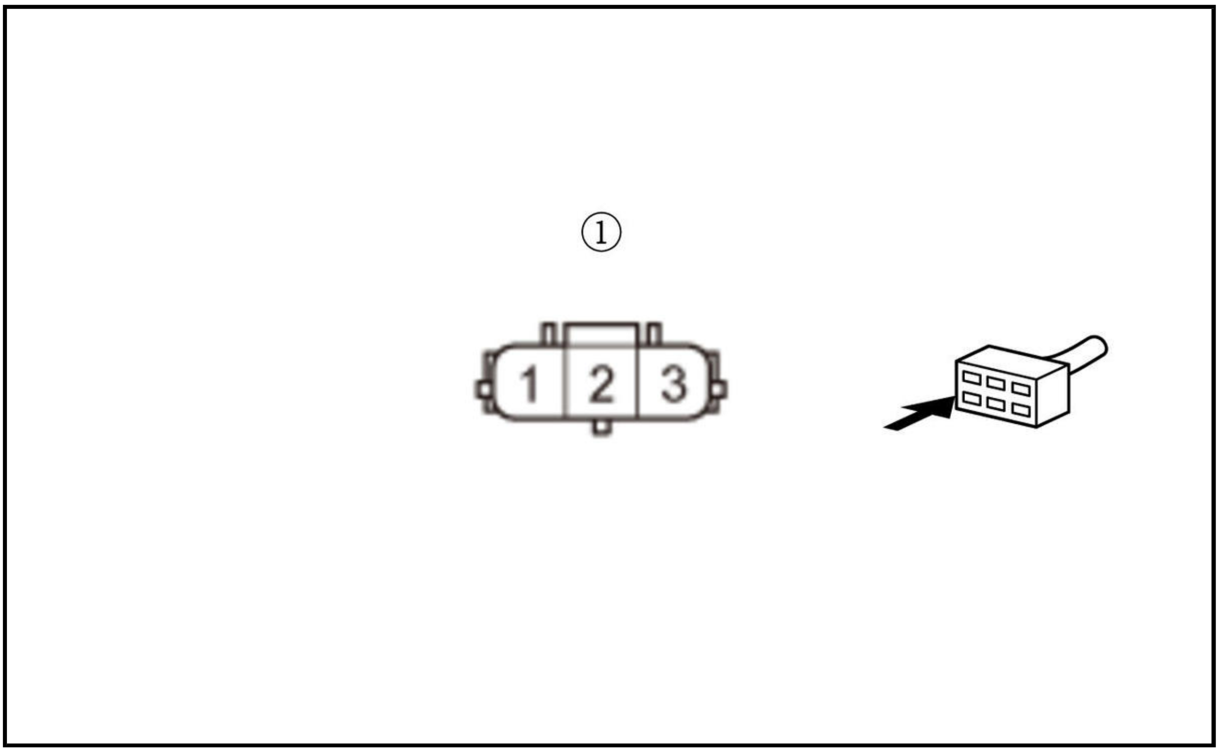
NO

Open in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

4. Open wire check (SWSS/LIN SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 30**
Test point 2	Front passenger's weight sensor (rear inner side) 3P connector (female terminals) No. 2 (on the front passenger's seat wire harness): ①



Is there 1.0 Ω or less?

YES

The SWSS/LIN SWS wire is OK. Go to step 5.

NO

Open in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

5. Front passenger's weight sensor check

-1. **Substitute a known-good front passenger's weight sensors as an assembly** .

-2. Reconnect the following connectors.

SRS unit connector B (39P)

Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness)

-3. Reconnect the negative cable to the 12 volt battery.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the ON mode, then wait for 10 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
B00C2-87 No signal from the front passenger's weight sensor (rear inner side)	B

Is DTC B00C2-87 indicated?

YES

The front passenger's weight sensor is OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness or the front passenger's seat wire harness.

NO

Faulty front passenger's weight sensor. **Replace the front passenger's weight sensors as an assembly** .

DTC B00D5-14

DTC B00D5-14 : Open or Short to Ground in the Front Passenger's Airbag Cutoff Indicator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .
- If there are other DTCs stored with B00D5-14; troubleshoot them first.

DTC Description	DTC
B00D5-14 Open or short to ground in the front passenger's airbag cutoff indicator	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B00D5-14 Open or short to ground in the front passenger's airbag cutoff indicator	B

Is DTC B00D5-14 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Open wire check (OFF_PTT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

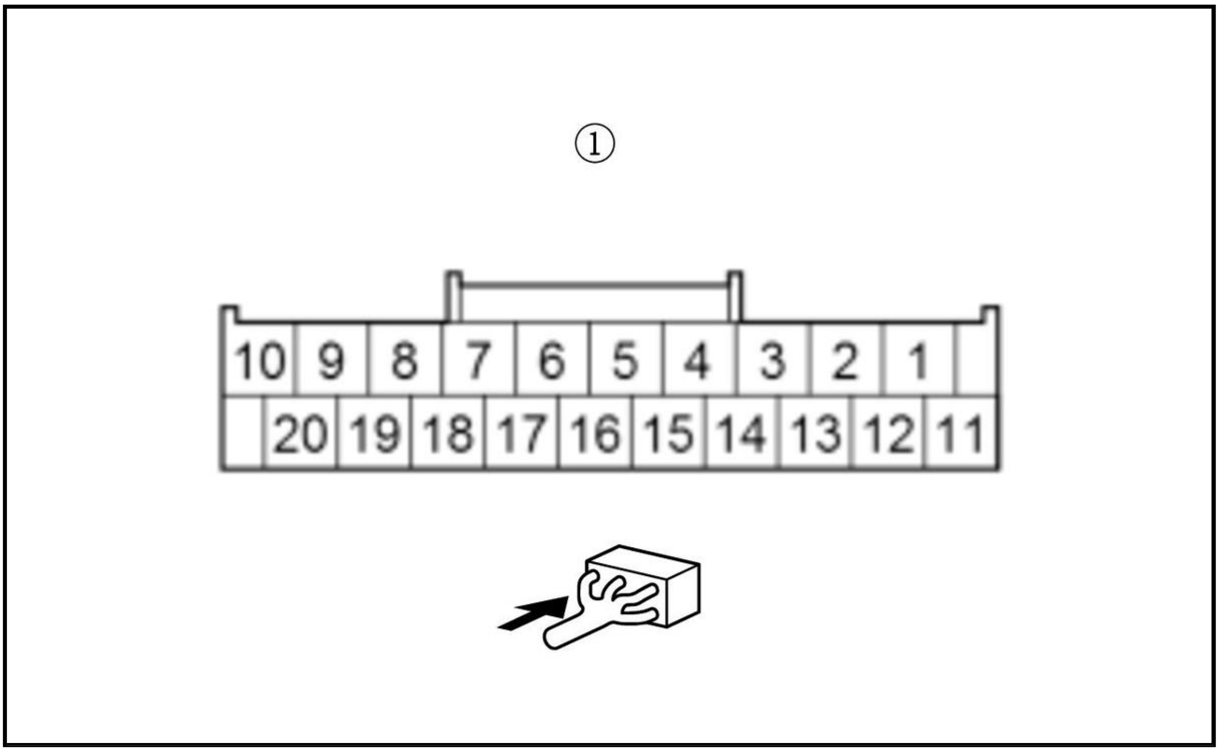
-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connectors.

Climate control panel 20P connector (on the dashboard wire harness)
SRS unit connector A (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control panel 20P connector (on the dashboard wire harness): disconnected SRS unit connector A (39P): disconnected
Test point 1	**SRS unit connector A (39P) No. 28**
Test point 2	Climate control panel 20P connector (female terminals) No. 7 (on the dashboard wire harness): ①



Is there 1.0 Ω or less?

YES

The OFF_PTT wire is not open. Go to step 3.

NO

Open in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

3. Shorted wire check (OFF_PTT line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Climate control panel 20P connector (on the dashboard wire harness): disconnected SRS unit connector A (39P): disconnected
Test point 1	**SRS unit connector A (39P) No. 28**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The OFF_PTT wire is OK. **Replace the front passenger's airbag cutoff indicator** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to ground in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B00D5-17

DTC B00D5-17 : Short to Power in the Front Passenger's Airbag Cutoff Indicator

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .
- If there are other DTCs stored with B00D5-17; troubleshoot them first.

DTC Description	DTC
B00D5-17 Short to power in the front passenger's airbag cutoff indicator	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B00D5-17 Short to power in the front passenger's airbag cutoff indicator	B

   Is DTC B00D5-17 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (OFF_PTT line to power)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -3. Disconnect the following connectors.

Climate control panel 20P connector (on the dashboard wire harness)	
SRS unit connector A (39P)	

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Climate control panel 20P connector (on the dashboard wire harness): disconnected
	SRS unit connector A (39P): disconnected
Test point 1	**SRS unit connector A (39P) No. 28**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The OFF_PTT wire is OK. **Replace the front passenger's airbag cutoff indicator** , then clear the DTC, and retest. If the DTC is still present, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Short to power in the dashboard wire harness; replace the dashboard wire harness, then clear the DTC.

DTC B2800-49, B2801-49, B2802-49, C0061-96, C0063-96

DTC B2800-49, B2801-49, B2802-49, C0061-96, C0063-96 : Internal Failure of the SRS Unit

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before troubleshooting any of these DTCs, **check the 12 volt battery/system voltage and 12 volt battery cable connections** . If the voltage is low, repair the charging system, test and charge the 12 volt battery, or replace the 12 volt battery before troubleshooting the SRS. If the 12 volt battery/system voltage is OK, ask the customer if the 12 volt battery ever went dead or if the engine was started and run with the 12 volt battery in a low state of charge. A dead 12 volt battery may trigger one or more of these DTCs.
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
B2800-49 Internal failure of the SRS unit	B
B2801-49 Internal failure of the SRS unit	B
B2802-49 Internal failure of the SRS unit	B
C0061-96 Internal failure of the SRS unit	B
C0063-96 Internal failure of the SRS unit	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B2800-49 Internal failure of the SRS unit	B
B2801-49 Internal failure of the SRS unit	B
B2802-49 Internal failure of the SRS unit	B
C0061-96 Internal failure of the SRS unit	B
C0063-96 Internal failure of the SRS unit	B

Is DTC B2800-49, B2801-49, B2802-49, C0061-96, or C0063-96 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

DTC B2840-13

DTC B2840-13 : SRS Unit Connector A Not Properly Installed

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B2840-13 SRS unit connector A not properly installed	B

DTC (SRS)

1. Problem verification

-1. Clear the DTCs with the HDS.

-2. Turn the vehicle to the ON mode, then wait for 10 seconds.

-3. Check for DTCs with the HDS.

DTC Description	DTC
B2840-13 SRS unit connector A not properly installed	B

Is DTC B2840-13 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Connector connection check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following connection.

SRS unit connector A (39P)

   Is the connector OK?

   YES

   Go to step 3.

   NO

   Repair the poor connector(s) connection which was the cause of the problem.

3. SRS unit check

   -1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -2. Disconnect the following connector.

SRS unit connector A (39P)

   -3. Check for bent or damaged terminals on the SRS unit.

   Are any terminals bent or damaged?

   YES

   Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

   NO

   Substitute a known-good SRS unit , then clear the DTC. If the DTC is still present, replace the dashboard wire harness.

DTC B2841-13

DTC B2841-13 : SRS Unit Connector B Not Properly Installed

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
B2841-13 SRS unit connector B not properly installed	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
B2841-13 SRS unit connector B not properly installed	B

   Is DTC B2841-13 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Connector connection check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following connection.

SRS unit connector B (39P)

   Is the connector OK?

   YES

   Go to step 3.

   NO

   Repair the poor connector(s) connection which was the cause of the problem.

3. SRS unit check

   -1. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

   -2. Disconnect the following connector.

SRS unit connector B (39P)

   -3. Check for bent or damaged terminals on the SRS unit.

   Are any terminals bent or damaged?

   YES

   Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** .

   NO

Substitute a known-good SRS unit , then clear the DTC. If the DTC is still present, replace the floor wire harness.

DTC U0122-00 (SRS UNIT)

DTC U0122-00 : Lost Communication With the VSA Modulator-Control Unit (wheel speed sensor signal error)

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .
- Check for the power circuit and the ground circuit of the VSA modulator-control unit which cannot communicate with the SRS unit.

DTC Description	DTC
U0122-00 Lost communication with the VSA modulator-control unit (Wheel speed sensor signal error)	B

DTC (SRS)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Go to the troubleshooting for CAN gateway system DTC(s) .

   NO

   Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Does the SRS unit detect the CAN gateway Bus channels C?

   Bus C is Not Available

   Go to step 3.

   Bus C is Available

   Go to step 4.

3. Open wire check (F-CAN C_H, F-CAN C_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery.

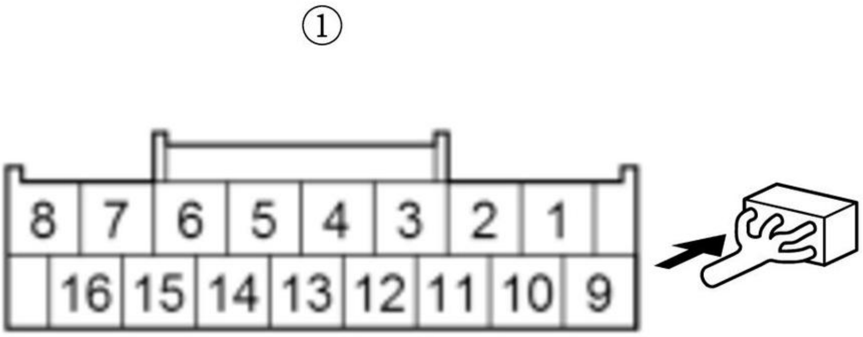
-3. Disconnect the following connectors.

CAN gateway 16P connector
SRS unit connector A (39P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
B	SRS unit connector A (39P): disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 5 (on the dashboard wire harness): ①
Test point 2	**SRS unit connector A (39P) No. 34**

Test point 1	CAN gateway 16P connector (female terminals) No. 13 (on the dashboard wire harness): ①
Test point 2	**SRS unit connector A (39P) No. 35**



Is there 1.0 Ω or less?

YES

The F-CAN C_H and the F-CAN C_L wires are OK. Check for poor connections or loose terminals at the CAN gateway and the SRS unit. If the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the SRS unit** .

NO

Replace an open in the wire between the CAN gateway and the SRS unit.

4. F-CAN circuit communication check

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

VSA modulator-control unit is Detected

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

VSA modulator-control unit (Bus B) is Not Available

Go to step 5.

VSA modulator-control unit (Bus C) is Not Available

Go to step 6.

5. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

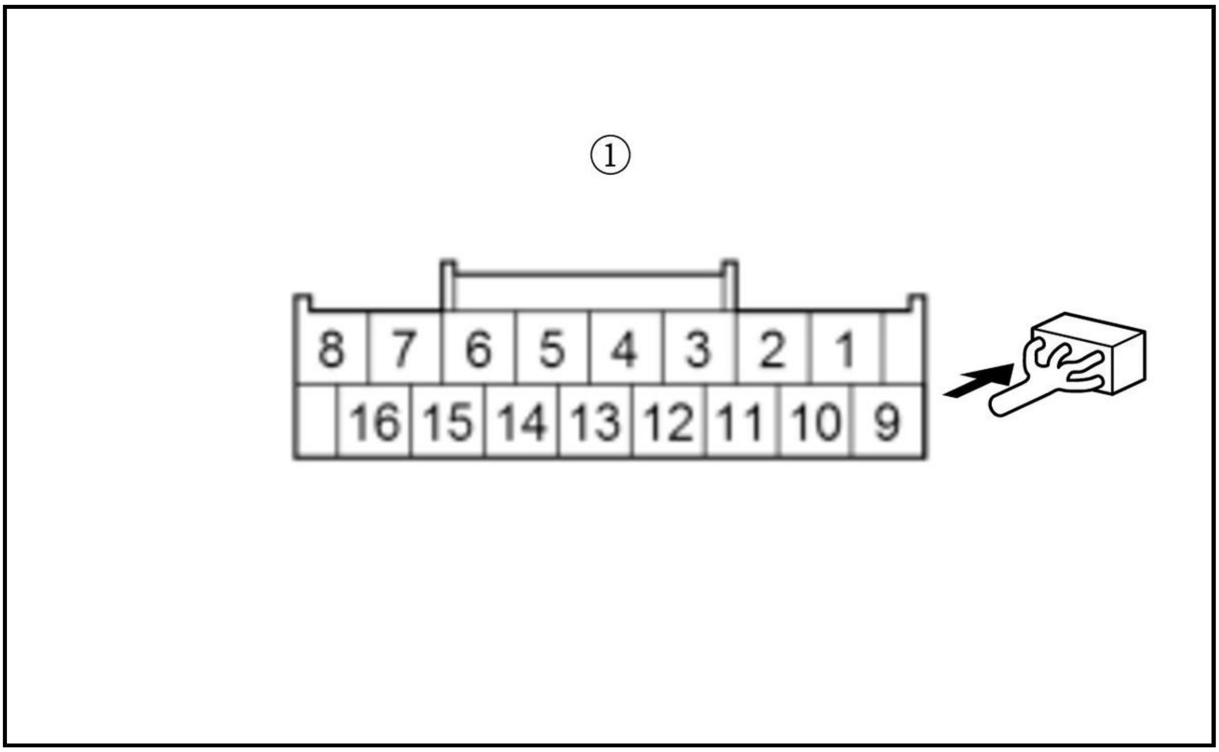
-2. Disconnect the following connectors.

CAN gateway 16P connector
VSA modulator-control unit 46P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	VSA modulator-control unit 46P connector
Test point 1	CAN gateway 16P connector (female terminals) No. 6: ①
Test point 2	**VSA modulator-control unit 46P connector No. 40**

Test point 1	CAN gateway 16P connector (female terminals) No. 14: ①
Test point 2	**VSA modulator-control unit 46P connector No. 28**



Is there 1.0 Ω or less?

YES

The F-CAN B_H and the F-CAN B_L wires are OK. Check for poor connections or loose terminals at the SRS unit and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

6. Open wire check (F-CAN C_H, F-CAN C_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

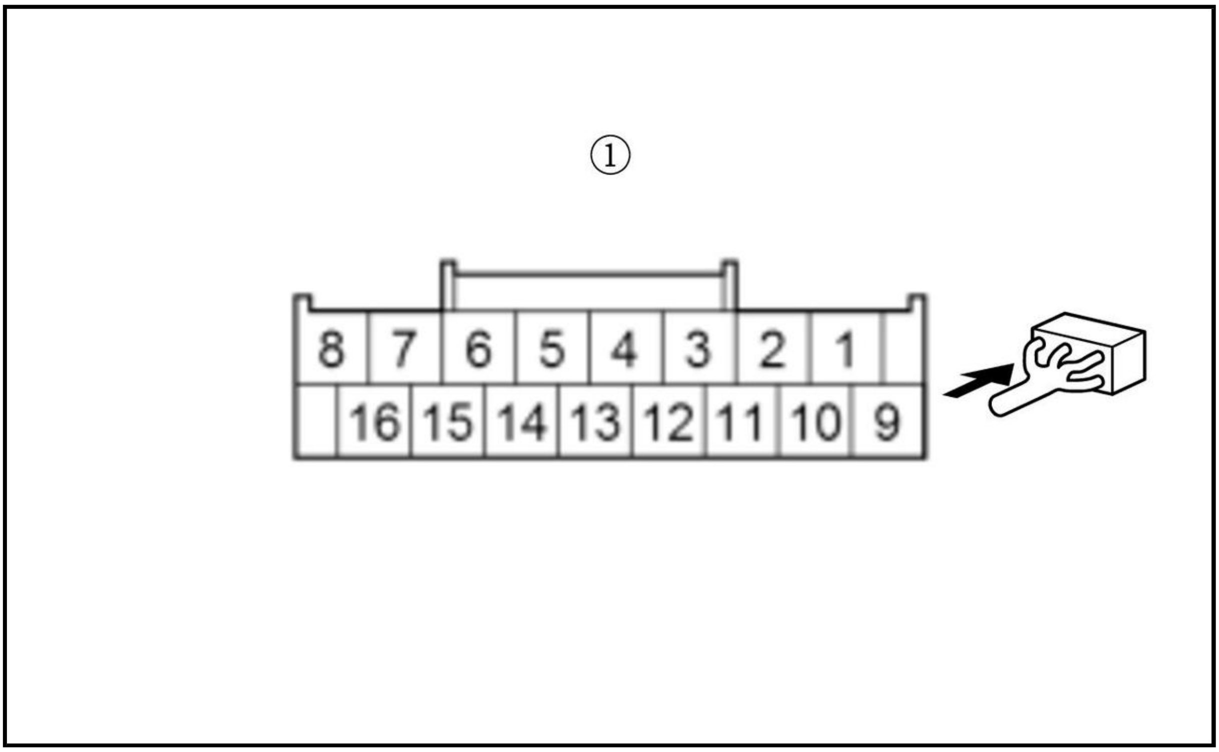
-2. Disconnect the following connectors.

CAN gateway 16P connector
VSA modulator-control unit 46P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	VSA modulator-control unit 46P connector
Test point 1	CAN gateway 16P connector (female terminals) No. 5: ①
Test point 2	**VSA modulator-control unit 46P connector No. 46**

Test point 1	CAN gateway 16P connector (female terminals) No. 13: ①
Test point 2	**VSA modulator-control unit 46P connector No. 34**



Is there 1.0 Ω or less?

YES

The F-CAN C_H and the F-CAN C_L wires are OK. Check for poor connections or loose terminals at the SRS unit and the VSA modulator-control unit. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the CAN gateway.

DTC U3000-49 (SRS UNIT)

DTC U3000-49 : Internal Failure of the SRS Unit

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** , **General Troubleshooting Information** , and **12 Volt Battery Terminal Disconnection and Reconnection** .

DTC Description	DTC
U3000-49 Internal failure of the SRS unit	B

DTC (SRS)

1. Problem verification

   -1. Clear the DTCs with the HDS.

   -2. Turn the vehicle to the ON mode, then wait for 10 seconds.

   -3. Check for DTCs with the HDS.

DTC Description	DTC
U3000-49 Internal failure of the SRS unit	B

Is DTC U3000-49 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Go to Troubleshooting Intermittent Failures. If another DTC is indicated, troubleshoot the DTC.

2. Shorted wire check (SWS+/PWR SWS line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Disconnect the following connectors.

SRS unit connector B (39P)
Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness)
Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness)

-4. Reconnect the negative cable to the 12 volt battery.

-5. Turn the vehicle to the ON mode.

-6. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	SRS unit connector B (39P): disconnected
B	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
B	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 26**
Test point 2	Body ground

Is there 0.2 V or less?

YES

The SWS+/PWR SWS wire is not shorted to power. Go to step 3.

NO

Short to power in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

3. Shorted wire check (SWS+/PWR SWS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the negative cable from the 12 volt battery, then wait at least 3 minutes.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
B	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
B	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 26**
Test point 2	Body ground

Is there an open circuit, or at least 1 MΩ?

YES

The SWS+/PWR SWS wire is not shorted. Go to step 4.

NO

Short to ground in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

4. Shorted wire check (SWS+/PWR SWS line to SWS-/GND SWS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	SRS unit connector B (39P): disconnected
B	Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness): disconnected
B	Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness): disconnected
Test point 1	**SRS unit connector B (39P) No. 26**
Test point 2	**SRS unit connector B (39P) No. 28**

Is there an open circuit, or at least 1 MΩ?

YES

The SWS+/PWR SWS to SWS-/GND SWS wires are OK. Go to step 5.

NO

Short to another wire in the floor wire harness or the front passenger's seat wire harness; replace the faulty harness, then clear the DTC.

5. Front passenger's weight sensor check

-1. **Substitute a known-good front passenger's weight sensors as an assembly** .

-2. Reconnect the following connectors.

SRS unit connector B (39P)
Front passenger's weight sensor (front inner side) 3P connector (on the front passenger's seat wire harness)

Front passenger's weight sensor (rear inner side) 3P connector (on the front passenger's seat wire harness)

-3. Reconnect the negative cable to the 12 volt battery.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the ON mode, then wait for 10 seconds.

-6. Check for DTCs with the HDS.

DTC Description	DTC
U3000-49 Internal failure of the SRS unit	B

Is DTC U3000-49 indicated?

YES

The front passenger's weight sensor is OK. Faulty SRS unit or poor connection at SRS unit connector B (39P) and the SRS unit. Check the connection; if the connection is OK, check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **replace the SRS unit** . If the DTC does not clear, replace the floor wire harness or the front passenger's seat wire harness.

NO

Faulty front passenger's weight sensor. **Replace the front passenger's weight sensors as an assembly** .

DTC U3000-51 (SRS UNIT)

DTC U3000-51 : SRS Unit Programming Error

NOTE:

- **Before doing this troubleshooting procedure, find out if the vehicle was in a collision. If so, verify that all the required components were replaced with new components of the correct part number and were properly installed** .
- This DTC is indicated when the SRS unit update is not completed properly.
- Never press the engine start/stop switch, while updating the SRS unit. If you press the engine start/stop switch, before you complete the SRS unit update procedure, the SRS unit can be damaged. If there is a problem with the update, keep the vehicle in ON mode.
- Before doing this troubleshooting procedure, review **SRS Precautions and Procedures** and **General Troubleshooting Information** .

DTC Description	DTC
U3000-51 SRS unit programming error	B

DTC (SRS)

1. Problem verification (update)

-1. **Do the SRS unit update procedure** .

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the ON mode, then wait for 10 seconds.

-4. Check for DTCs with the HDS.

DTC Description	DTC
U3000-51 SRS unit programming error	B

Is DTC U3000-51 indicated?

YES

The failure is duplicated. **Replace the SRS unit** .

NO

Update is complete.

HOW TO INFORMATION

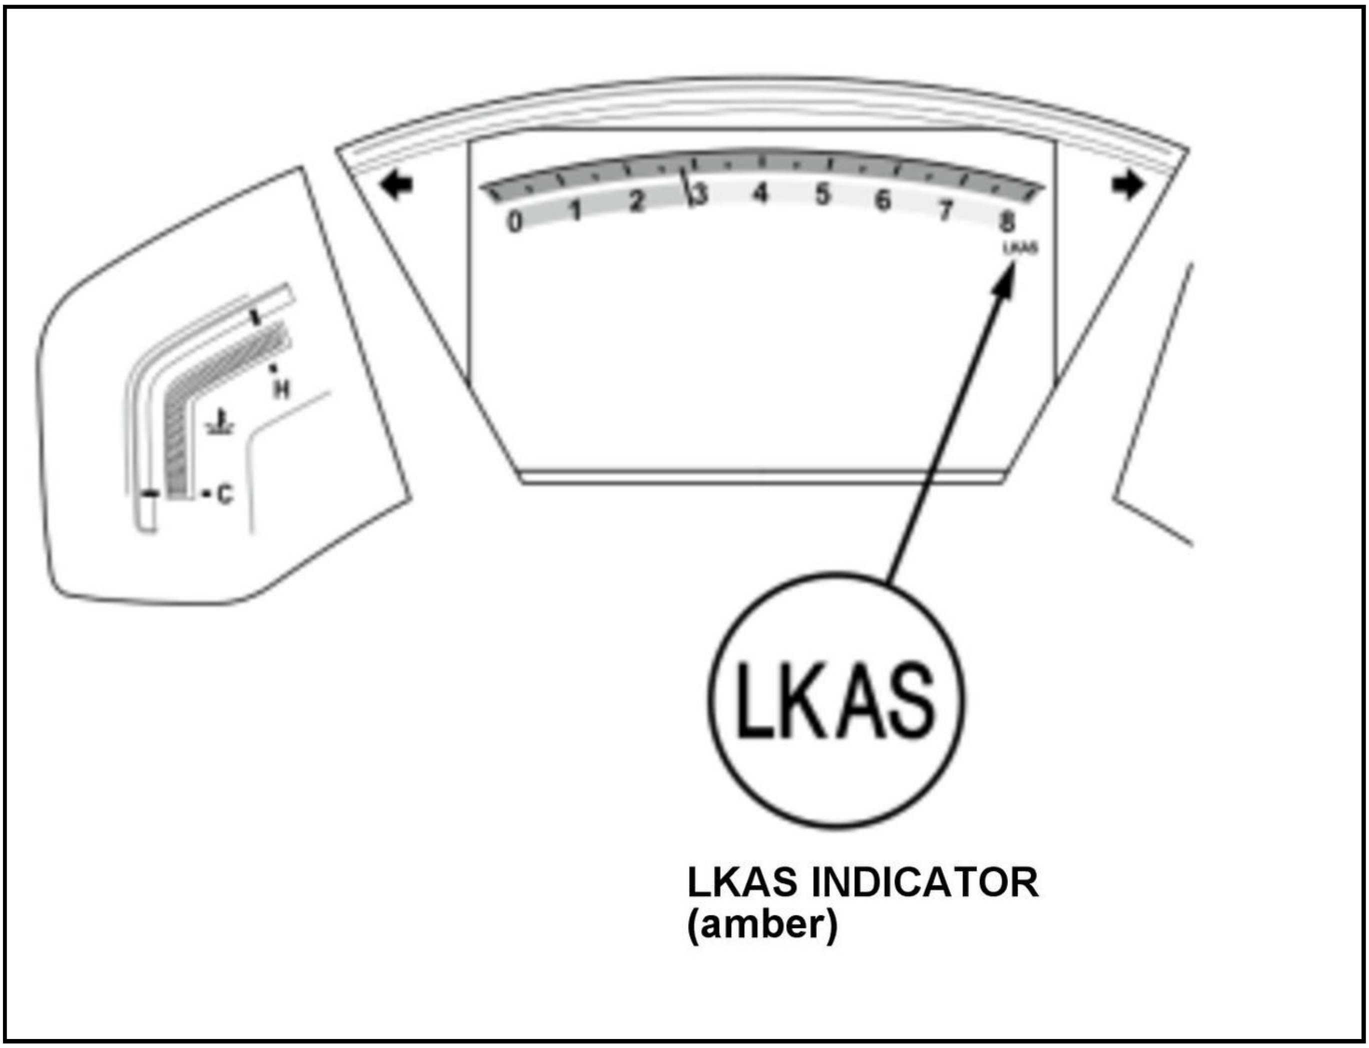
HOW TO TROUBLESHOOT THE LANE KEEPING ASSIST SYSTEM (LKAS)

LKAS Indicator (Amber)

When the LKAS detects a problem while operating, the LKAS stops operating, and the LKAS indicator stays on.

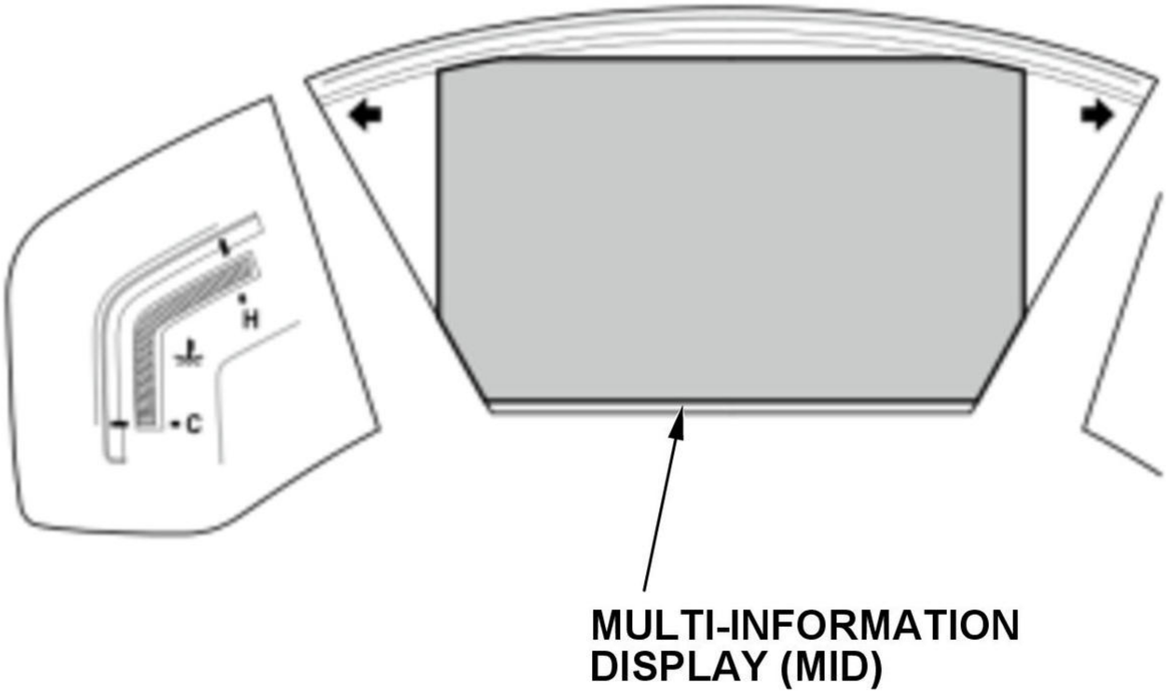
NOTE:

- For LKAS function, **review the Lane Keeping Assist System (LKAS) Description** .
- The LKAS communicates with other control units via F-CAN. For LKAS diagram, **refer to the System Diagram for LKAS** . If a connected unit malfunctions, the LKAS will not operate. In this case, both LKAS indicator and connected unit indicator come on and stay on (except for the gauge control module).



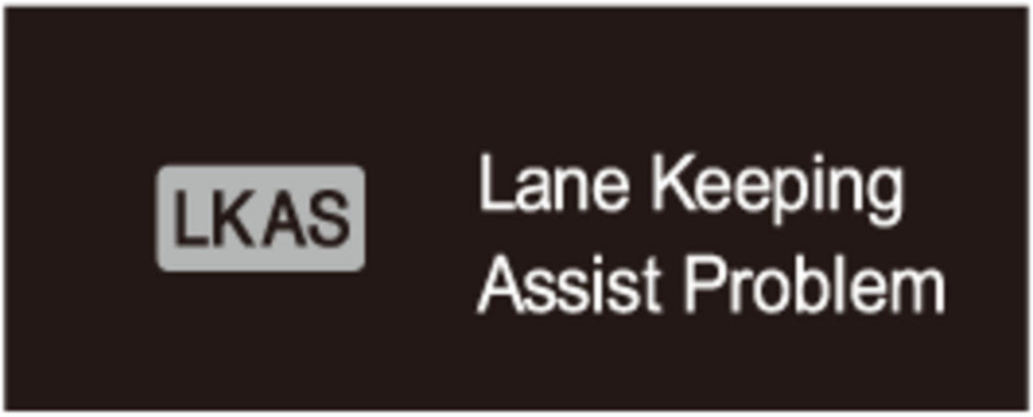
Multi-Information Display (MID) Indication

When the LKAS is OK, the LKAS indicates its operation on the MID when the MAIN switch is ON.



Self-Diagnostic Function

The LKAS has a self-diagnostic function. If the self-diagnostic function detects a malfunction, the LKAS stops operating. The LKAS indicator comes on, and the LKAS indicates "Lane Keeping Assist Problem" on the MID.



Lane Keeping Assist Problem

Millimeter Wave Radar

The millimeter wave radar measures the distance between your vehicle and the vehicle directly ahead to calculate the difference in speed between the vehicles.

The millimeter wave radar has a self-diagnostic function. If the system detects a problem, it disables the LKAS, and turns on the LKAS indicator.

Multipurpose Camera Unit

Multipurpose camera unit function sends the lane image which was received by the multipurpose camera to the multipurpose camera unit. Also, it is equipped with an error detection feature which sends error data to the multipurpose camera unit when a malfunction is detected.The multipurpose camera unit communicates with the gauge control module to send a warning signal.

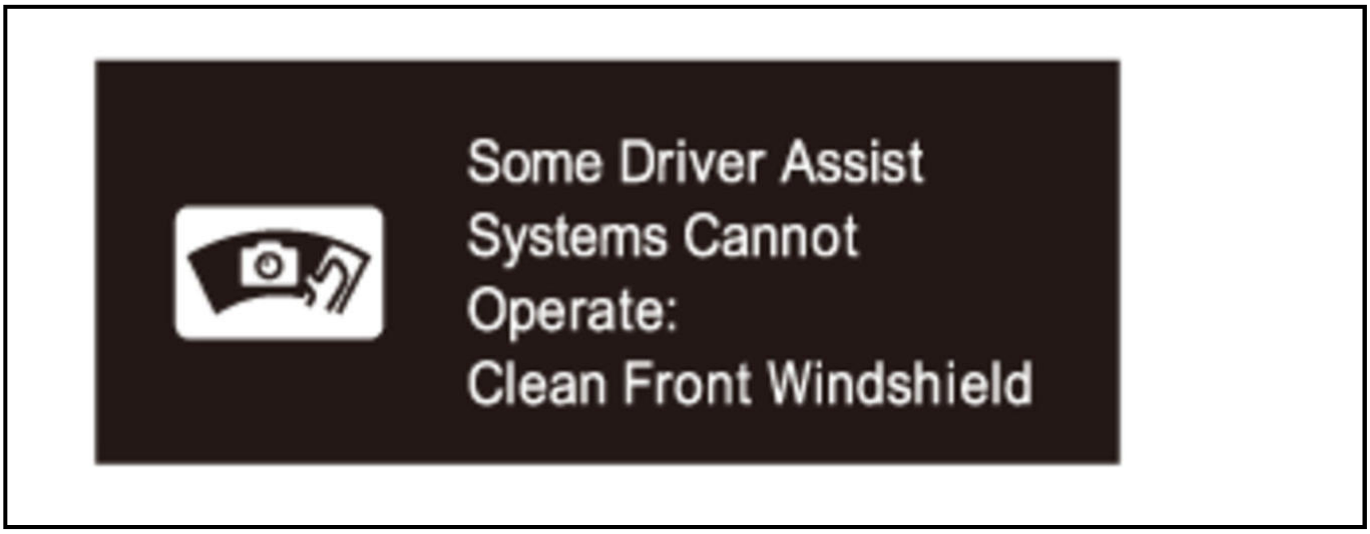
The multipurpose camera unit also has an error detection function which sends a signal to the millimeter wave radar if an error is detected. The millimeter wave radar receives this information from the multipurpose camera unit.

Dirt or dust detective function (CLEAN FRONT WINDSHIELD Indication)

If the following message appears on the MID, the camera lens or the windshield has enough dirt so that the camera view is obstructed, the LKAS stops operating.

Clean any dirt or contamination on the camera lens or the windshield. Once the camera's view is unobstructed, the indicator on the MID turns off and the LKAS automatically turns back to ON.

NOTE: When millimeter wave radar detected dirt or dust on the multipurpose camera lens or the windshield surface, DTC B2A60-97 is stored as a past failure.

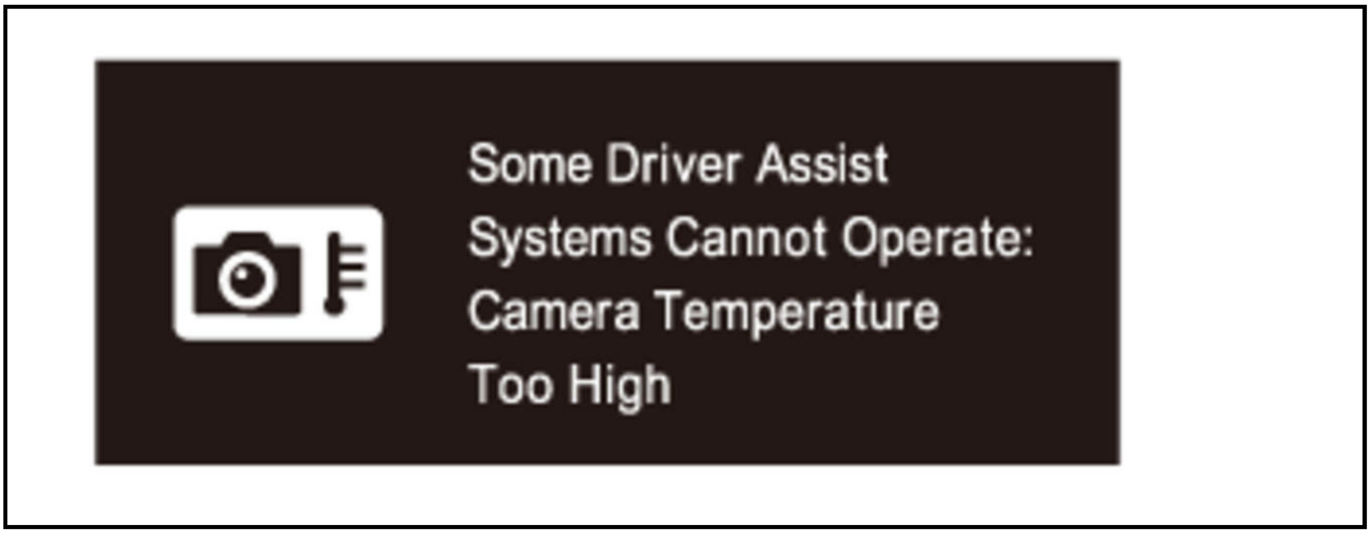


Some Driver Assist
Systems Cannot
Operate:
Clean Front Windshield

System Protect Function (High temperature) (MULTIPURPOSE CAMERA HOT Indication)

If the following message appears on the MID, the LKAS stops operating, and stores a DTC.

When the multipurpose camera temperature cools down to its proper operating temperature, the indicator on the MID turns off, and the LKAS automatically resumes operation.



Some Driver Assist
Systems Cannot Operate:
Camera Temperature
Too High

Multipurpose Camera Aiming Function

If the multipurpose camera unit is removed or replaced, you must do the multipurpose camera aiming procedure. If the aiming is incomplete, the LKAS indicator blinks.

CAN Communication

The LKAS communicates with other control units via F-CAN. For LKAS diagram, **refer to the System Diagram for LKAS** .

If the millimeter wave radar and the multipurpose camera unit detects a communication error or a malfunction in another connected unit, the LKAS system will not operate even though it is OK. In this case, both the LKAS indicator and the related unit indicator will come on and stay on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for intermittent failure DTCs. If intermittent failure DTCs are not stored, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Troubleshoot DTCs

Check the DTCs with the HDS.

NOTE: For LKAS DTCs, **refer to the DTC troubleshooting index** .

Before troubleshooting, check and note these items:

- Ask the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting.
- If the symptom does not appear and the LKAS indicator does not come on while test-driving and if your troubleshooting was based on a DTC, check for poor connections or loose terminals at all connectors related to the circuit that you are troubleshooting.
- After the troubleshooting or repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions as when the DTC was originally set. Make sure the LKAS indicator does not come on.
- The LKAS sometimes stops operating because of the environment (weather, road conditions, driving conditions, etc.). A code may be stored in these cases.

How to Retrieve DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**

2. Use the HDS to check for Integrated Driver Support System DTCs.

3. Read and record the DTC.

4. Turn the vehicle to the OFF (LOCK) mode.

5. Disconnect the HDS.

6. Do the troubleshooting procedure for the DTC.

How to Clear DTCs

NOTE: Make sure the 12 volt battery is fully charged before you begin.

1. **Connect the HDS**

2. In the Driving Support of the HDS, select Integrated Driver Support System, then DTCs, choose the clear DTCs icon, and follow the prompts.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Disconnect the HDS.

ADVANCED DIAGNOSTICS

DTC C0037-F0

DTC C0037-F0 : (Left Rear Wheel Speed Sensor Malfunction)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode. • Wait 30 seconds or more.
Execution	Regular Diagnosis
Duration	About 30 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist
Possible Cause	• Left-rear wheel speed sensor failure

DTC C003A-F0

DTC C003A-F0 : (Right Rear Wheel Speed Sensor Malfunction)

NOTE

- Initial Diagnosis:

The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode. • Wait 30 seconds or more.
Execution	Regular Diagnosis
Duration	About 30 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist
Possible Cause	• Right-rear wheel speed sensor failure

DTC C0062-96 (EPS CONTROL UNIT)

DTC C0062-96 : Longitudinal Acceleration Sensor Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode. • Wait 30 seconds or more.
Execution	Regular Diagnosis
Duration	About 30 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist
Possible Cause	• SRS unit internal failure

DTC C0063-96 (EPS CONTROL UNIT)

DTC C0063-96 : Yaw-Rate Sensor Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode. • Wait 30 seconds or more.
Execution	Regular Diagnosis
Duration	About 30 seconds
DTC Type	• 1 drive cycle

	- EPS indicator on
Fail Safe Action	- Continue EPS function/assist - Stop motion adaptive-EPS function/assist
Possible Cause	- SRS unit internal failure

DTC C1400-11

DTC C1400-11 : Motor Current Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the READY TO DRIVE mode. - Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Stop EPS function/assist
Possible Cause	- EPS motor/control unit internal failure

DTC C1400-13

DTC C1400-13 : EPS Motor Circuit Open

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop EPS function/assist
Possible Cause	• EPS motor/control unit internal failure

DTC C1400-14

DTC C1400-14 : Motor Voltage Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Stop EPS function/assist
Possible Cause	- EPS motor/control unit internal failure

DTC C1403-14

DTC C1403-14 : Motor Angle Sensor (SIN/COS) Signals Incorrect

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Stop EPS function/assist
Possible Cause	- EPS motor/control unit internal failure

DTC C1403-29

DTC C1403-29 : Motor Angle Sensor (SIN/COS) Signals Incorrect Correlation

NOTE

- Initial Diagnosis:

The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop EPS function/assist
Possible Cause	• EPS motor/control unit internal failure

DTC C1404-13

DTC C1404-13 : EPS Motor U Phase Circuit High Voltage

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	1 drive cycle EPS indicator on
Fail Safe Action	Stop EPS function/assist (Dependent upon the conditions) Stop motion adaptive-EPS function/assist
Possible Cause	EPS motor/control unit internal failure

DTC C1405-13

DTC C1405-13 : EPS Motor V Phase Circuit High Voltage

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: Turn the vehicle to the READY TO DRIVE mode. Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	1 drive cycle EPS indicator on
Fail Safe Action	Stop EPS function/assist (Dependent upon the conditions) Stop motion adaptive-EPS function/assist
Possible Cause	EPS motor/control unit internal failure

DTC C1406-13

DTC C1406-13 : EPS Motor W Phase Circuit High Voltage

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop EPS function/assist (Dependent upon the conditions) • Stop motion adaptive-EPS function/assist
Possible Cause	• EPS motor/control unit internal failure

DTC C1420-29

DTC C1420-29 : Main Torque Sensor and Sub Torque Sensor Incorrect Correlation

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - Torque sensor power supply voltage 4.5 - 5.5 V With the Driving Pattern: - Turn the vehicle to the READY TO DRIVE mode. - Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Stop or continue EPS function/assist (Limited assist) (Dependent upon the conditions) - Stop motion adaptive-EPS function/assist
Possible Cause	- EPS motor/control unit internal failure - Steering gearbox internal failure (Torque sensor)

DTC C1421-14

DTC C1421-14 : Main Torque Sensor Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - Torque sensor power supply voltage 4.5 - 5.5 V With the Driving Pattern: - Turn the vehicle to the READY TO DRIVE mode. - Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop or continue EPS function/assist (Limited assist) (Dependent upon the conditions) • Stop motion adaptive-EPS function/assist
Possible Cause	• Open, short to ground, short to power, or poor connection between the EPS motor/control unit and the torque sensor (TSM line) • Open between the EPS motor/control unit and the torque sensor (T/S_VDD line) • Open between the EPS motor/control unit and the torque sensor (T/S_GND line) • EPS motor/control unit internal failure • Steering gearbox internal failure (Torque sensor)

DTC C1422-14

DTC C1422-14 : Sub Torque Sensor Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Torque sensor power supply voltage 4.5 - 5.5 V With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on

Fail Safe Action	- Stop or continue EPS function/assist (Limited assist) (Dependent upon the conditions) - Stop motion adaptive-EPS function/assist
Possible Cause	- Open, short to ground, short to power, or poor connection between the EPS motor/control unit and the torque sensor (TSS line) - Open between the EPS motor/control unit and the torque sensor (T/S_VDD line) - Open between the EPS motor/control unit and the torque sensor (T/S_GND line) - EPS motor/control unit internal failure - Steering gearbox internal failure (Torque sensor)

DTC C1423-14

DTC C1423-14 : Torque Sensor Power Source Circuit Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Stop or continue EPS function/assist (Limited assist) (Dependent upon the conditions) - Stop motion adaptive-EPS function/assist
Possible Cause	- Short to ground between the EPS motor/control unit and the torque sensor (T/S_VDD line) - EPS motor/control unit internal failure - Steering gearbox internal failure (Torque sensor)

DTC C1432-62

DTC C1432-62 : Vehicle Speed and the Engine Speed Incorrect Correlation

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle at a steady speed of 13 mph (20 km/h) or more for at least 60 seconds. (Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 60 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist (Limited assist) (Continue system diagnosis: EPS function/assist will return to normal when the vehicle speed signal returns to normal) • Stop motion adaptive-EPS function/assist
Possible Cause	• PCM internal failure • EPS motor/control unit internal failure

DTC U0029-00 (EPS CONTROL UNIT)

DTC U0029-00 : F-CAN Malfunction (Bus-Off)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist (Limited assist) (Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal) • Stop motion adaptive-EPS function/assist
Possible Cause	• Open, short, or poor connection between the EPS control unit and other control units (F-CAN lines) • Internal failure of another unit on F-CAN • EPS motor/control unit internal failure

DTC U0100-00 (EPS CONTROL UNIT)

DTC U0100-00 : F-CAN Malfunction (EPS Control Unit-PCM/TCM)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 5 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist (Limited assist) (Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal)
Possible Cause	• Open or poor connection between the EPS control unit and the PCM (F-CAN lines) • PCM internal failure • EPS motor/control unit internal failure

DTC U0122-00 (EPS CONTROL UNIT)

DTC U0122-00 : F-CAN Malfunction (EPS Control Unit-VSA/ABS Modulator-Control Unit)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 10 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist • Stop motion adaptive-EPS function/assist (Dependent upon the conditions) (Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal)
Possible Cause	• Open or poor connection between the EPS control unit and the VSA modulator-control unit (F-CAN lines) • VSA modulator-control unit internal failure • EPS motor/control unit internal failure

DTC U0151-00 (EPS CONTROL UNIT)

DTC U0151-00 : F-CAN Malfunction (EPS Control Unit-SRS Unit)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V - IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: - Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 10 seconds
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Continue EPS function/assist - Stop motion adaptive-EPS function/assist(Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal)
Possible Cause	- Open or poor connection between the EPS control unit and the SRS unit (F-CAN lines) - SRS unit internal failure - EPS motor/control unit internal failure

DTC U0416-68 (EPS CONTROL UNIT)

DTC U0416-68 : (VSA System Malfunction)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Wait 60 seconds or more.
Execution	Regular Diagnosis
Duration	About 60 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist • Stop motion adaptive-EPS function/assist (Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal)
Possible Cause	• VSA modulator-control unit internal failure • VSA system failure

DTC U129C-00 (EPS CONTROL UNIT)

DTC U129C-00 : F-CAN Malfunction (EPS Control Unit-Driving Support System Control Unit)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis

Duration	About 10 seconds
DTC Type	- 1 drive cycle
Fail Safe Action	- Continue EPS function/assist - Stop LKAS function/assist
Possible Cause	- Open or poor connection between the EPS control unit and the millimeter wave radar (F-CAN lines) - Millimeter wave radar internal failure - EPS motor/control unit internal failure

DTC U1483-68 (EPS CONTROL UNIT)

DTC U1483-68 : (LKAS Malfunction (Indicator value check))

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V - IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: - Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 10 seconds
DTC Type	- 1 drive cycle
Fail Safe Action	- Continue EPS function/assist - Stop LKAS function/assist
Possible Cause	- Millimeter wave radar internal failure

DTC U1483-94 (EPS CONTROL UNIT)

DTC U1483-94 : (LKAS Malfunction)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 10 seconds
DTC Type	• 1 drive cycle
Fail Safe Action	• Continue EPS function/assist • Stop LKAS function/assist
Possible Cause	• Millimeter wave radar internal failure

DTC U3000-49 (EPS CONTROL UNIT)

DTC U3000-49 : EPS Control Unit Internal Circuit Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.

- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 5 seconds
DTC Type	• 1 drive cycle • EPS indicator on (Dependent upon the conditions)
Fail Safe Action	• Continue or stop EPS function/assist (Dependent upon the conditions) • Continue or stop motion adaptive-EPS function/assist (Dependent upon the conditions)
Possible Cause	• EPS motor/control unit internal failure

DTC U3000-51 (EPS CONTROL UNIT)

DTC U3000-51 : ECU Software Update Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the ON mode.
Execution	Initial Diagnosis
Duration	-
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Stop EPS function/assist - Stop motion adaptive-EPS function/assist
Possible Cause	- EPS control unit update not completed

DTC U3000-55 (EPS CONTROL UNIT)

DTC U3000-55 : EPS Control Unit Internal Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the ON mode.
Execution	Initial Diagnosis
Duration	-
DTC Type	- 1 drive cycle - EPS indicator blink
Fail Safe Action	- Continue EPS function/assist (Limited assist)
Possible Cause	- EPS motor/control unit internal failure

DTC U3003-16 (EPS CONTROL UNIT)

DTC U3003-16 : Battery Voltage Low

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Wait 15 seconds or more.
Execution	Regular Diagnosis
Duration	About 15 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop or continue EPS function/assist (Dependent upon the conditions) (Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal) • Stop motion adaptive-EPS function/assist
Possible Cause	• Open, Short to ground, or Poor connection between the under-hood fuse/relay box and the EPS control unit (+B_EPS line) • Fuse failure (Under-hood fuse/relay box No. A2-1) • Abnormal 12 volt battery • Electric powertrain system failure • EPS motor/control unit internal failure

DTC U3003-17 (EPS CONTROL UNIT)

DTC U3003-17 : Battery Voltage High

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop EPS function/assist(Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal) • Stop motion adaptive-EPS function/assist
Possible Cause	• Abnormal 12 volt battery • Electric powertrain system failure • EPS motor/control unit internal failure

---

ADVANCED DIAGNOSTICS

DTC C0037-F0

DTC C0037-F0 : Left Rear Wheel Speed Sensor Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode. • Wait 30 seconds or more.
Execution	Regular Diagnosis
Duration	About 30 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist
Possible Cause	• Left-rear wheel speed sensor failure

DTC C003A-F0

DTC C003A-F0 : Right Rear Wheel Speed Sensor Malfunction

NOTE

- Initial Diagnosis:

The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode. • Wait 30 seconds or more.
Execution	Regular Diagnosis
Duration	About 30 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist
Possible Cause	• Right-rear wheel speed sensor failure

DTC C0062-96 (EPS CONTROL UNIT)

DTC C0062-96 : Longitudinal Acceleration Sensor Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V - IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: - Turn the vehicle to the ON mode. - Wait 30 seconds or more.
Execution	Regular Diagnosis
Duration	About 30 seconds
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Continue EPS function/assist
Possible Cause	- SRS unit internal failure

DTC C0063-96 (EPS CONTROL UNIT)

DTC C0063-96 : Yaw-Rate Sensor Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 10 - 16 V - IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: - Turn the vehicle to the ON mode. - Wait 30 seconds or more.
Execution	Regular Diagnosis
Duration	About 30 seconds
DTC Type	- 1 drive cycle

	- EPS indicator on
Fail Safe Action	- Continue EPS function/assist - Stop motion adaptive-EPS function/assist
Possible Cause	- SRS unit internal failure

DTC C1400-11

DTC C1400-11 : Motor Current Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Start the engine. - Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Stop EPS function/assist
Possible Cause	- EPS motor/control unit internal failure

DTC C1400-13 (2020 2021)

DTC C1400-13 : EPS Motor Circuit Open

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Start the engine. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop EPS function/assist
Possible Cause	• EPS motor/control unit internal failure

DTC C1400-14

DTC C1400-14 : Motor Voltage Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Start the engine. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Stop EPS function/assist
Possible Cause	- EPS motor/control unit internal failure

DTC C1403-14

DTC C1403-14 : Motor Angle Sensor (SIN/COS) Signals Incorrect

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Stop EPS function/assist
Possible Cause	- EPS motor/control unit internal failure

DTC C1403-29

DTC C1403-29 : Motor Angle Sensor (SIN/COS) Signals Incorrect Correlation

NOTE

- Initial Diagnosis:

The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop EPS function/assist
Possible Cause	• EPS motor/control unit internal failure

DTC C1404-13

DTC C1404-13 : EPS Motor U Phase Circuit High Voltage

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Start the engine. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop EPS function/assist (Dependant upon the conditions) • Stop motion adaptive-EPS function/assist
Possible Cause	• EPS motor/control unit internal failure

DTC C1405-13

DTC C1405-13 : EPS Motor V Phase Circuit High Voltage

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Start the engine. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop EPS function/assist (Dependant upon the conditions) • Stop motion adaptive-EPS function/assist
Possible Cause	• EPS motor/control unit internal failure

DTC C1406-13

DTC C1406-13 : EPS Motor W Phase Circuit High Voltage

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Start the engine. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop EPS function/assist (Dependant upon the conditions) • Stop motion adaptive-EPS function/assist
Possible Cause	• EPS motor/control unit internal failure

DTC C1420-29

DTC C1420-29 : Main Torque Sensor and Sub Torque Sensor Incorrect Correlation

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Torque sensor power supply voltage 4.5 - 5.5 V With the Driving Pattern: • Start the engine. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop or continue EPS function/assist (Limited assist) (Dependant upon the conditions) • Stop motion adaptive-EPS function/assist
Possible Cause	• EPS motor/control unit internal failure • Steering gearbox internal failure (Torque sensor)

DTC C1421-14

DTC C1421-14 : Main Torque Sensor Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Torque sensor power supply voltage 4.5 - 5.5 V With the Driving Pattern: • Start the engine. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop or continue EPS function/assist (Limited assist) (Dependant upon the conditions) • Stop motion adaptive-EPS function/assist
Possible Cause	• Open, Short to ground, Short to power, or Poor connection between the EPS motor/control unit and the torque sensor (TSM line) • Open between the EPS motor/control unit and the torque sensor (T/S VDD line) • Open between the EPS motor/control unit and the torque sensor (T/S GND line) • EPS motor/control unit internal failure • Steering gearbox internal failure (Torque sensor)

DTC C1422-14

DTC C1422-14 : Sub Torque Sensor Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Torque sensor power supply voltage 4.5 - 5.5 V With the Driving Pattern: • Start the engine. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on

Fail Safe Action	- Stop or continue EPS function/assist (Limited assist) (Dependant upon the conditions) - Stop motion adaptive-EPS function/assist
Possible Cause	- Open, Short to ground, Short to power, or Poor connection between the EPS motor/control unit and the torque sensor (TSS line) - Open between the EPS motor/control unit and the torque sensor (T/S VDD line) - Open between the EPS motor/control unit and the torque sensor (T/S GND line) - EPS motor/control unit internal failure - Steering gearbox internal failure (Torque sensor)

DTC C1423-14

DTC C1423-14 : Torque Sensor Power Source Circuit Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Stop or continue EPS function/assist (Limited assist) (Dependant upon the conditions) - Stop motion adaptive-EPS function/assist
Possible Cause	- Short to ground between the EPS motor/control unit and the torque sensor (T/S VDD line) - EPS motor/control unit internal failure - Steering gearbox internal failure (Torque sensor)

DTC C1432-62

DTC C1432-62 : Vehicle Speed and the Engine Speed Incorrect Correlation

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Start the engine. • Test-drive the vehicle at a steady speed of 13 mph (20 km/h) or more for at least 60 seconds.(Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 60 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist (Limited assist) (Continue system diagnosis: EPS function/assist will return to normal when the vehicle speed signal returns to normal) • Stop motion adaptive-EPS function/assist
Possible Cause	• PCM internal failure • EPS motor/control unit internal failure

DTC U0029-00 (EPS CONTROL UNIT)

DTC U0029-00 : F-CAN Malfunction (Bus-Off)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist (Limited assist) (Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal) • Stop motion adaptive-EPS function/assist
Possible Cause	• Open, Short, or Poor connection between the EPS control unit and other control units (F-CAN lines) • Internal failure of another unit on F-CAN • EPS motor/control unit internal failure

DTC U0100-00 (EPS CONTROL UNIT)

DTC U0100-00 : F-CAN Malfunction (EPS Control Unit-PCM/TCM)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 5 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist (Limited assist) (Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal)
Possible Cause	• Open or Poor connection between the EPS control unit and the PCM (F-CAN lines) • Open or Poor connection between the EPS control unit and the TCM (F-CAN lines) *1 • PCM internal failure • TCM internal failure *1 • EPS motor/control unit internal failure

*1: L15BE engine

DTC U0122-00 (EPS CONTROL UNIT)

DTC U0122-00 : F-CAN Malfunction (EPS Control Unit-VSA Modulator-Control Unit)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:

	• 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 10 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist • Stop motion adaptive-EPS function/assist (Dependant upon the conditions) (Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal)
Possible Cause	• Open or Poor connection between the EPS control unit and the VSA modulator-control unit (F-CAN lines) • VSA modulator-control unit internal failure • EPS motor/control unit internal failure

DTC U0151-00 (EPS CONTROL UNIT)

DTC U0151-00 : F-CAN Malfunction (EPS Control Unit-SRS Unit)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis

Duration	About 10 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist • Stop motion adaptive-EPS function/assist(Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal)
Possible Cause	• Open or Poor connection between the EPS control unit and the SRS unit (F-CAN lines) • SRS unit internal failure • EPS motor/control unit internal failure

DTC U0416-68 (EPS CONTROL UNIT)

DTC U0416-68 : VSA System Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Start the engine. • Wait 60 seconds or more.
Execution	Regular Diagnosis
Duration	About 60 seconds
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Continue EPS function/assist • Stop motion adaptive-EPS function/assist(Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal)
Possible Cause	• VSA modulator-control unit internal failure • VSA system failure

DTC U129C-00 (EPS CONTROL UNIT)

DTC U129C-00 : F-CAN Malfunction (EPS Control Unit-Driving Support System Control Unit)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis

Duration	About 10 seconds
DTC Type	• 1 drive cycle
Fail Safe Action	• Continue EPS function/assist • Stop LKAS function/assist
Possible Cause	• Open or Poor connection between the EPS control unit and the millimeter wave radar (F-CAN lines) • Millimeter wave radar internal failure • EPS motor/control unit internal failure

DTC U1483-68 (EPS CONTROL UNIT)

DTC U1483-68 : LKAS Malfunction (Indicator value check)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 10 seconds
DTC Type	• 1 drive cycle
Fail Safe Action	• Continue EPS function/assist • Stop LKAS function/assist
Possible Cause	• Millimeter wave radar internal failure

DTC U1483-94 (EPS CONTROL UNIT)

DTC U1483-94 : LKAS Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 10 - 16 V • IG voltage continued more than 10 V for at least 1 second With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 10 seconds
DTC Type	• 1 drive cycle
Fail Safe Action	• Continue EPS function/assist • Stop LKAS function/assist
Possible Cause	• Millimeter wave radar internal failure

DTC U3000-13 (EPS CONTROL UNIT) (2017 2018 2019)

DTC U3000-13 : EPS Motor Circuit Open

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.

- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Start the engine. • Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • EPS indicator on
Fail Safe Action	• Stop EPS function/assist
Possible Cause	• EPS motor/control unit internal failure

DTC U3000-49 (EPS CONTROL UNIT)

DTC U3000-49 : EPS Control Unit Internal Circuit Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 5 seconds
DTC Type	• 1 drive cycle • EPS indicator on (Dependant upon the conditions)
Fail Safe Action	• Continue or stop EPS function/assist (Dependant upon the conditions)

	- Continue or stop motion adaptive-EPS function/assist (Dependant upon the conditions)
Possible Cause	- EPS motor/control unit internal failure

DTC U3000-51 (EPS CONTROL UNIT)

DTC U3000-51 : ECU Software Update Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the ON mode.
Execution	Initial Diagnosis
Duration	-
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Stop EPS function/assist - Stop motion adaptive-EPS function/assist
Possible Cause	- EPS control unit update not completed

DTC U3000-55 (EPS CONTROL UNIT)

DTC U3000-55 : EPS Control Unit Internal Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	-
DTC Type	• 1 drive cycle • EPS indicator blink
Fail Safe Action	• Continue EPS function/assist (Limited assist)
Possible Cause	• EPS motor/control unit internal failure

DTC U3003-16 (EPS CONTROL UNIT)

DTC U3003-16 : Battery Voltage Low

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Start the engine. • Wait 15 seconds or more.
Execution	Regular Diagnosis
Duration	About 15 seconds
DTC Type	• 1 drive cycle • EPS indicator on

Fail Safe Action	- Stop or continue EPS function/assist (Dependant upon the conditions) (Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal) - Stop motion adaptive-EPS function/assist
Possible Cause	- Open, Short to ground, or Poor connection between the under-hood fuse/relay box and the EPS control unit (+B EPS line) - Fuse failure (Under-hood fuse/relay box No. A2-1 (70 A)) - Alternator failure - Abnormal 12 volt battery - EPS motor/control unit internal failure

DTC U3003-17 (EPS CONTROL UNIT)

DTC U3003-17 : Battery Voltage High

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the EPS indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the EPS indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the EPS system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Start the engine.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - EPS indicator on
Fail Safe Action	- Stop EPS function/assist(Continue system diagnosis: EPS function/assist will return to normal after the system returns to normal) - Stop motion adaptive-EPS function/assist
Possible Cause	- Alternator failure - Abnormal 12 volt battery - EPS motor/control unit internal failure

DTC TROUBLESHOOTING INDEX

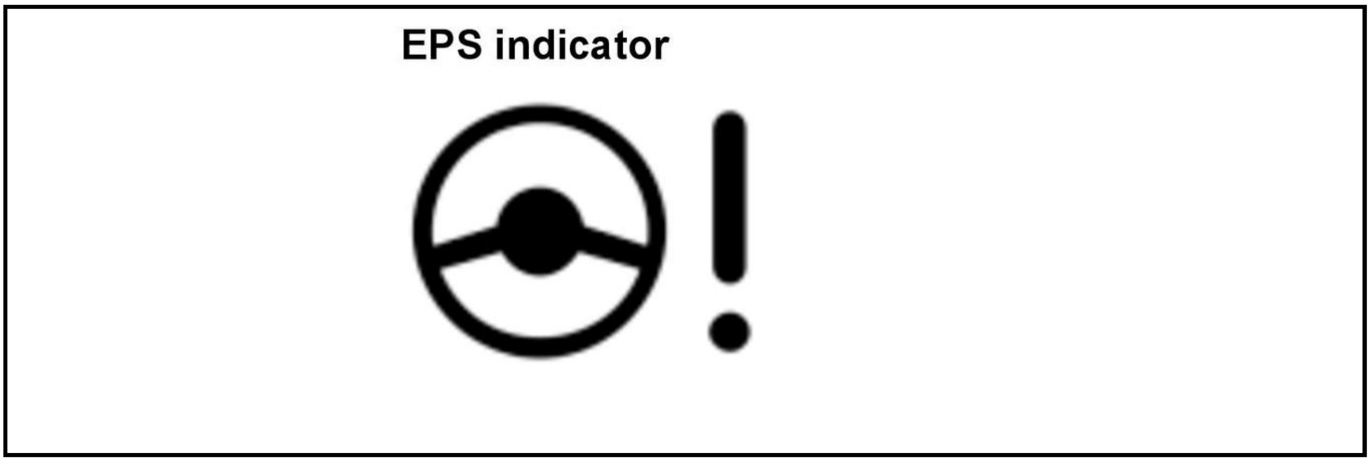
	-17	Battery Voltage High

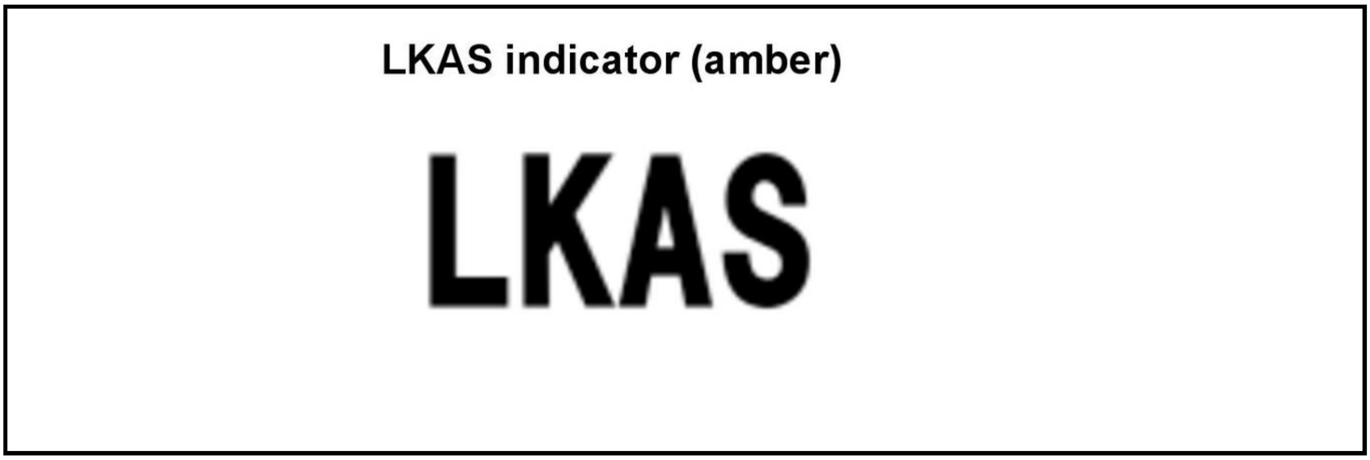
HOW TO INFORMATION

HOW TO TROUBLESHOOT THE EPS

System Indicator

This system has two indicators on the gauge control module.





NOTE: For locations of each indicator, refer to gauge control module component location index .

EPS Indicator

Under normal conditions, the EPS indicator comes on when turning the vehicle to the ON mode, then turns off after turning the vehicle to the READY TO DRIVE mode. This indicates that the LED and its circuit are operating correctly.

- If there is a failure in the system after turning the vehicle to the READY TO DRIVE mode, the EPS indicator will stay on and stores a DTC, and the power assist is turned off or restricted.
- The EPS indicator will blink when the DTC U3000-55 is detected.

When a problem is detected, the EPS indicator will turn on and remain on until the DTC is erased. There are cases when the indicator remains on until the vehicle is set to the OFF (LOCK) mode as well as other cases where the indicator automatically turns off when the system returns to normal. Under certain conditions, the EPS indicator will turn on even though the system is operating normally; for example when the vehicle is stopped with the engine at high revolutions with constant input from the steering wheel.

To determine the actual cause of the problem, question the customer about the conditions during which the problem occurred, taking the above conditions into consideration.

LKAS Indicator (amber)

This EPS system works in conjunction with the LKAS. When an LKAS related problem is detected, the LKAS indicator (amber) will come on. However, when the EPS control fails while the LKAS control is activated, the LKAS indicator (amber) will also come on. In this case, the EPS indicator will not come on, but the EPS control unit memorizes the DTC. If the LKAS indicator (amber) comes on, it deactivates the LKAS control. The power assist works as usual after deactivating the LKAS, but it may stop the power assist depending on the detected malfunction.

Diagnostic Trouble Code (DTC)

- If the CPU cannot be activated, or if it fails, the EPS indicator comes on, but no EPS DTC is stored.
- The memory can hold any number of DTCs. However, when the same DTC is detected more than once, the most recent DTC is written over the prior DTC, therefore only one occurrence is stored.
- The DTCs are stored in the EEPROM (non-volatile memory), therefore the stored DTCs cannot be erased by disconnecting the 12 volt battery. Do the specified procedures to clear the DTCs.

Self-Diagnosis

Self-diagnosis can be classified into three categories:

- Initial diagnosis: Done right after turning the vehicle to the READY TO DRIVE mode and until the EPS indicator goes off.
- Regular diagnosis: Done right after the initial diagnosis and continues until turning the vehicle to the OFF (LOCK) mode.
- Steering diagnosis: Done during regular diagnosis while turning the steering wheel.

Restriction on Power Assist Operation

Repeated extreme steering force, such as turning the steering wheel continuously back-and-forth with the vehicle stopped, causes an increase in electrical current draw by the EPS motor. The increase of electric current causes the EPS motor and EPS control unit to heat up. Because this heat adversely affects the system, the control unit monitors the electric current draw of the EPS motor.

When the control unit detects heat build-up in the EPS motor, it reduces the electric current to the EPS motor gradually to protect the system, and it restricts the power assist operation. The EPS indicator does not come on during this function.

When steering torque is not applied to the steering wheel, or when turning the vehicle to the OFF (LOCK) mode and the EPS motor cools, the control unit will restore the power assist gradually until it's fully restored (after about 20 minutes).

How to Troubleshoot DTCs

The troubleshooting procedures assume that the cause of the problem is still present and the EPS indicator is still on. Following the procedure when the EPS indicator does not come on can result in incorrect diagnosis.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the EPS indicator came on, such as while turning, after turning, when the vehicle was at a certain speed, etc.

2. When the EPS indicator does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor terminal contact, etc., in the affected circuit before you start troubleshooting.

3. After troubleshooting, clear the DTC and test-drive the vehicle. Be sure the EPS indicator does not come on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Use the HDS (Honda Diagnostic System)

NOTE: Make sure the 12 volt battery is in good condition and fully charged.

1. If the system indicator(s) stay on, connect the HDS to the data link connector (DLC)

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it does not, go to the DTC troubleshooting index

Check the diagnostic trouble code (DTC) and the freeze data, for all systems, troubleshoot the powertrain DTCs first. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.**NOTE:**

- Freeze data indicates the EPS conditions when the first system malfunction that activated the indicator was detected.
- The HDS can read the DTC, the freeze data, the current data, and other system data.
- For specific operations, refer to the Help menu that came with the HDS.

How to Retrieve DTCs

1. With the vehicle in OFF (LOCK) mode, connect the HDS to the data link connector (DLC)

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it does not, go to the DTC troubleshooting index

4. Follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the DTC troubleshooting. Do the all systems DTC check, and troubleshoot any powertrain DTCs first.

5. Turn the vehicle to the OFF (LOCK) mode.

How to Clear DTCs

1. With the vehicle in OFF (LOCK) mode, connect the HDS to the data link connector (DLC)

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it does not, go to the DTC troubleshooting index

4. Clear the DTC(s) by following the screen prompts on the HDS.

5. Turn the vehicle to the OFF (LOCK) mode.

DTC TROUBLESHOOTING

DTC C0037-F0, C003A-F0

DTC C0037-F0 : (Left Rear Wheel Speed Sensor Malfunction)

DTC C003A-F0 : (Right Rear Wheel Speed Sensor Malfunction)

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
C0037-F0 (Left Rear Wheel Speed Sensor Malfunction)	B	B
C003A-F0 (Right Rear Wheel Speed Sensor Malfunction)	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Wait for 30 seconds or more.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0037-F0 (Left Rear Wheel Speed Sensor Malfunction)	B	B
C003A-F0 (Right Rear Wheel Speed Sensor Malfunction)	B	B

Is DTC C0037-F0 or C003A-F0 indicated?

YES

The failure is duplicated. **Go to VSA system troubleshooting** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C0062-96 (EPS CONTROL UNIT)

DTC C0062-96 : Longitudinal Acceleration Sensor Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
C0062-96 Longitudinal Acceleration Sensor Malfunction	B	B

DTC (EPS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Wait for 30 seconds or more.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0062-96 Longitudinal Acceleration Sensor Malfunction	B	B

Is DTC C0062-96 indicated?

YES

The failure is duplicated. **Replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C0063-96 (EPS CONTROL UNIT)

DTC C0063-96 : Yaw-Rate Sensor Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
C0063-96 Yaw-Rate Sensor Malfunction	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Wait for 30 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0063-96 Yaw-Rate Sensor Malfunction	B	B

   Is DTC C0063-96 indicated?

   YES

   The failure is duplicated. Replace the SRS unit .

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C1400-11, C1400-13, C1400-14, C1403-14, C1403-29, C1404-13, C1405-13, C1406-13, U3000-49 (EPS CONTROL UNIT)

DTC C1400-11 : Motor Current Malfunction

DTC C1400-13 : EPS Motor Circuit Open

DTC C1400-14 : Motor Voltage Malfunction

DTC C1403-14 : Motor Angle Sensor (SIN/COS) Signals Incorrect

DTC C1403-29 : Motor Angle Sensor (SIN/COS) Signals Incorrect Correlation

DTC C1404-13 : EPS Motor U Phase Circuit High Voltage

DTC C1405-13 : EPS Motor V Phase Circuit High Voltage

DTC C1406-13 : EPS Motor W Phase Circuit High Voltage

GetFreeManuals.org

DTC U3000-49 : EPS Control Unit Internal Circuit Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
C1400-11 Motor Current Malfunction	B	B
C1400-13 EPS Motor Circuit Open	B	B
C1400-14 Motor Voltage Malfunction	B	B
C1403-14 Motor Angle Sensor (SIN/COS) Signals Incorrect	B	B
C1403-29 Motor Angle Sensor (SIN/COS) Signals Incorrect Correlation	B	B
C1404-13 EPS Motor U Phase Circuit High Voltage	B	B
C1405-13 EPS Motor V Phase Circuit High Voltage	B	B
C1406-13 EPS Motor W Phase Circuit High Voltage	B	B
U3000-49 EPS Control Unit Internal Circuit Malfunction	B	B

DTC (EPS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1400-11 Motor Current Malfunction	B	B
C1400-13 EPS Motor Circuit Open	B	B
C1400-14 Motor Voltage Malfunction	B	B
C1403-14 Motor Angle Sensor (SIN/COS) Signals Incorrect	B	B
C1403-29 Motor Angle Sensor (SIN/COS) Signals Incorrect Correlation	B	B
C1404-13 EPS Motor U Phase Circuit High Voltage	B	B
C1405-13 EPS Motor V Phase Circuit High Voltage	B	B
C1406-13 EPS Motor W Phase Circuit High Voltage	B	B
U3000-49 EPS Control Unit Internal Circuit Malfunction	B	B

Is DTC C1400-11, C1400-13, C1400-14, C1403-14, C1403-29, C1404-13, C1405-13, C1406-13, or U3000-49 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C1420-29

DTC C1420-29 : Main Torque Sensor and Sub Torque Sensor Incorrect Correlation

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1420-29 Main Torque Sensor and Sub Torque Sensor Incorrect Correlation	B	B

DTC (EPS)

1. DTC check

-1. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1420-29 Main Torque Sensor and Sub Torque Sensor Incorrect Correlation	B	B
C1421-14 Main Torque Sensor Malfunction	B	B
C1422-14 Sub Torque Sensor Malfunction	B	B

Is DTC C1420-29 indicated?

YES

Go to step 2.

YES

If DTC C1421-14 or C1422-14 are also indicated, go to DTC **C1421-14** or **C1422-14** troubleshooting.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Torque sensor internal resistance check

-1. Turn the vehicle to the OFF (LOCK) mode.

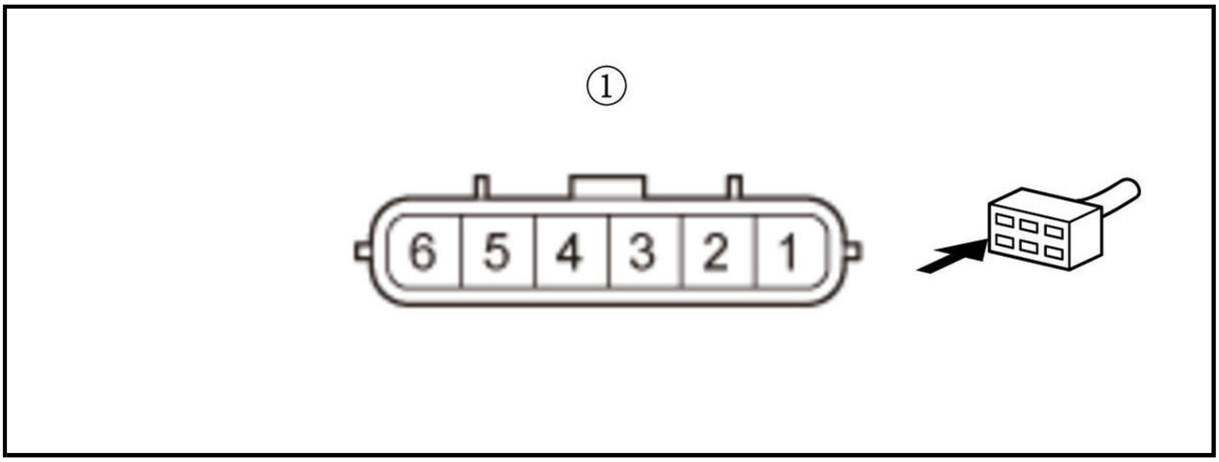
-2. Disconnect the following connector.

Torque sensor 6P connector

-3. On the sensor side, measure the resistance between test points 1 and 2 individually (see table).

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected

Test Circuit	Torque Sensor 6P Connector (male terminals): ①		Reference resistance value
	Test point 1	Test point 2	
T/S_VDD - T/S_GND	No. 5	No. 3	141-175 Ω
TSM - T/S_GND	No. 2	No. 3	179-244 Ω
TSS - T/S_GND	No. 4	No. 3	179-244 Ω



Is the resistance OK?

YES

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Replace the steering gearbox .

DTC C1421-14

DTC C1421-14 : Main Torque Sensor Malfunction

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1421-14 Main Torque Sensor Malfunction	B	B

DTC (EPS)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1421-14 Main Torque Sensor Malfunction	B	B
C1423-14 Torque Sensor Power Source Circuit Malfunction	B	B

Is DTC C1421-14 indicated?

YES

Go to step 2.

YES

If DTC C1423-14 is also indicated, go to DTC **C1423-14** troubleshooting.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Torque sensor performance check

-1. Turn the steering wheel to the right and left several times.

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
TORQUE SENSOR MAIN	B	B

Is there less than about 0.3 V or more than about 4.7 V?

YES (Less than about 0.3 V)

Go to step 3.

YES (More than about 4.7 V)

Go to step 7.

NO

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

3. Torque sensor check

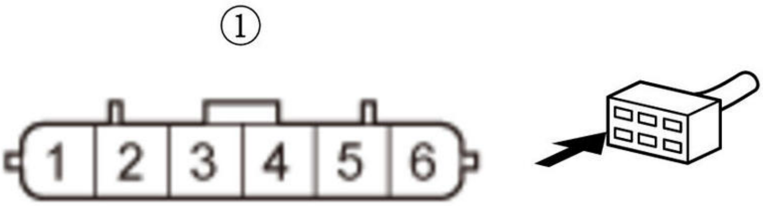
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Torque sensor 6P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Torque sensor 6P connector (female terminals) No. 5: ①
Terminal B	Torque sensor 6P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
TORQUE SENSOR MAIN	B	B

Is there about 5 V?

YES

Replace the steering gearbox .

NO

Go to step 4.

4. Open wire check (T/S_VDD line)

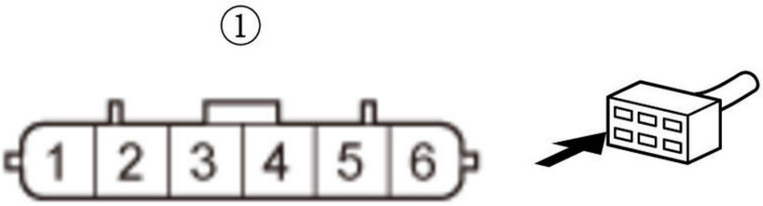
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector C (4P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected
B	EPS control unit connector C (4P): disconnected
Test point 1	Torque sensor 6P connector (female terminals) No. 5: ①
Test point 2	**EPS control unit connector C (4P) No. 1**



Is there 1.0 Ω or less?

YES

The T/S_VDD wire is OK. Go to step 5.

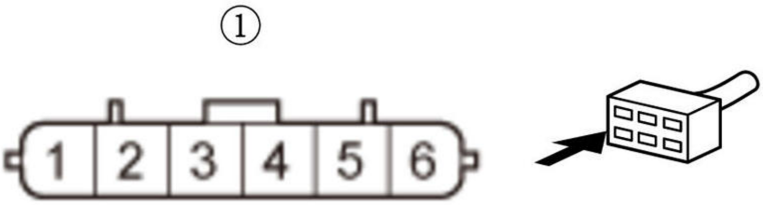
NO

Repair an open in the wire between the EPS control unit and the torque sensor.

5. Open wire check (TSM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected
B	EPS control unit connector C (4P): disconnected
Test point 1	Torque sensor 6P connector (female terminals) No. 2: ①
Test point 2	**EPS control unit connector C (4P) No. 4**



Is there 1.0 Ω or less?

YES

The TSM wire is not open. Go to step 6.

NO

Repair an open in the wire between the EPS control unit and the torque sensor.

6. Shorted wire check (TSM line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected
B	EPS control unit connector C (4P): disconnected
Test point 1	**EPS control unit connector C (4P) No. 4**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The TSM wire is OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Repair a short to ground in the wire between the EPS control unit and the torque sensor.

7. EPS control unit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector C (4P)

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Values	**Unit**
TORQUE SENSOR MAIN	B	B

Is there about 5 V?

YES

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Go to step 8.

8. Shorted wire check (TSM line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Torque sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector C (4P): disconnected
B	Torque sensor 6P connector: disconnected
Test point 1	**EPS control unit connector C (4P) No. 1**
Test point 2	**EPS control unit connector C (4P) No. 4**

Is there 1 MΩ or more?

YES

Go to step 9.

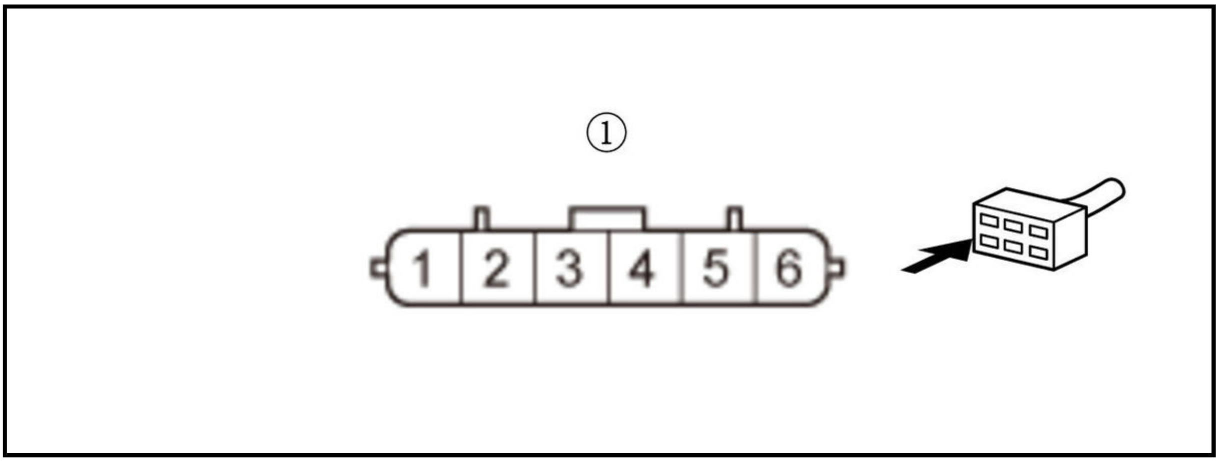
NO

Repair a short in the wire between the EPS control unit and the torque sensor.

9. Open wire check (T/S_GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector C (4P): disconnected
B	Torque sensor 6P connector: disconnected
Test point 1	**EPS control unit connector C (4P) No. 2**
Test point 2	Torque sensor 6P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

The T/S_GND wire is OK. **Replace the steering gearbox** .

NO

Repair an open in the wire between the EPS control unit and the torque sensor.

DTC C1422-14

DTC C1422-14 : Sub Torque Sensor Malfunction

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1422-14 Sub Torque Sensor Malfunction	B	B

DTC (EPS)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1422-14 Sub Torque Sensor Malfunction	B	B
C1423-14 Torque Sensor Power Source Circuit Malfunction	B	B

   Is DTC C1422-14 indicated?

   YES

   Go to step 2.

   YES

   If DTC C1423-14 is also indicated, go to DTC **C1423-14** troubleshooting.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Torque sensor performance check

   -1. Turn the steering wheel to the right and left several times.

   -2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
TORQUE SENSOR SUB	B	B

   Is there less than about 0.3 V or more than about 4.7 V?

   YES (Less than about 0.3 V)

   Go to step 3.

   YES (More than about 4.7 V)

   Go to step 7.

   NO

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

3. Torque sensor check

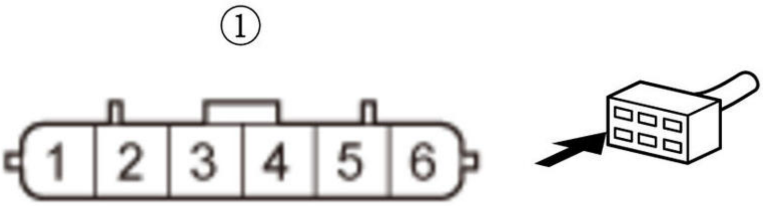
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Torque sensor 6P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Torque sensor 6P connector (female terminals) No. 5: ①
Terminal B	Torque sensor 6P connector (female terminals) No. 4: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
TORQUE SENSOR SUB	B	B

Is there about 5 V?

YES

Replace the steering gearbox .

NO

Go to step 4.

4. Open wire check (T/S_VDD line)

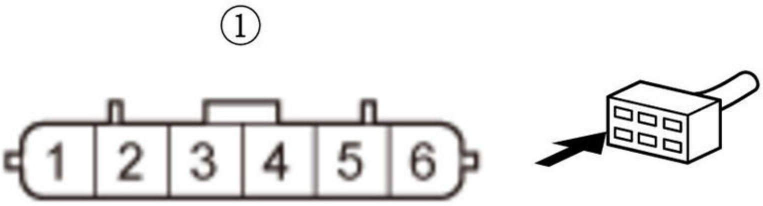
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector C (4P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected
B	EPS control unit connector C (4P): disconnected
Test point 1	Torque sensor 6P connector (female terminals) No. 5: ①
Test point 2	**EPS control unit connector C (4P) No. 1**



Is there 1.0 Ω or less?

YES

The T/S_VDD wire is OK. Go to step 5.

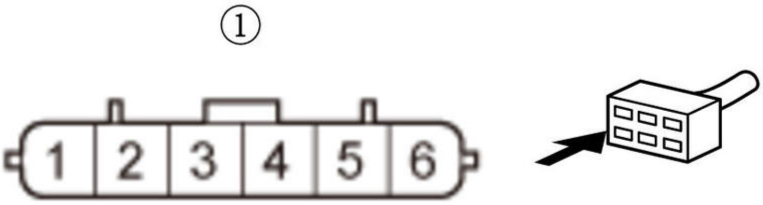
NO

Repair an open in the wire between the EPS control unit and the torque sensor.

5. Open wire check (TSS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected
B	EPS control unit connector C (4P): disconnected
Test point 1	Torque sensor 6P connector (female terminals) No. 4: ①
Test point 2	**EPS control unit connector C (4P) No. 3**



Is there 1.0 Ω or less?

YES

The TSS wire is not open. Go to step 6.

NO

Repair an open in the wire between the EPS control unit and the torque sensor.

6. Shorted wire check (TSS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected
B	EPS control unit connector C (4P): disconnected
Test point 1	**EPS control unit connector C (4P) No. 3**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The TSS wire is OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Repair a short to ground in the wire between the EPS control unit and the torque sensor.

7. EPS control unit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector C (4P)

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Values	**Unit**
TORQUE SENSOR SUB	B	B

Is there about 5 V?

YES

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Go to step 8.

8. Shorted wire check (TSS line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Torque sensor 6P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector C (4P): disconnected
B	Torque sensor 6P connector: disconnected
Test point 1	**EPS control unit connector C (4P) No. 1**
Test point 2	**EPS control unit connector C (4P) No. 3**

Is there 1 MΩ or more?

YES

Go to step 9.

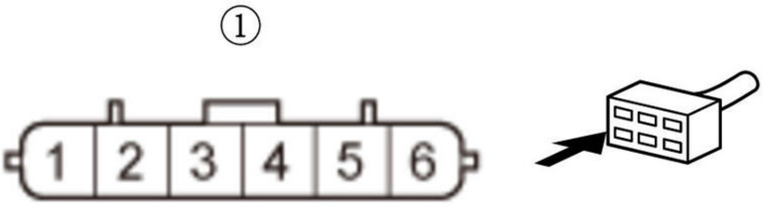
NO

Repair a short in the wire between the EPS control unit and the torque sensor.

9. Open wire check (T/S_GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector C (4P): disconnected
B	Torque sensor 6P connector: disconnected
Test point 1	**EPS control unit connector C (4P) No. 2**
Test point 2	Torque sensor 6P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

The T/S_GND wire is OK. **Replace the steering gearbox** .

NO

Repair an open in the wire between the EPS control unit and the torque sensor.

DTC C1423-14

DTC C1423-14 : Torque Sensor Power Source Circuit Malfunction

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1423-14 Torque Sensor Power Source Circuit Malfunction	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1423-14 Torque Sensor Power Source Circuit Malfunction	B	B

Is DTC C1423-14 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Torque sensor check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Torque sensor 6P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Torque sensor input voltage	B	B

Is the voltage between 4.5-5.5 V?

YES

Replace the steering gearbox .

NO

Go to step 3.

3. Shorted wire check (T/S_VDD line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

EPS control unit connector C (4P)

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Torque sensor input voltage	B	B

   Is the voltage between 4.5-5.5 V?

   YES

   Repair a short to ground in the wire between the EPS control unit and the torque sensor.

   NO

   The T/S_VDD wire is OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

DTC C1432-62

DTC C1432-62 : Vehicle Speed and the Engine Speed Incorrect Correlation

NOTE:

- **Before you troubleshoot, review the general troubleshooting information**.
- VSA DTCs may set during this troubleshooting. If so, clear them.

DTC Description	DTC	Freeze Frame
C1432-62 Vehicle Speed and the Engine Speed Incorrect Correlation	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Test-drive the vehicle at 12 mph (20 km/h) or more for 30 seconds or more.

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1432-62 Vehicle Speed and the Engine Speed Incorrect Correlation	B	B

Is DTC C1432-62 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Vehicle speed signal check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Raise and support the vehicle** , and allow all wheels to rotate freely.

-3. Turn the vehicle to the READY TO DRIVE mode.

-4. Turn off the VSA function by using the VSA OFF switch.

-5. Run the vehicle while in the D position/mode.

-6. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
VEHICLE SPEED	B	B

Is 0 mph (0 km/h) indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** , then recheck. If the symptom/indication goes away with a known-good PCM, **replace the original PCM** .

NO

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

DTC U0029-00 (EPS CONTROL UNIT)

DTC U0029-00 : F-CAN Malfunction (Bus-Off)

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
U0029-00 F-CAN Malfunction (Bus-Off)	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U0029-00 F-CAN Malfunction (Bus-Off)	B	B

   Is DTC U0029-00 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check (CAN gateway system)

   -1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

   Are DTC(s) indicated?

   YES

   Go to indicated DTC's troubleshooting.

   NO

   Go to step 3.

3. F-CAN circuit communication check

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Which result is indicated?

   EPS control unit (Bus C) is Not Available

   Go to step 4.

EPS control unit (Bus C) is Available

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

4. Open wire check (F-CAN C_H, F-CAN C_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

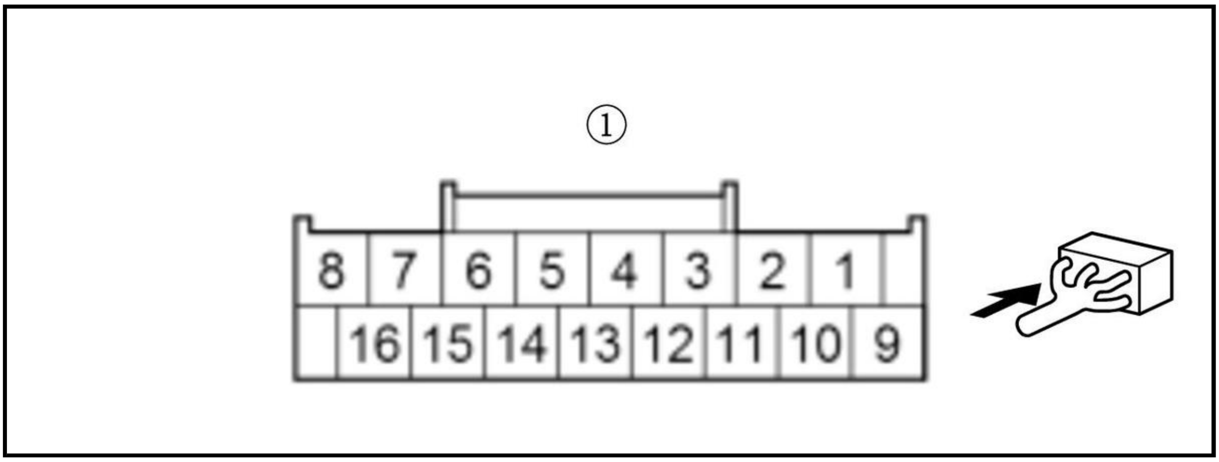
-2. Disconnect the following connectors.

EPS control unit connector B (6P)
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	CAN gateway 16P connector: disconnected
Test circuit 1	B
Test point 1	**EPS control unit connector B (6P) No. 1**
Test point 2	CAN gateway 16P connector (female terminals) No. 5: ①

Test circuit 2	B
Test point 1	**EPS control unit connector B (6P) No. 3**
Test point 2	CAN gateway 16P connector (female terminals) No. 13: ①



Is there 1.0 Ω or less?

YES

The F-CAN C_H and F-CAN C_L wires are OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Repair an open in the wire between the EPS control unit and the CAN gateway.

DTC U0100-00, U0122-00, U0151-00, U129C-00 (EPS CONTROL UNIT)

DTC U0100-00 : F-CAN Malfunction (EPS Control Unit-PCM/TCM)

DTC U0122-00 : F-CAN Malfunction (EPS Control Unit-VSA/ABS Modulator-Control Unit)

DTC U0151-00 : F-CAN Malfunction (EPS Control Unit-SRS Unit)

DTC U129C-00 : F-CAN Malfunction (EPS Control Unit-Driving Support System Control Unit)

NOTE:

- **Before you troubleshoot, review the general troubleshooting information**.
- According to the detected DTC(s), confirm the control unit that the EPS control unit lost communication with has the proper power supply and ground connection. Refer to the input testing for that control unit if necessary.

DTC Description	DTC	Freeze Frame
U0100-00 F-CAN Malfunction (EPS Control Unit-PCM/TCM)	B	B
U0122-00 F-CAN Malfunction (EPS Control Unit-VSA/ABS Modulator-Control Unit)	B	B
U0151-00 F-CAN Malfunction (EPS Control Unit-SRS Unit)	B	B
U129C-00 F-CAN Malfunction (EPS Control Unit-Driving Support System Control Unit)	B	B

DTC (EPS)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Wait 10 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U0100-00 F-CAN Malfunction (EPS Control Unit-PCM/TCM)	B	B
U0122-00 F-CAN Malfunction (EPS Control Unit-VSA/ABS Modulator-Control Unit)	B	B
U0151-00 F-CAN Malfunction (EPS Control Unit-SRS Unit)	B	B
U129C-00 F-CAN Malfunction (EPS Control Unit-Driving Support System Control Unit)	B	B

   Is DTC indicated?

   YES

   Go to step 2.

   NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check (CAN gateway system)

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

Are DTC(s) indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 3.

3. F-CAN circuit communication check (Receiving control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

EPS control unit (Bus C) is Not Available

Go to step 4.

EPS control unit (Bus C) is Available

Go to step 5.

4. Open wire check (F-CAN C_H, F-CAN C_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

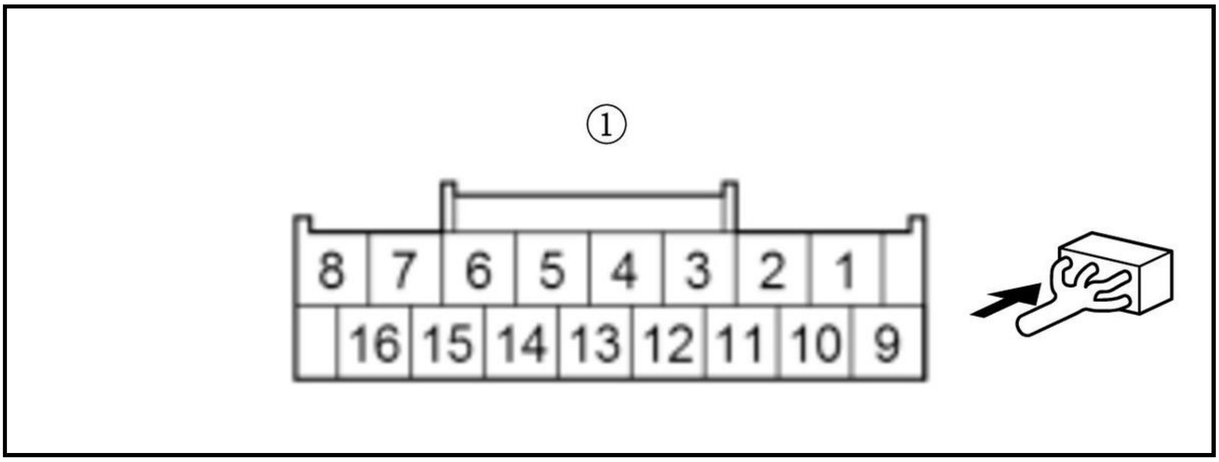
EPS control unit connector B (6P)
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	CAN gateway 16P connector: disconnected
Test circuit 1	B
Test point 1	**EPS control unit connector B (6P) No. 1**
Test point 2	CAN gateway 16P connector (female terminals) No. 5: ①

Test circuit 2	B

Test point 1	**EPS control unit connector B (6P) No. 3**
Test point 2	CAN gateway 16P connector (female terminals) No. 13: ①



Is there 1.0 Ω or less?

YES

The F-CAN C_H and F-CAN C_L wires are OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Repair an open in the wire between the EPS control unit and the CAN gateway.

5. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100-00	PCM	A, B
U0122-00	VSA modulator-control unit	B, C
U0151-00	SRS unit	C
U129C-00	Millimeter wave radar	C

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

U0100-00: PCM (Bus A) is Not Available

Go to step 6.

U0100-00: PCM (Bus B) is Not Available

Go to step 7.

U0122-00: VSA modulator-control unit (Bus B) is Not Available

Go to step 7.

U0122-00: VSA modulator-control unit (Bus C) is Not Available

Go to step 8.

U0151-00: SRS unit (Bus C) is Not Available

Go to step 8.

U129C-00: Millimeter wave radar (Bus C) is Not Available

Go to step 8.

6. Open wire check (F-CAN A_H, F-CAN A_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors according to the detected DTC.

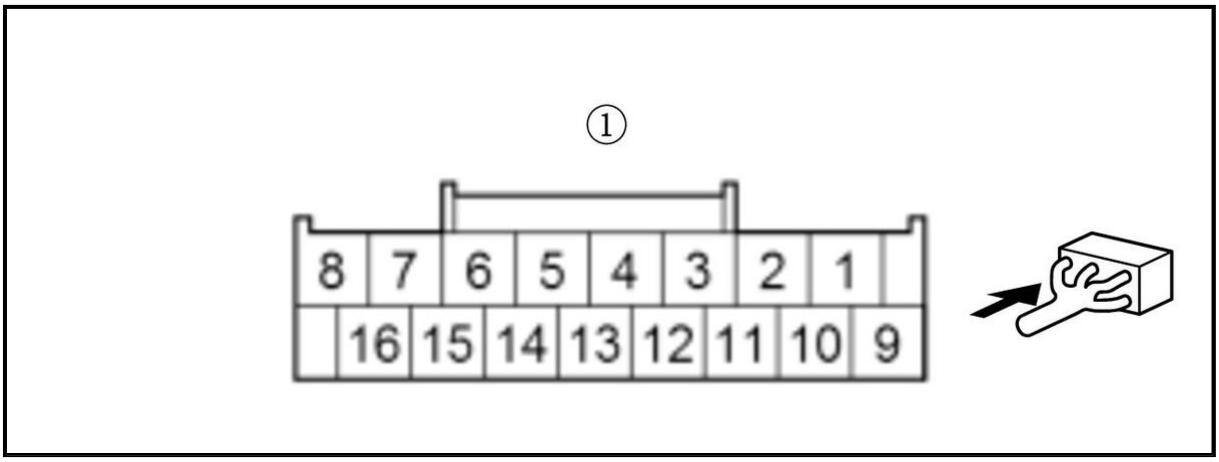
DTC	Connector
B	CAN gateway 16P connector
U0100-00	PCM connector A (50P)

NOTE: Jump the SCS line with the HDS, and wait more than 1 minute when disconnecting the PCM connector.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmitting control unit connector(s) for indicated DTCs: disconnected
B	CAN gateway 16P connector: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 11		No. 36



Is there 1.0 Ω or less?

YES

The F-CAN A_H and F-CAN A_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, replace the correspond control unit.

DTC	Transmitting Control Unit
U0100-00	PCM

NO

Repair an open in the wire between the receiving control unit and the transmitting control unit.

7. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors according to the detected DTC.

DTC	Connector
B	CAN gateway 16P connector
U0100-00	PCM connector A (50P)
U0122-00	VSA modulator-control unit 46P connector

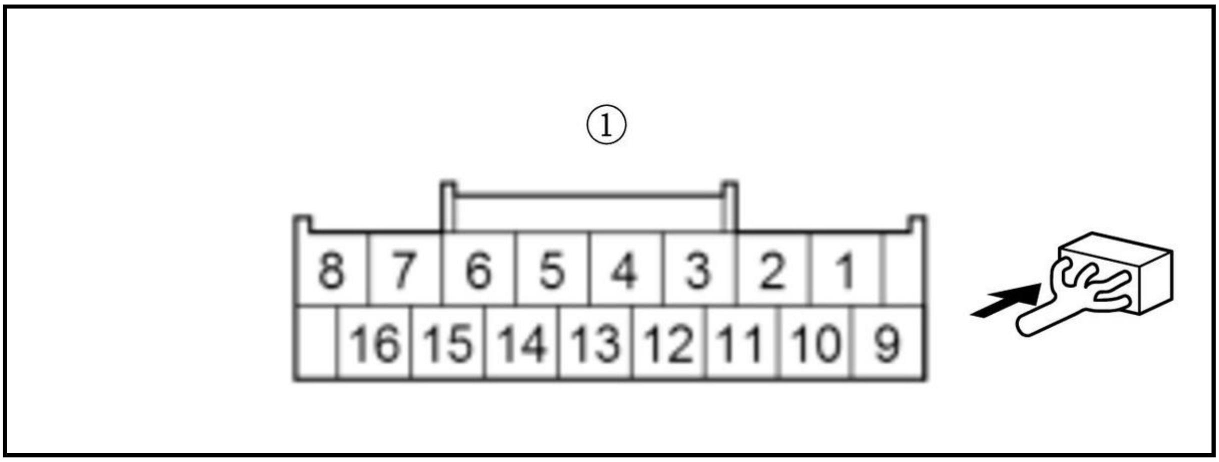
NOTE: Jump the SCS line with the HDS, and wait more than 1 minute when disconnecting the PCM connector.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmitting control unit connector(s) for indicated DTCs: disconnected
B	CAN gateway 16P connector: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	PCM connector A (50P)	No. 39
	F-CAN B_L		No. 14		No. 38

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0122-00	F-CAN B_H	CAN gateway 16P connector (female terminals): ①	No. 6	**VSA modulator-control unit 46P connector**	No. 40
	F-CAN B_L		No. 14		No. 28



Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, replace the correspond control unit.

DTC	Transmitting Control Unit
U0100-00	**PCM**
U0122-00	**VSA modulator-control unit**

NO

Repair an open in the wire between the receiving control unit and the transmitting control unit.

8. Open wire check (F-CAN C_H, F-CAN C_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors according to the detected DTC.

DTC	Connector
B	CAN gateway 16P connector
U0122-00	VSA modulator-control unit 46P connector
U0151-00	SRS unit connector A (39P)
U129C-00	Millimeter wave radar 8P connector

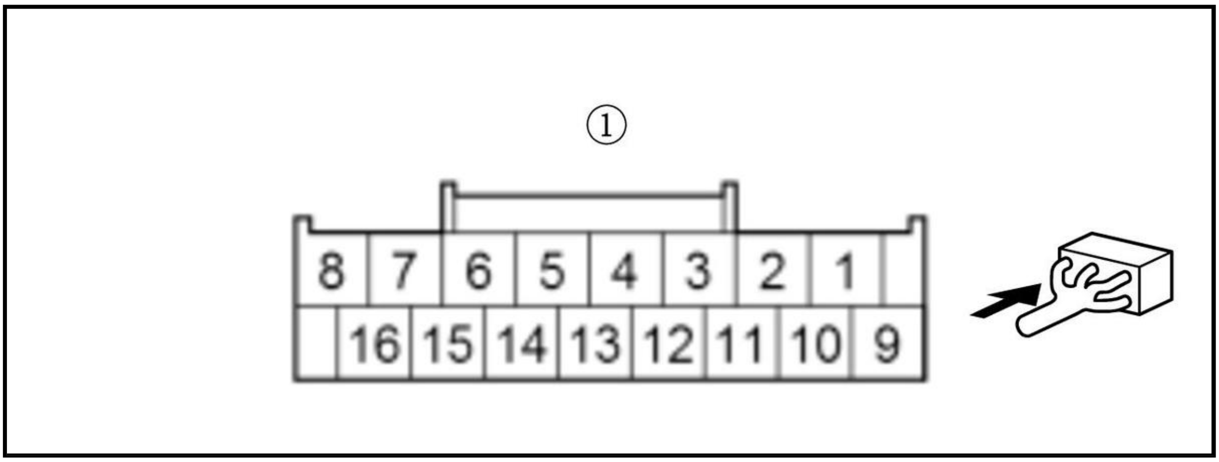
NOTE: Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** and wait for at least 3 minutes.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

B	CAN gateway 16P connector: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0122-00	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	**VSA modulator-control unit 46P connector**	No. 46
	F-CAN C_L		No. 13		No. 34
U0151-00	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	**SRS unit connector A (39P)**	No. 34
	F-CAN C_L		No. 13		No. 35
U129C-00	F-CAN C_H	CAN gateway 16P connector (female terminals): ①	No. 5	**Millimeter wave radar 8P connector**	No. 7
	F-CAN C_L		No. 13		No. 6



Is there 1.0 Ω or less?

YES

The F-CAN C_H and F-CAN C_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, replace the correspond control unit.

DTC	Transmitting Control Unit
U0122-00	**VSA modulator-control unit**
U0151-00	**SRS unit**
U129C-00	**Millimeter wave radar**

NO

Repair an open in the wire between the receiving control unit and the transmitting control unit.

DTC U0416-68 (EPS CONTROL UNIT)

DTC U0416-68 : (VSA System Malfunction)

NOTE:

- **Before you troubleshoot, review the general troubleshooting information**.

- This DTC is stored by VSA system malfunction. If the VSA indicator on, **troubleshoot the VSA system** first.

DTC Description	DTC	Freeze Frame
U0416-68 (VSA System Malfunction)	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Wait for 60 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U0416-68 (VSA System Malfunction)	B	B

   Is DTC U0416-68 indicated?

   YES

   The failure is duplicated. **Go to VSA system troubleshooting** .

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U1483-68, U1483-94 (EPS CONTROL UNIT)

DTC U1483-68 : (LKAS Malfunction (Indicate value check))

DTC U1483-94 : (LKAS Malfunction)

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
U1483-68 LKAS Malfunction (Indicate value check)	B	B
U1483-94 LKAS Malfunction	B	B

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Wait for 10 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U129C-00 F-CAN Malfunction (EPS Control Unit-Driving Support System Control Unit)	B	B
U1483-68 (LKAS Malfunction (Indicate value check))	B	B
U1483-94 (LKAS Malfunction)	B	B

Is DTC U1483-68 or U1483-94 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good millimeter wave radar** , then recheck. If the symptom/indication goes away with a known-good millimeter wave radar, **replace the original millimeter wave radar** .

YES

If DTC U129C-00 is also indicated, **go to DTC U129C-00**.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U3000-51 (EPS CONTROL UNIT)

DTC U3000-51 : ECU Software Update Failure

NOTE:

- **Before you troubleshoot, review the general troubleshooting information**.
- Do not turn the vehicle to the OFF (LOCK) mode while updating the EPS control unit. If you turn the vehicle to the OFF (LOCK) mode before completion, the EPS control unit will be damaged.

DTC Description	DTC	Freeze Frame
U3000-51 ECU Software Update Failure	B	B

DTC (EPS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3000-51 ECU Software Update Failure	B	B

Is DTC U3000-51 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. EPS control unit check (update)

-1. Update the EPS control unit .

-2. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3000-51 ECU Software Update Failure	B	B

Is DTC U3000-51 indicated?

YES

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good EPS motor/control unit , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, replace the original EPS motor/control unit .

NO

Troubleshooting is complete.

DTC U3000-55 (EPS CONTROL UNIT)

DTC U3000-55 : EPS Control Unit Internal Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
U3000-55 EPS Control Unit Internal Malfunction	B	B

DTC (EPS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3000-55 EPS Control Unit Internal Malfunction	B	B

Is DTC U3000-55 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or substitute a known-good EPS motor/control unit , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, replace the original EPS motor/control unit .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC U3003-16 (EPS CONTROL UNIT)

DTC U3003-16 : Battery Voltage Low

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
U3003-16 Battery Voltage Low	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Wait 15 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3003-16 Battery Voltage Low	B	B

   Is DTC U3003-16 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Power source performance check

   -1. Check and note the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
BATTERY VOLTAGE	About 8.9	V	B	B

   Do the current condition(s) match the threshold?

   YES

Check the 12 volt battery , and **check the electric powertrain system DTCs** .

NO

Go to step 3.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A2-1**

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 4.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A2-1 fuse circuit.

4. Open wire check (+B_EPS line)

-1. Disconnect the following connector.

EPS control unit connector A (2P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector A (2P): disconnected
Test point 1	**EPS control unit connector A (2P) No. 1**
Test point 2	Body ground

Is there battery voltage?

YES

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Repair an open in the wire between the under-hood fuse/relay box and the EPS control unit.

DTC U3003-17 (EPS CONTROL UNIT)

DTC U3003-17 : Battery Voltage High

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
U3003-17 Battery Voltage High	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3003-17 Battery Voltage High	B	B

   Is DTC U3003-17 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Power source performance check

   -1. Check and note the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
BATTERY VOLTAGE	More than 19.2	V	B	B

   Do the current condition(s) match the threshold?

   YES

   Check the 12 volt battery , and **check the electric powertrain system DTCs** .

   NO

   Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

DTC TROUBLESHOOTING

DTC C0037-F0, C003A-F0

DTC C0037-F0 : Left Rear Wheel Speed Sensor Malfunction

DTC C003A-F0 : Right Rear Wheel Speed Sensor Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
C0037-F0 Left Rear Wheel Speed Sensor Malfunction	B	B
C003A-F0 Right Rear Wheel Speed Sensor Malfunction	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Wait for 30 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0037-F0 Left Rear Wheel Speed Sensor Malfunction	B	B
C003A-F0 Right Rear Wheel Speed Sensor Malfunction	B	B

Is DTC C0037-F0 or C003A-F0 indicated?

YES

The failure is duplicated. Go to VSA system troubleshooting .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C0062-96(EPS CONTROL UNIT)

DTC C0062-96 : Longitudinal Acceleration Sensor Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
C0062-96 Longitudinal Acceleration Sensor Malfunction	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Wait for 30 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0062-96 Longitudinal Acceleration Sensor Malfunction	B	B

Is DTC C0062-96 indicated?

YES

The failure is duplicated. **Replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C0063-96(EPS CONTROL UNIT)

DTC C0063-96 : Yaw-Rate Sensor Malfunction

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C0063-96 Yaw-Rate Sensor Malfunction	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Wait for 30 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0063-96 Yaw-Rate Sensor Malfunction	B	B

Is DTC C0063-96 indicated?

YES

The failure is duplicated. **Replace the SRS unit** .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C1400-11, C1400-13, C1400-14, C1403-14, C1403-29, C1404-13, C1405-13, C1406-13, U3000-13, U3000-49

DTC C1400-11 : Motor Current Malfunction

DTC C1400-13 : EPS Motor Circuit Open

DTC C1400-14 : Motor Voltage Malfunction

DTC C1403-14 : Motor Angle Sensor (SIN/COS) Signals Incorrect

DTC C1403-29 : Motor Angle Sensor (SIN/COS) Signals Incorrect Correlation

DTC C1404-13 : EPS Motor U Phase Circuit High Voltage

DTC C1405-13 : EPS Motor V Phase Circuit High Voltage

DTC C1406-13 : EPS Motor W Phase Circuit High Voltage

DTC U3000-13 : EPS Motor Circuit Open

DTC U3000-49 : EPS Control Unit Internal Circuit Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
C1400-11 Motor Current Malfunction	B	B
C1400-13 EPS Motor Circuit Open	B	B
C1400-14 Motor Voltage Malfunction	B	B
C1403-14 Motor Angle Sensor (SIN/COS) Signals Incorrect	B	B
C1403-29 Motor Angle Sensor (SIN/COS) Signals Incorrect Correlation	B	B
C1404-13 EPS Motor U Phase Circuit High Voltage	B	B
C1405-13 EPS Motor V Phase Circuit High Voltage	B	B
C1406-13 EPS Motor W Phase Circuit High Voltage	B	B
U3003-13 EPS Motor Circuit Open	B	B
U3000-49 EPS Control Unit Internal Circuit Malfunction	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1400-11 Motor Current Malfunction	B	B
C1400-13 EPS Motor Circuit Open	B	B
C1400-14 Motor Voltage Malfunction	B	B
C1403-14 Motor Angle Sensor (SIN/COS) Signals Incorrect	B	B
C1403-29 Motor Angle Sensor (SIN/COS) Signals Incorrect Correlation	B	B
C1404-13 EPS Motor U Phase Circuit High Voltage	B	B
C1405-13 EPS Motor V Phase Circuit High Voltage	B	B
C1406-13 EPS Motor W Phase Circuit High Voltage	B	B
U3003-13 EPS Motor Circuit Open	B	B
U3000-49 EPS Control Unit Internal Circuit Malfunction	B	B

Is DTC C1400-11, C1400-13, C1400-14, C1403-14, C1403-29, C1404-13, C1405-13, C1406-13, U3000-13, or U3000-49 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C1420-29

DTC C1420-29 : Main Torque Sensor and Sub Torque Sensor Incorrect Correlation

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1420-29 Main Torque Sensor and Sub Torque Sensor Incorrect Correlation	B	B

DTC (EPS)

1. DTC check

-1. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1420-29 Main Torque Sensor and Sub Torque Sensor Incorrect Correlation	B	B

DTC Description	DTC	Freeze Frame
C1421-14 Main Torque Sensor Malfunction	B	B
C1422-14 Sub Torque Sensor Malfunction	B	B

Is DTC C1420-29 indicated?

YES

Go to step 2.

YES

If DTC C1421-14 or C1422-14 are also indicated, go to DTC **C1421-14** or **C1422-14** troubleshooting.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Torque sensor internal resistance check

-1. Turn the vehicle to the OFF (LOCK) mode.

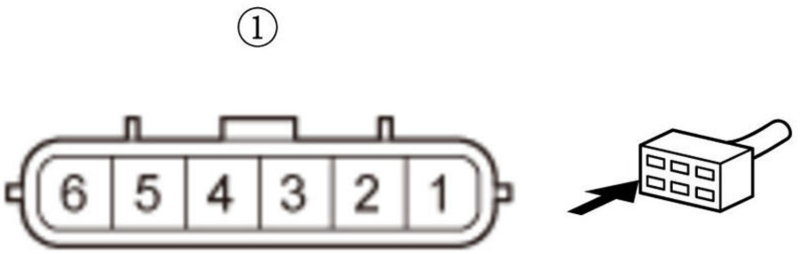
-2. Disconnect the following connector.

Torque sensor 6P connector

-3. On the sensor side, measure the resistance between test points 1 and 2 individually (see table).

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected

Test Circuit	Torque Sensor6P Connector(male terminals): ①		Reference resistance value
	Test point 1	Test point 2	
T/S VDD - T/S GND	No. 5	No. 3	141-175 Ω
TSM - T/S GND	No. 2	No. 3	179-244 Ω
TSS - T/S GND	No. 4	No. 3	179-244 Ω



Is the resistance OK?

YES

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Replace the steering gearbox .

DTC C1421-14

DTC C1421-14 : Main Torque Sensor Malfunction

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1421-14 Main Torque Sensor Malfunction	B	B

DTC (EPS)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1421-14 Main Torque Sensor Malfunction	B	B
C1423-14 Torque Sensor Power Source Circuit Malfunction	B	B

   Is DTC C1421-14 indicated?

   YES

   Go to step 2.

   YES

   If DTC C1423-14 is also indicated, go to DTC **C1423-14** troubleshooting.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Torque sensor performance check

   -1. Turn the steering wheel to the right and left several times.

   -2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
TORQUE SENSOR MAIN	B	B

Is there less than about 0.3 V or more than about 4.8 V?

YES (Less than about 0.3 V)

Go to step 3.

YES (More than about 4.8 V)

Go to step 7.

NO

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

3. Torque sensor check

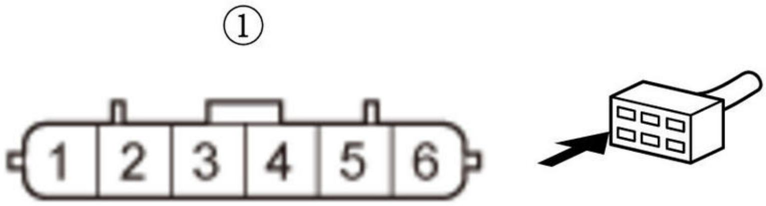
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Torque sensor 6P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Torque sensor 6P connector (female terminals) No. 5: ①
Terminal B	Torque sensor 6P connector (female terminals) No. 2: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
TORQUE SENSOR MAIN	B	B

Is there about 5 V?

YES

Replace the steering gearbox .

NO

Go to step 4.

4. Open wire check (T/S VDD line)

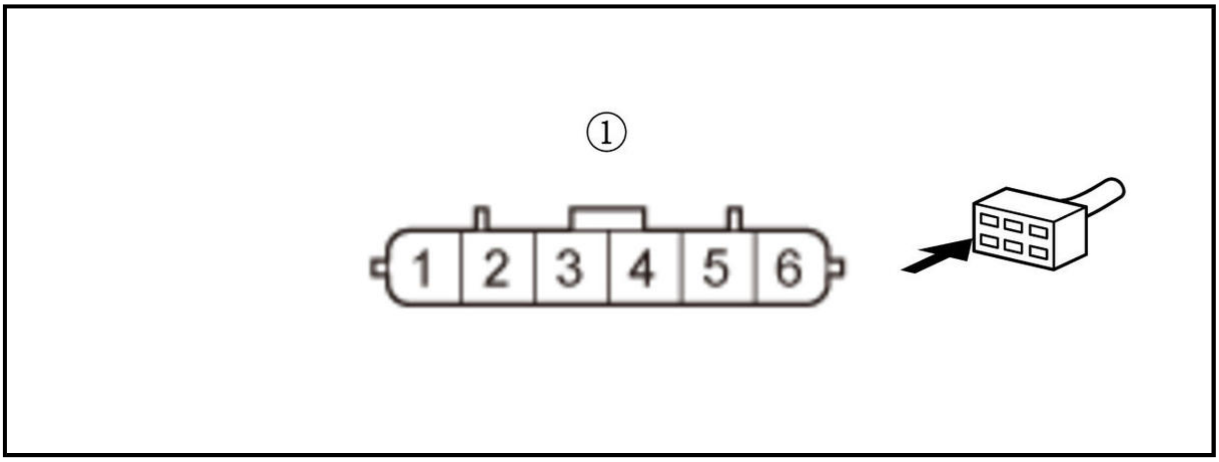
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector C (4P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected
B	EPS control unit connector C (4P): disconnected
Test point 1	Torque sensor 6P connector (female terminals) No. 5: ①
Test point 2	**EPS control unit connector C (4P) No. 2**



Is there continuity?

YES

The T/S VDD wire is OK. Go to step 5.

NO

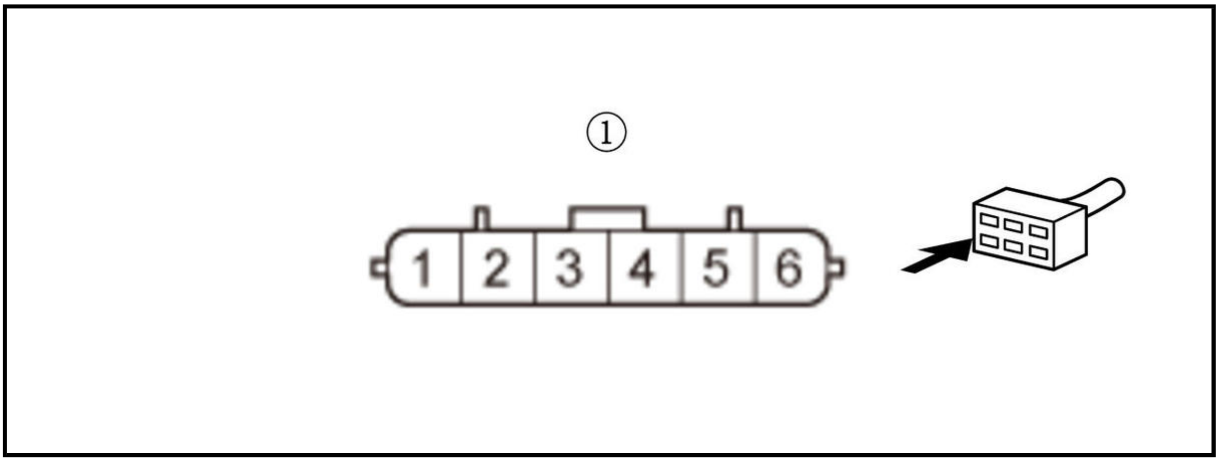
Repair an open in the wire between the EPS control unit and the torque sensor.

5. Open wire check (TSM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected
B	EPS control unit connector C (4P): disconnected
Test point 1	Torque sensor 6P connector (female terminals) No. 2: ①

Test point 2	**EPS control unit connector C (4P) No. 3**



Is there continuity?

YES

The TSM wire is not open. Go to step 6.

NO

Repair an open in the wire between the EPS control unit and the torque sensor.

6. Shorted wire check (TSM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected
B	EPS control unit connector C (4P): disconnected
Test point 1	**EPS control unit connector C (4P) No. 3**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire between the EPS control unit and the torque sensor.

NO

The TSM wire is OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

7. EPS control unit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector C (4P)

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
TORQUE SENSOR MAIN	B	B

Is there about 5 V?

YES

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Go to step 8.

8. Shorted wire check (TSM line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Torque sensor 6P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector C (4P): disconnected
B	Torque sensor 6P connector: disconnected
Test point 1	**EPS control unit connector C (4P) No. 2**
Test point 2	**EPS control unit connector C (4P) No. 3**

Is there continuity?

YES

Repair a short in the wire between the EPS control unit and the torque sensor.

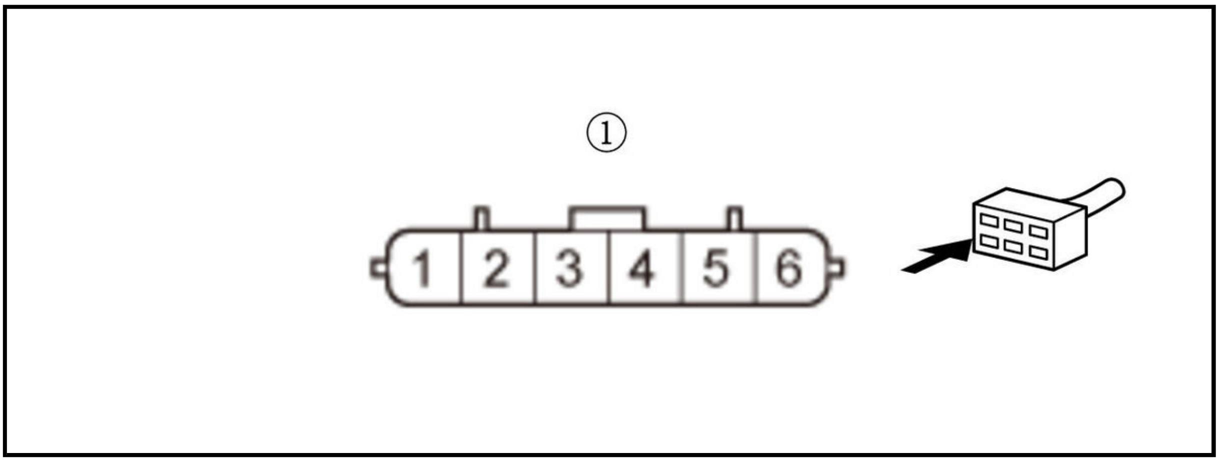
NO

Go to step 9.

9. Open wire check (T/S GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector C (4P): disconnected
B	Torque sensor 6P connector: disconnected
Test point 1	**EPS control unit connector C (4P) No. 1**
Test point 2	Torque sensor 6P connector (female terminals) No. 3: ①



Is there continuity?

YES

The T/S GND wire is OK. **Replace the steering gearbox** .

NO

Repair an open in the wire between the EPS control unit and the torque sensor.

DTC C1422-14

DTC C1422-14 : Sub Torque Sensor Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
C1422-14 Sub Torque Sensor Malfunction	B	B

DTC (EPS)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Turn the steering wheel to left and right several times, and keep holding each direction for 10 seconds.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1422-14 Sub Torque Sensor Malfunction	B	B
C1423-14 Torque Sensor Power Source Circuit Malfunction	B	B

Is DTC C1422-14 indicated?

YES

Go to step 2.

YES

If DTC C1423-14 is also indicated, go to DTC C1423-14 troubleshooting.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Torque sensor performance check

-1. Turn the steering wheel to the right and left several times.

-2. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Values	**Unit**
TORQUE SENSOR SUB	B	B

Is there less than about 0.3 V or more than about 4.8 V?

YES (Less than about 0.3 V)

Go to step 3.

YES (More than about 4.8 V)

Go to step 7.

NO

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

3. Torque sensor check

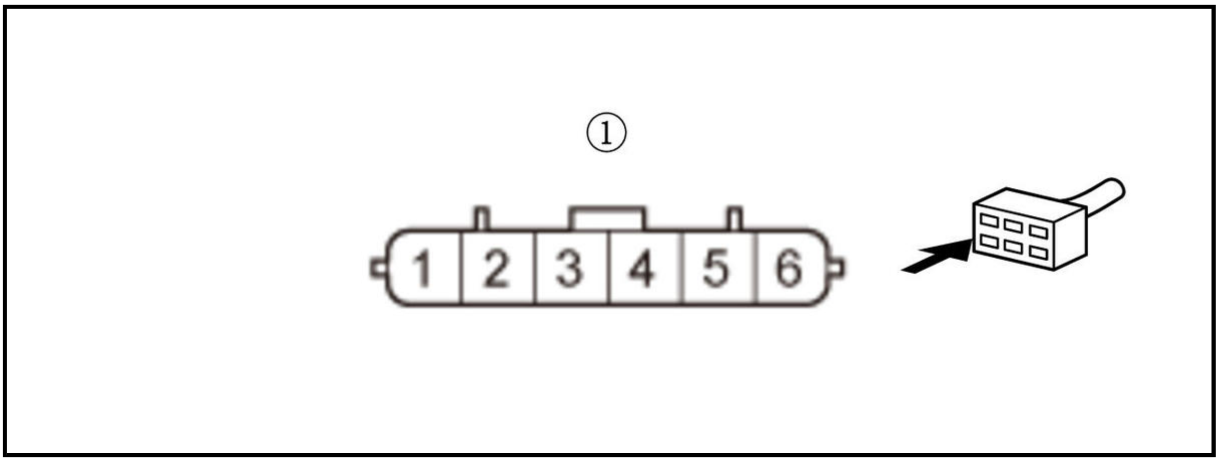
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Torque sensor 6P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Torque sensor 6P connector (female terminals) No. 5: ①
Terminal B	Torque sensor 6P connector (female terminals) No. 4: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Values	**Unit**
TORQUE SENSOR SUB	B	B

Is there about 5 V?

YES

Replace the steering gearbox .

NO

Go to step 4.

4. Open wire check (T/S VDD line)

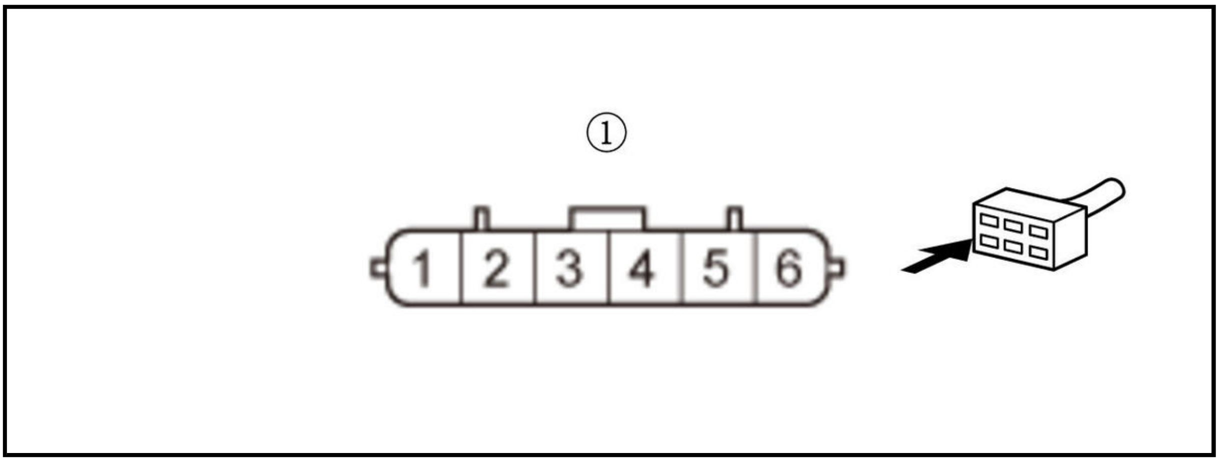
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector C (4P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected
B	EPS control unit connector C (4P): disconnected
Test point 1	Torque sensor 6P connector (female terminals) No. 5: ①
Test point 2	**EPS control unit connector C (4P) No. 2**



Is there continuity?

YES

The T/S VDD wire is OK. Go to step 5.

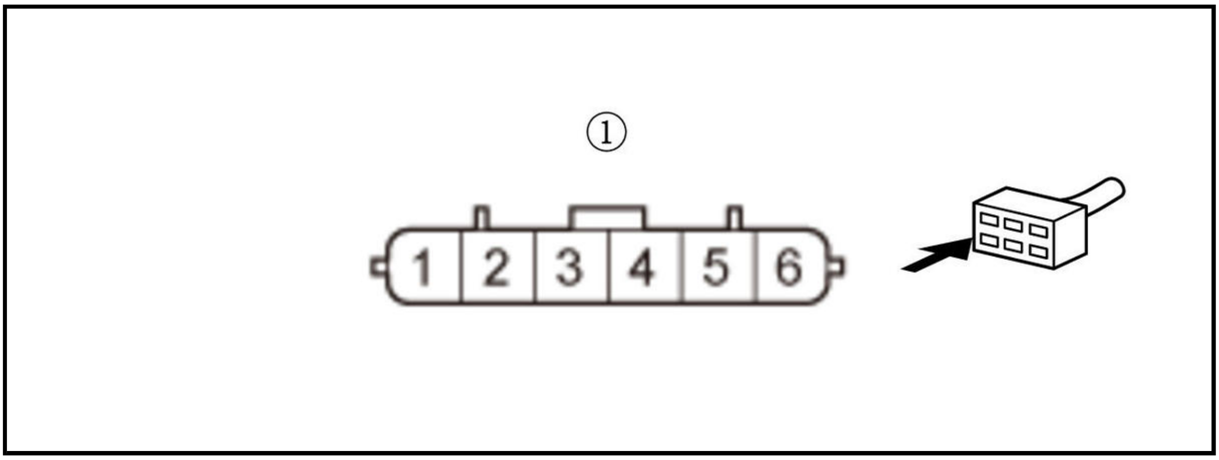
NO

Repair an open in the wire between the EPS control unit and the torque sensor.

5. Open wire check (TSS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected
B	EPS control unit connector C (4P): disconnected
Test point 1	Torque sensor 6P connector (female terminals) No. 4: ①
Test point 2	**EPS control unit connector C (4P) No. 4**



Is there continuity?

YES

The TSS wire is not open. Go to step 6.

NO

Repair an open in the wire between the EPS control unit and the torque sensor.

6. Shorted wire check (TSS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque sensor 6P connector: disconnected
B	EPS control unit connector C (4P): disconnected
Test point 1	**EPS control unit connector C (4P) No. 4**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire between the EPS control unit and the torque sensor.

NO

The TSS wire is OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

7. EPS control unit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector C (4P)

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
TORQUE SENSOR SUB	B	B

Is there about 5 V?

YES

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Go to step 8.

8. Shorted wire check (TSS line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Torque sensor 6P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector C (4P): disconnected
B	Torque sensor 6P connector: disconnected
Test point 1	**EPS control unit connector C (4P) No. 2**
Test point 2	**EPS control unit connector C (4P) No. 4**

Is there continuity?

YES

Repair a short in the wire between the EPS control unit and the torque sensor.

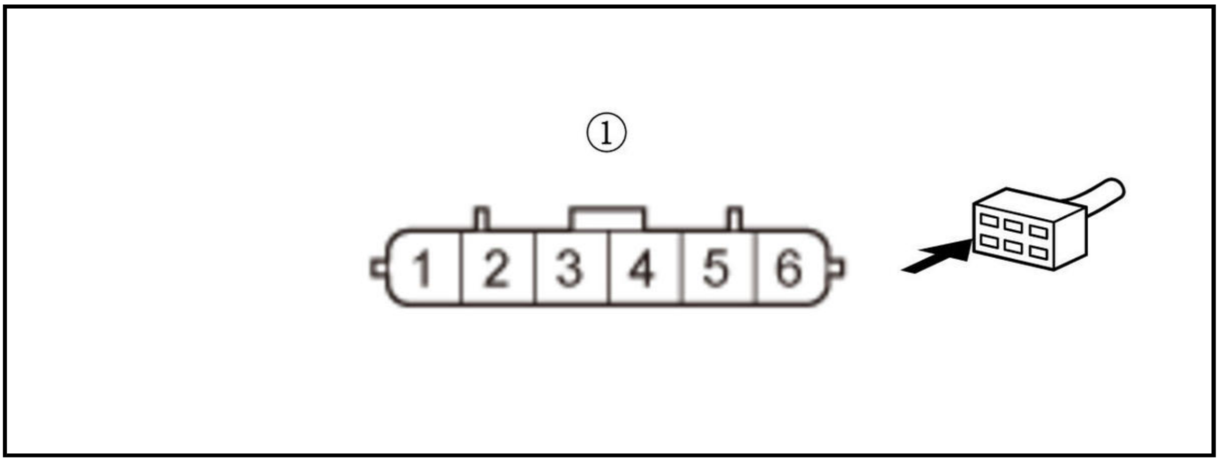
NO

Go to step 9.

9. Open wire check (T/S GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector C (4P): disconnected
B	Torque sensor 6P connector: disconnected
Test point 1	**EPS control unit connector C (4P) No. 1**
Test point 2	Torque sensor 6P connector (female terminals) No. 3: ①



Is there continuity?

YES

The T/S GND wire is OK. **Replace the steering gearbox** .

NO

Repair an open in the wire between the EPS control unit and the torque sensor.

DTC C1423-14

DTC C1423-14 : Torque Sensor Power Source Circuit Malfunction

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1423-14 Torque Sensor Power Source Circuit Malfunction	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1423-14 Torque Sensor Power Source Circuit Malfunction	B	B

   Is DTC C1423-14 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Torque sensor check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Torque sensor 6P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
Torque sensor input voltage	B	B

   Is the voltage between 4.5-5.5 V?

   YES

   Replace the steering gearbox .

   NO

   Go to step 3.

3. Shorted wire check (T/S VDD line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector C (4P)

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	**Unit**
Torque sensor input voltage	B	B

Is the voltage between 4.5-5.5 V?

YES

Repair a short to ground in the wire between the EPS control unit and the torque sensor.

NO

The T/S VDD wire is OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

DTC C1432-62

DTC C1432-62 : Vehicle Speed and the Engine Speed Incorrect Correlation

NOTE:

- **Before you troubleshoot, review the general troubleshooting information**.
- VSA DTCs may set during this troubleshooting. If so, clear them.

DTC Description	DTC	Freeze Frame
C1432-62 Vehicle Speed and the Engine Speed Incorrect Correlation	B	B

DTC (EPS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Test-drive the vehicle at 12 mph (20 km/h) or more for 30 seconds or more.

NOTE: Drive the vehicle on the road, not on a lift.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1432-62 Vehicle Speed and the Engine Speed Incorrect Correlation	B	B

Is DTC C1432-62 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Vehicle speed signal check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Raise and support the vehicle** , and allow all wheels to rotate freely.

-3. Start the engine.

-4. Turn off the VSA function by using the VSA OFF switch.

-5. Run the vehicle while in the D position/mode.

-6. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
VEHICLE SPEED	B	B

Is 0 mph (0 km/h) indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good PCM** , then recheck. If the symptom/indication goes away with a known-good PCM, **replace the original PCM** .

NO

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

DTC U0029-00(EPS CONTROL UNIT (WITH CAN GATEWAY))

DTC U0029-00 : F-CAN Malfunction (Bus-Off)

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

*1: CAN gateway 12P connector type*2: CAN gateway 16P connector type

DTC Description	DTC	Freeze Frame
U0029-00 F-CAN Malfunction (Bus-Off)	B	B

DTC (EPS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U0029-00 F-CAN Malfunction (Bus-Off)	B	B

Is DTC U0029-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check (CAN gateway system)

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

Is DTC indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 3.

3. F-CAN circuit communication check

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

EPS control unit (Bus B) is Not Available

Go to step 4.

EPS control unit (Bus B) is Available

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

4. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

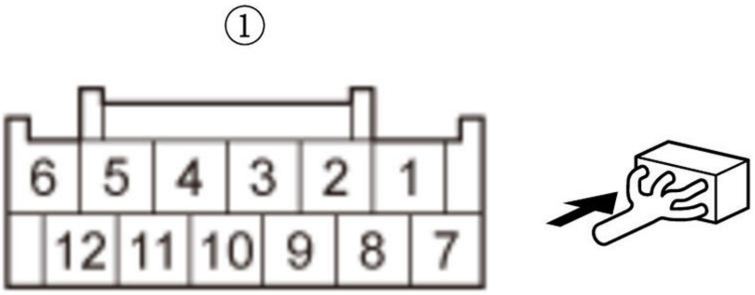
-2. Disconnect the following connectors.

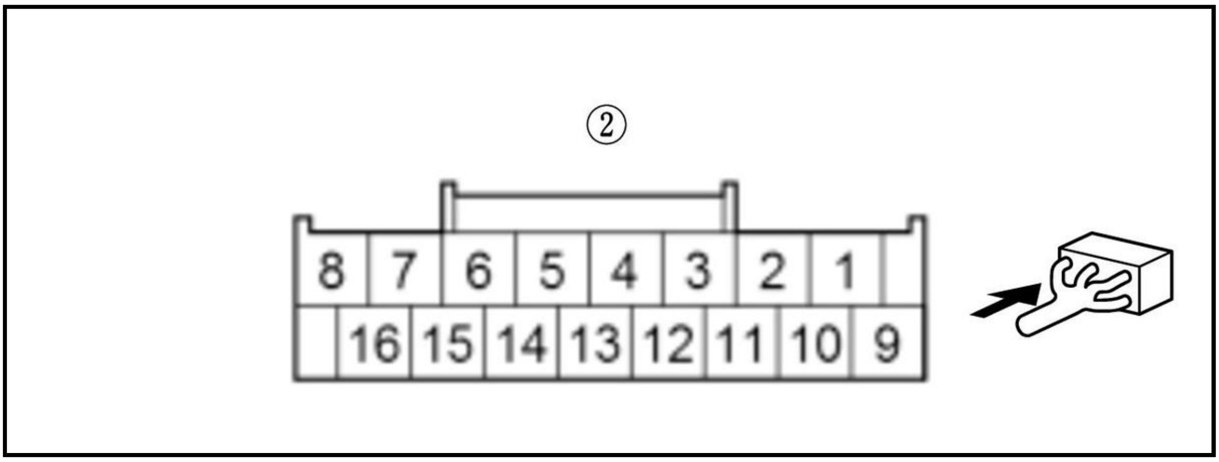
EPS control unit connector B (6P)
CAN gateway 12P connector *1
CAN gateway 16P connector *2

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	CAN gateway 12P connector *1: disconnected
B	CAN gateway 16P connector *2: disconnected
Test circuit 1	B
Test point 1	**EPS control unit connector B (6P) No. 3**
Test point 2	CAN gateway 12P connector *1 (female terminals) No. 12: ①
B	CAN gateway 16P connector *2 (female terminals) No. 6: ②

Test circuit 2	B
Test point 1	**EPS control unit connector B (6P) No. 1**
Test point 2	CAN gateway 12P connector *1 (female terminals) No. 5: ①
B	CAN gateway 16P connector *2 (female terminals) No. 14: ②





Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Repair an open in the wire between the EPS control unit and the CAN gateway.

DTC U0029-00(EPS CONTROL UNIT (WITHOUT CAN GATEWAY)) (2017 2018 2019)

DTC U0029-00 : F-CAN Malfunction (Bus-Off)

NOTE:

- **Before you troubleshoot, review the general troubleshooting information**.
- This DTC is stored by communication failure between the F-CAN line and the EPS control unit. When DTC U0029-00 is indicated, the F-CAN line has already returned to normal. Check for loose terminals and poor connections in the connectors. If the connectors are OK, clear the DTC and following this troubleshooting.

DTC Description	DTC	Freeze Frame
U0029-00 F-CAN Malfunction (Bus-Off)	B	B

DTC (EPS)

1. EPS control unit communication check

   -1. Start the engine.

   -2. Check for communication between the EPS control unit and the HDS.

   Is there communication between the EPS control unit and the HDS?

   YES

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

Go to step 2.

2. Open wire check (F-CAN_H, F-CAN_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

EPS control unit connector B (6P)
PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	PCM connector A (51P): disconnected
Test circuit 1	B
Test point 1	**EPS control unit connector B (6P) No. 3**
Test point 2	**PCM connector A (51P) No. 2**

Test circuit 2	B
Test point 1	**EPS control unit connector B (6P) No. 1**
Test point 2	**PCM connector A (51P) No. 1**

Is there continuity?

YES

The F-CAN_H and F-CAN_L wires are OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Repair an open in the wire between the EPS control unit and the PCM.

DTC TROUBLESHOOTING: U0100-00, U0122-00, U0151-00(EPS CONTROL UNIT (WITHOUT CAN GATEWAY)) (2017 2018 2019)

DTC U0100-00 : F-CAN Malfunction (EPS Control Unit-PCM/TCM)

DTC U0122-00 : F-CAN Malfunction (EPS Control Unit-VSA Modulator-Control Unit)

DTC U0151-00 : F-CAN Malfunction (EPS Control Unit-SRS Unit)

NOTE:

- **Before you troubleshoot, review the general troubleshooting information**.
- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the EPS control unit.

DTC Description	DTC	Freeze Frame
U0100-00 F-CAN Malfunction (EPS Control Unit-PCM/TCM)	B	B
U0122-00 F-CAN Malfunction (EPS Control Unit-VSA Modulator-Control Unit)	B	B
U0151-00 F-CAN Malfunction (EPS Control Unit-SRS Unit)	B	B

DTC (EPS)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Wait 10 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U0100-00 F-CAN Malfunction (EPS Control Unit-PCM/TCM)	B	B
U0122-00 F-CAN Malfunction (EPS Control Unit-VSA Modulator-Control Unit)	B	B

DTC Description	DTC	Freeze Frame
U0151-00 F-CAN Malfunction (EPS Control Unit-SRS Unit)	B	B

   Is DTC indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (F-CAN_H, F-CAN_L lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

EPS control unit connector B (6P)

   -3. Disconnect the following connectors according to the detected DTC.

DTC	Connector
U0100-00	PCM connector A (51P)
U0122-00	VSA modulator-control unit 46P connector
U0151-00	SRS unit connector A (39P)

NOTE: Jump the SCS line with the HDS, and wait more than 1 minute when disconnecting the PCM connector.

-4. Check for continuity between the receiving control unit and the transmitting control unit according to the detected DTC.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN_H	**EPS control unit connector B (6P)**	No. 3	**PCM connector A (51P)**	No. 2
	F-CAN_L		No. 1		No. 1
U0122-00	F-CAN_H	**EPS control unit connector B (6P)**	No. 3	**VSA modulator-control unit 46P connector**	No. 40
	F-CAN_L		No. 1		No. 28
U0122-00	F-CAN_H	**EPS control unit connector B (6P)**	No. 3	**SRS unit connector A (39P)**	No. 34
	F-CAN_L		No. 1		No. 35

Is there continuity?

YES

The F-CAN_H and F-CAN_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, replace the correspond control unit.

DTC	Transmitting Control Unit
U0100-00	**PCM**
U0122-00	**VSA modulator-control unit**
U0151-00	**SRS unit**

NO

Repair an open in the wire between the receiving control unit and the transmitting control unit.

DTC U0100-00, U0122-00, U0151-00, U129C-00(EPS CONTROL UNIT (WITH CAN GATEWAY))

DTC U0100-00 : F-CAN Malfunction (EPS Control Unit-PCM/TCM)

DTC U0122-00 : F-CAN Malfunction (EPS Control Unit-VSA/ABS Modulator-Control Unit)

DTC U0151-00 : F-CAN Malfunction (EPS Control Unit-SRS Unit)

DTC U129C-00 : F-CAN Malfunction (EPS Control Unit-Driving Support System Control Unit)

NOTE:

- **Before you troubleshoot, review the general troubleshooting information**.
- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the EPS control unit.

*1: CAN gateway 12P connector type*2: CAN gateway 16P connector type

DTC Description	DTC	Freeze Frame
U0100-00 F-CAN Malfunction (EPS Control Unit-PCM/TCM)	B	B
U0122-00 F-CAN Malfunction (EPS Control Unit-VSA/ABS Modulator-Control Unit)	B	B
U0151-00 F-CAN Malfunction (EPS Control Unit-SRS Unit)	B	B
U129C-00 F-CAN Malfunction (EPS Control Unit-Driving Support System Control Unit)	B	B

DTC (EPS)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Wait 10 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U0100-00 F-CAN Malfunction (EPS Control Unit-PCM/TCM)	B	B
U0122-00 F-CAN Malfunction (EPS Control Unit-VSA/ABS Modulator-Control Unit)	B	B
U0151-00 F-CAN Malfunction (EPS Control Unit-SRS Unit)	B	B
U129C-00 F-CAN Malfunction (EPS Control Unit-Driving Support System Control Unit)	B	B

   Is DTC indicated?

   YES

   Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check (CAN gateway system)

   -1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

   Are DTC(s) indicated?

   YES

   Go to indicated DTC's troubleshooting.

NO

Go to step 3.

3. F-CAN circuit communication check (Receiving control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Which result is indicated?

   EPS control unit (Bus B) is Not Available

   Go to step 4.

   EPS control unit (Bus B) is Available

   Go to step 5.

4. Open wire check (F-CAN B_H, F-CAN B_L lines)

   -1. Turn the vehicle to the OFF (LOCK) mode.

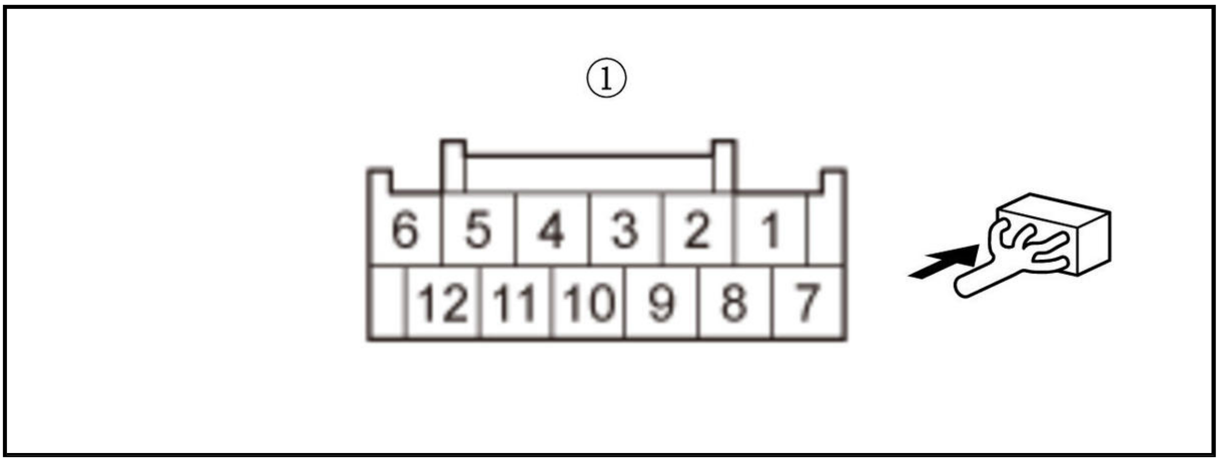
   -2. Disconnect the following connectors.

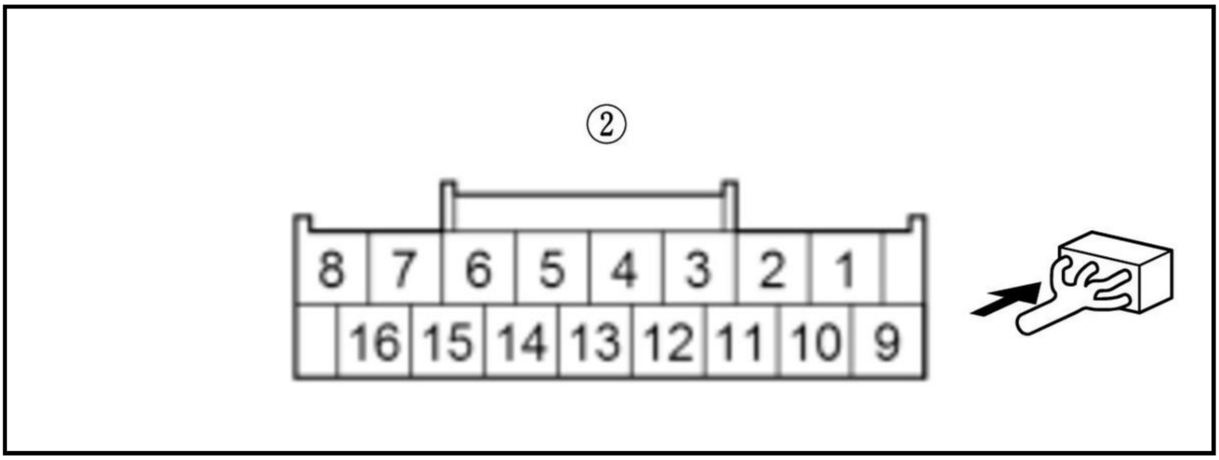
EPS control unit connector B (6P)
CAN gateway 12P connector *1CAN gateway 16P connector *2

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	CAN gateway 12P connector *1: disconnected
B	CAN gateway 16P connector *2: disconnected
Test circuit 1	B
Test point 1	**EPS control unit connector B (6P) No. 3**
Test point 2	CAN gateway 12P connector *1 (female terminals) No. 12: ①
B	CAN gateway 16P connector *2 (female terminals) No. 6: ②

Test circuit 2	B
Test point 1	**EPS control unit connector B (6P) No. 1**
Test point 2	CAN gateway 12P connector *1 (female terminals) No. 5: ①
B	CAN gateway 16P connector *2 (female terminals) No. 14: ②





Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Repair an open in the wire between the EPS control unit and the CAN gateway.

5. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN gateway Bus channel(s) at normal
U0100-00	PCM	A, B
U0122-00	VSA modulator-control unit	A, B
U0151-00	SRS unit	B
U129C-00	Millimeter wave radar	B

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

U0100-00: PCM (Bus A) is Not Available

Go to step 6.

U0100-00: PCM (Bus B) is Not Available

Go to step 7.

U0122-00: VSA modulator-control unit (Bus A) is Not Available

Go to step 6.

U0122-00: VSA modulator-control unit (Bus B) is Not Available

Go to step 7.

U0151-00: SRS unit (Bus B) is Not Available

Go to step 7.

U129C-00: Millimeter wave radar (Bus B) is Not Available

Go to step 7.

6. Open wire check (F-CAN A_H, F-CAN A_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors according to the detected DTC.

DTC	Connector
B	CAN gateway 12P connector *1CAN gateway 16P connector *2
U0100-00	PCM connector A (50P)
U0122-00	VSA modulator-control unit 46P connector

NOTE: Jump the SCS line with the HDS, and wait more than 1 minute when disconnecting the PCM connector.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmitting control unit connector(s) for indicated DTCs: disconnected
B	CAN gateway 12P connector *1: disconnected
B	CAN gateway 16P connector *2: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100-00	F-CAN A_H	CAN gateway 12P connector *1 (female terminals): ①	No. 3	**PCM connector A (50P)**	No. 37
	F-CAN A_L		No. 9		No. 36

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
	F-CAN A_H	CAN gateway 16P connector *2 (female terminals): ②	No. 3		No. 37

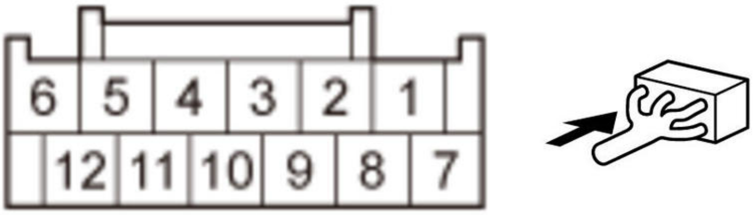
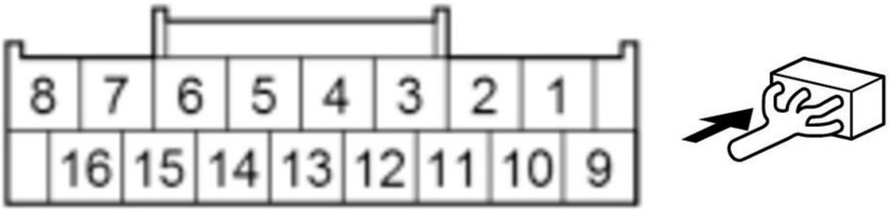
U0122-00	F-CAN A_H	CAN gateway 12P connector *1 (female terminals): ①	No. 3	**VSA modulator-control unit 46P connector**	No. 40
	F-CAN A_L		No. 9		No. 28
	F-CAN A_H	CAN gateway 16P connector *2 (female terminals): ②	No. 3		No. 40
	F-CAN A_L		No. 11		No. 28

①



②



Is there 1.0 Ω or less?

YES

The F-CAN A_H and F-CAN A_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, replace the correspond control unit.

DTC	Transmitting Control Unit
U0100-00	**PCM**
U0122-00	**VSA modulator-control unit**

NO

Repair an open in the wire between the receiving control unit and the transmitting control unit.

7. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors according to the detected DTC.

DTC	Connector
B	CAN gateway 12P connector *1CAN gateway 16P connector *2
U0100-00	PCM connector A (50P)
U0122-00	VSA modulator-control unit 46P connector
U0151-00	SRS unit connector A (39P)
U129C-00	Millimeter wave radar 8P connector

NOTE: Jump the SCS line with the HDS, and wait more than 1 minute when disconnecting the PCM connector.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmitting control unit connector(s) for indicated DTCs: disconnected
B	CAN gateway 12P connector *1: disconnected
B	CAN gateway 16P connector *2: disconnected

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)

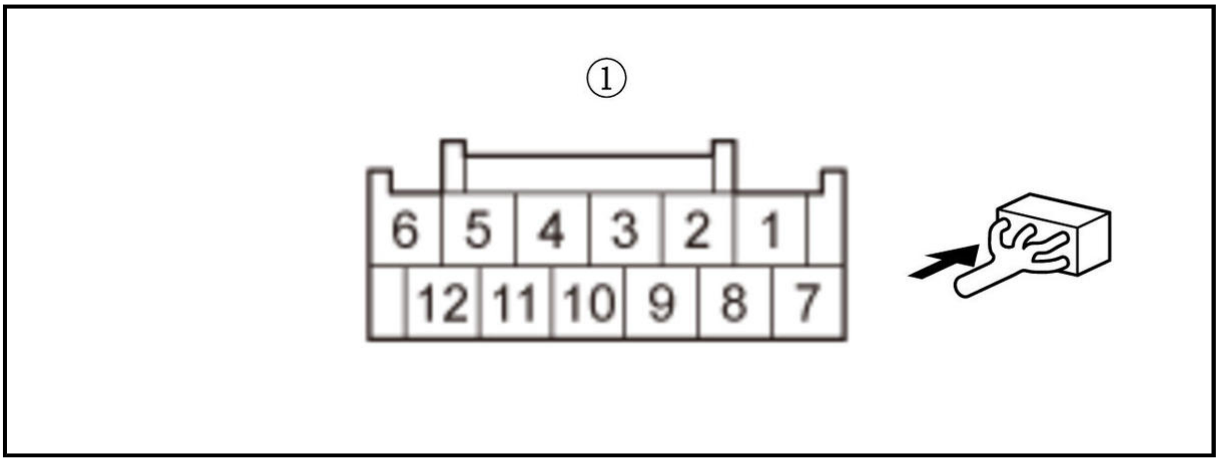
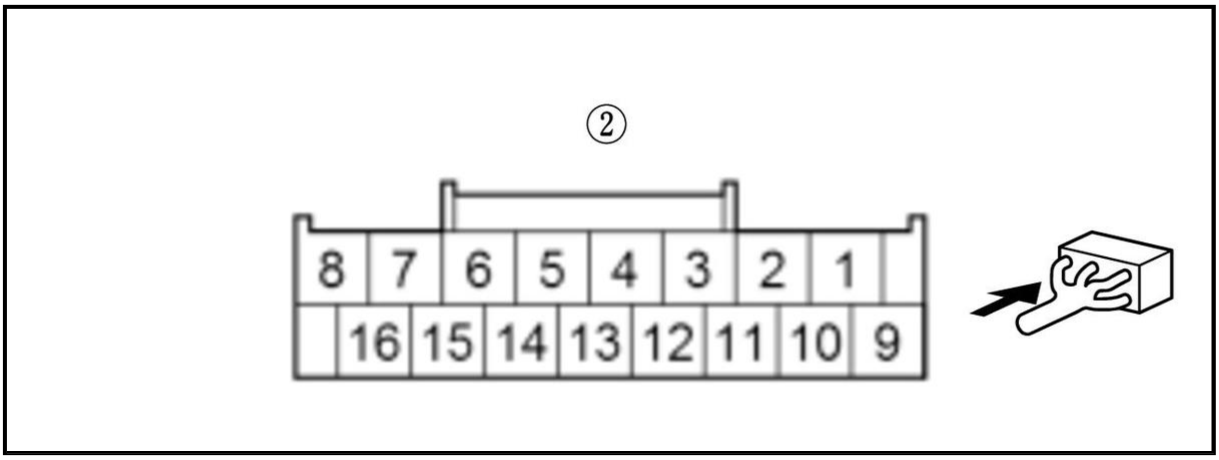
	F-CAN B_H	CAN gateway 16P connector *2 (female terminals): ②	No. 6		No. 7
	F-CAN B_L		No. 14		No. 6





Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. According to the detected DTC on the following table, replace the correspond control unit.

DTC	Transmitting Control Unit
U0100-00	PCM
U0122-00	VSA modulator-control unit
U0151-00	SRS unit
U129C-00	Millimeter wave radar

NO

Repair an open in the wire between the receiving control unit and the transmitting control unit.

DTC TROUBLESHOOTING: U0416-68 (EPS CONTROL UNIT)

DTC U0416-68 : VSA System Malfunction

NOTE:

- **Before you troubleshoot, review the general troubleshooting information**.
- This DTC is stored by VSA system malfunction. If the VSA indicator on, **troubleshoot the VSA system** first.

DTC Description	DTC	Freeze Frame
U0416-68 VSA System Malfunction	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Wait for 60 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U0416-68 VSA System Malfunction	B	B

   Is DTC U0416-68 indicated?

   YES

   The failure is duplicated. **Go to VSA system troubleshooting** .

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: U1483-68, U1483-94 (EPS CONTROL UNIT)

DTC U1483-68 : LKAS Malfunction (Indicate value check)

DTC U1483-94 : LKAS Malfunction

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
U1483-68 LKAS Malfunction (Indicate value check)	B	B
U1483-94 LKAS Malfunction	B	B

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Wait for 10 seconds or more.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U129C-00 F-CAN Malfunction (EPS Control Unit-Driving Support System Control Unit)	B	B
U1483-68 LKAS Malfunction (Indicate value check)	B	B
U1483-94 LKAS Malfunction	B	B

Is DTC U1483-68 or U1483-94 indicated?

YES

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good millimeter wave radar** , then recheck. If the symptom/indication goes away with a known-good millimeter wave radar, **replace the original millimeter wave radar** .

YES

If DTC U129C-00 is also indicated, **go to DTC U129C-00**.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: U3000-51 (EPS CONTROL UNIT)

DTC U3000-51 : ECU Software Update Failure

NOTE:

- **Before you troubleshoot, review the general troubleshooting information**.
- Do not turn the vehicle to the OFF (LOCK) mode while updating the EPS control unit. If you turn the vehicle to the OFF (LOCK) mode before completion, the EPS control unit will be damaged.

DTC Description	DTC	Freeze Frame
U3000-51 ECU Software Update Failure	B	B

DTC (EPS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3000-51 ECU Software Update Failure	B	B

Is DTC U3000-51 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. EPS control unit check (update)

-1. **Update the EPS control unit** .

-2. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

-3. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3000-51 ECU Software Update Failure	B	B

Is DTC U3000-51 indicated?

YES

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Troubleshooting is complete.

DTC TROUBLESHOOTING: U3000-55 (EPS CONTROL UNIT)

DTC U3000-55 : EPS Control Unit Internal Malfunction

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
U3000-55 EPS Control Unit Internal Malfunction	B	B

DTC (EPS)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3000-55 EPS Control Unit Internal Malfunction	B	B

Is DTC U3000-55 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: U3003-16 (EPS CONTROL UNIT)

DTC U3003-16 : Battery Voltage Low

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
U3003-16 Battery Voltage Low	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Wait 15 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3003-16 Battery Voltage Low	B	B

   Is DTC U3003-16 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Power source performance check

   -1. Check and note the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
BATTERY VOLTAGE	About 8.9	V	B	B

Do the current condition(s) match the threshold?

YES

Check the 12 volt battery , and **check the PGM-FI DTCs** .

NO

Go to step 3.

3. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	**No. A2-1**

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 4.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A2-1 fuse circuit.

4. Open wire check (+B EPS line)

-1. Disconnect the following connector.

EPS control unit connector A (2P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector A (2P): disconnected
Test point 1	**EPS control unit connector A (2P) No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Repair an open in the wire between the under-hood fuse/relay box and the EPS control unit.

DTC TROUBLESHOOTING: U3003-17 (EPS CONTROL UNIT)

DTC U3003-17 : Battery Voltage High

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
U3003-17 Battery Voltage High	B	B

DTC (EPS)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then start the engine.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3003-17 Battery Voltage High	B	B

   Is DTC U3003-17 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Power source performance check

   -1. Check and note the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
BATTERY VOLTAGE	More than 19.2	V	B	B

   Do the current condition(s) match the threshold?

   YES

   Check the 12 volt battery , and **check the PGM-FI DTCs** .

   NO

   Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

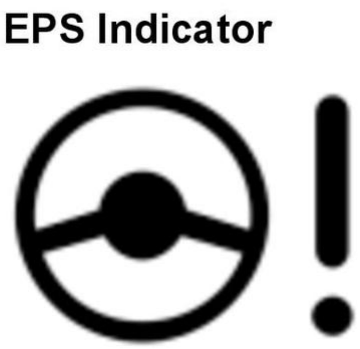
	-17	Battery Voltage High

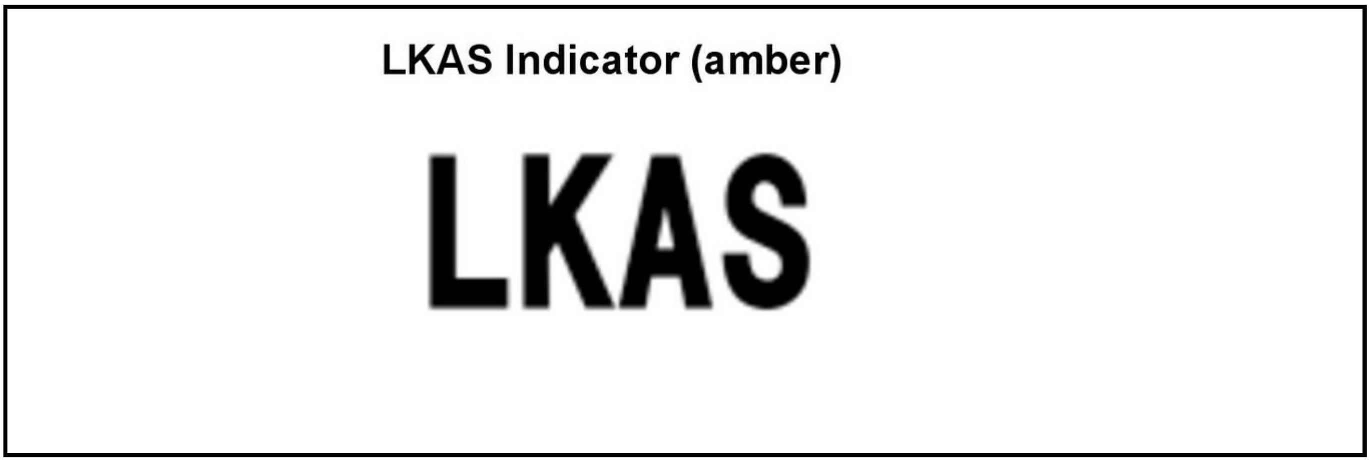
HOW TO INFORMATION

HOW TO TROUBLESHOOT THE EPS

System Indicator

This system has one (without LKAS) or two (with LKAS) indicators on the gauge control module.





NOTE: For locations of each indicator, refer to gauge control module component location index .

EPS Indicator

Under normal conditions, the EPS indicator comes on when turning the vehicle to the ON mode, then turns off after the engine is started. This indicates that the LED and its circuit are operating correctly.

- If there is a failure in the system after the engine is started, the EPS indicator will stay on and stores a DTC, and the power assist is turned off or restricted.
- The EPS indicator will blink when the DTC U3000-55 is detected.

When a problem is detected, the EPS indicator will turn on and remain on until the DTC is erased. There are cases when the indicator remains on until the vehicle is set to the OFF (LOCK) mode as well as other cases where the indicator automatically turns off when the system returns to normal. Under certain conditions, the EPS indicator will turn on even though the system is operating normally; for example when the vehicle is stopped with the engine at high revolutions with constant input from the steering wheel.

To determine the actual cause of the problem, question the customer about the conditions during which the problem occurred, taking the above conditions into consideration.

LKAS Indicator (amber)

This EPS system works in conjunction with the LKAS. When an LKAS related problem is detected, the LKAS indicator (amber) will come on. However, when the EPS control fails while the LKAS control is activated, the LKAS indicator (amber) will also come on. In this case, the EPS indicator will not come on, but the EPS control unit memorizes the DTC. If the LKAS indicator (amber) comes on, it deactivates the LKAS control. The power assist works as usual after deactivating the LKAS, but it may stop the power assist depending on the detected malfunction.

Diagnostic Trouble Code (DTC)

- If the CPU cannot be activated, or if it fails, the EPS indicator comes on, but no EPS DTC is stored.
- The memory can hold any number of DTCs. However, when the same DTC is detected more than once, the most recent DTC is written over the prior DTC, therefore only one occurrence is stored.
- The DTCs are stored in the EEPROM (non-volatile memory), therefore the stored DTCs cannot be erased by disconnecting the 12 volt battery. Do the specified procedures to clear the DTCs.

Self-Diagnosis

Self-diagnosis can be classified into three categories:

- Initial diagnosis: Done right after the engine starts and until the EPS indicator goes off.
- Regular diagnosis: Done right after the initial diagnosis and continues until turning the vehicle to the OFF (LOCK) mode.
- Steering diagnosis: Done during regular diagnosis while turning the steering wheel.

Restriction on Power Assist Operation

Repeated extreme steering force, such as turning the steering wheel continuously back-and-forth with the vehicle stopped, causes an increase in electrical current draw by the EPS motor. The increase of electric current causes the EPS motor and EPS control unit to heat up. Because this heat adversely affects the system, the control unit monitors the electric current draw of the EPS motor.

When the control unit detects heat build-up in the EPS motor, it reduces the electric current to the EPS motor gradually to protect the system, and it restricts the power assist operation. The EPS indicator does not come on during this function.

When steering torque is not applied to the steering wheel, or when turning the vehicle to the OFF (LOCK) mode and the EPS motor cools, the control unit will restore the power assist gradually until it's fully restored (after about 20 minutes).

How to Troubleshoot DTCs

The troubleshooting procedures assume that the cause of the problem is still present and the EPS indicator is still on. Following the procedure when the EPS indicator does not come on can result in incorrect diagnosis.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the EPS indicator came on, such as while turning, after turning, when the vehicle was at a certain speed, etc.

2. When the EPS indicator does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor terminal contact, etc., in the affected circuit before you start troubleshooting.

3. After troubleshooting, clear the DTC and test-drive the vehicle. Be sure the EPS indicator does not come on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Use the HDS (Honda Diagnostic System)

NOTE: Make sure the 12 volt battery is in good condition and fully charged.

1. If the system indicator(s) stay on, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it does not, **go to the F-CAN circuit troubleshooting**

4. Check the diagnostic trouble code (DTC) and the freeze data, for all systems, troubleshoot the powertrain DTCs first. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.

NOTE:

- Freeze data indicates the EPS conditions when the first system malfunction that activated the indicator was detected.
- The HDS can read the DTC, the freeze data, the current data, and other system data.
- For specific operations, refer to the Help menu that came with the HDS.

How to Retrieve DTCs

1. With the vehicle in OFF (LOCK) mode, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it does not, **go to the F-CAN circuit troubleshooting**

4. Follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the DTC troubleshooting. Do the all systems DTC check, and troubleshoot any powertrain DTCs first.

5. Turn the vehicle to the OFF (LOCK) mode.

How to Clear DTCs

1. With the vehicle in OFF (LOCK) mode, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the EPS control unit. If it does not, **go to the F-CAN circuit troubleshooting**

4. Clear the DTC(s) by following the screen prompts on the HDS.

5. Turn the vehicle to the OFF (LOCK) mode.

☒	Replace

1. 12 Volt Battery Terminal - Disconnect
2. Vehicle - Lift
3. Engine Undercover - Remove
4. Heat Baffle - Remove
5. EPS Motor/Control Unit - Remove

Installation

NOTE: Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

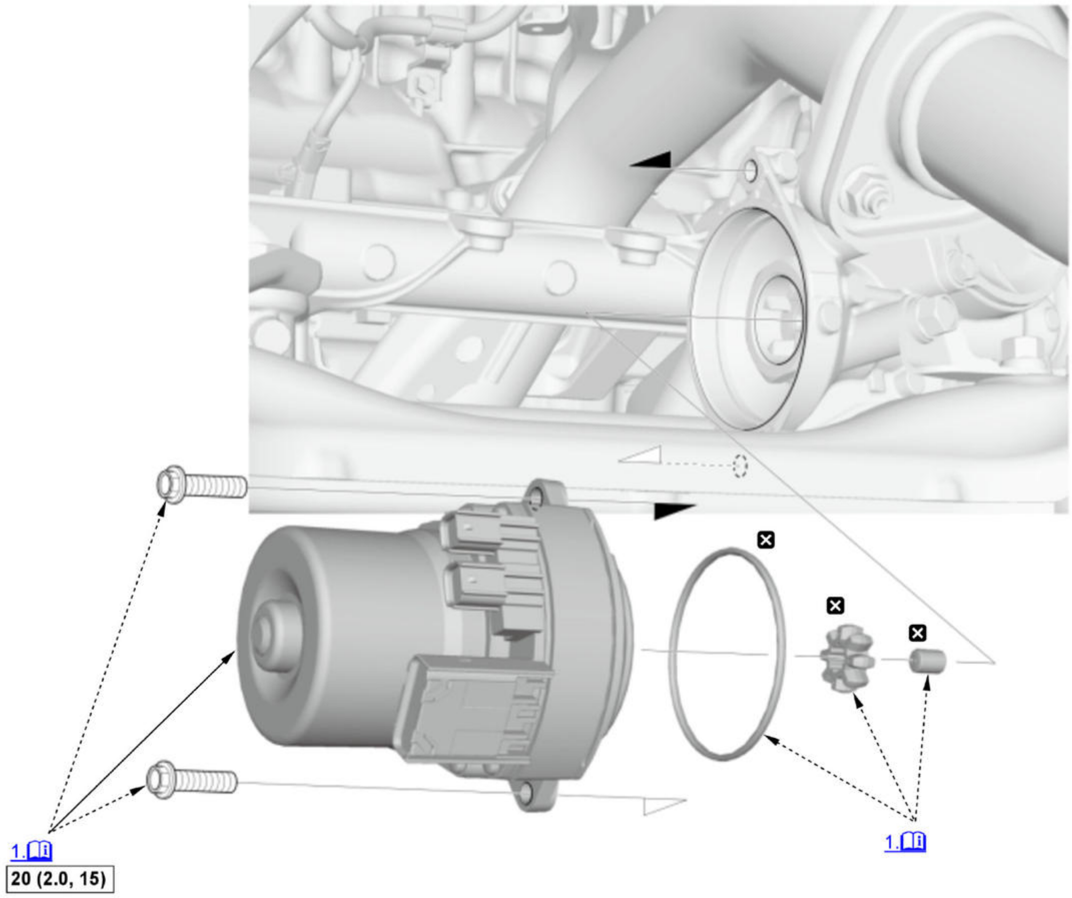

Fig. 2: Exploded View Of EPS Motor/Control Unit Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. EPS Motor/Control Unit - Install

	1. Install a new O-ring (A) onto the EPS motor/control unit (B). **NOTE:** Apply steering grease to the O-ring if necessary. 2. Check the rubber bush (C) and motor bush (D) for damage and cracks. If the rubber bush and motor bush are cracked, replace the rubber bush and motor bush. **NOTE:** If the rubber bush and motor bush are removed, apply steering grease to the rubber bush and motor bush, then install them to the EPS motor/control unit.

	3. Loosely install the EPS motor/control unit mounting bolts (E) by hand but do not tighten. **NOTE:** Make sure the EPS motor/control unit is evenly seated. 4. Tighten the EPS motor/control unit mounting bolts to the specified torque.

2. Heat Baffle - Install
3. Engine Undercover - Install
4. 12 Volt Battery Terminal - Connect
5. EPS Control Unit Software - Check

1. Make sure the EPS control unit has the latest software. If it does not have the latest, update the software in the EPS control unit .

6. VSA Sensor Neutral Position - Memorize
7. EPS Control Unit After Install - Check

1. After installation, check these items:
   - Check for noise and abnormality by turning the steering wheel fully to the right and left several times.
   - Check that the EPS indicator does not come on.

STEERING COLUMN REMOVAL AND INSTALLATION

Removal

SRS components are located in this area. Review the SRS component locations , and the precautions and procedures before doing repairs or service.

NOTE: Do not release the lock lever until the steering column is installed. If the lock lever is released before installation, adjust the steering column after installation.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

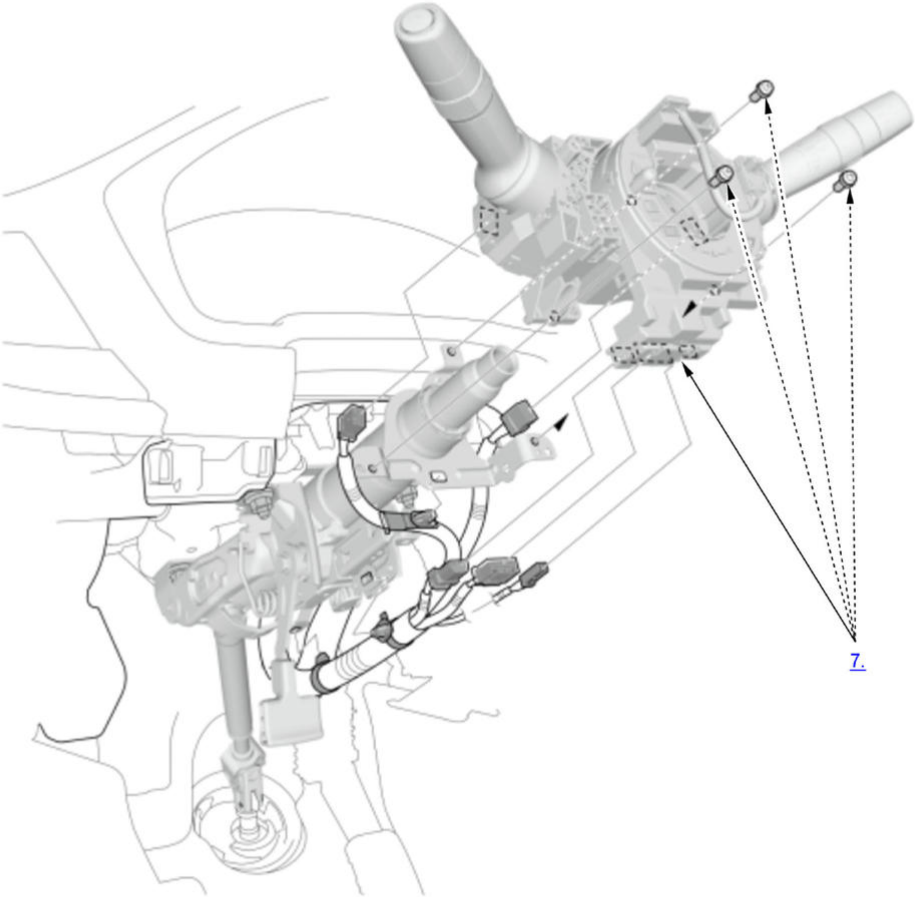

Fig. 3: Exploded View Of Steering Column Components (1 Of 2)
Courtesy of HONDA, U.S.A., INC.

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

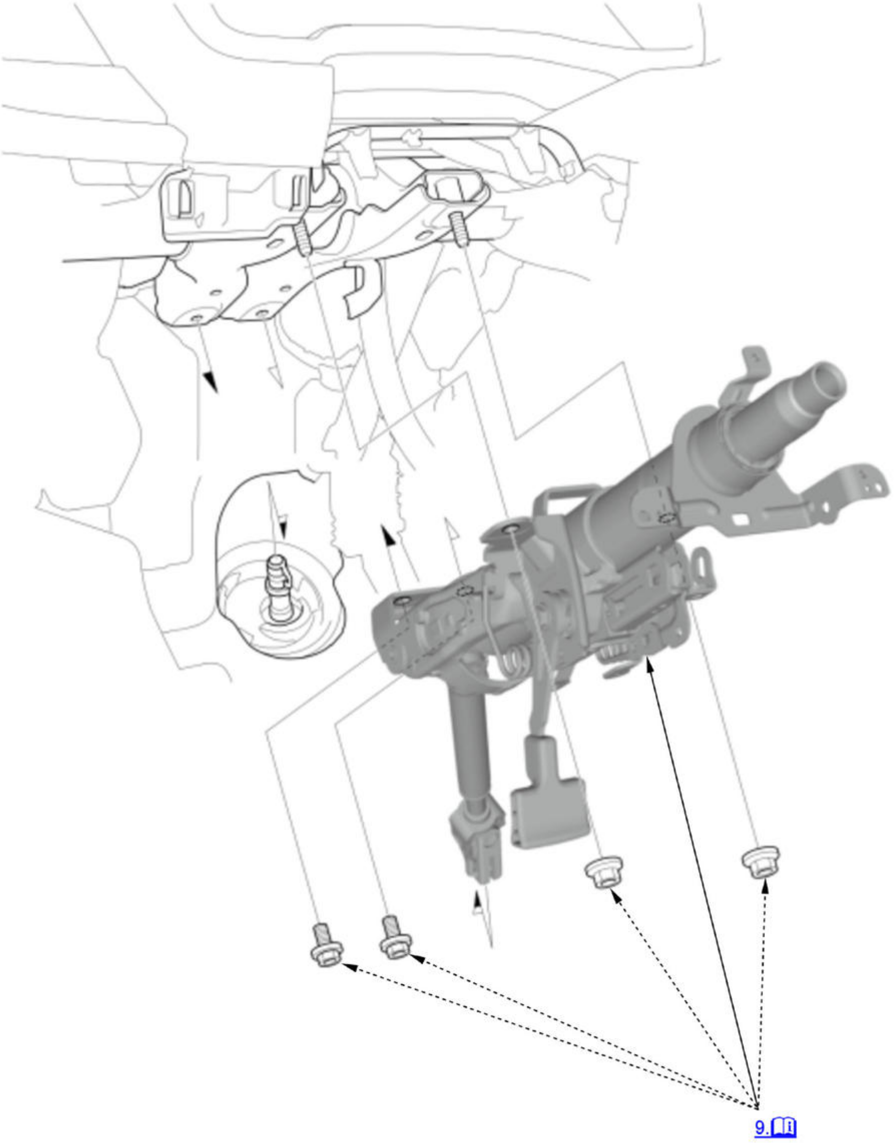

Fig. 4: Exploded View Of Steering Column Components (2 Of 2)
Courtesy of HONDA, U.S.A., INC.

1. 12 Volt Battery Terminal - Disconnect

   NOTE: Wait at least 3 minutes before starting work.

2. Driver's Airbag - Remove
3. Steering Wheel - Remove
4. Driver's Dashboard Undercover - Remove
5. Driver's Dashboard Lower Cover - Remove
6. Column Cover - Remove
7. Combination Switch Body Assembly - Remove
8. Steering Joint - Disconnect
9. Steering Column - Remove

   NOTE: Be careful not to damage the brake pedal position switch.

Installation

SRS components are located in this area. Review the **SRS component locations** , and the **precautions and procedures** before doing repairs or service.

NOTE: Do not release the lock lever until the steering column is installed. If the lock lever is released before installation, adjust the steering column after installation.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

1. Steering Column - Install

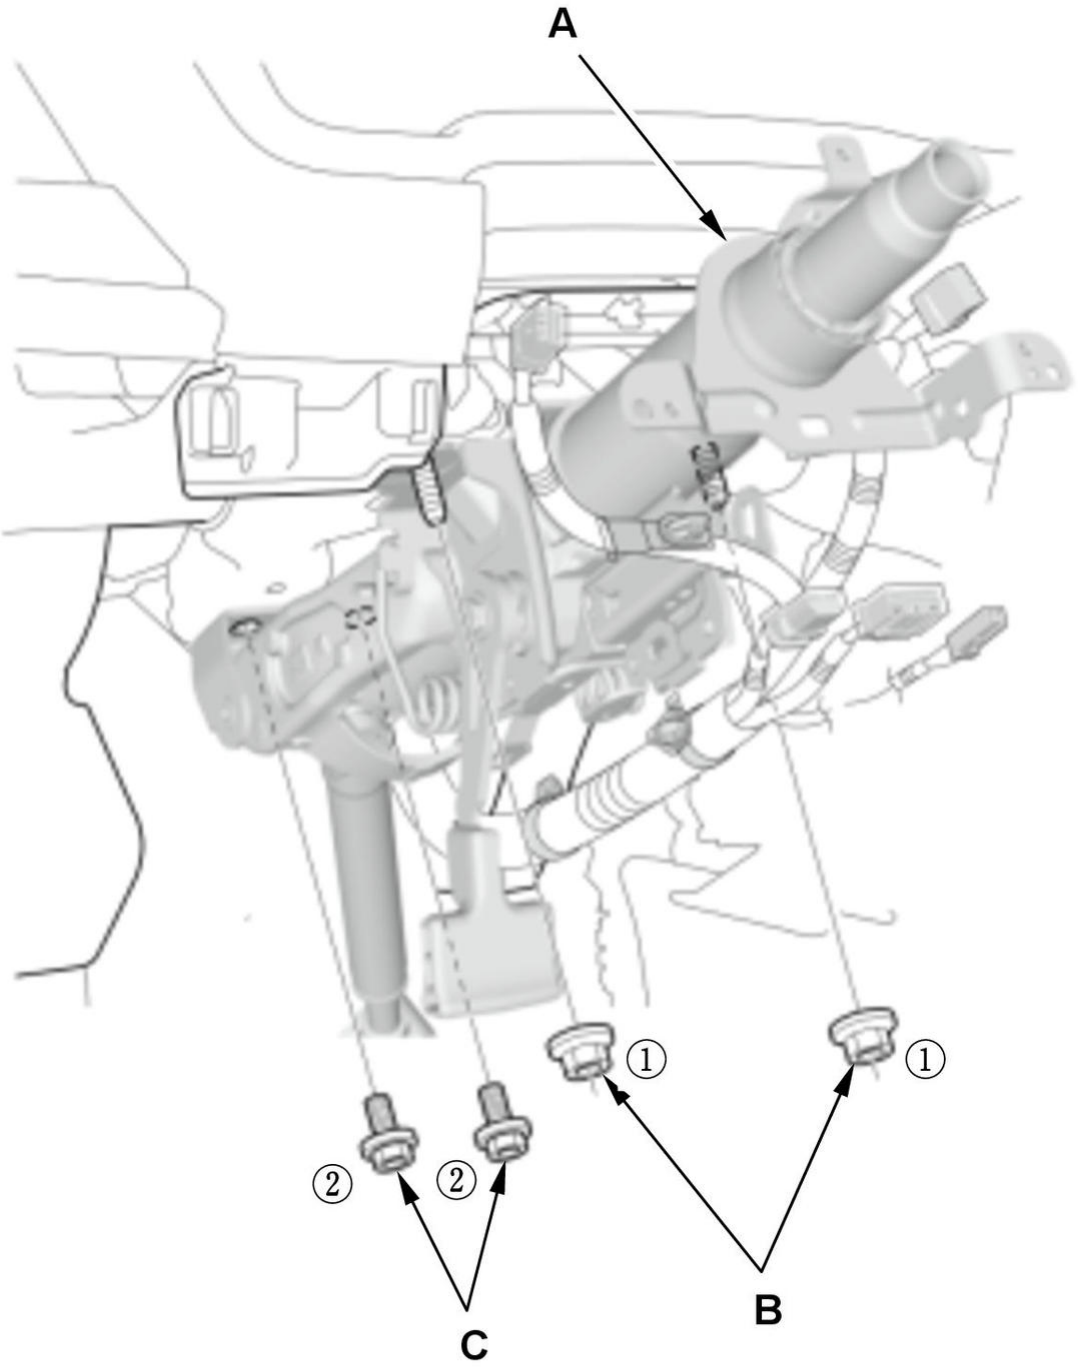

Fig. 7: Steering Column Bolts And Nuts With Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

1. Install the steering column (A).

NOTE: Be careful not to damage the brake pedal position switch.

2. Loosely install the attaching nuts (B) and bolts (C).

3. Tighten the attaching nuts and bolts to the specified torque in the numbered sequence shown.

2. Steering Joint - Connect
3. Combination Switch Body Assembly - Install

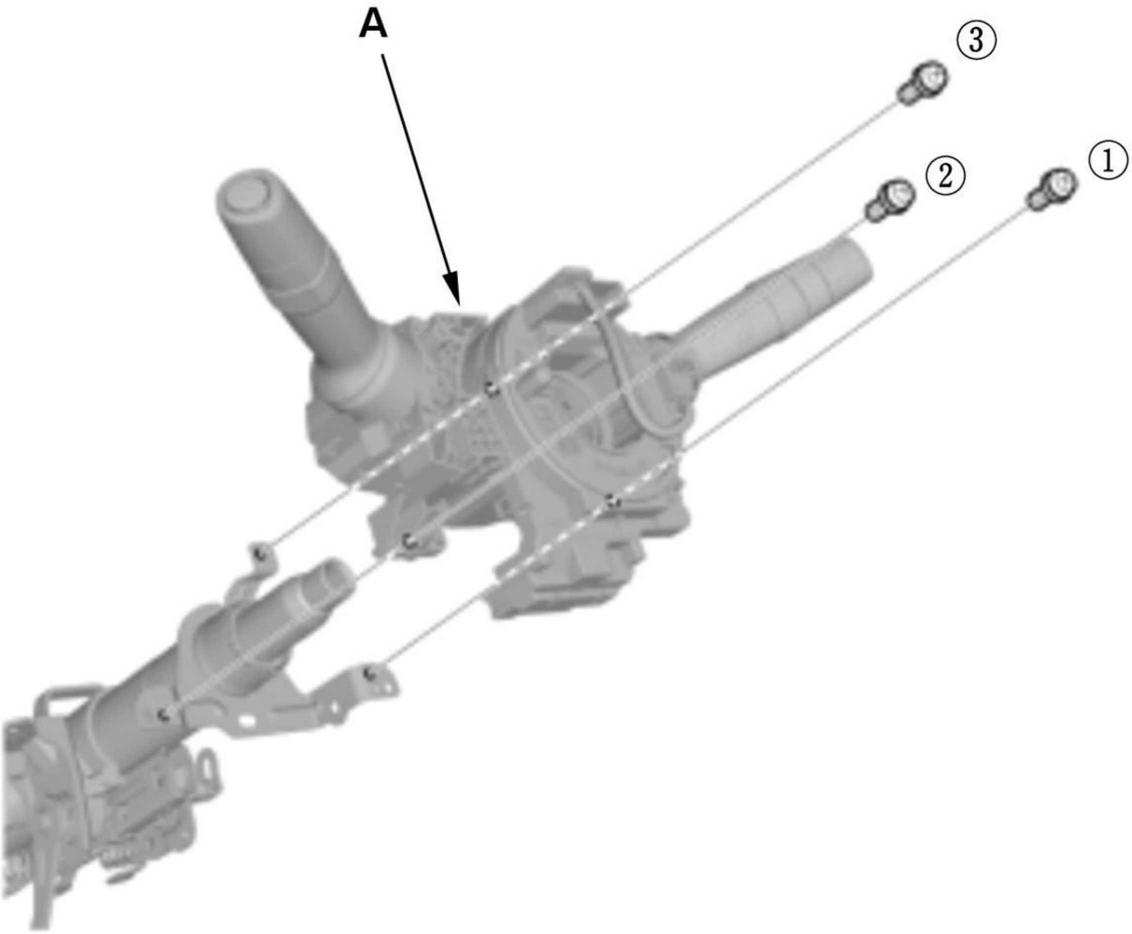

Fig. 8: Combination Switch Body Assembly And Screws With Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

1. Install the combination switch body assembly (A). **NOTE:** Tighten the screws in the numbered sequence shown.

4. **Column Cover - Install**
5. **Driver's Dashboard Lower Cover - Install**
6. **Driver's Dashboard Undercover - Install**
7. **Steering Wheel - Install**
8. **Driver's Airbag - Install**
9. **12 Volt Battery Terminal - Connect**
10. Steering - Check

1. After installation, check these items:
    - Check the tilt mechanism and the telescopic mechanism for movement and damage.
    - With the front wheels straight ahead, make sure the steering wheel is centered and the turning revolutions from center to full lock (left and right) is equal. If not, check the installation of the steering wheel and the engagement of the joint/pinion shaft splines.

11. Wheel Alignment - Check
12. VSA Sensor Neutral Position - Memorize

STEERING GEARBOX REMOVAL AND INSTALLATION

Special Tools Required

Image	Description/Tool Number
	Subframe Adapter VSB02C000016*

*: Available through the Honda Tool and Equipment Program 888-424-6857.

Removal

NOTE:

- Using clean solvent and a brush, wash any oil and dirt off the end of the steering gearbox. Blow dry with compressed air.
- Lower the front subframe from the body, and remove the steering gearbox through the gap produced by lowering the front subframe.
- The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain service precautions before doing repairs or service.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

1. 12 Volt Battery Terminal - Disconnect
2. Vehicle - Lift
3. Front Wheels - Remove
4. Steering Joint - Disconnect
5. Tie-Rod End Ball Joint - Disconnect (Both Sides)
6. Engine Undercover - Remove
7. Connectors (EPS Motor/Control Unit) - Disconnect

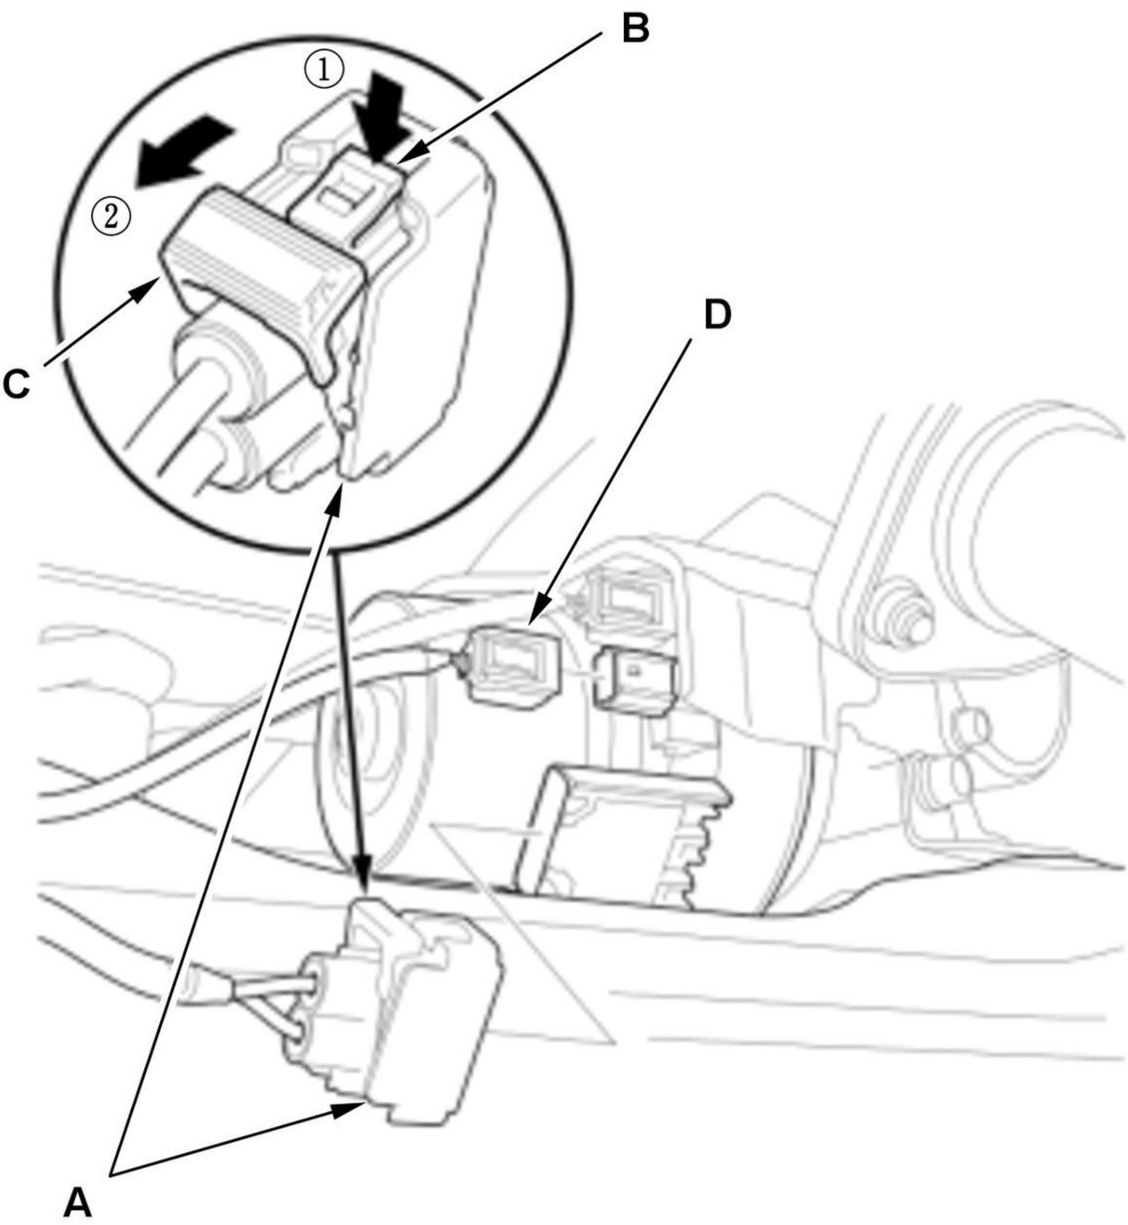

Fig. 12: EPS Motor/Control Unit Connector With Disconnection Sequence
Courtesy of HONDA, U.S.A., INC.

1. Disconnect the connector (A) by pushing the lock (B) and the lever (C) up in the numbered sequence shown.

2. Disconnect the connector (D).

NOTE: Wrap the connectors with vinyl tape to avoid contamination from grease or water.

8. Stabilizer Link - Disconnect

1. Disconnect both sides of the stabilizer link from the stabilizer bar .

9. Front Lower Arm - Disconnect

1. **Disconnect both sides of the front lower arm from the ball joints** .

10. **Exhaust Pipe A - Remove**
11. Lower Torque Rod Mounting Bolt - Remove
12. Front Subframe - Lift Down

	1. Remove both sides of the front lower arm mounting bolt (A) from the body.

	2. Set the subframe adapter (VSB02C000016) on a transmission jack (A), line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts. 3. Attach the subframe adapter to the front subframe (B). 4. **Remove the front subframe mounting bolts** . 5. Lower the front subframe until dropped from the body. **NOTE:** Do not lower the front subframe more than required.

13. Pinion Shaft Grommet - Remove
14. Steering Gearbox - Remove

	1. Remove the steering gearbox (A) from the front subframe (B).

	2. Carefully rotate the steering gearbox so that the top of the pinion shaft points towards the front of the vehicle. 3. Remove the steering gearbox (A) through the wheelwell opening on the driver's side. **NOTE:** Be careful not to damage the steering gearbox.

15. Heat Baffle - Remove
16. EPS Harness - Remove

Installation

NOTE:

- Using clean solvent and a brush, wash any oil and dirt off the end of the steering gearbox. Blow dry with compressed air.
- The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain **service precautions** before doing repairs or service.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

☒	Replace

1. EPS Harness - Install
2. Heat Baffle - Install

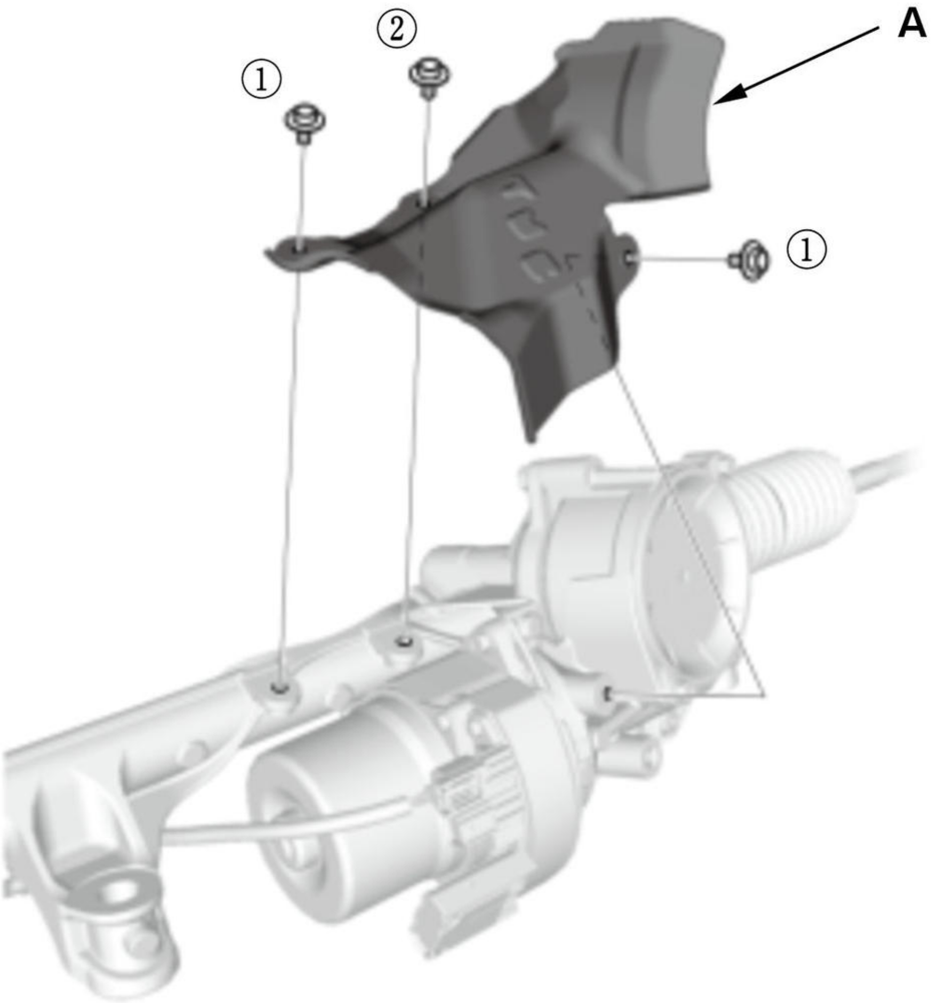

Fig. 16: Heat Baffle And Mounting Bolts With Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

1. Loosely install the heat baffle (A), then tighten the mounting bolts to the specified torque in the sequence shown.

3. Steering Gearbox - Install

	1. Slide the steering gearbox (A) between the front subframe and the body from the driver's side. **NOTE:** Be careful not to damage the steering gearbox. 2. Install the steering gearbox until the steering gearbox is in position.

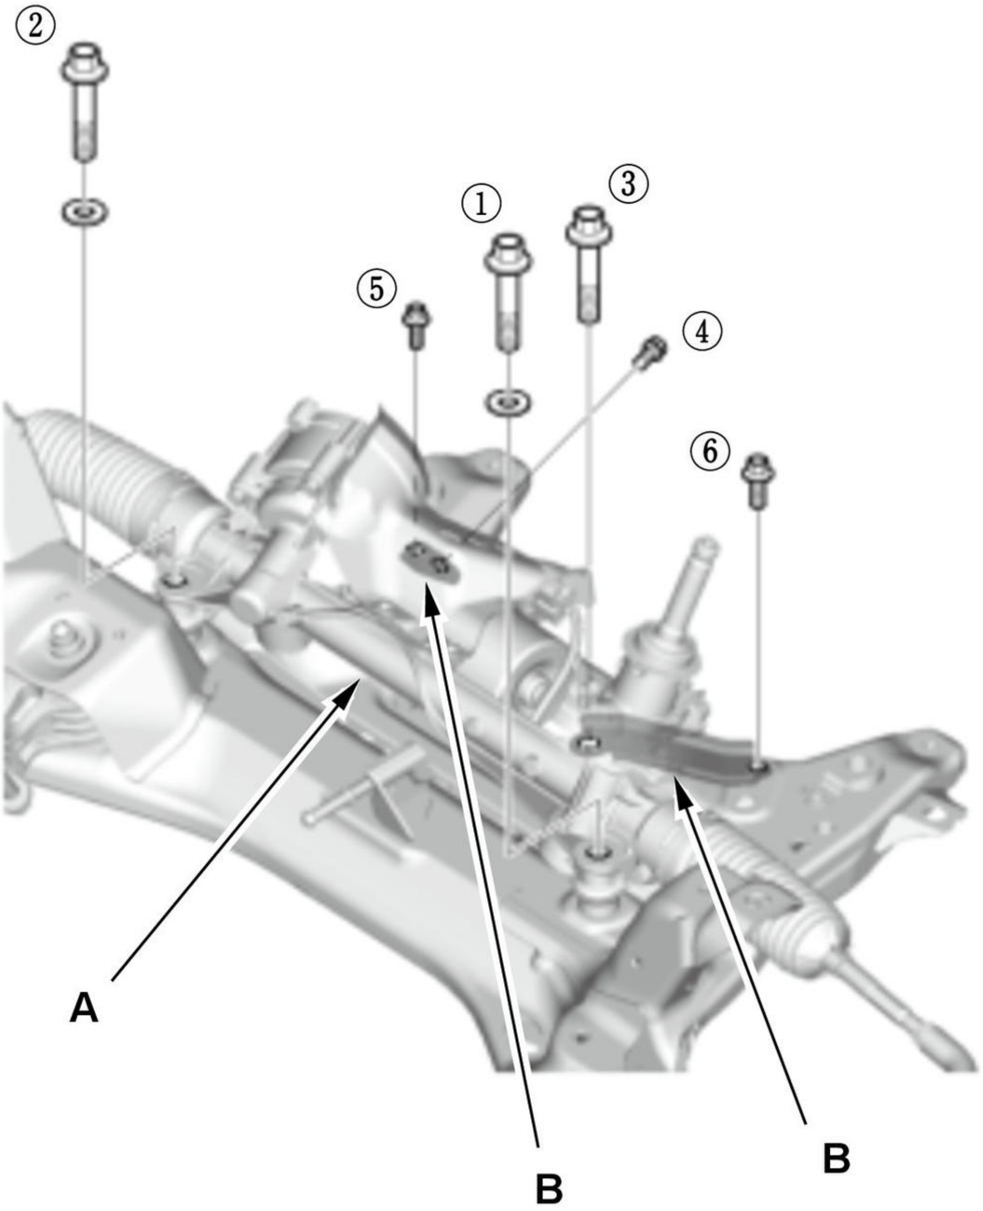

Fig. 17: Steering Gearbox And Steering Gearbox Stiffener Components With Tightening Sequence
Courtesy of HONDA, U.S.A., INC.

3. Loosely install the steering gearbox (A) and steering gearbox stiffeners (B) to the front subframe with new mounting bolts.

4. Tighten the mounting bolts to the specified torque in the numbered sequence shown.

4. Pinion Shaft Grommet - Install

	1. Install the pinion shaft grommet (A). **NOTE:** - Align the arrow mark (B) on the pinion shaft grommet with forward of the vehicle. - Align the cutout portion (C) with the lug portion (D).

5. Front Subframe - Lift Up

	1. Set the subframe adapter (VSB02C000016) on a transmission jack (A), line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts. 2. Attach the subframe adapter to the front subframe (B). 3. Upper the front subframe. 4. **Install the front subframe mounting bolts to the body** .

	5. Install both sides of the front lower arm mounting bolt (A) to the body. **Then tighten the bolt to the specified torque** .

6. **Front Subframe - Tighten**
7. Lower Torque Rod Mounting Bolt - Loosely Install
8. **Engine/Transmission Mount - Tightening Procedure**
9. **Exhaust Pipe A - Install**
10. Front Lower Arm - Connect

1. **Connect both sides of the front lower arm to the ball joints** .

11. Stabilizer Link - Connect

1. Connect both sides of the stabilizer link to the stabilizer bar .

12. Connectors (EPS Motor/Control Unit) - Connect

	1. Connect the connectors (A).

13. Engine Undercover - Install
14. Tie-Rod End Ball Joint - Connect (Both Sides)
15. Steering Joint - Connect
16. Front Wheels - Install
17. 12 Volt Battery Terminal - Connect
18. Wheel Alignment - Check
19. Steering Gearbox After Install - Check

1. After installation, check these items: • With the front wheels straight ahead, make sure the steering wheel is centered and the turning revolutions from center to full lock (left and right) is equal. If not, check the installation of the steering wheel and the engagement of the joint/pinion shaft splines. • With the tires raised off the ground, check for noise and abnormality by turning the steering wheel fully to the right and left several times. • Check the power steering assist . • Check that the EPS indicator does not come on.

20. VSA Sensor Neutral Position - Memorize

STEERING JOINT DISCONNECTION AND RECONNECTION

Removal and Installation

NOTE:

- Set the steering wheel to the straight ahead position before disconnecting the steering shaft.
- Do not turn a steering wheel while disconnecting a steering joint.
- If the center guide is in place and has not moved, leave it in place.
- If the center guide has come off, discard it.
- Be careful not to pull out the lower side from the steering shaft during working.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

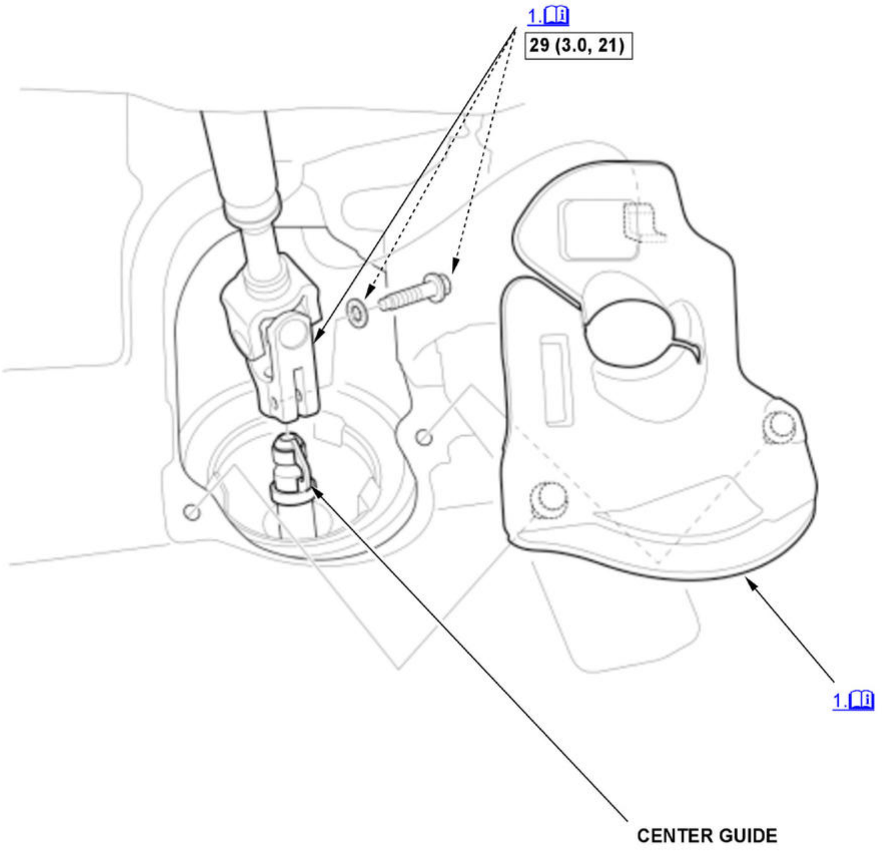

Fig. 18: Exploded View Of Steering Joint Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)

1. Steering Joint - Disconnect

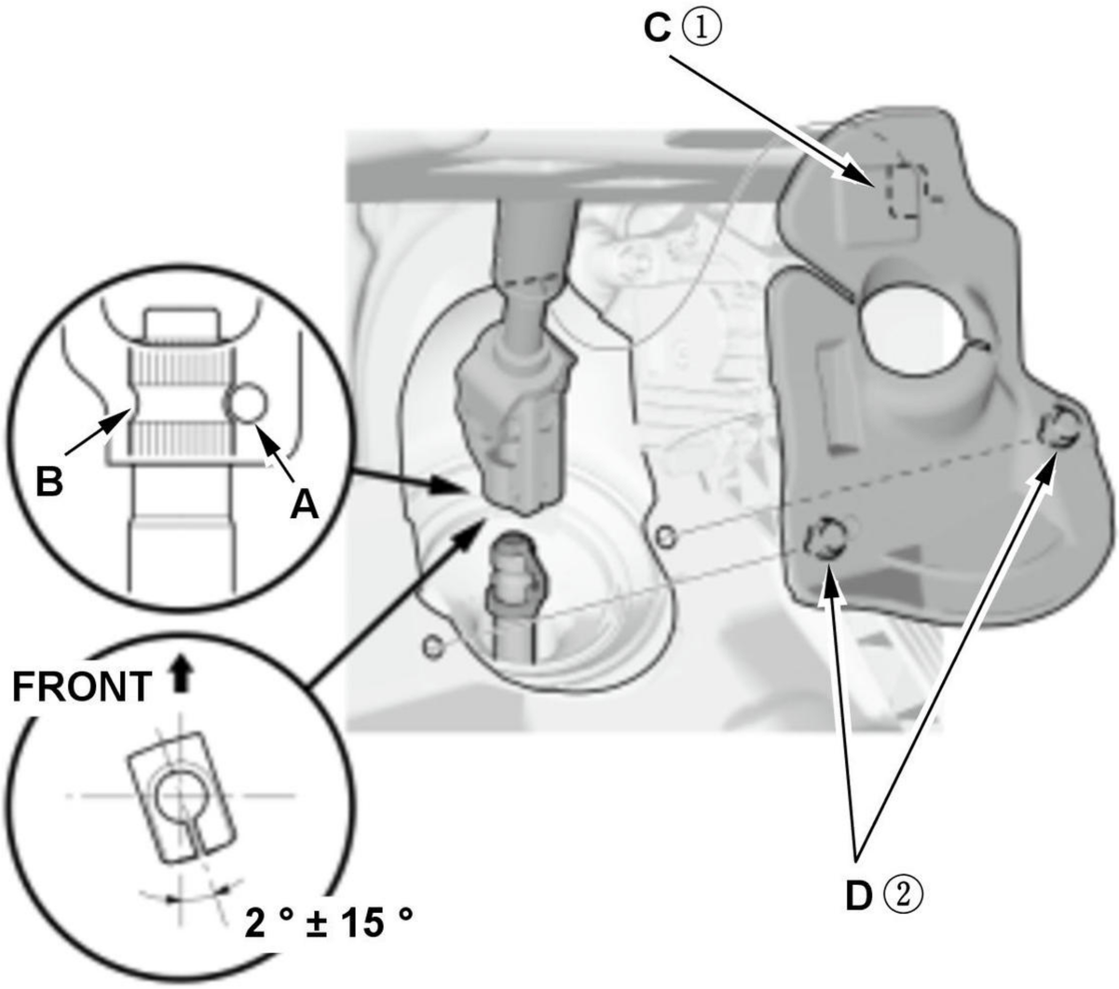

Fig. 19: Steering Joint Cover Hook And Clips With Installation Sequence
Courtesy of HONDA, U.S.A., INC.

Note for installation

- Pinion shaft without center guide: Position the steering column by aligning the gap within the angle.
- Align the bolt hole (A) on the steering joint with the groove (B) around the pinion shaft.
- When tightening the joint bolt, turn the steering wheel, if necessary.
- Install the hook (C) and the clips (D) in the numbered sequence shown.
- Check the steering joint cover for damage and cracks. If the steering joint cover is cracked, replace the steering joint cover.

2. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

3. VSA Sensor Neutral Position - Memorize

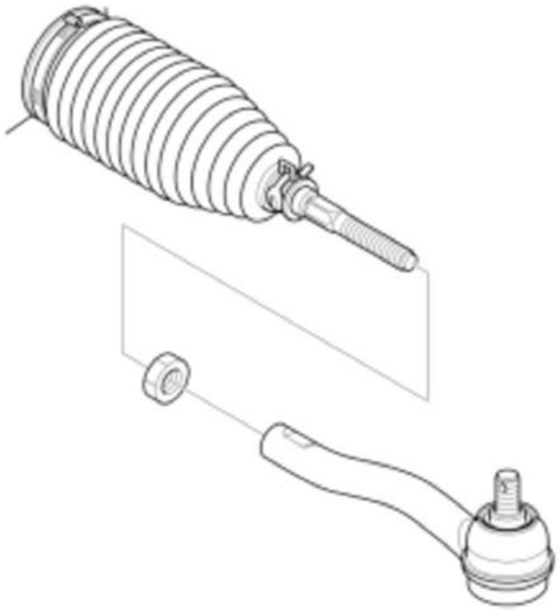
STEERING RACK END REMOVAL AND INSTALLATION

Removal

NOTE:

- Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.
- Refer to **Steering Gearbox Disassembly and Reassembly** as needed during this procedure.

1. **Steering Gearbox - Remove**
2. Tie-Rod End - Remove



3. Rack End Boot - Remove

	1. Remove the boot band (A). 2. Remove the tie-rod clip (B). 3. Pull the boot (C) away from the ends of the steering gearbox.

4. Rack End - Remove

	1. Hold the gearbox housing using a C-clamp (A) and wooden blocks (B) to a workbench as shown. **NOTE:** - Be careful not to damage the mounting surface with a C-clamp. - Do not clamp the cylinder part of the gearbox housing with a C-clamp.

	2. Unscrew the rack end (A) with a wrench. **NOTE:** - Hold the flat surfaces (B) with a wrench when unscrewing both rack ends. - Be careful not to damage the rack surface. 3. Remove the rack end and the rubber stopper (C).

Installation

NOTE:

- **How to read the torque specifications** .
- Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.
- Refer to **Steering Gearbox Disassembly and Reassembly** as needed during this procedure.

1. Rack End - Install

	1. Hold the gearbox housing using a C-clamp (A) and wooden blocks (B) to a workbench as shown. **NOTE:** - Be careful not to damage the mounting surface with a C-clamp. - Do not clamp the cylinder part of the gearbox housing with a C-clamp.

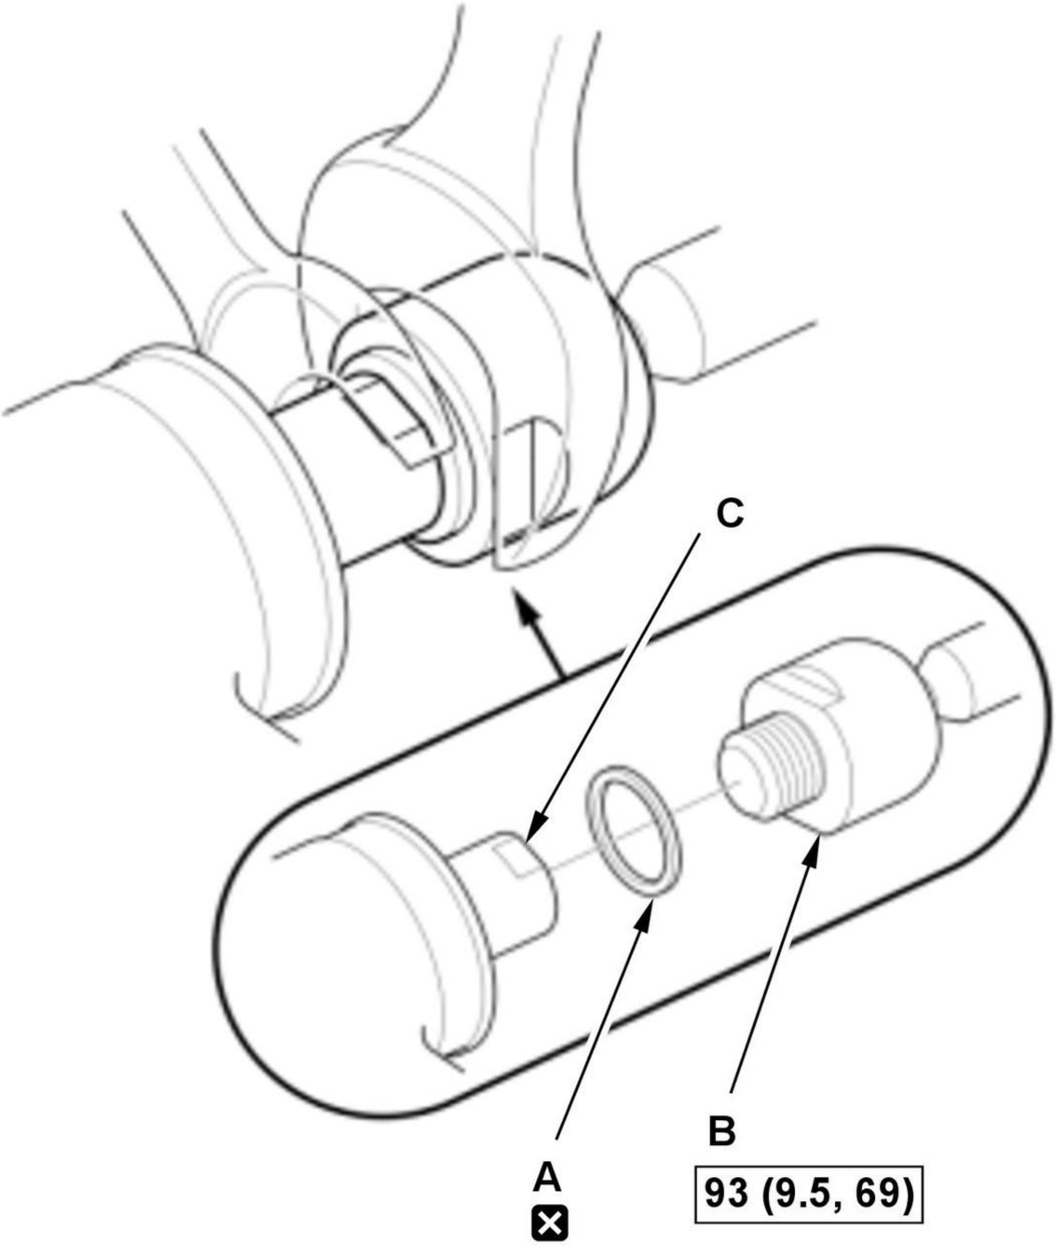


Fig. 20: Steering Rack End Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

2. Install a new rubber stopper (A).

3. Tighten the rack end (B) with a wrench.

NOTE:

- Be careful not to damage the rack surface.
- Hold the flat surfaces (C) with a wrench when tightening both rack ends.

2. Rack End Boot - Install

	1. Apply multipurpose grease to the rack end joint housing (A) and the boot installation grooves (B). 2. Clean off any grease or contamination from the boot installation groove (C) around the gearbox housing. 3. Install the boot (D) on the rack end with the tie-rod clip (E) and a new boot band (F). **NOTE:** • Fit the boot end in the installation grooves in the housing properly. • After installing the boots, wipe the grease off the threaded section (G) of the rack end.
	4. Set the boot band (A) by aligning the tabs (B) with the holes (C) on the band. 5. Close the ear portion (D) of the boot band with pincers Oetiker 1098, commercially available or equivalent (E). 6. Slide the rack right and left to be certain that the boots are not deformed or twisted.

3. Tie-Rod End - Install

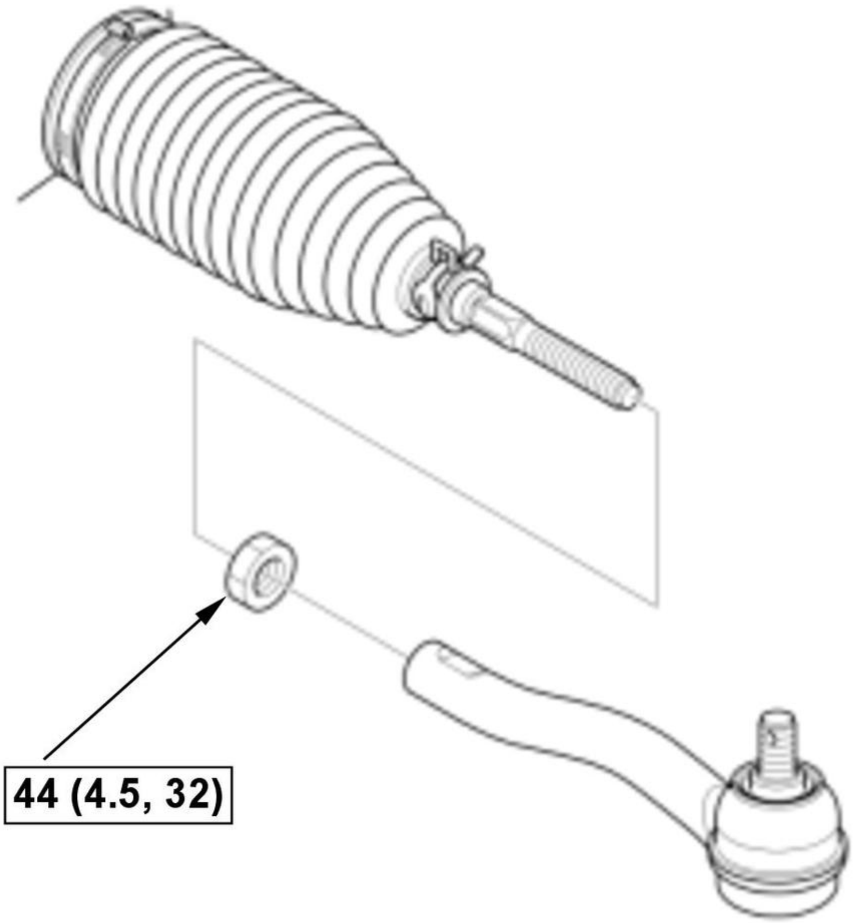

Fig. 21: Tie-Rod End Locknut With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

4. Steering Gearbox - Install

STEERING WHEEL REMOVAL AND INSTALLATION

Removal

SRS components are located in this area. Review the SRS component locations , and the precautions and procedures before doing repairs or service.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

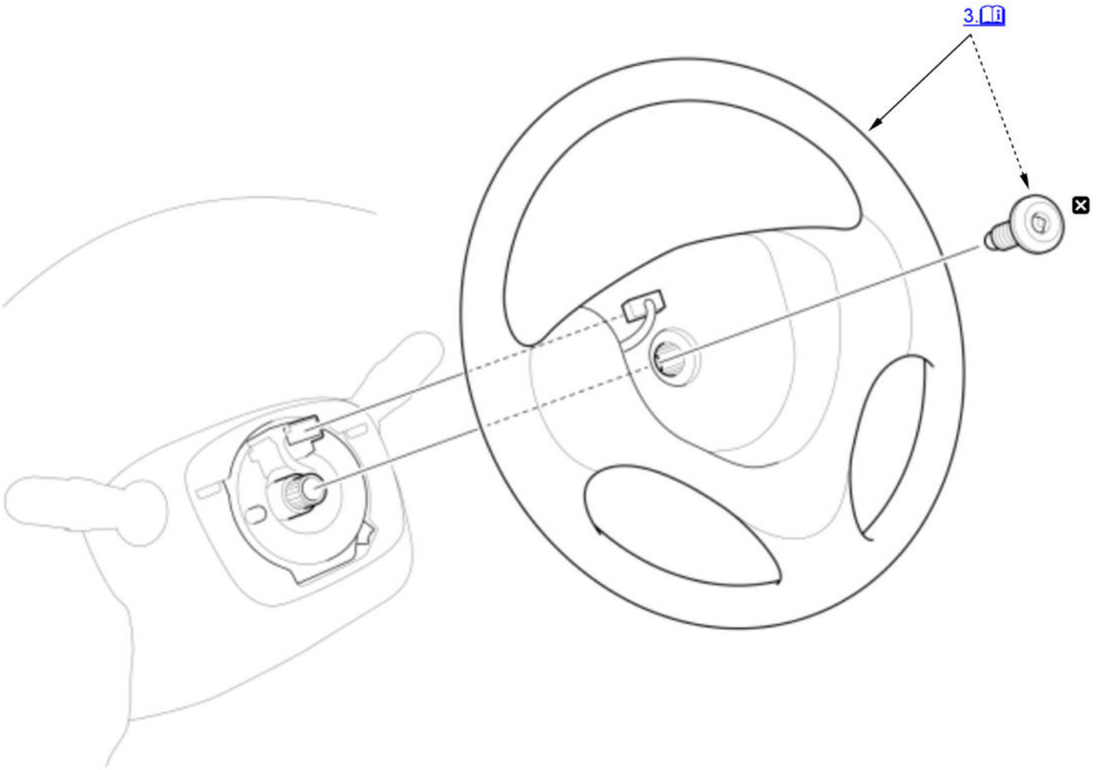

Fig. 22: Exploded View Of Steering Wheel Components
Courtesy of HONDA, U.S.A., INC.

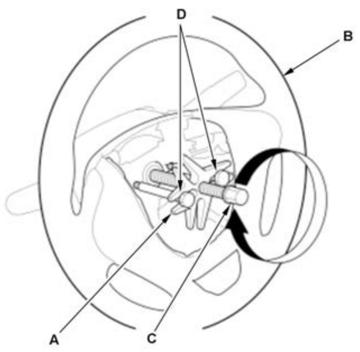
☒	Replace

1. 12 Volt Battery Terminal - Disconnect

   NOTE: Wait at least 3 minutes to start the following work.

2. Driver's Airbag - Remove
3. Steering Wheel - Remove

	1. Set the front wheels in the straight ahead position. 2. Disconnect the connector (A). 3. With heated steering wheel: Disconnect the connector (B). 4. Loosen the steering wheel bolt (C) three turns.

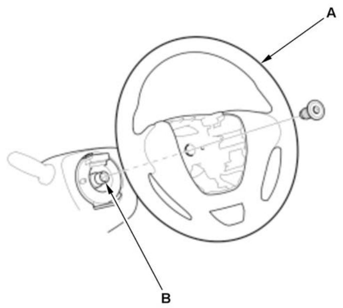


5. Install a commercially available steering wheel puller (A) on the steering wheel (B).

6. Free the steering wheel from the steering column shaft by turning the pressure bolt (C) of the puller.

Note these items when removing the steering wheel:

- Do not tap on the steering wheel or the steering column shaft when removing the steering wheel.
- If you thread the puller bolts (D) into the wheel hub more than five threads, the bolts will hit the cable reel and damage it. To prevent this, install a pair of jam nuts five threads up on each puller bolt.



7. Remove the steering wheel puller.

8. Remove the steering wheel (A).

NOTE: Remove the old sealant from the threads (B) in the column shaft.

Installation

SRS components are located in this area. Review the **SRS component locations** , and the **precautions and procedures** before doing repairs or service.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

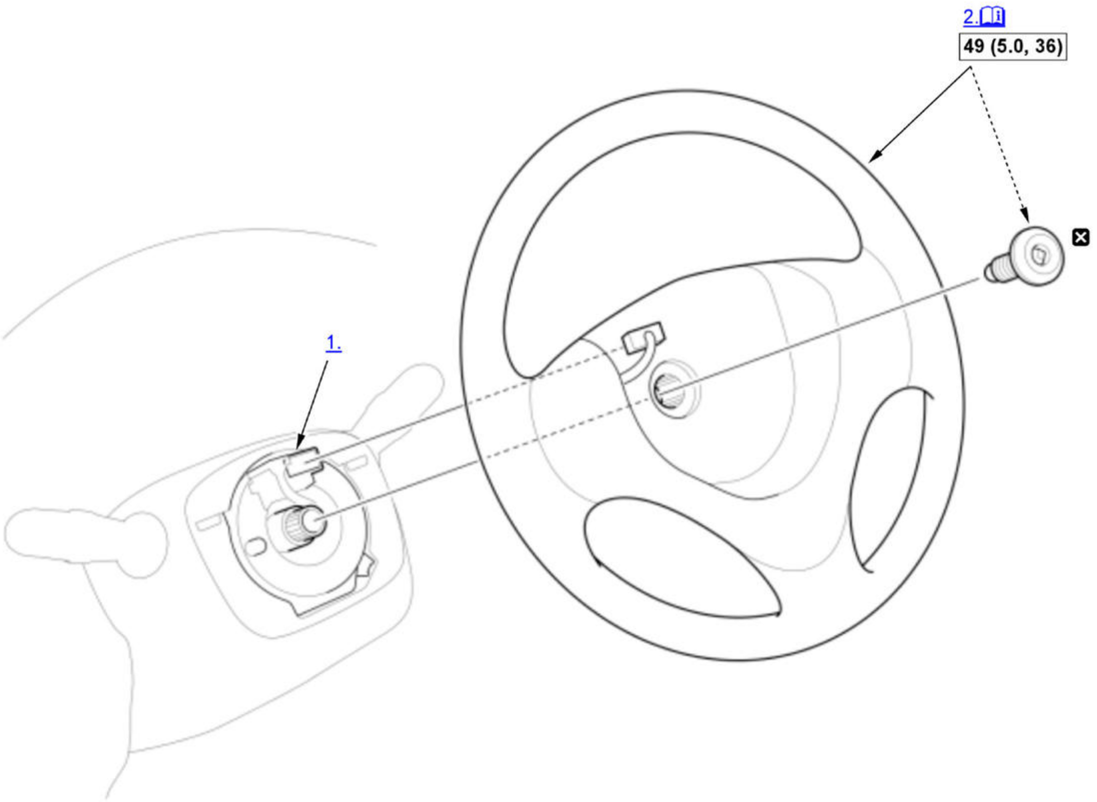


Fig. 23: Exploded View Of Steering Wheel Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Cable Reel - Align
2. Steering Wheel - Install

	1. Position the steering wheel hub (A) so that it engages the pin (B) of the cable reel. 2. Install the steering wheel (C) onto the steering column shaft. **NOTE:** Do not tap on the steering wheel or the steering column shaft when installing the steering wheel.

	3. Install a new steering wheel bolt (A), and tighten it to the specified torque. **NOTE:** Install the steering wheel bolt and tighten it within 5 minutes using the specified tightening torque. 4. With heated steering wheel: Connect the connector (B). 5. Connect the connector (C). 6. At point (D), make sure that the cable reel subharness (E) is routed above the SRS harness (F).

3. Driver's Airbag - Install
4. 12 Volt Battery Terminal - Connect
5. Steering Wheel Spoke Angle - Check

1. Check the steering wheel spoke angle.

2. With the front wheels straight ahead, make sure the steering wheel is centered and the turning revolutions from center to full lock (left and right) is equal. If not, check the installation of the steering wheel and the engagement of the joint/pinion shaft splines.

6. VSA Sensor Neutral Position - Memorize

TIE-ROD END BALL JOINT DISCONNECTION AND RECONNECTION

Special Tools Required

Image	Description/Tool Number
	Ball Joint Thread Protector, 12 mm 07AAF-SDAA100
	Ball Joint Remover, 28 mm 07MAC-SL00202

Removal and Installation

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Front Wheel - Remove
3. Tie-Rod End Ball Joint - Disconnect

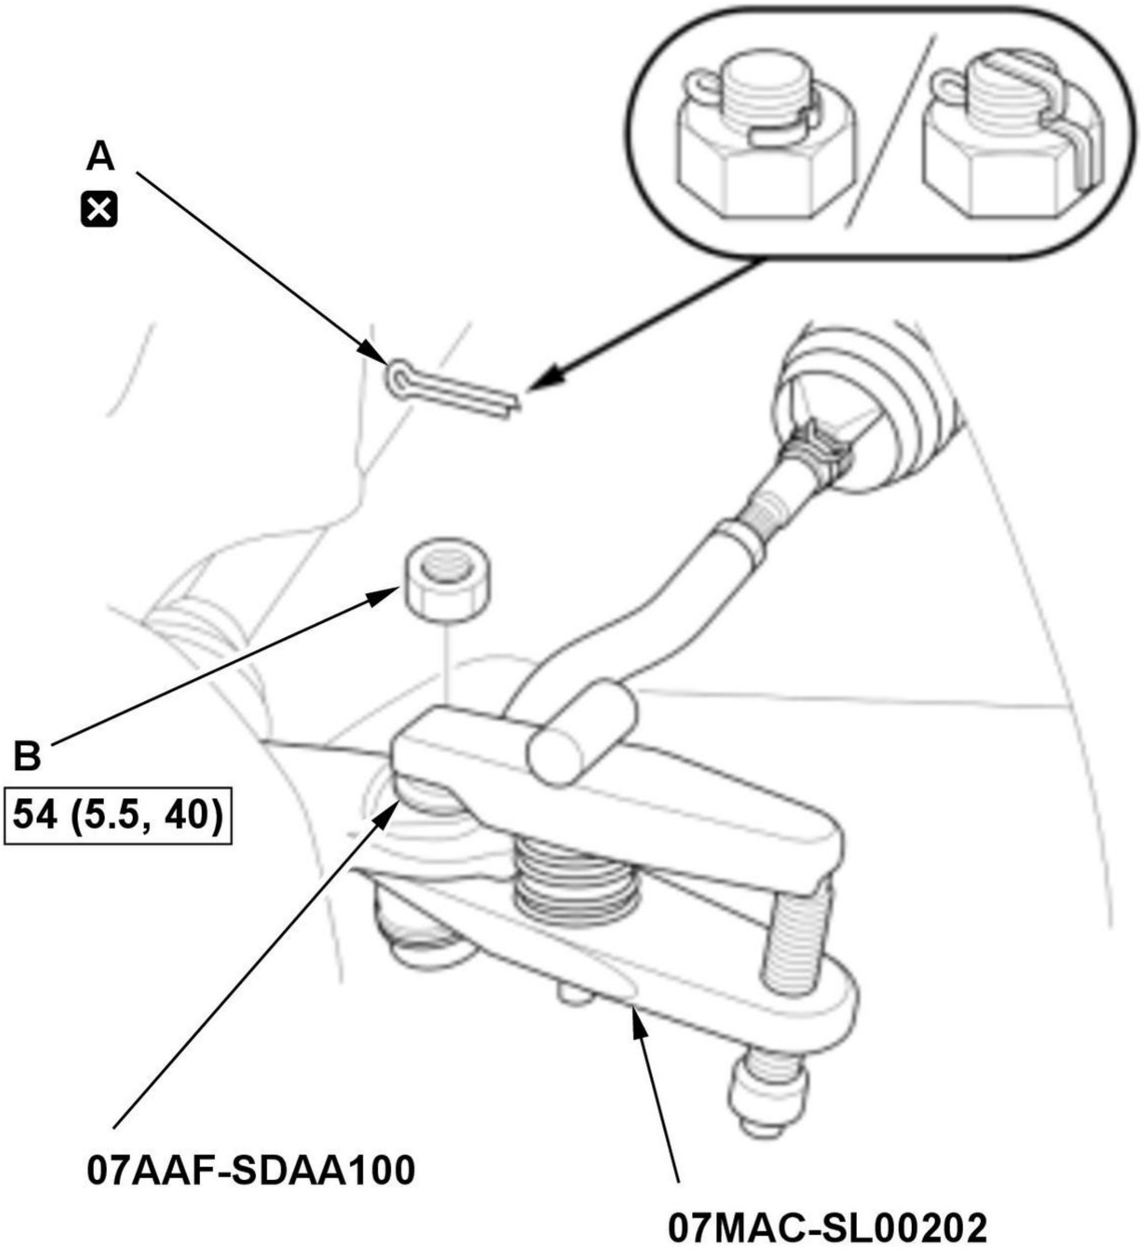

Fig. 24: Tie-Rod End Ball Joint Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the cotter pin (A).

2. Remove the nut (B).

3. Disconnect the tie-rod end ball joint from the knuckle using the ball joint thread protector and the ball joint remover .

NOTE:

- Be careful not to damage the ball joint boot when installing the ball joint remover.

- During installation, install a new cotter pin after tightening the nut, and bend its end as shown.

4. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

DISASSEMBLY AND REASSEMBLY

STEERING GEARBOX DISASSEMBLY AND REASSEMBLY

Exploded View

NOTE:

- How to read the torque specifications .
- For these operations, refer to the complete procedure as needed.
-
    - Rack end removal and installation
    - Tie-rod end ball joint boot replacement
    - EPS motor/control unit removal and installation
- Check for deterioration and damage to each part during removal.

REMOVAL, INSTALLATION, AND TEST

HEATED STEERING WHEEL SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE:

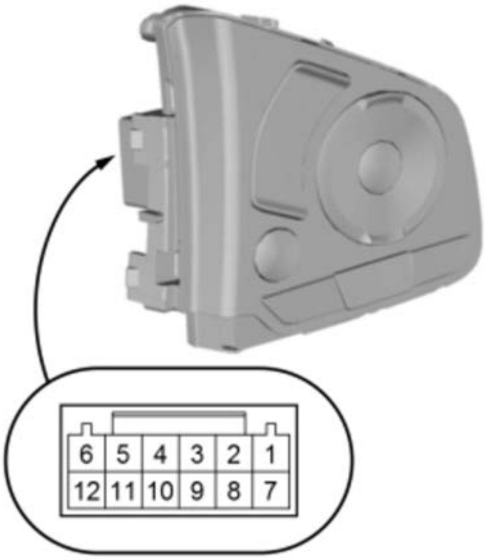
- SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.
- The heated steering wheel switch is built into the steering wheel assembly.

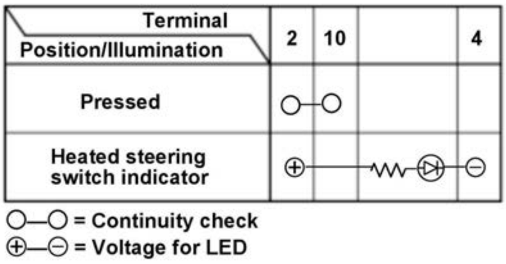
1. Driver's Airbag - Remove
2. Steering Wheel Trim - Remove
3. Heated Steering Wheel Switch - Remove
4. All Remove Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. Heated Steering Wheel Switch - Test





Terminal / Position/Illumination	2	10		4
Pressed	○—	—○		
Heated steering switch indicator	⊕—	—	—ʍʍ—⊳|—	—⊖

○—○ = Continuity check
⊕—⊖ = Voltage for LED

1. Check for continuity between the terminals in each switch position according to the table.

NOTE:

- When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.
- Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

2. If the result is not as specified, replace the heated steering wheel switch.

REMOVAL AND INSTALLATION

DASHBOARD/STEERING HANGER BEAM REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- How to read the torque specifications
- SRS components are located in this area. Review the SRS component locations and the precautions and procedures before doing repairs or service.

1. 12 Volt Battery Terminal - Disconnect

   NOTE: Wait at least 3 minutes before starting work.

2. Both A Pillar Trims - Removal
3. Driver's Dashboard Lower Cover - Remove
4. Both Dashboard Undercover - Remove
5. Both Dashboard Side Lid - Remove
6. Column Cover - Remove
7. Center Console - Remove
8. Center Console Bracket - Remove
9. Shift Cable (Shift Lever Side) - Disconnect
10. Brake Pedal Position Switch - Remove
11. Linkage Assembly - Remove

12. Dashboard/Steering Hanger Beam - Remove

Driver's Side  **Passenger's Side** 	**A-Pillar Area** 1. Disconnect the connectors (A) and remove the clips (B). **NOTE:** The positions and number of connectors vary depending on model type.

Steering Column Area

2. Disconnect the connectors (A) and remove the clips (B).

NOTE: The positions and number of connectors vary depending on model type.

NOTE: If either collar bolt was not seated, replace the special bolts.

	16. Remove the dashboard/steering hanger beam (A).

13. All Removed Parts - Install

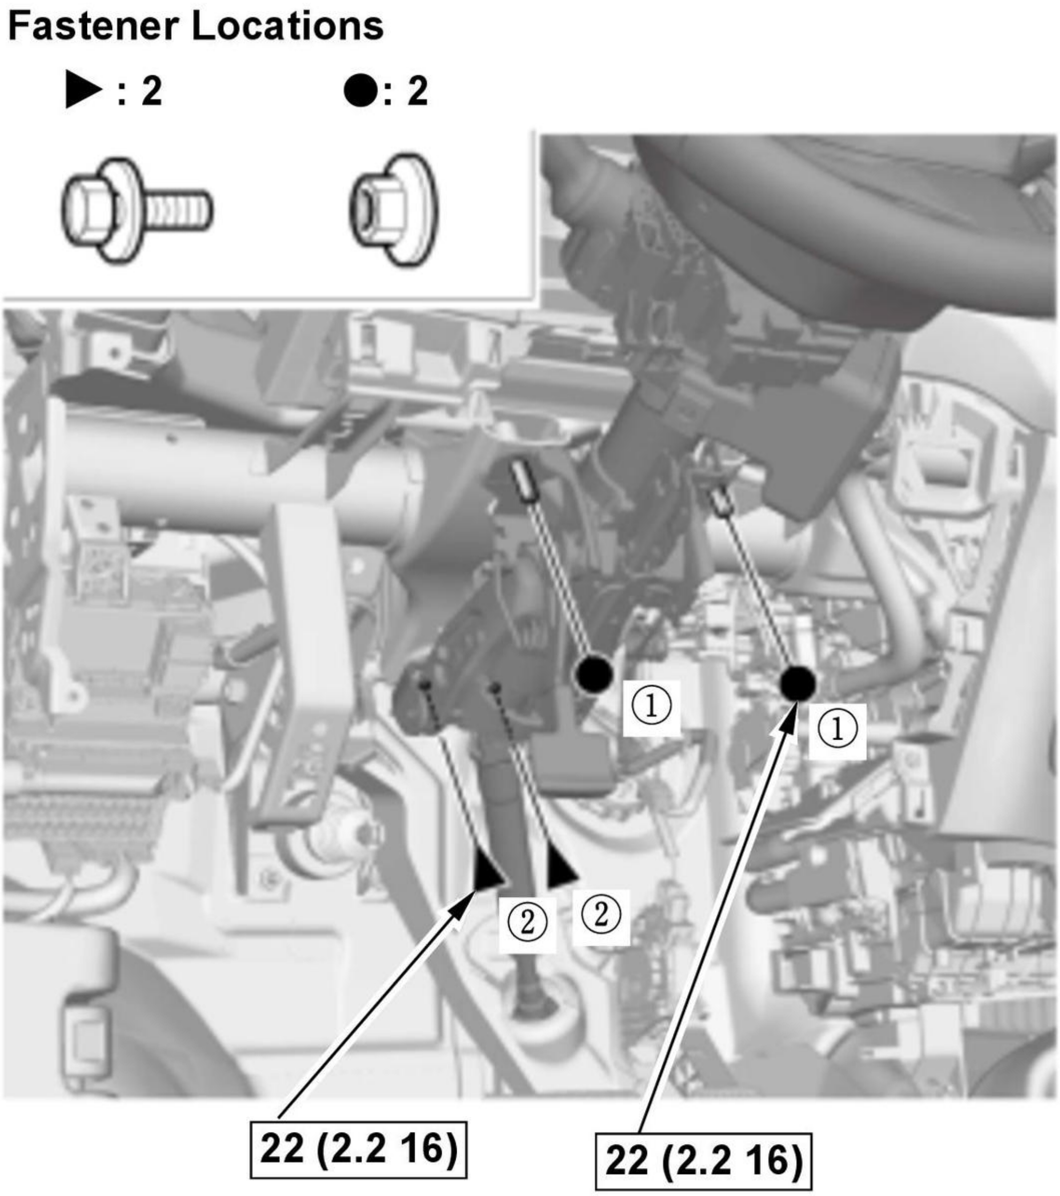

Fig. 1: Steering Column Tightening Sequence With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

Special Bolt Tightening  **Steering Column**	1. Install the parts in the reverse order of removal, and note these items: **NOTE:** • Before reinstalling the dashboard, screw the special bolt (A) into the collar bolt (B), and check that they turn together. If they do not turn together, replace the special bolts. • Before reinstalling the dashboard, be sure the collar bolts can be screwed/unscrewed lightly by hand, and then screw them into the fixed space adjusters (C) fully by hand. Do not tighten them with any tools. • Make sure the dashboard fits onto the guide pins correctly. • Before tightening the bolts, make sure the wire harnesses are not pinched. • Make sure the connectors are plugged in properly.

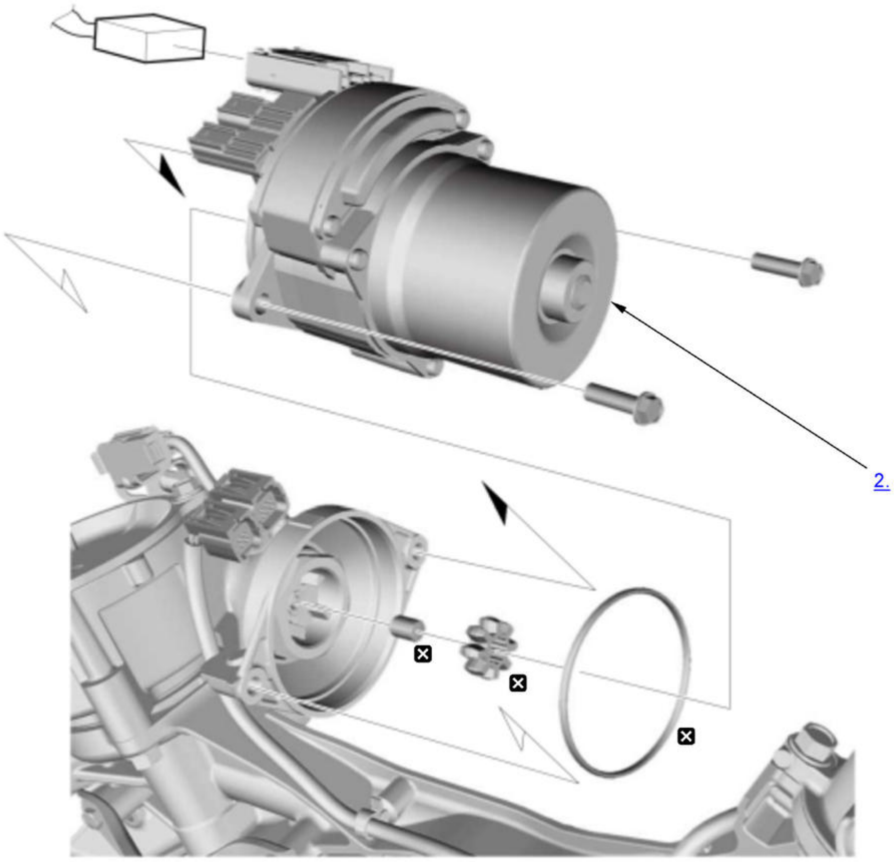
	- After setting the dashboard in the body, reinstall all of the mounting bolts but do not tighten them. First tighten the driver's side mounting bolts to the specified torque, then tighten the remaining special bolts. As you tighten the bolts, the collar bolts screw out of the space adjuster until they contact the body. Continue tightening the special bolts to the specified torque. - When installing the steering column, tighten the nuts and bolts to the specified torque in the numbered sequence shown. - **Do the 12 volt battery terminal connection procedure** . - Check for any DTCs that may have been set during repairs, and clear them.

EPS MOTOR/CONTROL UNIT REMOVAL AND INSTALLATION

Removal

NOTE: Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.

1



☒	Replace

1. **Engine Undercover - Remove**

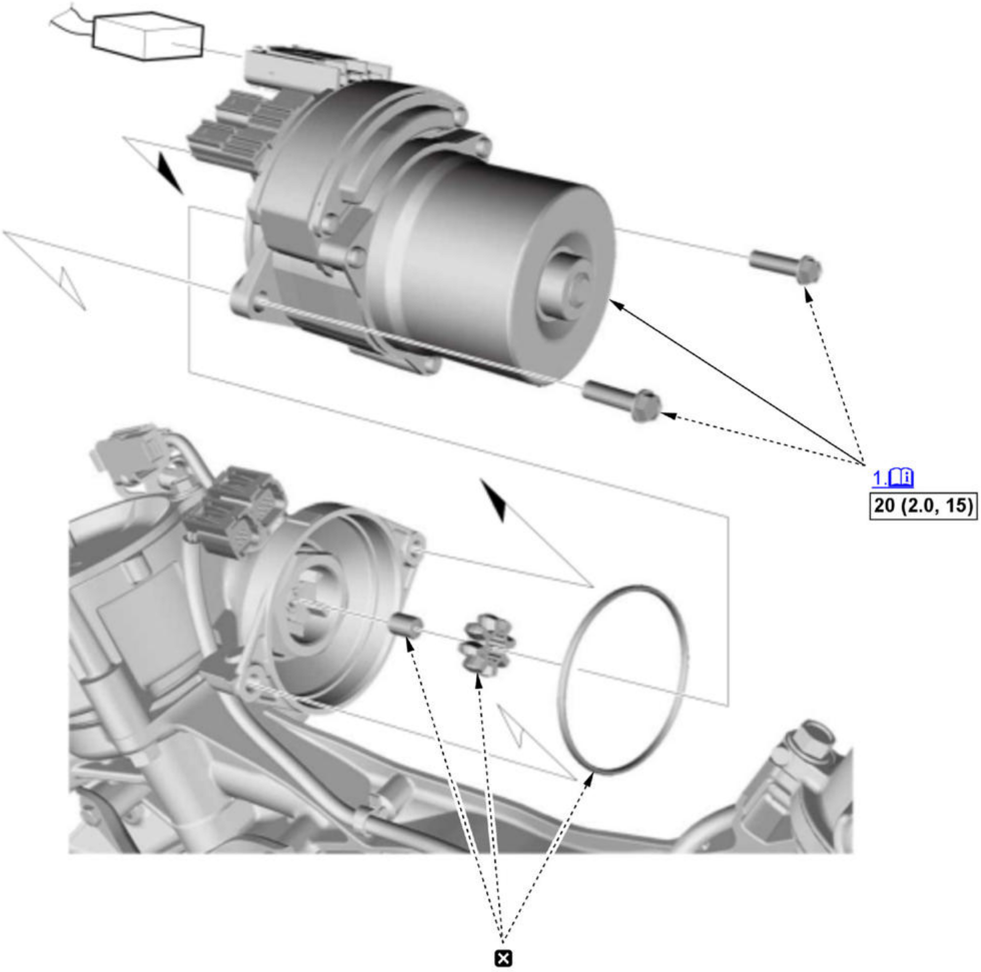
Installation

NOTE: Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.

1



ℹ	Detailed information, notes and precautions
▭	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. EPS Motor/Control Unit - Install

	1. Install a new O-ring (A) to the EPS motor/control unit (B). **NOTE:** Apply steering grease to the O-ring if necessary. 2. Check the rubber bush (C) and motor bush (D) for damage and cracks. If the rubber bush and motor bush are cracked, replace the rubber bush and motor bush. **NOTE:** If the rubber bush and motor bush are removed, apply steering grease to the rubber bush and motor bush, then install them to the EPS motor/control unit. 3. Install the EPS motor/control unit, but do not install the mounting bolts. 4. Turn the EPS motor/control unit two or three times to the right and left about 45 degrees. 5. Loosely install the EPS motor/control unit mounting bolts (E) by hand but do not tighten. **NOTE:** Make sure the EPS motor/control unit is evenly seated. 6. Tighten the EPS motor/control unit mounting bolts to the specified torque.

2. **Engine Undercover - Install**
3. EPS Control Unit Software - Check

1. Make sure the EPS control unit has the latest software. If it does not have the latest, **update the software in the EPS control unit** .

4. **VSA Sensor Neutral Position - Memorize**
5. EPS System - Check

1. After installation, check these items:
   - Start the engine, allow it to idle, and turn the steering wheel from lock to lock several times.
   - Check that the EPS indicator does not come on.

HEATED STEERING WHEEL CONTROL UNIT REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.
- The heated steering wheel control unit is built into the steering wheel assembly.

1. **Driver's Airbag - Remove**
2. **Heated Steering Wheel Control Unit - Remove**
3. All Remove Parts - Install

1. Install the parts in the reverse order of removal.

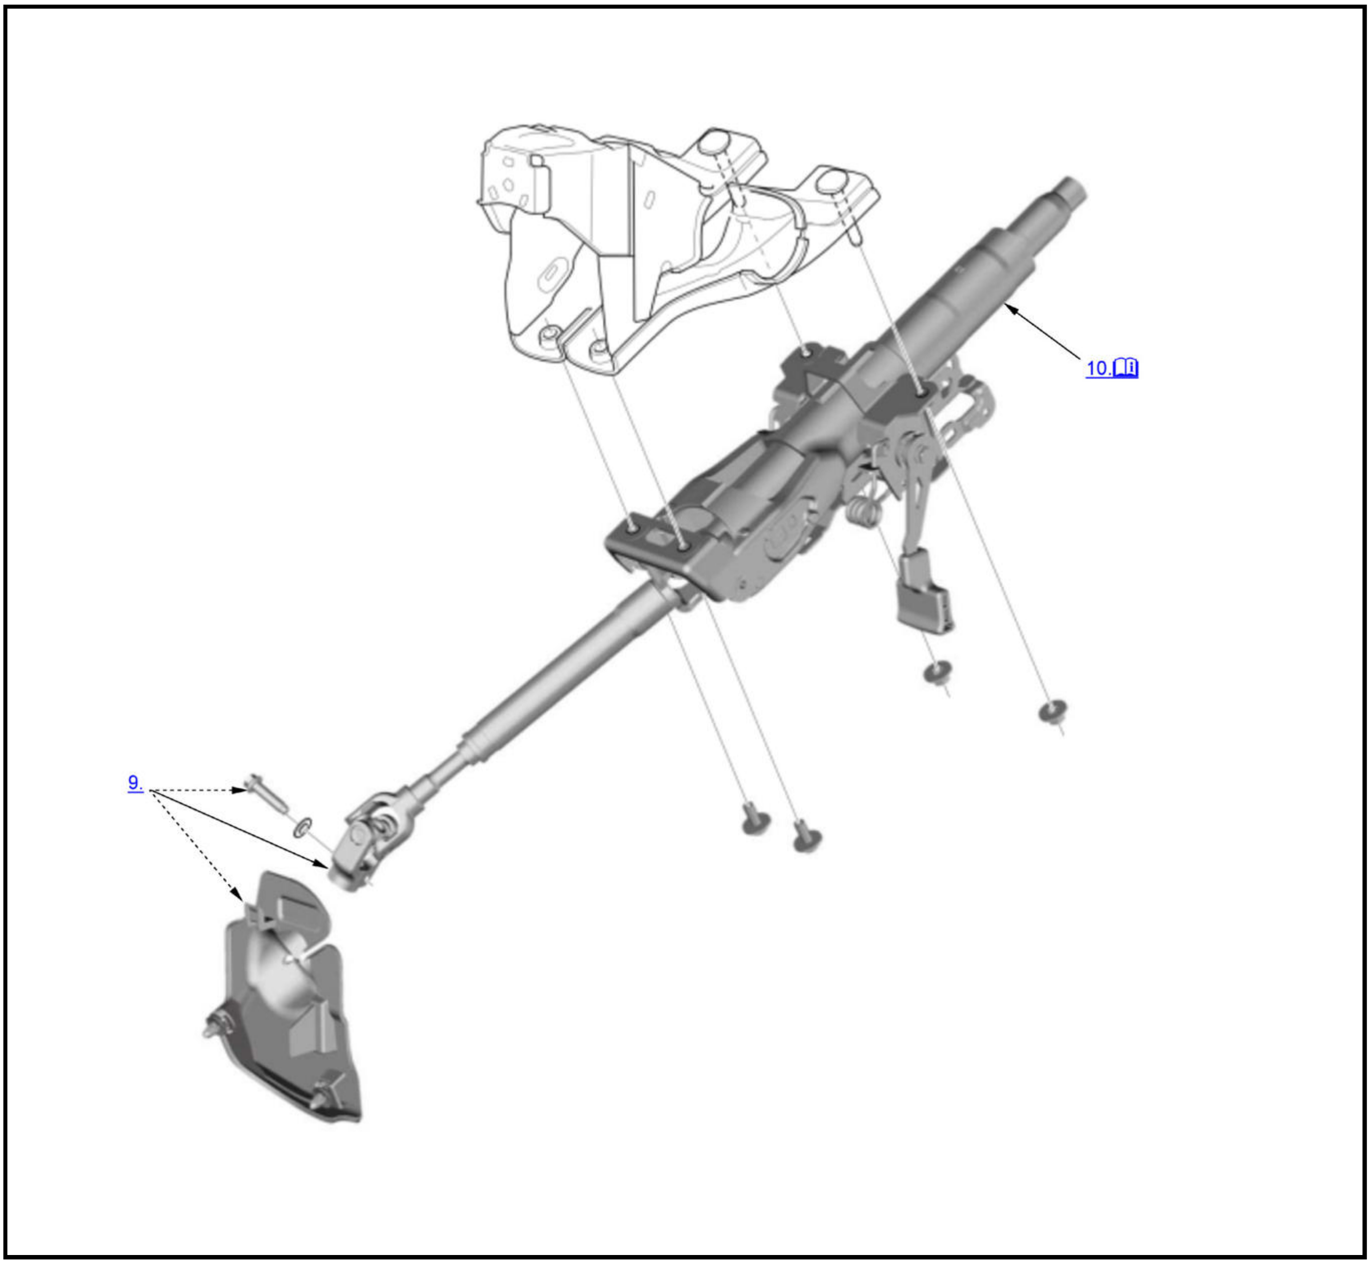
STEERING COLUMN REMOVAL AND INSTALLATION

Removal

SRS components are located in this area. Review the **SRS component locations** , and the **precautions and procedures** before doing repairs or service.

NOTE: Do not release the lock lever until the steering column is installed. If the lock lever is released before installation, adjust the steering column after installation.

1



1. Steering Column Tilt and Telescopic Position - Set

   1. Set the steering column to the highest tilt position, and to the longest telescopic position.

2. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes to start the following work.

3. **Driver's Airbag - Remove**

4. **Steering Wheel - Remove**
5. **Driver's Dashboard Undercover - Remove**
6. **Driver's Dashboard Lower Cover - Remove**
7. **Column Cover - Remove**
8. Combination Switch - Remove

	1. Disconnect the connectors (A). 2. Remove the harness clip (B). 3. Remove the combination switch body assembly (C).

9. **Steering Joint - Disconnect**
10. Steering Column - Remove

    NOTE: Be careful not to damage the brake pedal position switch.

Installation

SRS components are located in this area. Review the **SRS component locations** , and the **precautions and procedures** before doing repairs or service.

NOTE: Do not release the lock lever until the steering column is installed. If the lock lever is released before installation, adjust the steering column after installation.

STEERING LOCK REMOVAL AND INSTALLATION

Removal

WARNING:

Wear goggles or safety glasses to prevent eye injury.

SRS components are located in this area. Review the **SRS component locations** , and the **precautions and procedures** before doing repairs or service.

1. **Immobilizer-Keyless Control Unit - Remove (Without Keyless Access System)**
2. **Steering Column - Remove**
3. Steering Lock - Remove

	1. Center-punch both of the two shear bolts (A). 2. Drill their heads off with a 5 mm (0.20 in) drill bit. Be careful not to damage the steering lock when removing the shear bolts. **NOTE:** The shear bolts have left-hand threads. 3. Remove the steering lock (B).

Installation

SRS components are located in this area. Review the **SRS component locations** , and the **precautions and procedures** before doing repairs or service.

1. Steering Lock - Install

	1. Install the steering lock (A). 2. Loosely tighten new shear bolts (B). **NOTE:** The shear bolts have left-hand threads. 3. Without keyless access system: Insert the ignition key, and check for proper operation of the steering wheel lock and that the ignition key turns freely.

	4. Tighten the shear bolts (A) until the hex heads (B) twist off. **NOTE:** The shear bolts have left-hand threads.

2. Steering Column - Install
3. Immobilizer-Keyless Control Unit (Without Keyless Access System) - Install
4. Keyless Access System - Register (With Keyless Access System)

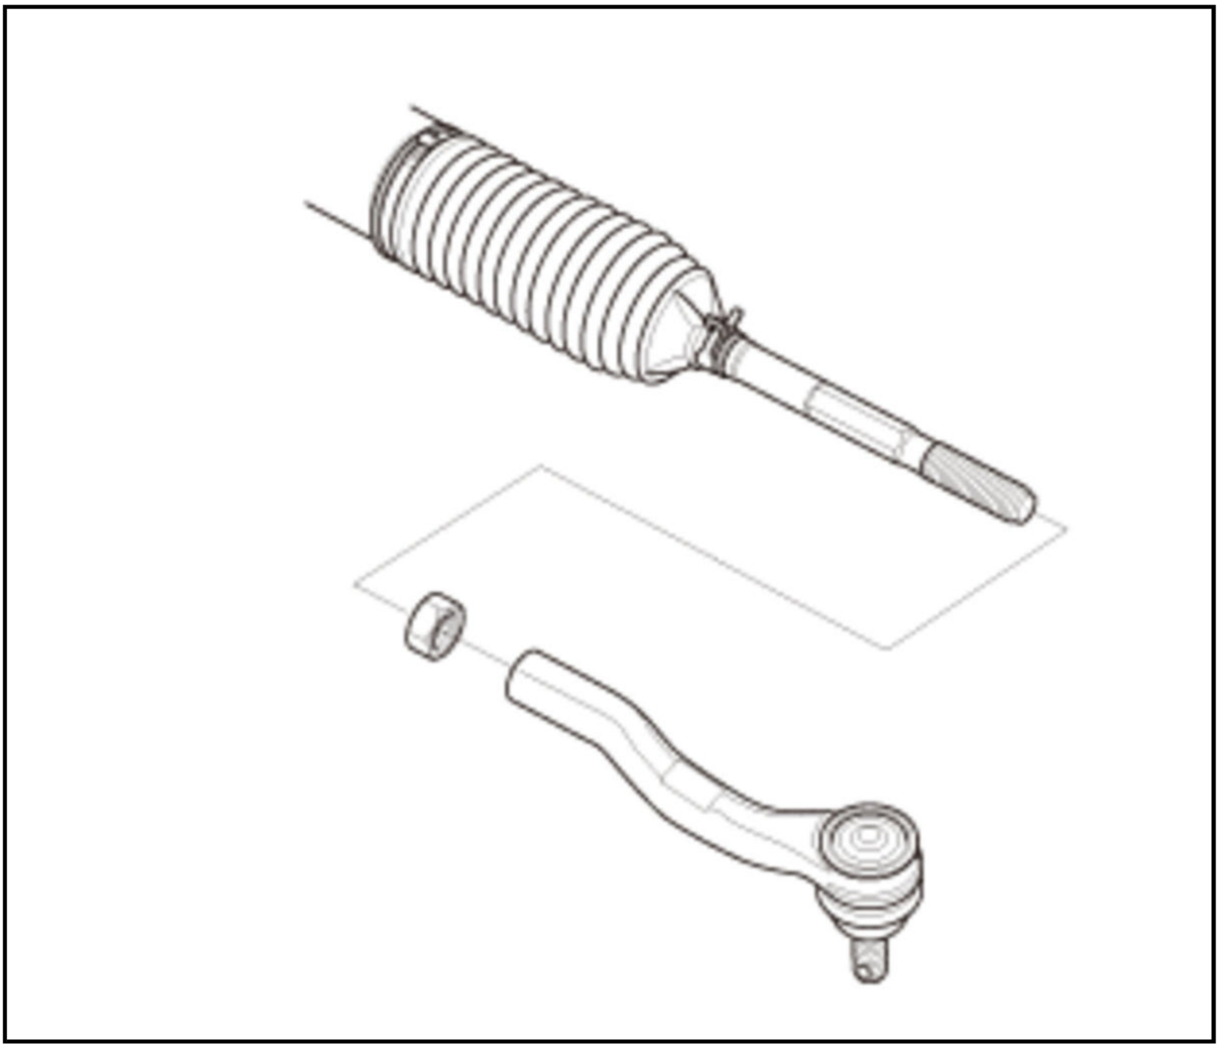
STEERING RACK END REMOVAL AND INSTALLATION

Removal

NOTE:

- Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.
- Refer to Steering Gearbox Disassembly and Reassembly as needed during this procedure.

1. Steering Gearbox - Remove
2. Tie-Rod End - Remove



3. Rack End Boot - Remove

	1. Remove the boot band (A). 2. Remove the tie-rod clip (B). 3. Pull the boot (C) away from the ends of the steering gearbox.

4. Rack End - Remove

	1. Hold the gearbox housing using a C-clamp (A) and wooden blocks (B) to a workbench as shown. **NOTE:** • Be careful not to damage the mounting surface with a C-clamp. • Do not clamp the cylinder part of the gearbox housing with a C-clamp.

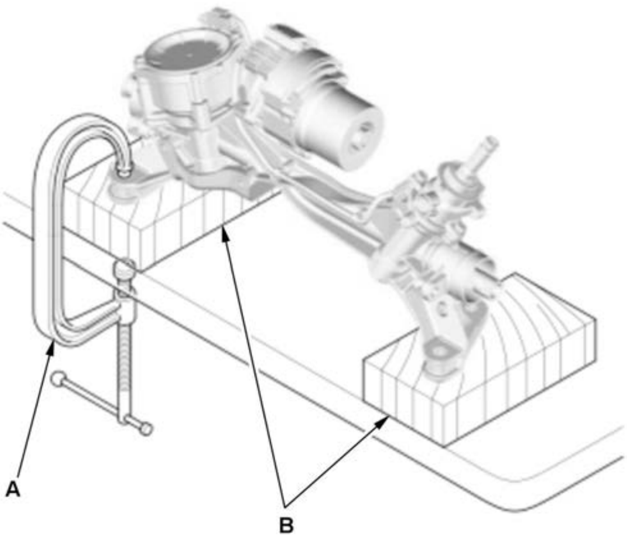
	2. Unscrew the rack end (A) with a wrench. **NOTE:** • Hold the flat surfaces (B) with a wrench when unscrewing both rack ends. • Be careful not to damage the rack surface. 3. Remove the rack end and the rubber stopper (C).

Installation

NOTE:

- **How to read the torque specifications** .
- Do not allow dust, dirt, or other foreign materials to enter the steering gearbox.
- Refer to **Steering Gearbox Disassembly and Reassembly** as needed during this procedure.

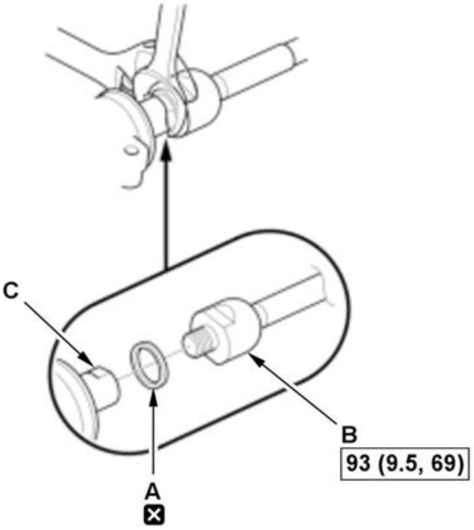
1. Rack End - Install



1. Hold the gearbox housing using a C-clamp (A) and wooden blocks (B) to a workbench as shown.

NOTE:

- Be careful not to damage the mounting surface with a C-clamp.
- Do not clamp the cylinder part of the gearbox housing with a C-clamp.



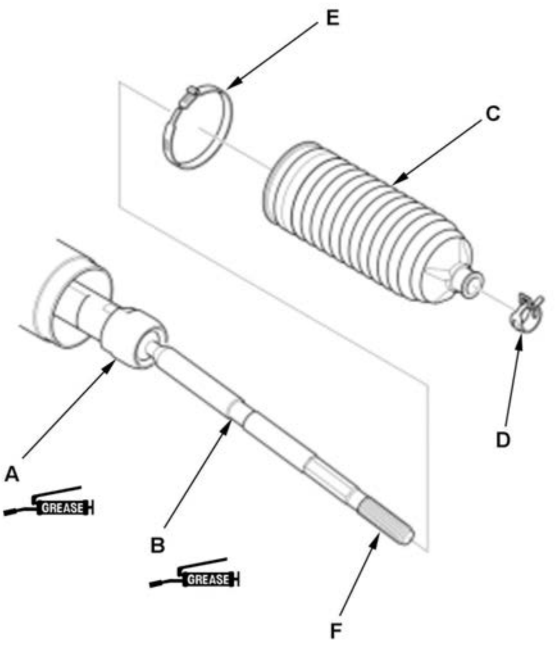
2. Install a new rubber stopper (A).

3. Tighten the rack end (B) with a wrench.

NOTE:

- Be careful not to damage the rack surface.
- Hold the flat surfaces (C) with a wrench when tightening both rack ends.

2. Rack End Boot - Install

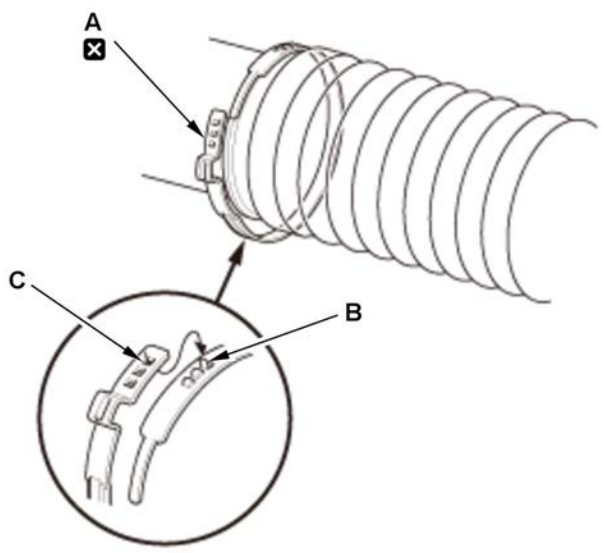


1. Apply multipurpose grease to the rack end joint housing (A) and the boot installation grooves (B).

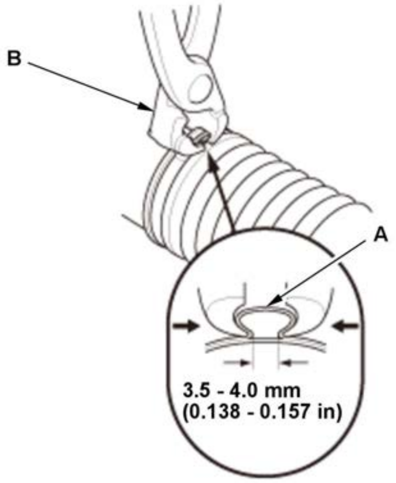
2. Install the boot (C) on the rack end with the tie-rod clip (D) and a new boot band (E).

NOTE:

- Fit the boot end in the installation grooves in the housing properly.
- After installing the boots, wipe the grease off the threaded section (F) of the rack end.



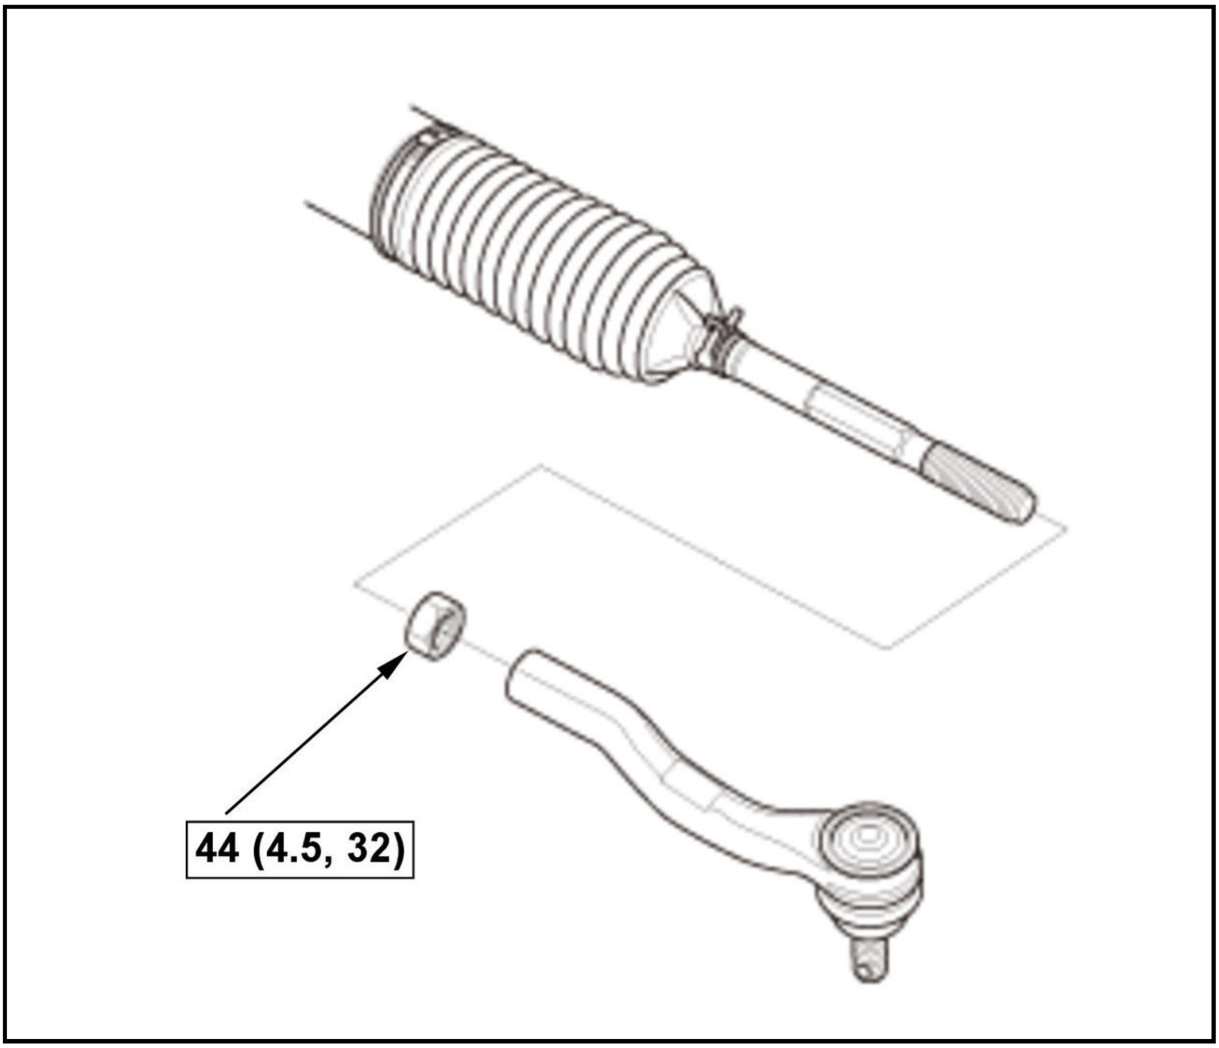
3. Set the boot band (A) by aligning the tabs (B) with the holes (C) on the band.



4. Close the ear portion (A) of the boot band with pincers Oetiker 1098, commercially available or equivalent (B).

5. Slide the rack right and left to be certain that the boots are not deformed or twisted.

3. Tie-Rod End - Install



4. Steering Gearbox - Install

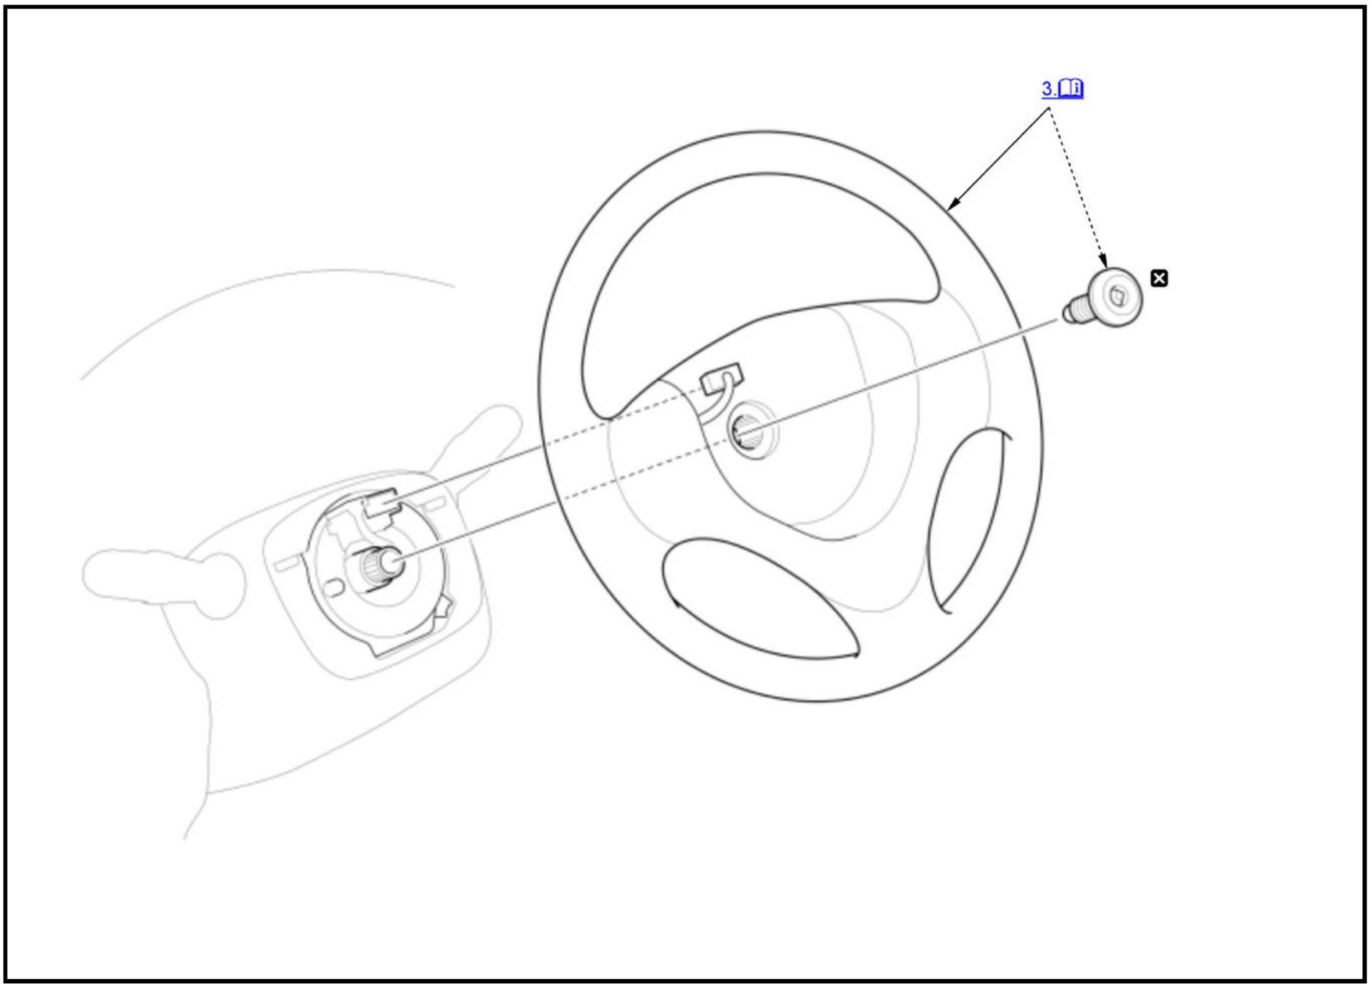
STEERING WHEEL REMOVAL AND INSTALLATION

Removal

SRS components are located in this area. Review the SRS component locations , and the precautions and procedures before doing repairs or service.

NOTE: 🛈 Where icon is shown, further information shown below.

1

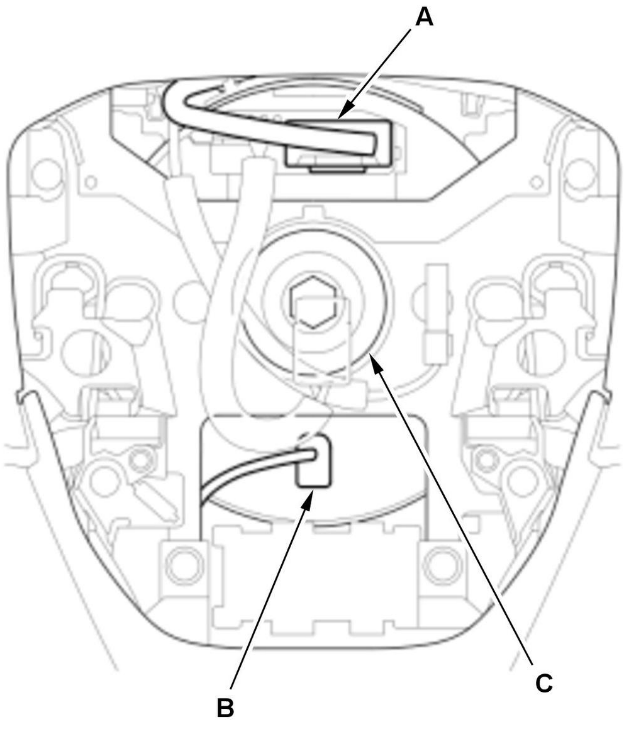


ℹ	Detailed information, notes and precautions
☒	Replace

1. **12 Volt Battery Terminal - Disconnect**

   NOTE: Wait at least 3 minutes to start the following work.

2. **Driver's Airbag - Remove**
3. Steering Wheel - Remove

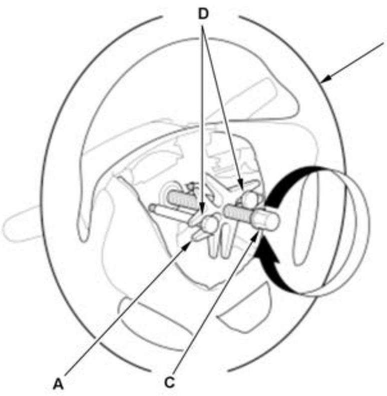


1. Set the front wheels in the straight ahead position.

2. Disconnect the connector (A).

3. With heated steering wheel: Disconnect the connector (B).

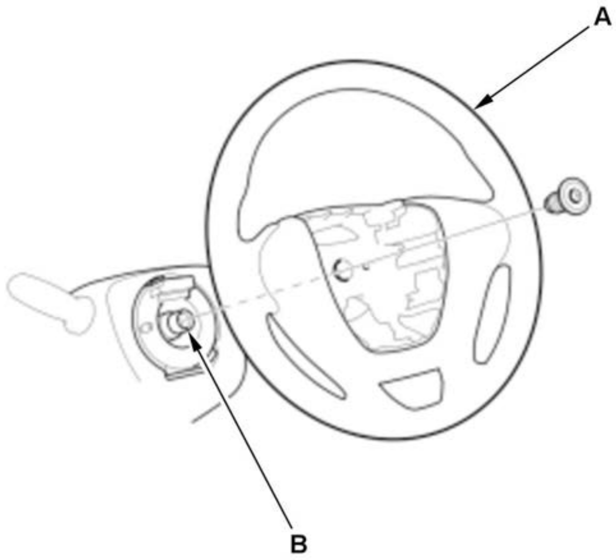
4. Loosen the steering wheel bolt (C) three turns.



5. Install a commercially available steering wheel puller (A) on the steering wheel (B).

6. Free the steering wheel from the steering column shaft by turning the pressure bolt (C) of the puller. Note these items when removing the steering wheel:

- Do not tap on the steering wheel or the steering column shaft when removing the steering wheel.
- If you thread the puller bolts (D) into the wheel hub more than five threads, the bolts will hit the cable reel and damage it. To prevent this, install a pair of jam nuts five threads up on each puller bolt.



7. Remove the steering wheel puller.

8. Remove the steering wheel (A).

NOTE: Remove the old sealant from the threads (B) in the column shaft.

Installation

SRS components are located in this area. Review the **SRS component locations** , and the **precautions and procedures** before doing repairs or service.

NOTE: ℹ Where icon is shown, further information shown below.

1. **Cable Reel - Align**
2. Steering Wheel - Install

	1. Position the steering wheel hub (A) so that it engages the pin (B) of the cable reel. 2. Install the steering wheel (C) onto the steering column shaft. **NOTE:** Do not tap on the steering wheel or the steering column shaft when installing the steering wheel.

	3. Install a new steering wheel bolt (A), and tighten it to the specified torque. **NOTE:** Install the steering wheel bolt and tighten it within 5 minutes using the specified tightening torque. 4. With heated steering wheel: Connect the connector (B). 5. Connect the connector (C). 6. At point (D), make sure that the cable reel subharness (E) is routed above the SRS harness (F).

3. Driver's Airbag - Install
4. 12 Volt Battery Terminal - Connect
5. Steering Wheel Spoke Angle - Check

1. Check the steering wheel spoke angle. 2. With the front wheels straight ahead, make sure the steering wheel is centered and the turning revolutions from center to full lock (left and right) is equal. If not, check the installation of the steering wheel and the engagement of the joint/pinion shaft splines.

6. VSA Sensor Neutral Position - Memorize

TIE-ROD END BALL JOINT DISCONNECTION AND RECONNECTION

Special Tools Required

Image	Description/Tool Number
	Ball Joint Thread Protector, 12 mm 07AAF-SDAA100
	Ball Joint Remover, 28 mm 07MAC-SL00202

Removal and Installation

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Front Wheel - Remove
3. Tie-Rod End Ball Joint - Disconnect

 07MAC-SL00202 07AAF-SDAA100 B 54 (5.5, 40) ☒ A	1. Remove the cotter pin (A). 2. Remove the nut (B). 3. **Disconnect the tie-rod end ball joint from the knuckle using the ball joint thread protector and the ball joint remover** . **NOTE:** • Be careful not to damage the ball joint boot when installing the ball joint remover. • During installation, install the new cotter pin after tightening the nut, and bend its end as shown.

4. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

DESCRIPTION & OPERATION

EPS SYSTEM DESCRIPTION

Overview

This vehicle is equipped with electrical power steering (EPS). The driver's steering force is assisted by an electric motor at the steering gearbox, instead of an engine-driven oil pump to generate oil pressure, so the EPS system improves engine efficiency.

The EPS control unit monitors and controls the EPS motor's assisting force to match driving conditions.

- Low vehicle speeds: High power assist (for easy handling)
- High speed driving: Low power assist (for stable driving)
- Low speed to high speed driving: Change smoothly from high assist to low assist

EPS Control

The EPS control unit calculates the assistance torque based on the steering torque signal and the vehicle speed signal, and activates the motor to assist the steering force. To protect the system, the EPS control unit reduces motor current when repeated extreme steering force, such as turning the steering wheel continuously with the vehicle stopped or holding the steering at the lock position (full right or left). Also, the EPS control unit assists the steering force when the EPS control unit receives the steering assist request from the driving support system.

Steering Wheel Return Control

The steering wheel return control controls the return speed of the steering wheel based upon the steering angle and the vehicle speed. This control is responsible for the returning the steering wheel to the neutral position.

EPS Motor Control Circuit

The EPS motor control circuit is composed of a system control CPU, the FET (field-effect transistor) bridge, the FET drive circuit, the power relay, the fail-safe relays, the relay drive circuit, the electric current detection circuit, and the EPS motor. With the signal from the input sensor, the CPU calculates and duty cycle outputs the appropriate three-phase current for the FET drive circuit. This operation is duty controlled.

FAIL-SAFE RELAY
FAIL-SAFE RELAY
EPS MOTOR
Motor current
ELECTRIC CURRENT DETECTION CIRCUIT

Steering Angle Detection

The EPS control unit calculates a steering angle from the motor angle sensor value.

The EPS control unit detects the motor rotational angle (A) with the motor angle sensor, and calculates the assist pinion shaft angle (B) by multiplying the motor rotational angle by the reduction ratio of the worm gear. The assist pinion shaft angle and the initial steering angle are converted by using the VGR (Variable Gear Ratio) conversion map, and the manual pinion shaft angle (C) is calculated. The EPS control unit also corrects the torsional angle of the torsion bar based on the torque sensor value for the manual pinion shaft angle, and calculates the steering wheel angle (D).

Steering Angle Neutral Position Learning

The EPS control unit learns the steering angle neutral position to detect an initial steering angle when turning the vehicle to the ON mode.

The steering angle neutral position learning is classified into initial learning and the regular learning.

Initial Learning

The initial learning is performed automatically at the time of the first driving after steering angle neutral position is cleared.

When the EPS control unit judges that the vehicle is going straight based on each sensor signals, the steering angle neutral position is learned.

For more details of the learning procedure, refer to **Steering Angle Neutral Position Learning**.

The steering angle neutral position is cleared whenever you do any of these actions:

- Replacing the EPS motor/control unit.
- Disconnecting the 12 volt battery cable from the 12 volt battery.
- Disconnecting the power from the EPS control unit.
- Decreasing the power supply voltage for the EPS control unit.

Regular Learning

The regular learning revises a gap of the neutral position that occurs due to normal wear and tear of the vehicle and a change of the wheel alignment during driving.

Learning using the HDS

The VSA sensor neutral position memorization for VSA system is performed using the HDS, the steering angle neutral position is cleared and overwritten.

Driver Attention Monitor Function

Overview

To help avoid a crash or collision due to drowsiness or fatigue, the driver attention monitor function can detect if the driver is tired or inattentive and prompt the driver to take a break.

System Description

The driver attention monitor function can detect driver drowsiness by analyzing the driving behavior based on the steering angle and the yaw rate when the vehicle speed is above a set point. If the system detects driver drowsiness or inattention, the driver attention monitor function warns the driver to take a break by showing a message on the multi-information display (MID) and/or vibrating the steering wheel.

Driver Attention
Driver Attention
Driver Attention
Driver Attention
As one of the display contents, show driver attention as level meter

NOTE: This illustration shows a typical sample of attention display.

Operation Conditions

The driver attention monitor function operates under these conditions:

- Vehicle speed is 25 - 112 mph (40 - 180 km/h).
- The EPS system, the SRS, and/or the gear system does not have a malfunction.

Function Prohibition

The driver attention monitor function is not activated under these conditions:

- Driving duration is less than 30 minutes.
- Driving on rough roads.
- Driving in a strong side wind.
- Active driving situation (changing the traffic lane or the vehicle speed).

Attention Level Reset

The driver attention monitor function resets the attention level displayed on the multi-information display (MID) if detects these conditions.

- The vehicle is turned to the OFF (LOCK) mode.
- The driver releases the seat belt and opens the driver's door with the vehicle in ON mode.

Motion Adaptive-EPS Control

Overview

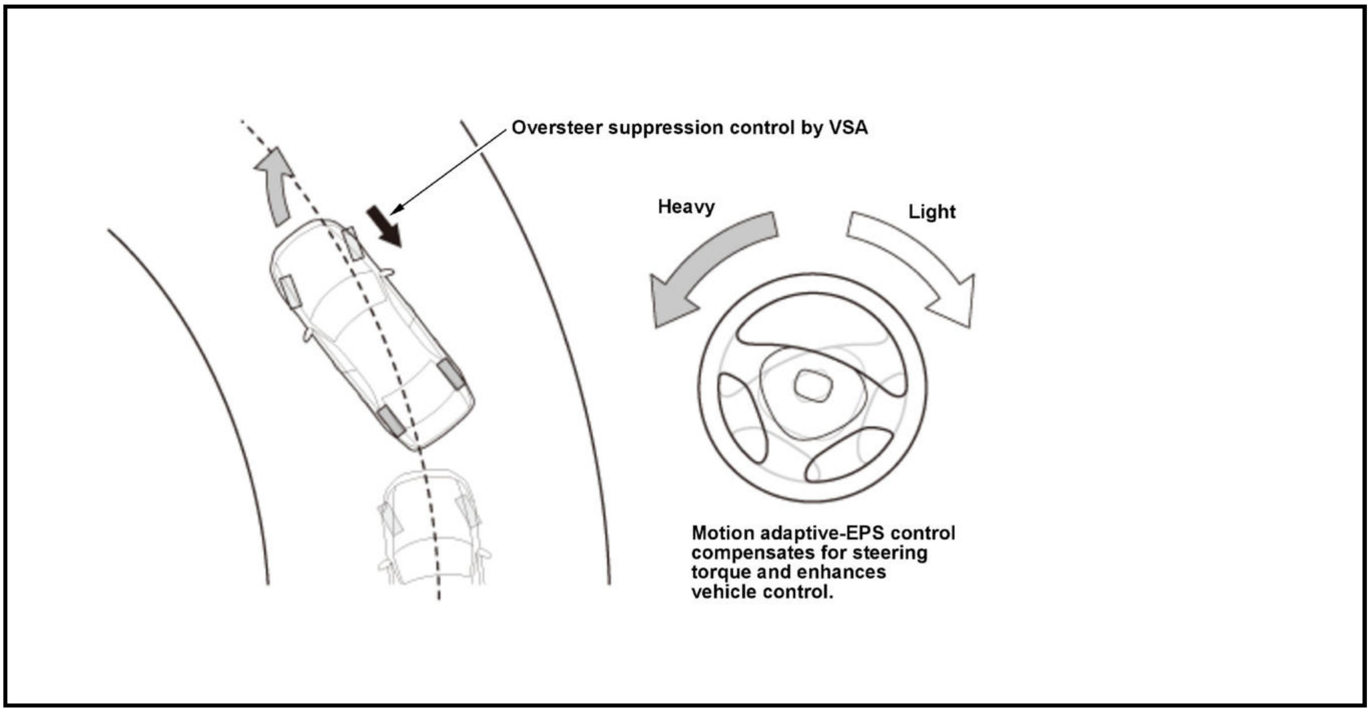
The motion adaptive-EPS control performs the steering torque correction control coordinated with VSA system for stabilizing the vehicle when the steering is unstable.

The EPS system determines the state of the vehicle based on the data calculated by the VSA modulator-control unit, and the data from the yaw rate sensor and the acceleration sensor. When the system determines that the vehicle behavior is abnormal, the EPS control unit calculates the correction current based on the vehicle behavior and corrects the steering torque.

The motion adaptive-EPS control is stopped in the event of failure in the VSA system.

Mitigates Oversteer Control

When oversteer occurs, it compensates for steering torque to steer in the countersteer direction, and enhances vehicle control.



Oversteer suppression control by VSA
Heavy
Light
Motion adaptive-EPS control compensates for steering torque and enhances vehicle control.

Mitigates Understeer Control

When understeer occurs, it compensates for steering torque to control the oversteer, then holds the tire grip to enhance vehicle control.

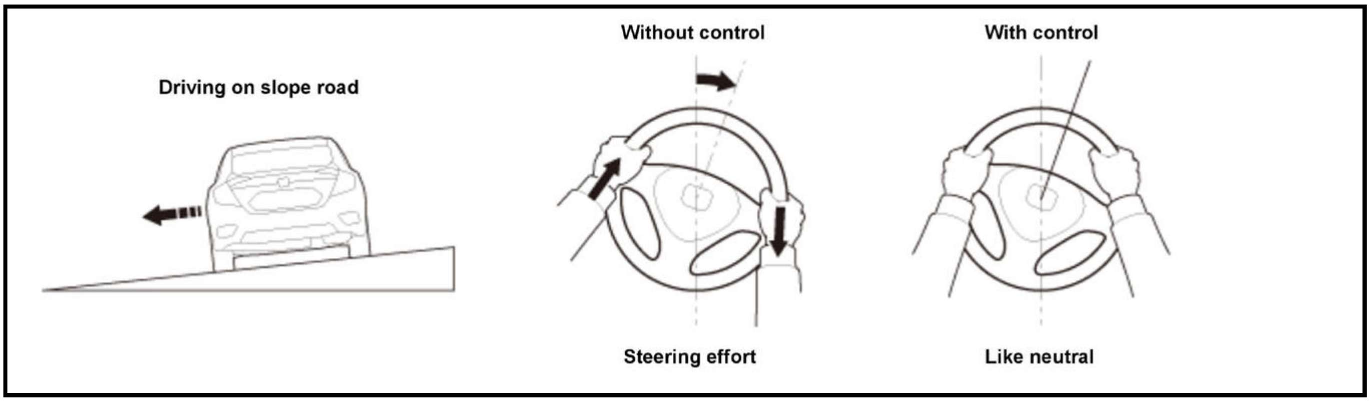
Wet road surface
Dry road surface
Light
Heavy
Motion adaptive-EPS control compensates steering torque and enhances vehicle control.

Straight Driving Assist

Steering effort is detected and reduced by applying EPS motor assist when driving on a sloped road. This control will return to normal when no longer driving on a sloped road. This function only operates when the cruise control is on and the speed is set.

Assist image



Driving on slope road
Without control
With control

Like neutral

Fail-Safe

The EPS control unit diagnoses and monitors the motor system, the torque sensor system, the power supply system, the communication system, and the CPU. When a failure is detected, the EPS indicator comes on and the unit takes one of the following fail-safe actions:

- Stop assist
- Limit assist
- Start alternative assist (limited control)

EPS SYSTEM DESCRIPTION - COMPONENTS

Components

The EPS system mainly consists of the following parts:

- EPS control unit
- EPS motor
- Torque sensor
- Steering gearbox
- System indicator

For functions of indicator, refer to How to Troubleshoot the EPS System .

Steering Gearbox

The EPS system is rack-assist type, and the steering gearbox is a dual pinion type, which includes two pinions that are engaged with steering rack.

The assist pinion shaft transmits the EPS motor power to the steering rack. The EPS motor power is transmitted to the worm wheel by the worm gear. The assist pinion shaft moves the steering rack with the EPS motor power that is increased and transmitted by the worm wheel.

The manual pinion shaft transmits the steering torque from the steering wheel to the steering rack. The steering torque is transmitted from the steering column shaft to the input shaft, and the manual pinion shaft connecting with the input shaft by the torsion bar moves the steering rack.

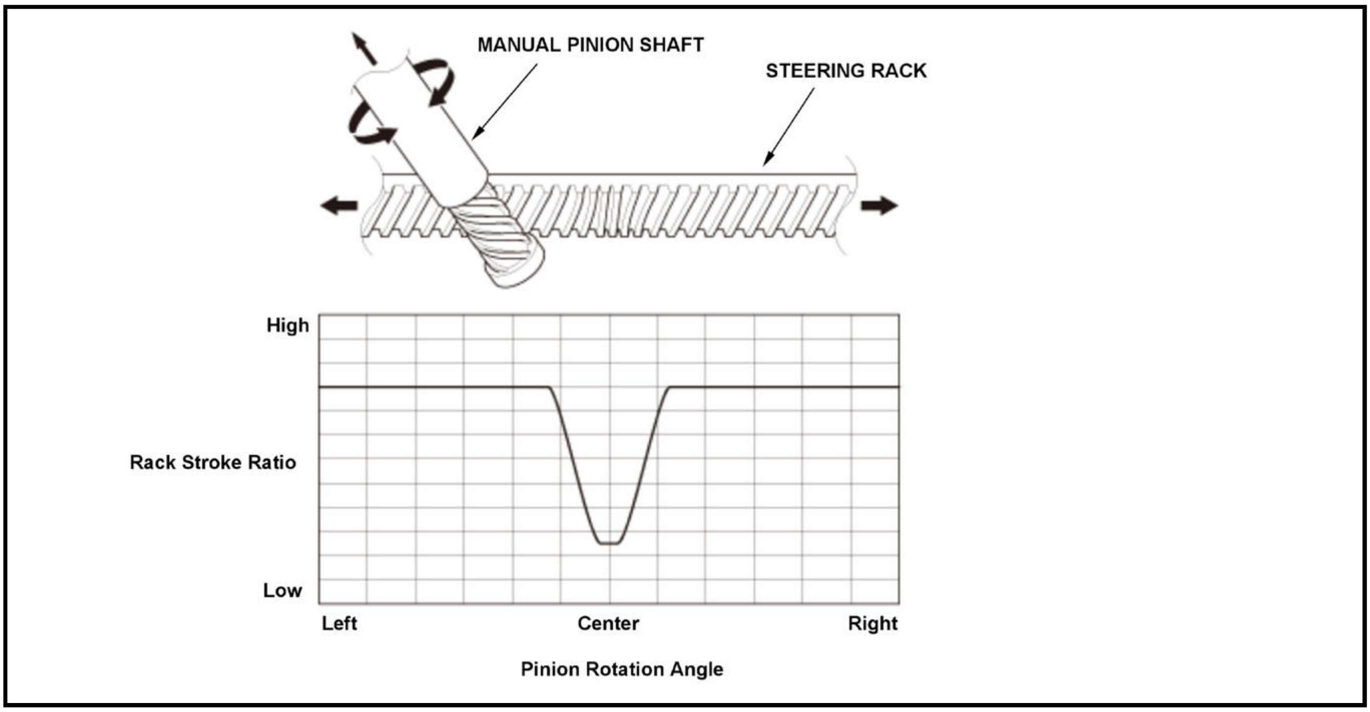
TORQUE SENSOR
WORM WHEEL
ASSIST PINION SHAFT
STEERING RACK
WORM GEAR
TORSION BAR
INPUT SHAFT
MANUAL PINION SHAFT
STEERING RACK

VGR (Variable Gear Ratio)

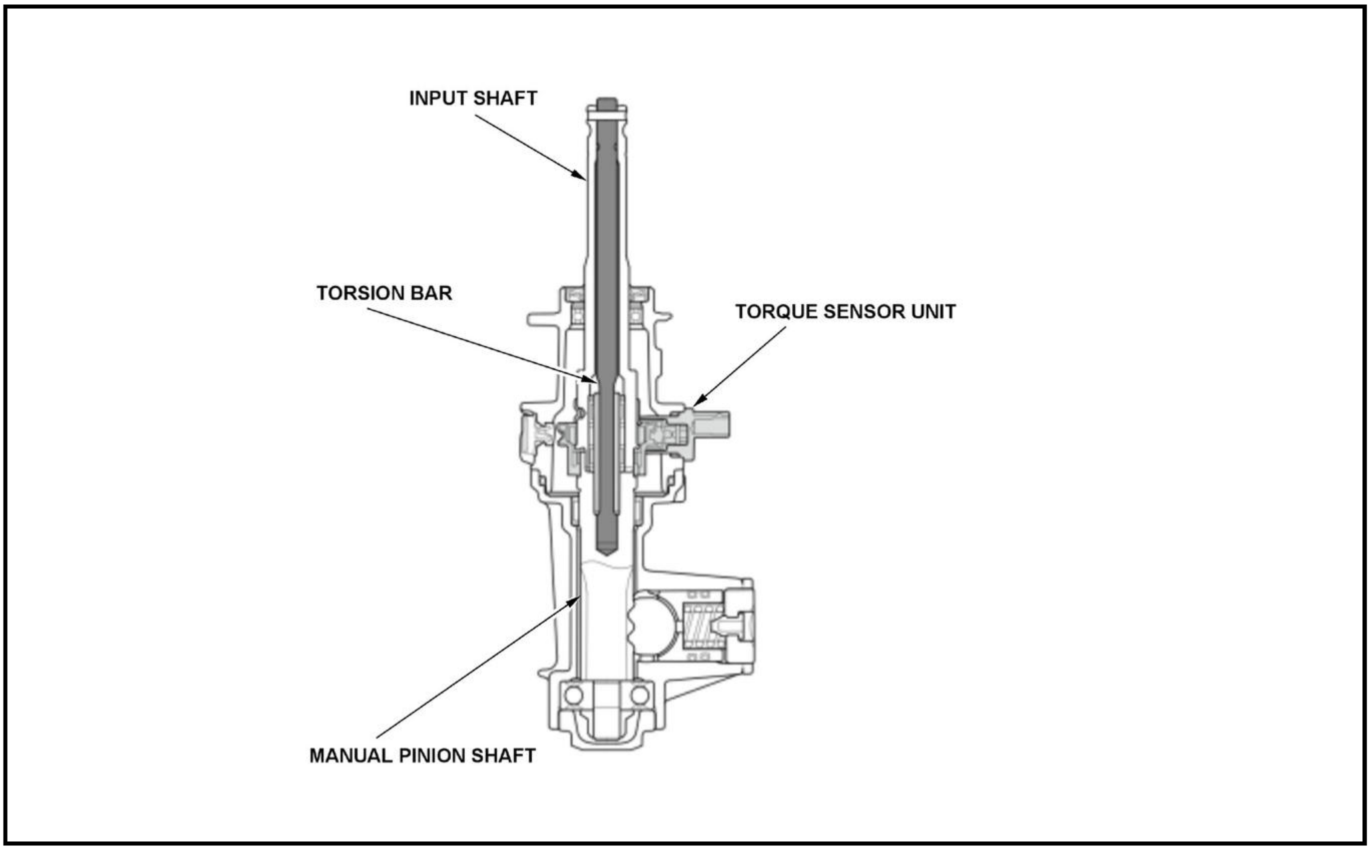
The VGR is applied to the manual pinion shaft side of the steering rack. The normal gear ratio is applied to the near the straight ahead position of the steering rack for smooth start of steering operation. The quick gear ratio is applied for a large steering angle, which reduces lock-to-lock steering.



Torque Sensor

Overview

The torque sensor is built into the steering gearbox, using a Hall IC sensor to detect steering wheel torque forces. The torque sensor consists of the input shaft, the torsion bar, the manual pinion shaft, and the torque sensor unit.



EPS SYSTEM DESCRIPTION - SYSTEM DIAGRAM

- The steering force of the steering wheel is detected by the torque sensor, and the signal is sent to the EPS control unit. The EPS control unit calculates the assistance torque based on the steering torque signal and vehicle speed signal, and activates the motor to assists the steering force.

- To activate the three-phase brushless motor properly, the motor angle sensor detects the motor angle, and sends the signal to the EPS control unit.
- The EPS control unit sends the motor load status to the PCM.
- The EPS control unit receives the vehicle behavior information from the VSA modulator-control unit.
- The EPS control unit assists the steering force when the EPS control unit receives the steering assist request from the millimeter wave radar.
- When the EPS system detects a problem, the EPS control unit stores the DTC, and sends the signal to the gauge control module to cause the EPS indicator to come on.

For locations of each component on vehicle, refer to Component Location Index:

- **EPS control unit, EPS motor, Torque sensor, EPS motor angle sensor**

CHECK

POWER STEERING ASSIST CHECK

Check

1. Power Steering Assist - Check

	**NOTE:** This test should be done with original equipment tires and wheels at the correct tire pressure. 1. Turn the vehicle to the READY TO DRIVE mode. 2. Park the vehicle on a clean, dry floor and attach a commercially available spring scale (A) to the steering wheel. With the vehicle in READY TO DRIVE mode, pull the scale as shown and note the reading as soon as the tires begin to turn. 3. If the scale reads less than the specification, the power assist is OK. If it reads more, check these items: • Steering linkage • EPS system • Wheel alignment

Initial turning load:	**34 N (3.5 kgf, 7.6 lbf) max.**

STEERING WHEEL ROTATIONAL PLAY CHECK

Check

1. Steering Wheel Rotational Play - Check

	1. Set the front wheels in the straight ahead position. 2. Measure how far you can turn the steering wheel left and right without moving the front wheels. • If the play is within the limit, the steering gearbox and the steering linkage are OK. • If the play exceeds the limit, inspect the steering linkage and the steering gearbox.

Rotational play (A):	**0-10 mm (0-0.39 in)**

INSPECTION

STEERING COLUMN INSPECTION

Inspection

Check of Tilting Force

1. Check of Tilting Force

	1. Set the steering wheel in the straight ahead driving position, and loosen the lock lever fully. 2. Attach a commercially available spring scale (A) to the highest point of the steering wheel, and tilt the steering column to the lowest position. 3. Pull the spring scale straight up, and read the force required to move the steering column. 4. Attach the spring scale to the lowest point of the steering wheel. 5. Pull the spring scale straight down, and read the force required to move the steering column. 6. If the measurement is higher than the specified, replace the steering column as an assembly.

Tilting force (upward/downward):	
Standard:	**69 N (7.0 kgf, 15.5 lbf) max.**

Check of Telescoping Force

2. Check of Telescoping Force

	1. Set the steering wheel in the straight ahead driving position, and loosen the lock lever fully. 2. Attach a commercially available spring scale (A) to the center point of the steering wheel as shown. 3. Pull the spring scale, and read the force required to move the steering column during telescoping out. 4. If the measurement is higher than specified, replace the steering column as an assembly.

Telescoping force:	
Standard:	**106 N (10.8 kgf, 23.8 lbf) max.**

Check of Lock Lever Force

3. Check of Lock Lever Force

	1. Move the lock lever (A) from the loosened position to the locked position three to five times, then release the lock lever. Adjust the steering column to the center tilt position and also to the full telescopic out position, and hold the steering wheel. 2. Using a commercially available push-pull gauge, push up the lock lever 10 mm (0.39 in) in from its end, and measure the force required to move the lock lever. 3. If the measurement is higher than specified, replace the steering column as an assembly.

Lock lever force:	
Standard:	**82 N (8.4 kgf, 18.4 lbf) max.**

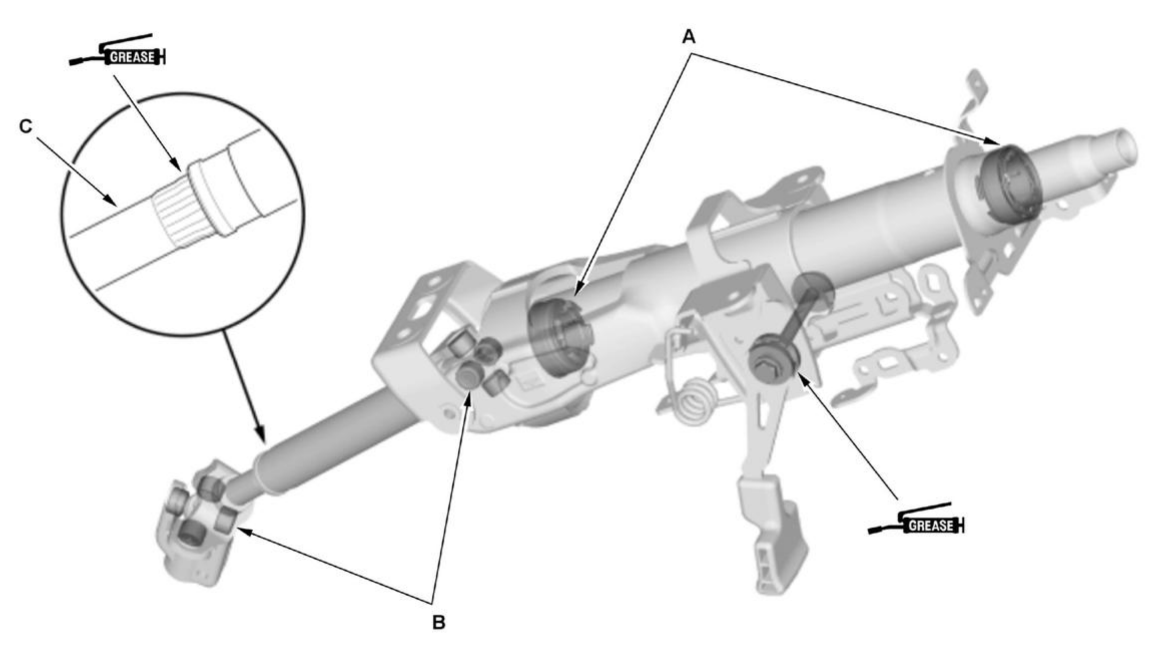
Steering Column Inspect

4. Steering Column - Inspect

   1. Check these items:

      - Check the column shaft bearings (A) for play and proper movement. If bearing is noisy or has excessive play, replace the steering column as an assembly.
      - Check the steering joint bearings (B) for play and proper movement. If any bearing is noisy or has excessive play, replace the steering column as an assembly.
      - Check the lower slide shaft (C) for smooth movement in and out.
      - Check the tilt mechanism and telescopic mechanism for movement and damage.
      - Apply multipurpose grease to the steering column.

      NOTE: Do not use silicone grease.



STEERING LINKAGE AND GEARBOX INSPECTION

Inspection

1. Steering Linkage and Gearbox - Inspect
   - -

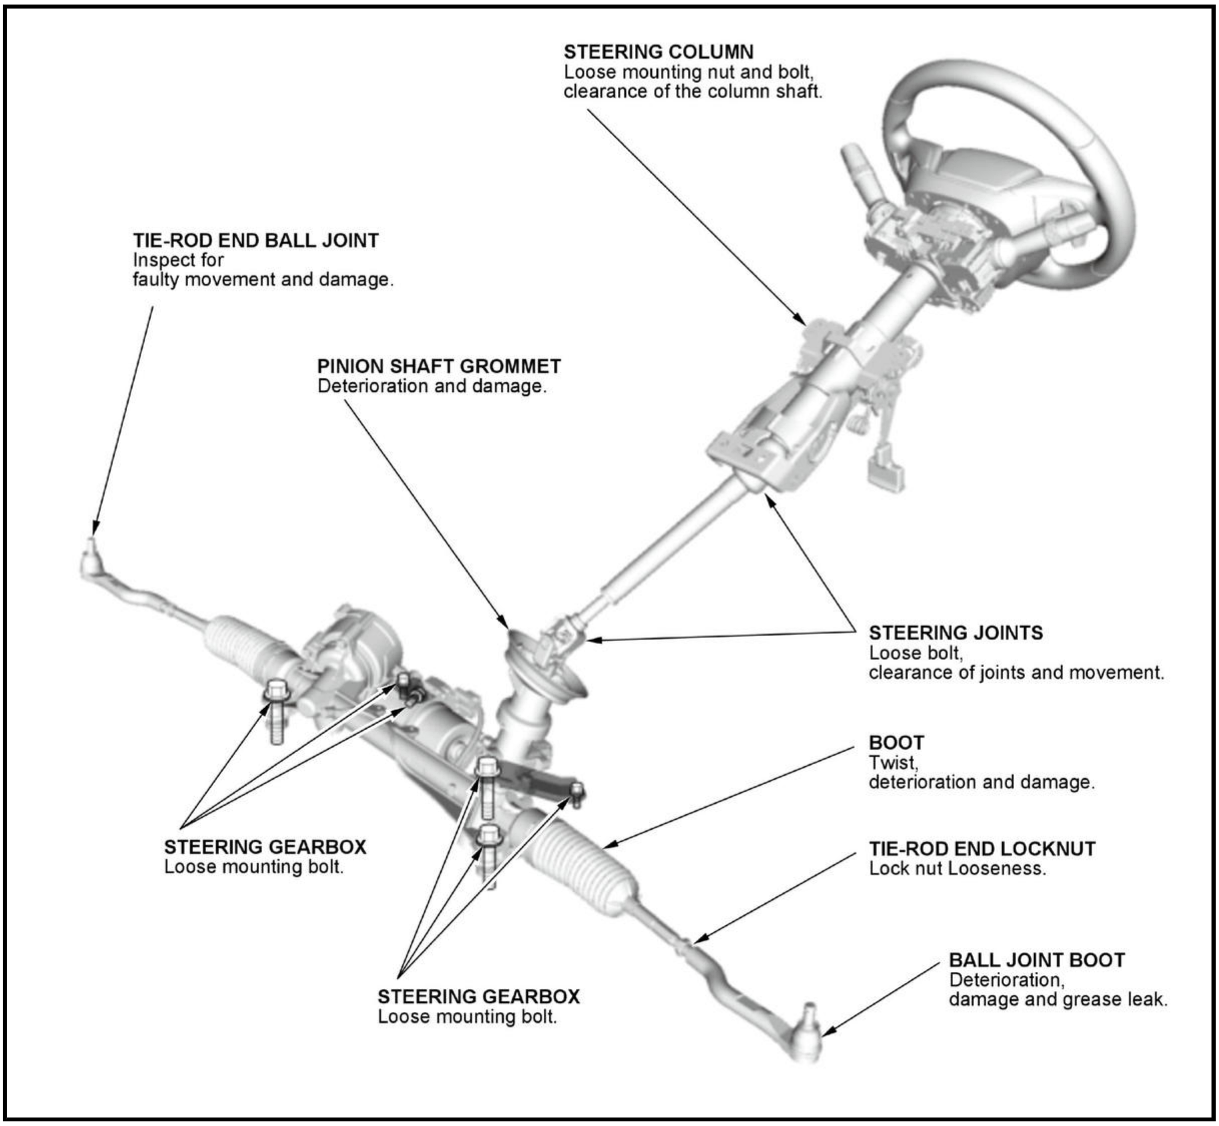
Inspect for noise and clearance for the longitudinal and lateral directions of the steering wheel.

- -

  Inspect for noise, clearance and unevenness of the handle steering while rotating the steering wheel.

- -

  Inspect for each point below.



STEERING COLUMN
Loose mounting nut and bolt,
clearance of the column shaft.
TIE-ROD END BALL JOINT
Inspect for
faulty movement and damage.
PINION SHAFT GROMMET
Deterioration and damage.
STEERING JOINTS
Loose bolt,
clearance of joints and movement.
BOOT
Twist,
deterioration and damage.
STEERING GEARBOX
Loose mounting bolt.
TIE-ROD END LOCKNUT
Lock nut Looseness.
BALL JOINT BOOT
Deterioration,
damage and grease leak.
STEERING GEARBOX
Loose mounting bolt.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

EPS INDICATOR DOES NOT COME ON

REPLACEMENT

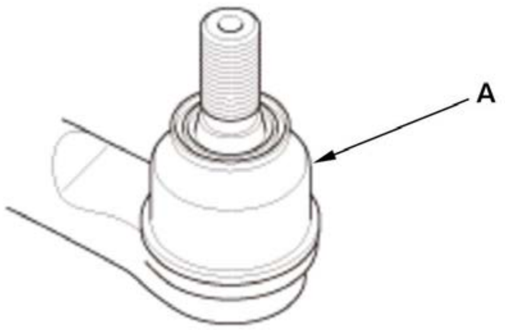
STEERING TIE-ROD END BALL JOINT BOOT REPLACEMENT

Special Tools Required

Image	Description/Tool Number
	Driver, 32.5 mm 070AD-SAAA100

Replacement

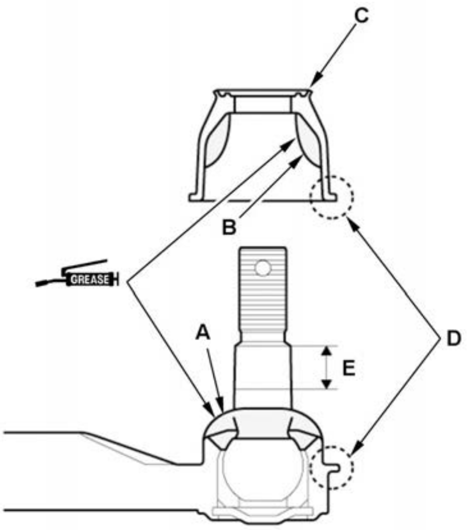
1. Tie-Rod End Ball Joint Boot - Remove



1. Remove the ball joint boot (A) from the tie-rod end.

2. Wipe the old grease off the ball pin.

2. Tie-Rod End Ball Joint Boot - Install

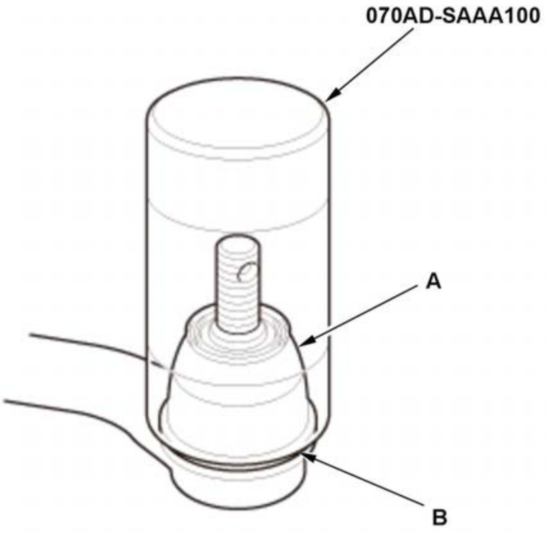


1. Pack the lower area of the ball pin (A) with fresh multipurpose grease.

2. Pack the interior of a new ball joint boot (B) and the lip (C) with fresh multipurpose grease.

Note these items when installing new grease:

- Use the grease that comes with the tie-rod end boot set, or multipurpose grease.
- Keep grease off the boot mounting area (D) and the tapered section (E) of the ball pin.
- Do not allow dust, dirt, or other foreign materials to enter the boot.



3. Install the ball joint boot (A) using the driver.

4. The ball joint boot must not have a gap at the ball joint boot installation sections (B).

5. After installing the ball joint boot, check the ball pin tapered section for grease contamination.

6. Wipe the ball pin tapered section if necessary.

REWRITE

EPS CONTROL UNIT UPDATE

Procedure

1. EPS Control Unit - Update

   NOTE: When updating control units, use the most current version of the HDS software and interface device. Check any official service information website for more information about updating control units.

LEARNING/RESET/CLEAR

STEERING ANGLE NEUTRAL POSITION LEARNING

Procedure

NOTE:

- If the steering angle neutral position is cleared, do the steering angle neutral position learning procedure.
- The steering angle neutral position is cleared whenever you do any of these actions:
-
    - EPS motor/control unit replacement, removal, or installation.
    - 12 volt battery terminal is disconnected from the 12 volt battery.
    - The power is disconnected from the EPS control unit.
    - The power supply voltage for the EPS control unit is decreased.
- If the steering angle neutral position is cleared, the VSA indicator, VSA OFF indicator, low tire pressure/TPMS indicator, and CMBS indicator will come on.
- There are two learning methods.
- The learning cannot be done when the EPS indicator is on.

- If the learning does not complete, **check the EPS system** .

1. Steering Angle Neutral Position - Learn

   Learning method without the HDS

   1. Drive the vehicle in a straight line at speeds of 10 mph (15 km/h) or more until the indicators go off.

   NOTE:

   - The learning will complete after driving in a straight line for about 10 seconds.
   - Difficult situations for learning are below:
   -
     - Driving on a non straight line.
     - Driving on a rough road.
     - Driving under 10 mph (15 km/h) or less.
     - Driving on a sloped road.
     - Rapid acceleration and deceleration.

   2. Check that the indicators go off.

   Learning method with the HDS

   1. **Do the VSA sensor neutral position memorization** .

   NOTE: When the VSA sensor neutral position memorization is performed, the current position is cleared and overwritten.

DESCRIPTION AND OPERATION

EPS SYSTEM

System Description

System Outline

This vehicle is equipped with electrical power steering (EPS). The driver's steering force is assisted by an electric motor at the steering gearbox, instead of an engine-driven oil pump to generate oil pressure, so the EPS system improves engine efficiency.

The EPS control unit monitors and controls the EPS motor's assisting force to match driving conditions.

- Low vehicle speeds: High power assist (for easy handling)
- High speed driving: Low power assist (for stable driving)
- Low speed to high speed driving: Change smoothly from high assist to low assist

Components

The EPS system is rack-assist type, and the steering gearbox is a dual pinion type, which includes two pinions that are engaged with steering rack.

The EPS system mainly consists of the following parts:

- The EPS control unit: Control the EPS motor
- The EPS motor: Generate the assisting torque
- The torque sensor: Measure the steering force applied to the steering wheel
- The steering gearbox: Transmit the steering force
- System indicator: Indicates system status

The EPS control unit, the EPS motor, and the torque sensor are combined into the steering gearbox.

For locations of each component on the vehicle, **refer to Components**, and for functions of indicator, **refer to How to Troubleshoot the EPS System** .

EPS Control

Base Current

The base current is a basic current value to drive the motor and is calculated using the steering torque and the vehicle speed.

Inertia Compensation

The torque of the EPS motor tends to be lower as the vehicle begins to move and higher as it decreases in speed due to the inertia of the rotating body. To reduce the impact of the inertia, the inertia compensation increases the base current in acceleration and decreases in deceleration. The current of the inertia compensation is calculated by using the steering torque, vehicle speed, and motor speed.

Damping Compensation

The steering wheel receives vibration from the road surface during braking or cornering. The damping compensation reduces the vibration of the steering wheel by applying a damping effect through the motor current control. The damping compensation current is calculated by the steering torque, the vehicle speed, and the motor speed.

Target Current

The target current is a value necessary to perform feedback control of the motor and is determined by applying inertia and damping compensation to the base current and adding steering torque direction.

Current Feedback Control

Current feedback control monitors the motor current through sensors and reduces any deviation of motor current compared to the target current, thus accurately running the motor.

Unloader Control

The unloader control reduces motor current at the lock to lock (full right or left) of the steering wheel to protect the system. This value is determined by using the target current and the motor speed.

Steering Speed Feedback Control

The steering speed feedback control improves stability in the high speed range by controlling the hysteresis of the steering torque. The steering speed feedback control current is calculated by using the deviation between the target and actual steering angle speed to adjust to the base current.

EPS Motor Control Circuit

The EPS motor control circuit is composed of a system control CPU, the FET (field-effect transistor) bridge drive circuit, the power relays, the fail-safe relays, the electric current detection circuit, and the EPS motor. With the signal from the input sensor, the CPU calculates and duty cycle outputs the appropriate three-phase current for the FET drive circuit. This operation is duty controlled.

Fail-Safe Relay
Fail-Safe Relay
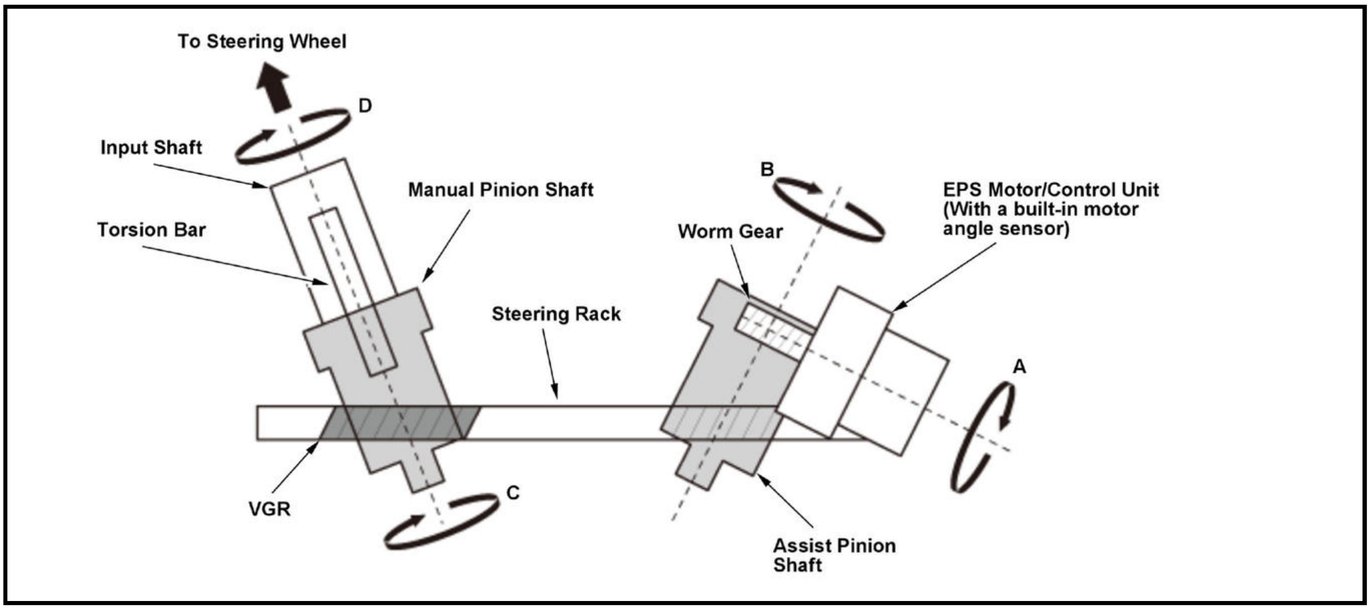
EPS Motor
Motor current
Electric Current Detection Circuit

Motor Output Limit Control

The motor output limit control reduces the motor current in the event of repeated turning of the steering wheel when the vehicle is not in motion. This control gradually reduces power assist force. The power assist force resumes gradually from the steering torque of 0 N.m (0 kgf.m, 0 lbf.ft) or from having the ignition switch in the off position and it may take up to 20 minutes to go back to normal assist force conditions. The activation of the motor limit control is based on the motor and the internal temperature of the control system.

Steering Angle Detection

The EPS control unit calculates the steering angle from the motor angle sensor value.The EPS control unit detects the motor rotational angle (A) with the motor angle sensor, and calculates the assist pinion shaft angle (B) by multiplying the motor rotational angle by the reduction ratio of the worm gear. The assist pinion shaft angle and the initial steering angle are converted by using the VGR (Variable Gear Ratio) conversion map, and the manual pinion shaft angle (C) is calculated. The EPS control unit also corrects the torsional angle of the torsion bar based on the torque sensor value for the manual pinion shaft angle, and calculates the steering wheel angle (D).



Steering Angle Neutral Position Learning

The EPS control unit learns the steering angle neutral position to detect an initial steering angle when turning the vehicle to the ON mode.The steering angle neutral position learning is classified into initial learning and the regular learning.

Initial Learning

The initial learning is performed automatically at the time of the first driving after steering angle neutral position is cleared.When the EPS control unit judges that the vehicle is going straight based on each sensor signals, the steering angle neutral position is learned. For more details of the learning procedure, refer to **Steering Angle Neutral Position Learning**.

The steering angle neutral position is cleared whenever you do any of these actions:

- Replacing the EPS motor/control unit.
- Disconnecting the 12 volt battery cable from the 12 volt battery.
- Disconnecting the power from the EPS control unit.
- Decreasing the power supply voltage for the EPS control unit.

Regular Learning

The regular learning revises a gap of the neutral position that occurs due to normal wear and tear of the vehicle and a change of the wheel alignment during driving.

Learning method with the HDS

The VSA sensor neutral position memorization for VSA system is performed using the HDS, the steering angle neutral position is cleared and overwritten.

Driver Attention Monitor Function (For some models)

Overview

To help avoid a crash or collision due to drowsiness or fatigue, the driver attention monitor function can detect if the driver is tired or inattentive and prompt the driver to take a break.

System Description

The driver attention monitor function can detect driver drowsiness by analyzing the driving behavior based on the steering angle and the yaw rate when the vehicle speed is above a set point. If the system detects driver drowsiness or inattention, the driver attention monitor function warns the driver to take a break by showing a message on the multi-information display (MID) and/or vibrating the steering wheel.

Driver Attention
Driver Attention
Driver Attention
Driver Attention
As one of the display contents, show driver attention as level meter

NOTE: This illustration shows a typical sample of attention display.

Operation Conditions

The driver attention monitor function operates under these conditions:

- Vehicle speed is 25 - 112 mph (40 - 180 km/h).
- The EPS system, the SRS, and/or the transmission system does not have a malfunction.

Function Prohibition

The driver attention monitor function is not activated under these conditions:

- Driving duration is less than 30 minutes.

- Driving on rough roads.
- Driving in a strong side wind.
- Active driving situation (changing the traffic lane or the vehicle speed).

Attention Level Reset

The driver attention monitor function resets the attention level displayed on the multi-information display (MID) if detects these conditions.

- The vehicle is turned to the OFF (LOCK) mode.
- The driver releases the seat belt and opens the driver's door with the vehicle in ON mode.

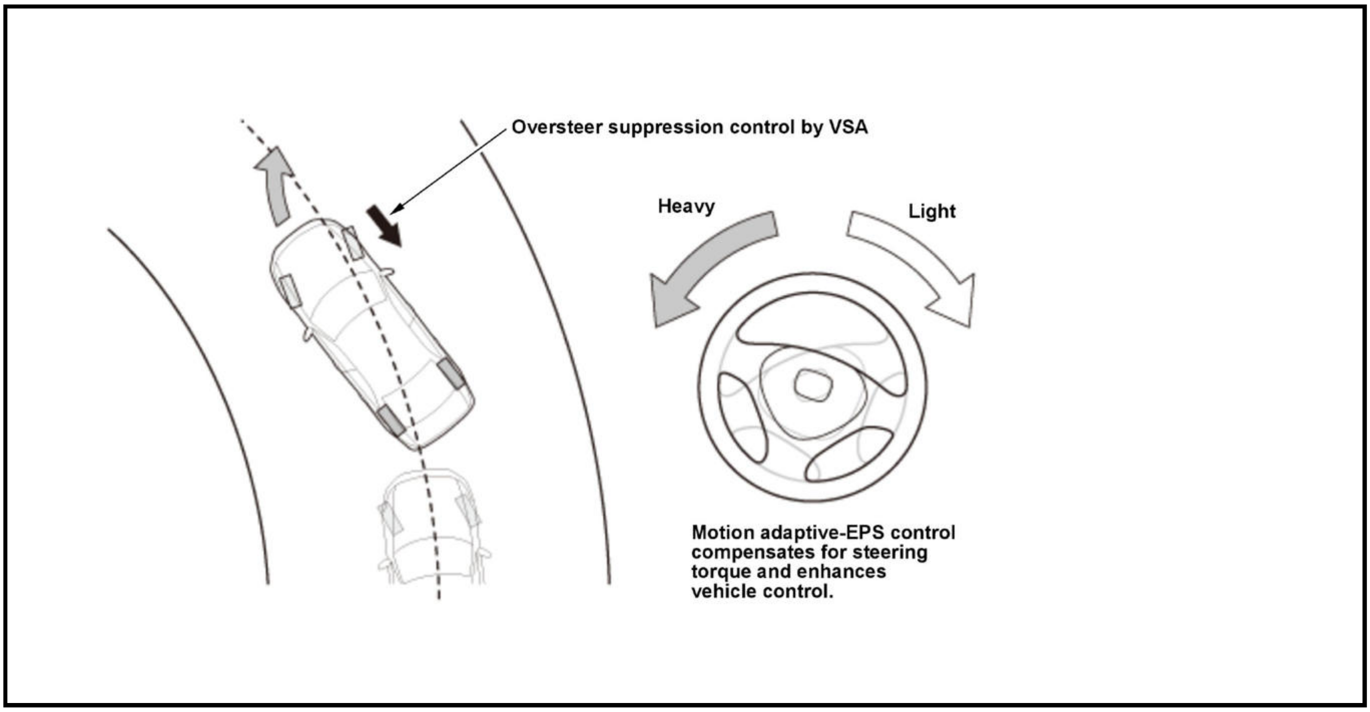
Motion Adaptive-EPS Control

Overview

The motion adaptive-EPS control performs the steering torque correction control coordinated with VSA system for stabilizing the vehicle when the steering is unstable. The EPS system determines the state of the vehicle based on the data calculated by the VSA modulator-control unit, and the data from the yaw rate sensor and the acceleration sensor. When the system determines that the vehicle behavior is abnormal, the EPS control unit calculates the correction current based on the vehicle behavior and corrects the steering torque. The motion adaptive-EPS control is stopped in the event of failure in the VSA system.

Mitigates Oversteer Control

When oversteer occurs, it compensates for steering torque to steer in the countersteer direction, and enhances vehicle control.



Oversteer suppression control by VSA
Heavy
Light
Motion adaptive-EPS control compensates for steering torque and enhances vehicle control.

Mitigates Understeer Control

When understeer occurs, it compensates for steering torque to control the oversteer, then holds the tire grip to enhance vehicle control.

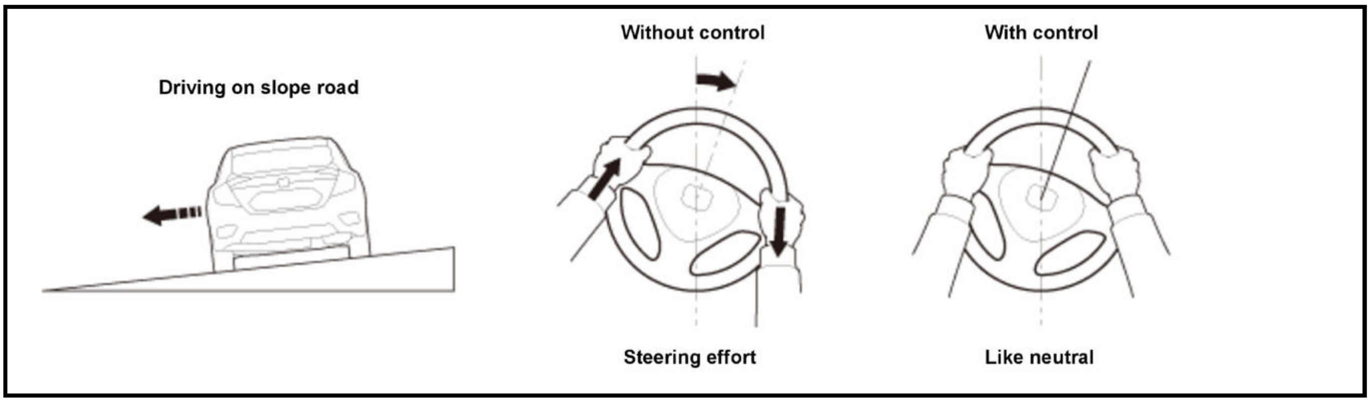
Motion adaptive-EPS control compensates steering torque and enhances vehicle control.
Wet road surface
Dry road surface

Straight Driving Assist

Steering effort is detected and reduced by applying EPS motor assist when driving on a sloped road. This control will return to normal when no longer driving on a sloped road. This function only operates when the cruise control is on and the speed is set.

Assist image



Fail-safe

The EPS control unit diagnoses and monitors the motor system, the torque sensor system, the power supply system, the communication system, and the CPU. When a failure is detected, the EPS indicator comes on and the unit takes one of the following fail-safe actions:

- Stop assist
- Limit assist
- Start alternative assist (vehicle speed fixed control)

Components

Steering Gearbox

The assist pinion shaft transmits the EPS motor power to the steering rack. The EPS motor power is transmitted to the worm wheel by the worm gear. The assist pinion shaft moves the steering rack with the EPS motor power that is increased and transmitted by the worm wheel.The manual pinion shaft transmits the steering torque from the steering wheel to the steering rack. The steering torque is transmitted from the steering column shaft to the input shaft, and the manual pinion shaft connecting with the input shaft by the torsion bar moves the steering rack.

Steering Rack

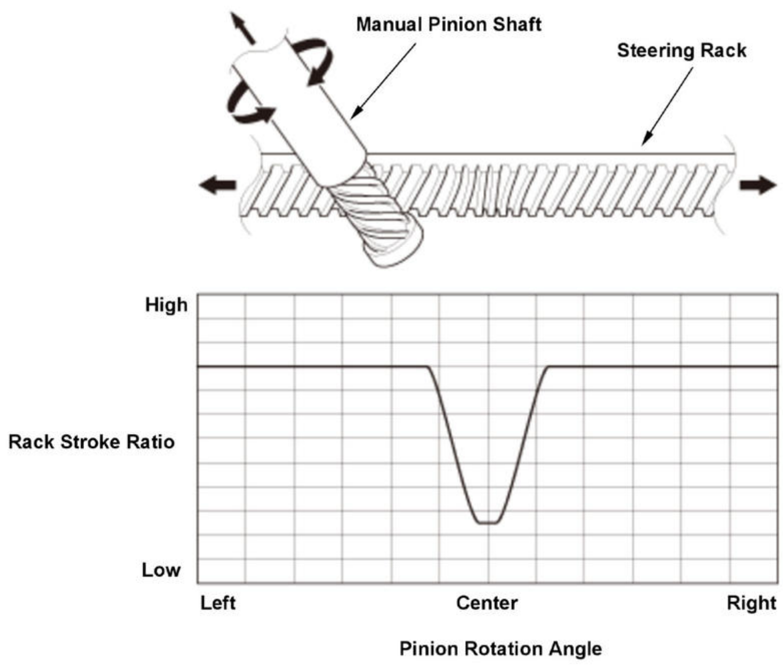
VGR (Variable Gear Ratio)

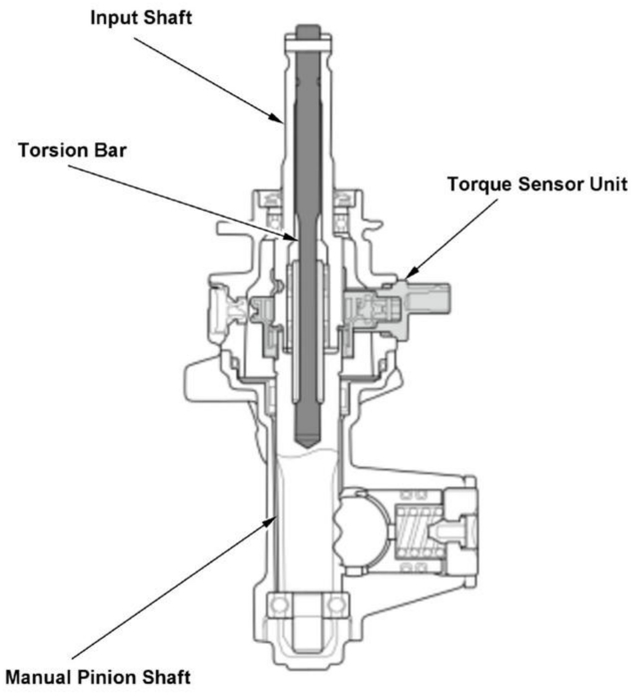
The VGR is applied to the manual pinion shaft side of the steering rack. The normal gear ratio is applied near the straight ahead position of the steering rack for smooth start of steering operation. The quick gear ratio is applied for a large steering angle, which reduces lock-to-lock steering.



Torque Sensor

Overview

The torque sensor is built into the steering gearbox, using a Hall IC sensor to detect steering wheel torque forces. The torque sensor consists of the input shaft, the torsion bar, the manual pinion shaft, and the torque sensor unit.



Input Shaft
Torsion Bar
Torque Sensor Unit
Manual Pinion Shaft

System Diagram

- The steering force of the steering wheel is detected by the torque sensor, and the signal is sent to the EPS control unit. The EPS control unit calculates the assistance torque based on the steering torque signal and vehicle speed signal, and activates the motor to assists the steering force.

- To activate the three-phase brushless motor properly, the motor angle sensor detects the motor angle, and sends the signal to the EPS control unit.
- The EPS control unit sends the motor load status to the PCM. If the electric load of the motor is high while the vehicle is idling or running at a low speed, the PCM increases the idling speed to avoid engine stall.
- The EPS control unit receives the vehicle behavior information from the VSA modulator-control unit.
- When the EPS system detects a problem, the EPS control unit stores the DTC, and sends the signal to the gauge control module to cause the EPS indicator to come on.
- With LKAS: The EPS control unit assists the steering force when the EPS control unit receives the steering assist request from the millimeter wave radar.

HEATED STEERING WHEEL SYSTEM

System Description

Basic Control/Function

The heated steering wheel switch turns on or off the heated steering wheel system. When the heated steering wheel switch is pressed, the switch sends on signals to the heated steering wheel control unit and turns on the heated steering wheel indicator. The heated steering wheel control unit controls outputs to the steering heater based on the heater temperature sensor values. While the heater is working, the heated steering wheel control unit receives the illumination signal via LIN, and adjusts the brightness of the indicator.

Automatic Control

When the remote engine start control system is activated, the climate control system turns on the seat heater system based on the vehicle temperature. When the seat heater is turned on by the remote engine start control system, the gauge control module sends ON commands to the heated steering wheel control unit, and provides power to the heater pad. When the seat heater is turned on in this mode, the heated steering wheel indicator does not turn on.

Transition to Off State

The heater output shall transition to the off state under any of the following conditions

- HTR +B power is off.
- The current operation state is off.
- Thermistor open/short failure is detected (DTC store).
- Heater current abnormal failure is detected (DTC store).
- Steering wheel not heating failure is detected (DTC store).
- Main heater switch failure is detected (DTC store).
- Heated steering wheel switch failure is detected.

Components

Steering Heater

Heating is done by the current from the heated steering wheel control unit.

Heated Steering Wheel Switch

The heated steering wheel switch is a momentary switch and performs input to the heated steering wheel control unit. The heated steering wheel indicator is driven by the heated steering wheel control unit.

Heater Temperature Sensor

The temperature of the steering heater is fedback to the heated steering wheel control unit.

CHECK

POWER STEERING ASSIST CHECK

Check

1. Power Steering Assist - Check

	**NOTE:** This test should be done with original equipment tires and wheels at the correct tire pressure. 1. Start the engine, and let it idle. 2. Attach a commercially available spring scale (A) to the steering wheel. With the engine idling and the vehicle on a clean, dry floor, pull the scale as shown, and read it as soon as the tires begin to turn. 3. If the scale reads less than the specification, the power assist is OK. If it reads more, check these items: • Steering linkage • EPS system

	• Wheel alignment

B	**Initial turning load:**	**34 N (3.5 kgf, 7.7 lbf) max.**

STEERING WHEEL ROTATIONAL PLAY CHECK

Check

1. Steering Wheel Rotational Play - Check

	1. Set the front wheels in the straight ahead position. 2. Measure how far you can turn the steering wheel left and right without moving the front wheels. • If the play is within the limit, the steering gearbox and the steering linkage are OK. • If the play exceeds the limit, inspect the steering linkage and the steering gearbox.

Rotational play (A):	**0-10 mm (0-0.39 in)**

INSPECTION

STEERING COLUMN INSPECTION

Inspection

Check of Tilting Force

1. Check of Tilting Force

	1. Set the steering wheel in the straight ahead driving position, and loosen the lock lever fully. 2. Attach a commercially available spring scale (A) to the highest point of the steering wheel, and tilt the steering column to the lowest position. 3. Pull the spring scale straight up, and read the force required to move the steering column. 4. Attach the spring scale to the lowest point of the steering wheel. 5. Pull the spring scale straight down, and read the force required to move the steering column. 6. If the measurement is higher than the specified, **replace the steering column as an assembly** .

Tilting force (upward/downward):	
Standard:	**69 N (7.0 kgf, 15.5 lbf) max.**

Check of Telescoping Force

2. Check of Telescoping Force

	1. Set the steering wheel in the straight ahead driving position, and loosen the lock lever fully. 2. Attach a commercially available spring scale (A) to the center point of the steering wheel as shown. 3. Pull the spring scale, and read the force required to move the steering column during telescoping out. 4. If the measurement is higher than specified, **replace the steering column as an assembly** .

Telescoping force:	
Standard:	**106 N (10.8 kgf, 23.8 lbf) max.**

Check of Lock Lever Force

3. Check of Lock Lever Force

 	1. Move the lock lever (A) from the loosened position to the locked position three to five times, then release the lock lever. Adjust the steering column to the center tilt position and also to the full telescopic out position, and hold the steering wheel. 2. Using a commercially available push-pull gauge, push up the lock lever 10 mm (0.39 in) in from its end, and measure the force required to move the lock lever. 3. If the measurement is higher than specified, **replace the steering column as an assembly** .

Lock lever force:	
Standard:	**82 N (8.4 kgf, 18.4 lbf) max.**

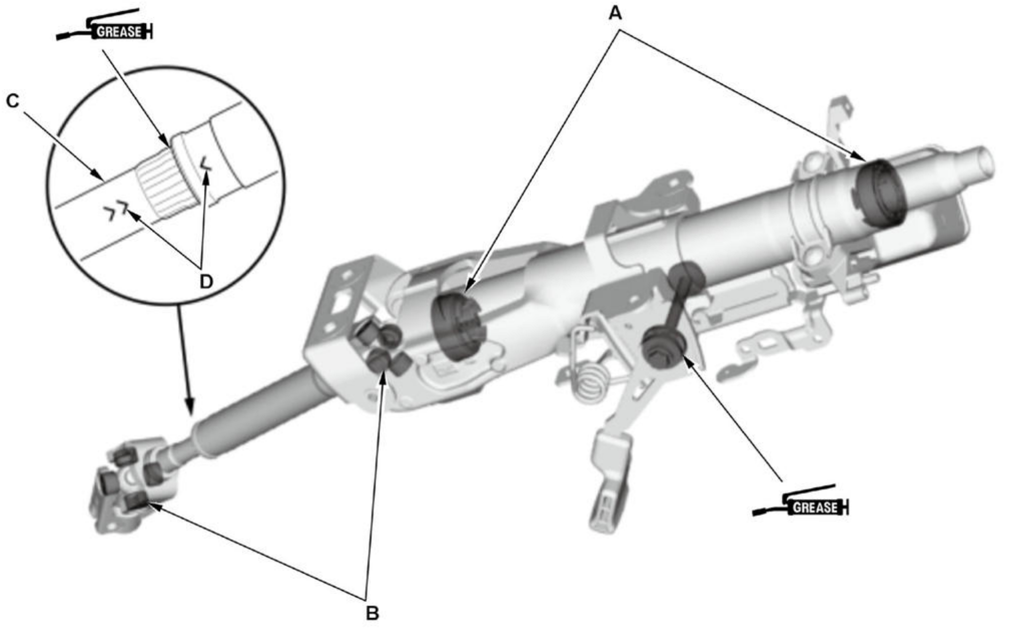
Steering Column Inspect

4. Steering Column - Inspect

1. Check these items:

- Check the column shaft bearings (A) for play and proper movement. If bearing is noisy or has excessive play, replace the steering column as an assembly.
- Check the steering joint bearings (B) for play and proper movement. If any bearing is noisy or has excessive play, replace the steering column as an assembly.
- Check the lower slide shaft (C) for smooth movement in and out. If the lower slide shaft is removed, slip it into the upper slide shaft by aligning the paint or stamped marks (D). If it sticks or binds, replace the steering column as an assembly.
- Check the tilt mechanism and telescopic mechanism for movement and damage.
- Apply multipurpose grease to the steering column.

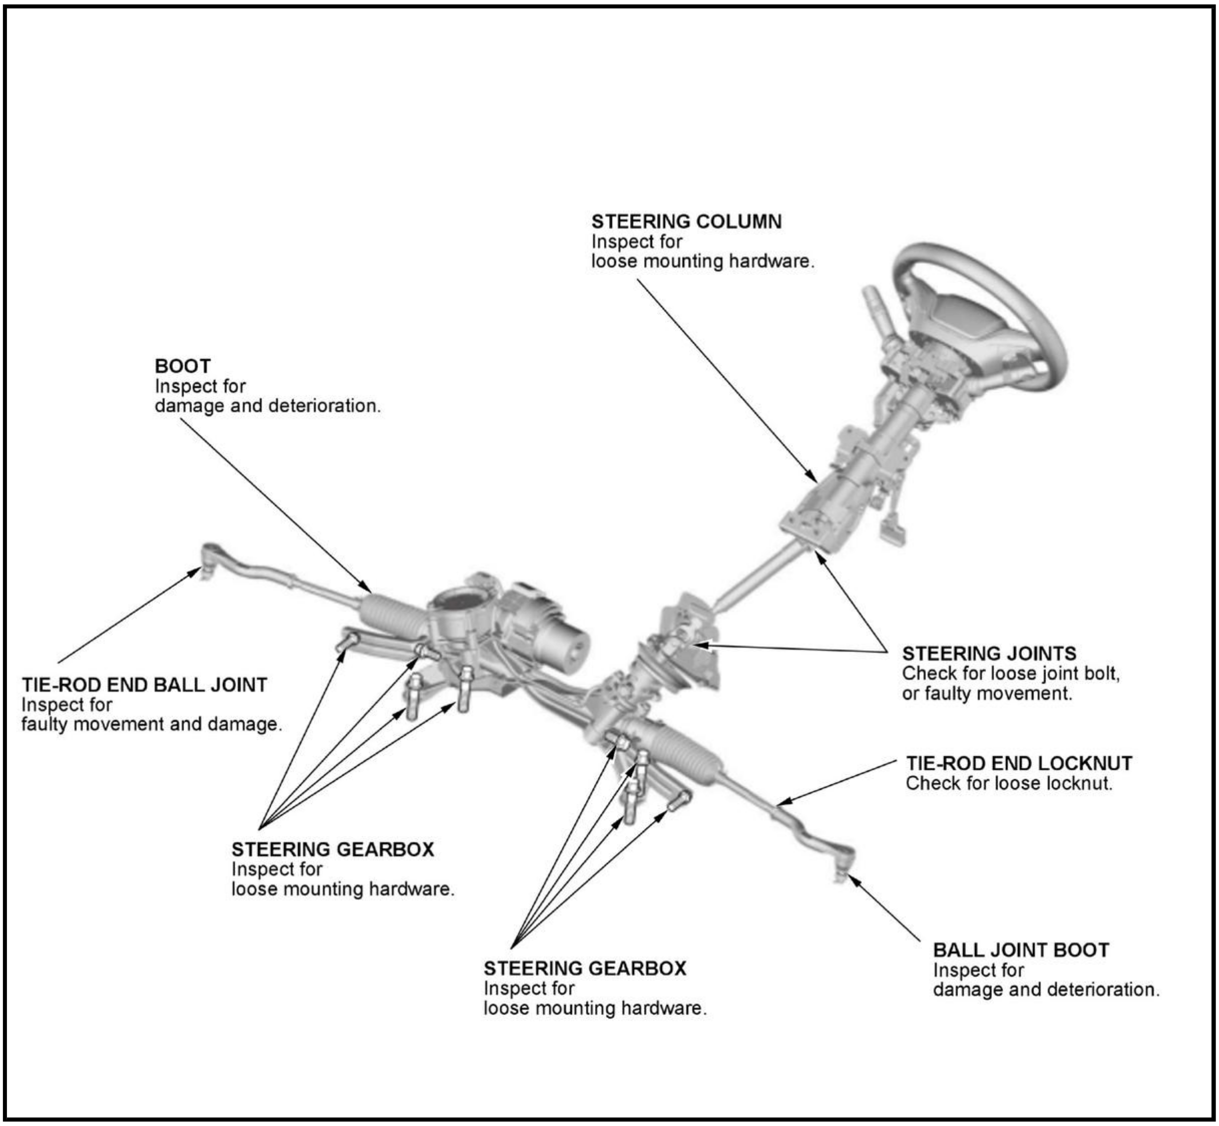
NOTE: Do not use silicone grease.



STEERING LINKAGE AND GEARBOX INSPECTION

Inspection

1. Steering Linkage and Gearbox - Inspect



STEERING COLUMN
Inspect for
loose mounting hardware.
BOOT
Inspect for
damage and deterioration.
TIE-ROD END BALL JOINT
Inspect for
faulty movement and damage.
STEERING JOINTS
Check for loose joint bolt,
or faulty movement.
TIE-ROD END LOCKNUT
Check for loose locknut.
STEERING GEARBOX
Inspect for
loose mounting hardware.
STEERING GEARBOX
Inspect for
loose mounting hardware.
BALL JOINT BOOT
Inspect for
damage and deterioration.

LEARNING RESET CLEAR

STEERING ANGLE NEUTRAL POSITION LEARNING

Procedure

NOTE:

- If the steering angle neutral position is cleared, do the steering angle neutral position learning procedure.
- The steering angle neutral position is cleared whenever you do any of these actions:
-
    - EPS motor/control unit replacement, removal, or installation.
    - 12 volt battery terminal is disconnected from the 12 volt battery.
    - The power is disconnected from the EPS control unit.
    - The power supply voltage for the EPS control unit is decreased.
- If the steering angle neutral position is cleared, the VSA indicator, VSA OFF indicator, deflation warning system indicator, and CMBS indicator (if equipped) will come on.
- There are two learning methods.
- The learning cannot be done when the EPS indicator is on.
- If the learning does not complete, **check the EPS system** .

1. Steering Angle Neutral Position - Learn

   Learning method without the HDS

   1. Drive the vehicle in a straight line at speeds of 10 mph (15 km/h) or more until the indicators go off.

   NOTE:

   - The learning will complete after driving in a straight line for about 10 seconds.
   - Difficult situations for learning are below:
   -
     - Driving on a non straight line.
     - Driving on a rough road.
     - Driving under 10 mph (15 km/h) or less.
     - Driving on a sloped road.
     - Rapid acceleration and deceleration.

   2. Check that the indicators go off.

   Learning method with the HDS

   1. **Do the VSA sensor neutral position memorization** .

   NOTE: When the VSA sensor neutral position memorization is performed, the current position is cleared and overwritten.

REPAIR PROCEDURES AND TESTS

BALL JOINT DISCONNECTION

Special Tools Required

Image	Description/Tool Number
	Ball Joint Thread Protector, 14 mm 07AAE-SJAA100

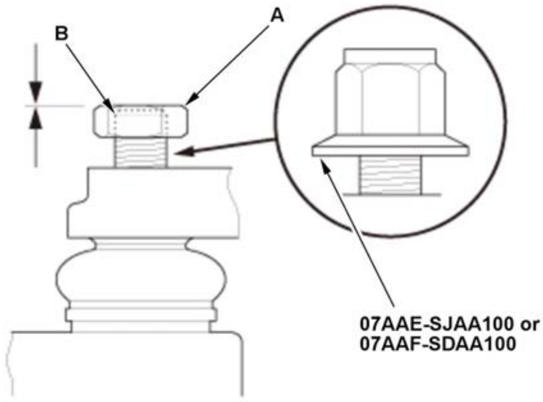
Image	Description/Tool Number
	Ball Joint Thread Protector, 12 mm 07AAF-SDAA100
	Ball Joint Remover, 32 mm 07MAC-SL00102
	Ball Joint Remover, 28 mm 07MAC-SL00202

Removal

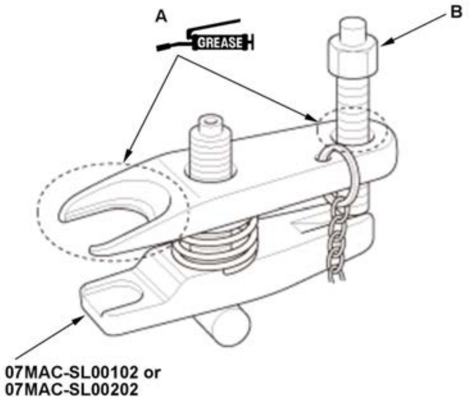
NOTICE:

Always use a ball joint remover to disconnect a ball joint. Do not strike the housing or any other part of the ball joint connection to disconnect it.

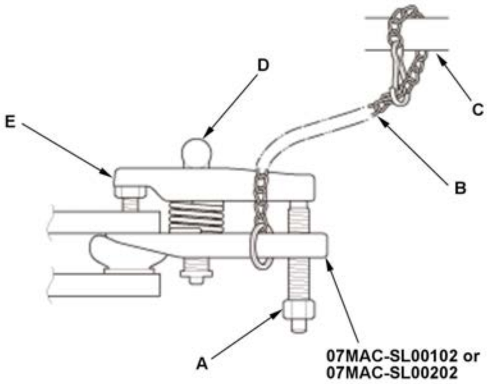
1. Ball Joint - Disconnection



1. Install a hex nut (A) or the ball joint thread protector onto the threads of the ball joint (B).
NOTE: When using a hex nut, make sure the nut is flush with the ball joint pin end to prevent damage to the threaded end of the ball joint pin.



2. Apply multipurpose grease to the ball joint remover on the areas as shown (A). This will ease the installation of the tool, and prevent damage to the pressure bolt (B) threads.



3. Loosen the pressure bolt (A), and install the ball joint remover as shown.
NOTE:

- Insert the jaws carefully, making sure not to damage the ball joint boot.
- Fasten the safety chain (B) securely to a suspension arm or the subframe (C). Do not fasten it to a brake line or wire harness.

4. Adjust the jaw spacing by turning the adjusting bolt (D).

5. Make sure the head of the adjusting bolt is in the position shown to allow the jaw (E) to pivot.

6. Tighten the pressure bolt until the ball joint pin pops loose from the ball joint connecting hole. If necessary, apply penetrating type lubricant to loosen the ball joint pin.

NOTE: Do not use pneumatic or electric tools on the pressure bolt.

7. Remove the ball joint remover.

8. Remove the nut or the ball joint thread protector.

9. Pull the ball joint out of the ball joint connecting hole.

	10. Inspect the ball joint boot, and replace it if damaged.

REPLACEMENT

STEERING TIE-ROD END BALL JOINT BOOT REPLACEMENT

Special Tools Required

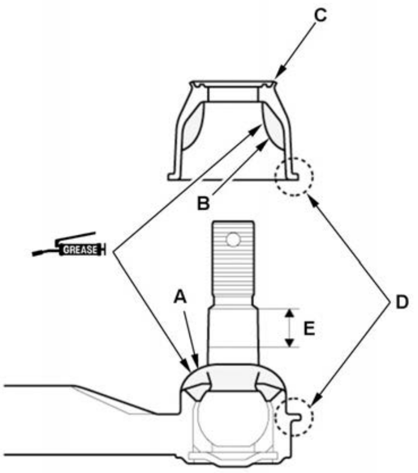
Image	Description/Tool Number
	Driver, 32.5 mm 070AD-SAAA100

Replacement

1. Tie-Rod End Ball Joint Boot - Remove

	1. Remove the ball joint boot (A) from the tie-rod end. 2. Wipe the old grease off the ball pin.

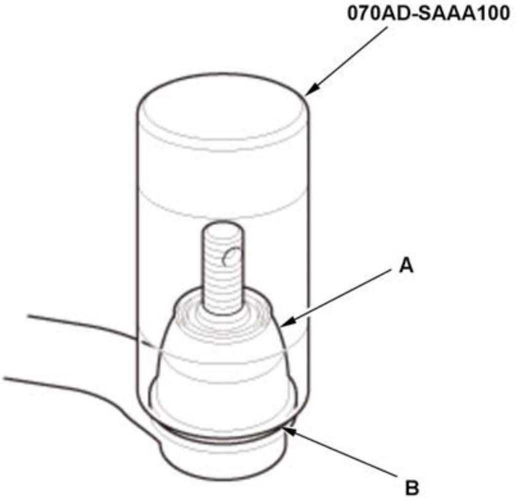
2. Tie-Rod End Ball Joint Boot - Install



1. Pack the lower area of the ball pin (A) with fresh multipurpose grease.

2. Pack the interior of the ball joint boot (B) and the lip (C) with fresh multipurpose grease. Note these items when installing new grease:

- Keep grease off the boot mounting area (D) and the tapered section (E) of the ball pin.
- Do not allow dust, dirt, or other foreign materials to enter the boot.



3. Install the ball joint boot (A) using the driver.

NOTE:

- The ball joint boot must not have a gap at the ball joint boot installation sections (B).
- After installing the ball joint boot, check the ball pin tapered section for grease contamination.

REWRITE

EPS CONTROL UNIT UPDATE

Procedure

1. EPS Control Unit - Update

   NOTE: When updating control units, use the most current version of the HDS software and interface device. Check any official service information website for more information about updating control units.

SYMPTOM TROUBLESHOOTING

EPS SYMPTOM TROUBLESHOOTING

EPS indicator does not go off (With CAN Gateway (With Auto Idle Stop System)) (2020 2021)

NOTE:

- The indicator comes on when the reprogramming fails.
- Do the reprogramming of the EPS control unit again.
- The all sensor learn in the VSA system may not have properly completed.

1. Problem verification

   -1. Start the engine.

-2. Check the EPS indicator.

Does the EPS indicator come on, then go off?

YES

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

NO

Go to step 2.

2. All DTCs check

   -1. All DTCs check with the HDS.

   All DTCs

   Are there DTCs indicated?

   YES

   Go to indicated DTC's troubleshooting.

   NO

   Go to step 3.

3. Fuse check 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	**No. A2-1**

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 4.

   NO

   Replace the fuse. If the fuse blows again, repair a short to ground in the No. A2-1 fuse circuit.

4. Fuse check 2

   -1. Check the following fuse.

Fuse	**No. D34**

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 5.

   NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair a short to ground in the No. D34 fuse circuit.

5. Fuse check 3

-1. Check the following fuse.

Fuse	**No. F5**

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 6.

NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair a short to ground in the No. F5 fuse circuit.

6. DC-DC converter IG1 relay 2 check

-1. **Remove the DC-DC converter IG1 relay 2** , and **test it** .

Is the relay OK?

YES

The relay is OK. Reinstall the relay, then go to step 7.

NO

Replace the DC-DC converter IG1 relay 2 .

7. Open wire check (IG1 RELAY1/IG1 line)

-1. Disconnect the following connector.

EPS control unit connector B (6P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EPS control unit connector B (6P): disconnected
Test point 1	**EPS control unit connector B (6P) No. 5**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 RELAY1/IG1 wire is OK. Go to step 12.

NO

Go to step 8.

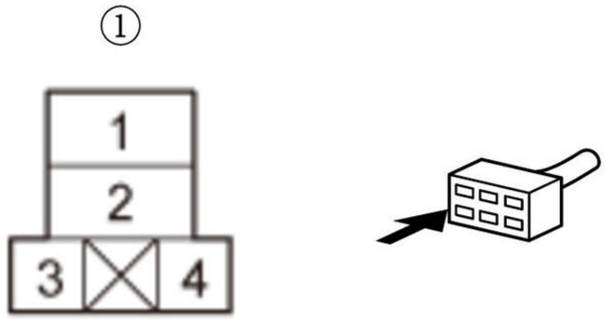
8. Open wire check (IG1 RELAY1/IG1, IG1 RLY2 OUT lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the DC-DC converter IG1 relay 2** .

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	DC-DC converter IG1 relay 2: removed
Test point 1	**EPS control unit connector B (6P) No. 5**
Test point 2	DC-DC converter IG1 relay 2 4P socket (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

The IG1 RELAY1/IG1 and the IG1 RLY2 OUT wires are OK. Go to step 9.

NO

Repair an open in the wire between the EPS control unit and the DC-DC converter IG1 relay 2.

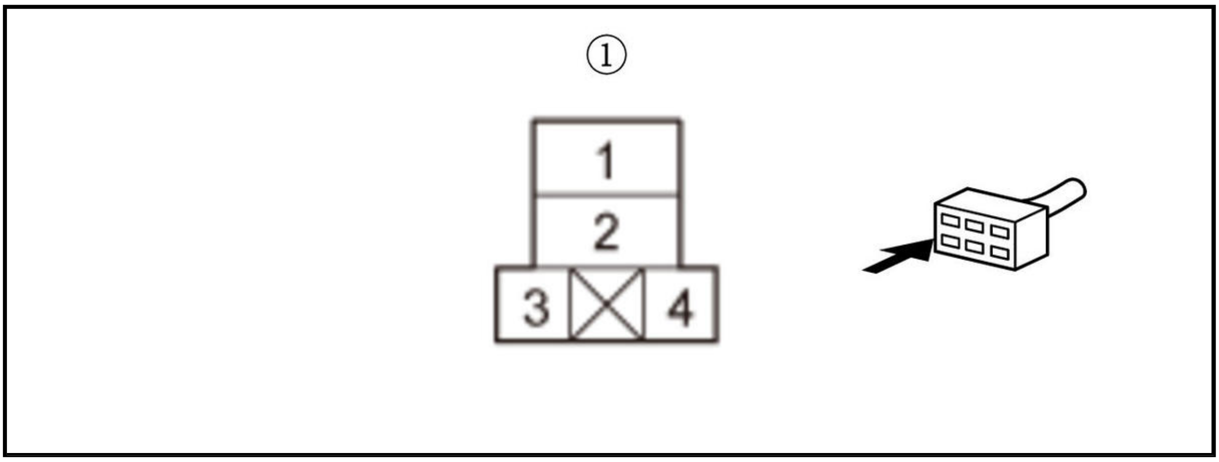
9. Open wire check (DCDC OUT2 line)

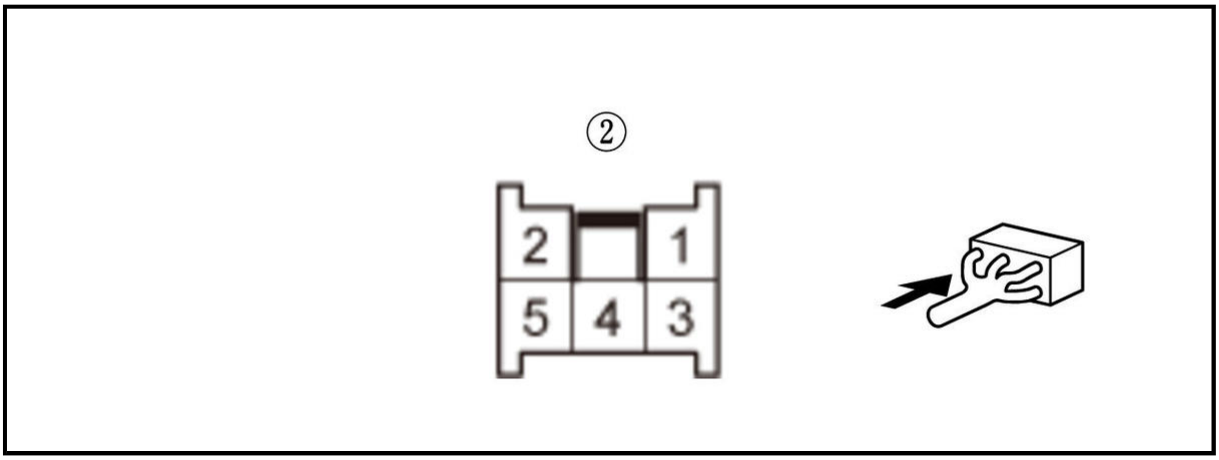
-1. Disconnect the following connector.

DC-DC converter connector B (5P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	DC-DC converter IG1 relay 2: removed
B	DC-DC converter connector B (5P): disconnected
Test point 1	DC-DC converter IG1 relay 2 4P socket (female terminals) No. 2: ①
Test point 2	DC-DC converter connector B (5P) (female terminals) No. 5: ②





Is there 1.0 Ω or less?

YES

The DCDC OUT2 wire is OK. Go to step 10.

NO

Repair an open in the wire between the DC-DC converter and the DC-DC converter IG1 relay 2.

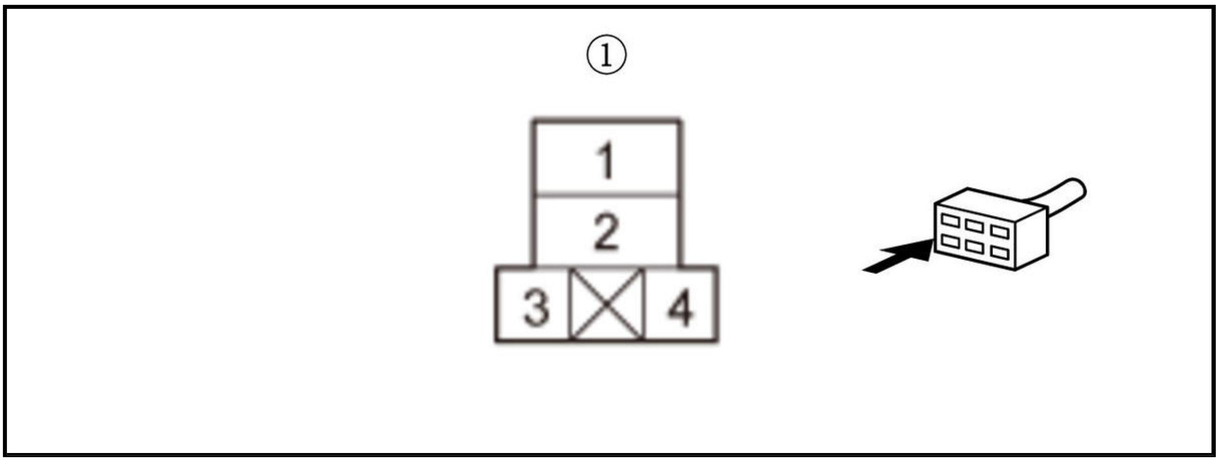
10. Open wire check (IG1 VSA/ABS line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EPS control unit connector B (6P): disconnected
B	DC-DC converter IG1 relay 2: removed

B	DC-DC converter connector B (5P): disconnected
Test point 1	DC-DC converter IG1 relay 2 4P socket (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 VSA/ABS wire is OK. Go to step 11.

NO

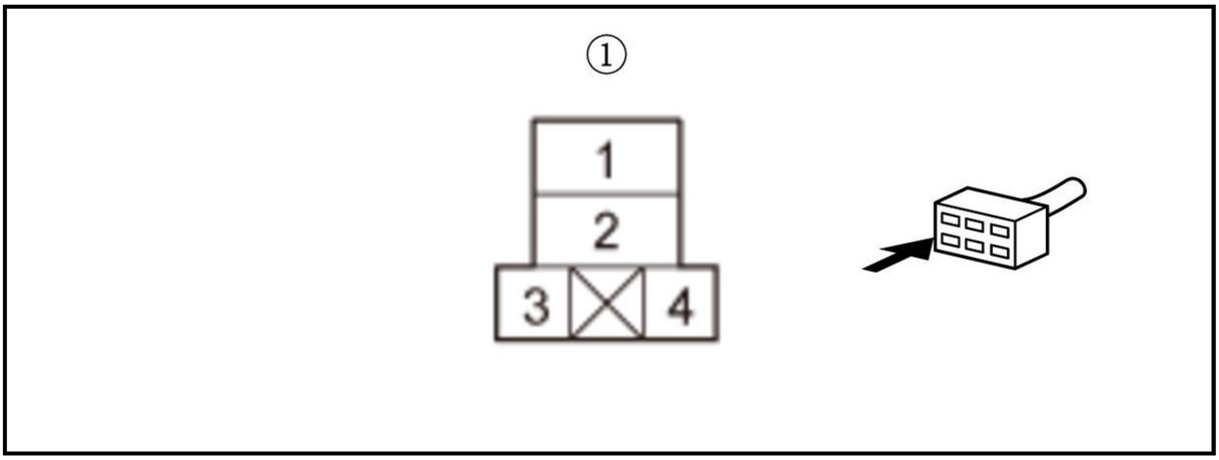
Repair an open in the wire between the under-dash fuse/relay box and the DC-DC converter IG1 relay 2.

11. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	DC-DC converter IG1 relay 2: removed
B	DC-DC converter connector B (5P): disconnected
Test point 1	DC-DC converter IG1 relay 2 4P socket (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Replace the DC-DC converter .

NO

Repair an open in the wire between the DC-DC converter IG1 relay 2 and body ground (G402).

12. Open wire check (+B EPS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector A (2P)

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector A (2P): disconnected
B	EPS control unit connector B (6P): disconnected
Test point 1	**EPS control unit connector A (2P) No. 2**

Test point 2	Body ground

Is there battery voltage?

YES

The +B EPS wire is OK. Go to step 13.

NO

Repair an open in the wire between the under-hood fuse/relay box and the EPS control unit.

13. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector A (2P): disconnected
B	EPS control unit connector B (6P): disconnected
Test point 1	**EPS control unit connector A (2P) No. 1**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 14.

NO

Repair an open in the wire between the EPS control unit and body ground (G202).

14. F-CAN circuit communication check

-1. Reconnect the following connectors.

EPS control unit connector A (2P)
EPS control unit connector B (6P)

-2. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

Gauge control module (Bus A) is Not Available

Go to step 15.

EPS control unit (Bus B) is Not Available

Go to step 16.

Gauge control module and EPS control unit are Available

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

15. Open wire check (F-CAN A_H, F-CAN A_L lines)

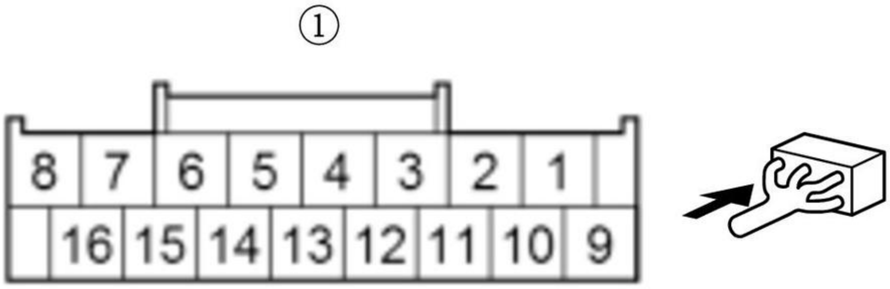
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Gauge control module connector A (32P)
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Gauge control module connector A (32P): disconnected
B	CAN gateway 16P connector: disconnected
Test circuit 1	B
Test point 1	**Gauge control module connector A (32P) No. 19**
Test point 2	CAN gateway 16P connector (female terminals) No. 3: ①
Test circuit 2	B
Test point 1	**Gauge control module connector A (32P) No. 20**
Test point 2	CAN gateway 16P connector (female terminals) No. 11: ①



Is there 1.0 Ω or less?

YES

The F-CAN A_H and F-CAN A_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good gauge control module** , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

NO

Repair an open in the wire between the gauge control module and the CAN gateway.

16. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

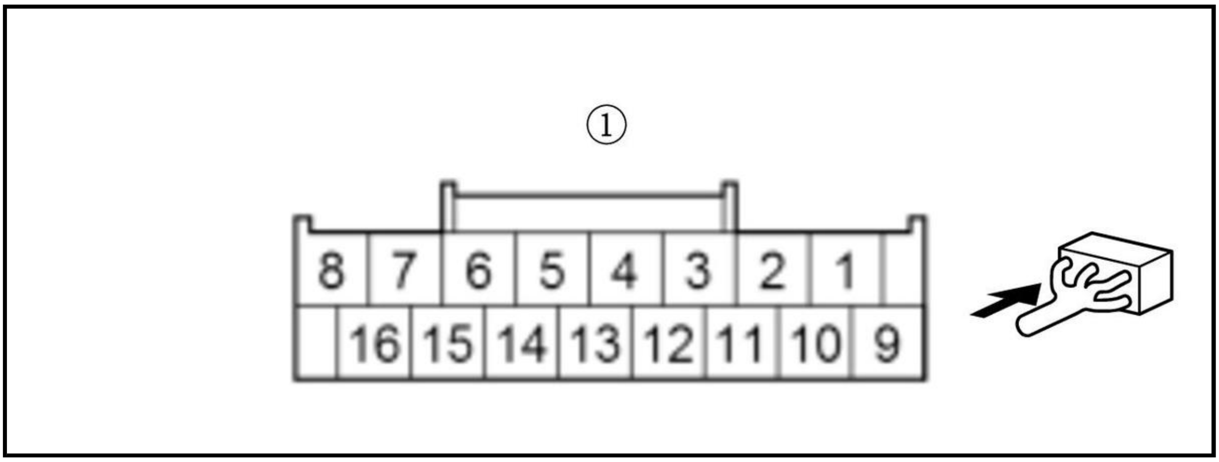
-2. Disconnect the following connectors.

EPS control unit connector B (6P)
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	CAN gateway 16P connector: disconnected
Test circuit 1	B
Test point 1	**EPS control unit connector B (6P) No. 3**
Test point 2	CAN gateway 16P connector (female terminals) No. 6: ①

Test circuit 2	B
Test point 1	**EPS control unit connector B (6P) No. 1**
Test point 2	CAN gateway 16P connector (female terminals) No. 14: ①



Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Repair an open in the wire between the EPS control unit and the CAN gateway.

EPS indicator does not go off (With CAN Gateway (Without Auto Idle Stop System))

NOTE:

- The indicator comes on when the reprogramming fails.
- Do the reprogramming of the EPS control unit again.

1. Problem verification

   -1. Start the engine.

   -2. Check the EPS indicator.

   Does the EPS indicator come on, then go off?

   YES

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

   NO

   Go to step 2.

2. DTC check (EPS control unit)

   -1. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

   Is DTC indicated?

   YES

   Go to indicated DTC's troubleshooting.

   NO

   Go to step 3.

3. Gauge control module operation check

   -1. **Do the gauge control module self-diagnostic function** .

   Is the gauge control module OK?

   YES

   Go to step 4.

   NO

   Replace the gauge control module .

4. DTC check (CAN gateway system)

   -1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

Is DTC indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 5.

5. Fuse check 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. A2-1 (70 A)

Location	Under-hood fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 6.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A2-1 (70 A) fuse circuit.

6. Fuse check 2

-1. Check the following fuse.

Fuse	No. D34 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 7.

NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair a short to ground in the No. D34 (10 A) fuse circuit.

7. Open wire check (IG1/IG1 VSA/ABS line)

-1. Disconnect the following connector.

EPS control unit connector B (6P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EPS control unit connector B (6P): disconnected
Test point 1	**EPS control unit connector B (6P) No. 5**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1/IG1 VSA/ABS wire is OK. Go to step 8.

NO

Repair an open in the wire between the under-dash fuse/relay box and the EPS control unit.

8. Open wire check (+B EPS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector A (2P)

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector A (2P): disconnected
B	EPS control unit connector B (6P): disconnected
Test point 1	**EPS control unit connector A (2P) No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

The +B EPS wire is OK. Go to step 9.

NO

Repair an open in the wire between the under-hood fuse/relay box and the EPS control unit.

9. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector A (2P): disconnected
B	EPS control unit connector B (6P): disconnected
Test point 1	**EPS control unit connector A (2P) No. 1**
Test point 2	Body ground

Is there continuity?

YES

The GND wire is OK. Go to step 10.

NO

Repair an open in the wire between the EPS control unit and body ground (G202).

10. F-CAN circuit communication check

-1. Reconnect the following connectors.

EPS control unit connector A (2P)
EPS control unit connector B (6P)

-2. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

Gauge control module (Bus A) is Not Available

Go to step 11.

EPS control unit (Bus B) is Not Available

Go to step 12.

Gauge control module and EPS control unit are Available

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

11. Open wire check (F-CAN A_H, F-CAN A_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

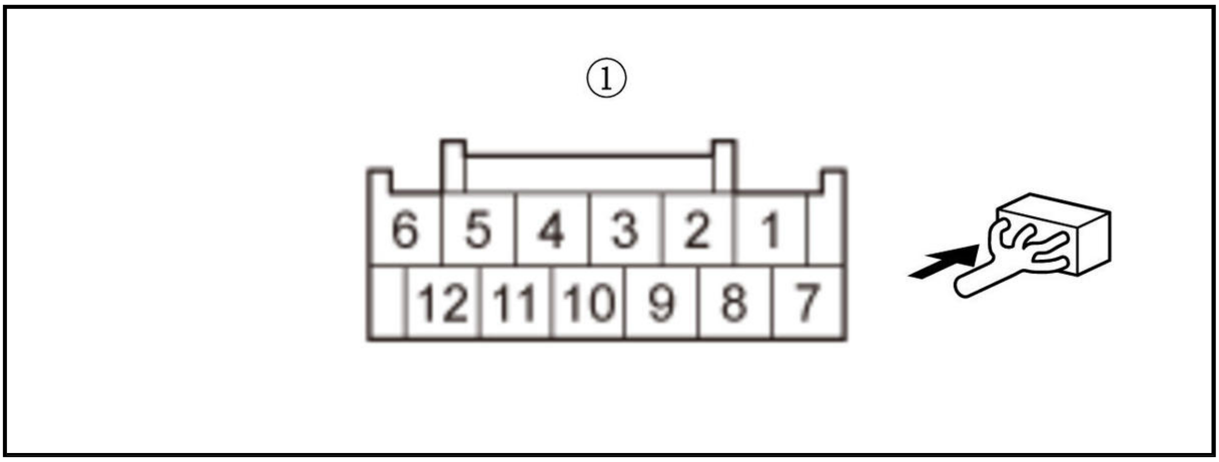
Gauge control module connector A (32P)
CAN gateway 12P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Gauge control module connector A (32P): disconnected
B	CAN gateway 12P connector: disconnected
Test circuit 1	B
Test point 1	**Gauge control module connector A (32P) No. 19**
Test point 2	CAN gateway 12P connector (female terminals) No. 3: ①

Test circuit 2	B
Test point 1	**Gauge control module connector A (32P) No. 20**

Test point 2	CAN gateway 12P connector (female terminals) No. 9: ①



Is there continuity?

YES

The F-CAN A_H and F-CAN A_L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good gauge control module** , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

NO

Repair an open in the wire between the gauge control module and the CAN gateway.

12. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

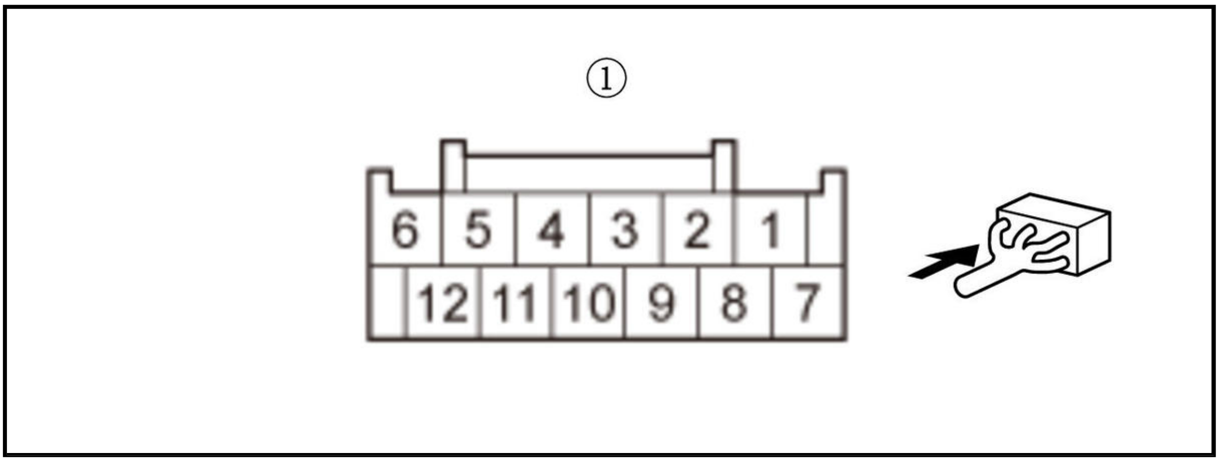
-2. Disconnect the following connectors.

EPS control unit connector B (6P)
CAN gateway 12P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector B (6P): disconnected
B	CAN gateway 12P connector: disconnected
Test circuit 1	B
Test point 1	**EPS control unit connector B (6P) No. 3**
Test point 2	CAN gateway 12P connector (female terminals) No. 12: ①

Test circuit 2	B
Test point 1	**EPS control unit connector B (6P) No. 1**
Test point 2	CAN gateway 12P connector (female terminals) No. 5: ①



Is there continuity?

YES

The F-CAN B_H and F-CAN B_L wires are OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Repair an open in the wire between the EPS control unit and the CAN gateway.

EPS indicator does not go off (Without CAN Gateway) (2017 2018 2019)

NOTE:

- The indicator comes on when the reprogramming fails.
- Do the reprogramming of the EPS control unit again.

1. Problem verification

-1. Start the engine.

-2. Check the EPS indicator.

Does the EPS indicator come on, then go off?

YES

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** .

NO

Go to step 2.

2. DTC check (EPS control unit)

-1. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

Is DTC indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 3.

3. Gauge control module operation check

   -1. **Do the gauge control module self-diagnostic function** .

   Is the gauge control module OK?

   YES

   Go to step 4.

   NO

   Replace the gauge control module .

4. Fuse check 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. A2-1 (70 A)
Location	Under-hood fuse/relay box

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 5.

   NO

   Replace the fuse. If the fuse blows again, repair a short to ground in the No. A2-1 (70 A) fuse circuit.

5. Fuse check 2

   -1. Check the following fuse.

Fuse	No. D34 (10 A)
Location	Under-dash fuse/relay box

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 6.

   NO

   Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair a short to ground in the No. D34 (10 A) fuse circuit.

6. Open wire check (IG1/IG1 VSA/ABS line)

-1. Disconnect the following connector.

EPS control unit connector B (6P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	EPS control unit connector B (6P): disconnected
Test point 1	**EPS control unit connector B (6P) No. 5**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1/IG1 VSA/ABS wire is OK. Go to step 7.

NO

Repair an open in the wire between the under-dash fuse/relay box and the EPS control unit.

7. Open wire check (+B EPS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

EPS control unit connector A (2P)

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector A (2P): disconnected
B	EPS control unit connector B (6P): disconnected
Test point 1	**EPS control unit connector A (2P) No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

The +B EPS wire is OK. Go to step 8.

NO

Repair an open in the wire between the under-hood fuse/relay box and the EPS control unit.

8. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector A (2P): disconnected
B	EPS control unit connector B (6P): disconnected
Test point 1	**EPS control unit connector A (2P) No. 1**

Test point 2	Body ground

Is there continuity?

YES

The GND wire is OK. Go to step 9.

NO

Repair an open in the wire between the EPS control unit and body ground (G202).

9. Open wire check (F-CAN_H, F-CAN_L lines)

-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	EPS control unit connector A (2P): disconnected
B	EPS control unit connector B (6P): disconnected
B	Gauge control module connector A (32P): disconnected
Test circuit 1	B
Test point 1	**EPS control unit connector B (6P) No. 3**
Test point 2	**Gauge control module connector A (32P) No. 19**

Test circuit 2	B
Test point 1	**EPS control unit connector B (6P) No. 1**
Test point 2	**Gauge control module connector A (32P) No. 20**

Is there continuity?

YES

The F-CAN_H and F-CAN_L wires are OK. Check for loose terminals and poor connections at the EPS control unit connectors. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good EPS motor/control unit** , then recheck. If the symptom/indication goes away with a known-good EPS motor/control unit, **replace the original EPS motor/control unit** .

NO

Repair an open in the wire between the EPS control unit and the gauge control module.

SYMPTOM TROUBLESHOOTING INDEX

EPS SYMPTOM TROUBLESHOOTING INDEX

When the vehicle has one of these symptoms, check for a diagnostic trouble code (DTC) with the HDS. If there is no DTC, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.

Symptom	Diagnostic Procedure	Also check for
HDS does not communicate with the EPS control unit or the vehicle	**Troubleshoot the F-CAN circuit** .	Faulty data link cable

Symptom	Diagnostic Procedure	Also check for
EPS indicator does not come on	**Do the gauge control module self-diagnostic function** .	B
EPS indicator does not go off	**Symptom Troubleshooting**	B

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

EPS INDICATOR DOES NOT COME ON

Diagnostic Procedure

- **Do the gauge control module self-diagnostic function** .

EPS INDICATOR DOES NOT GO OFF

Diagnostic Procedure

- **Symptom Troubleshooting**

HDS DOES NOT COMMUNICATE WITH THE EPS CONTROL UNIT OR THE VEHICLE

Diagnostic Procedure

- **Troubleshoot the F-CAN circuit** .

Also check for

Faulty data link cable

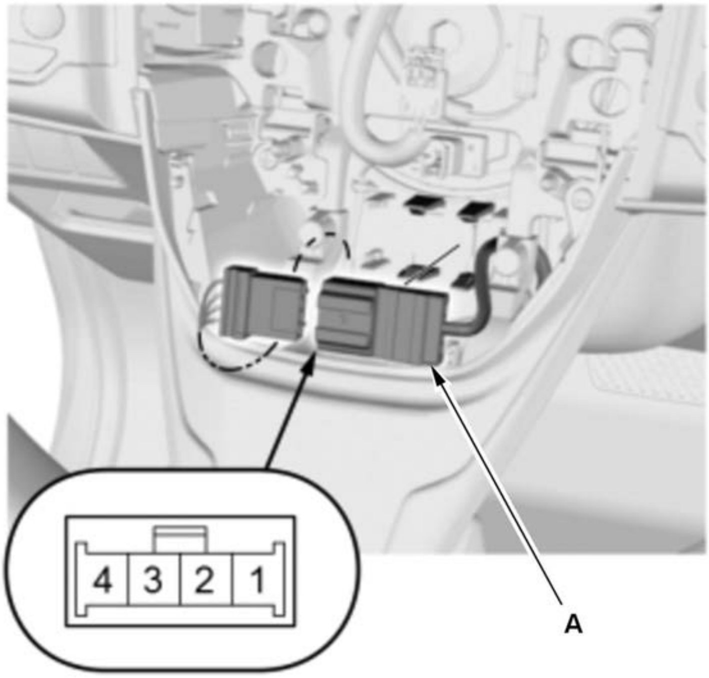
TEST

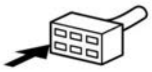
HEATED STEERING WHEEL TEMPERATURE SENSOR TEST

Test

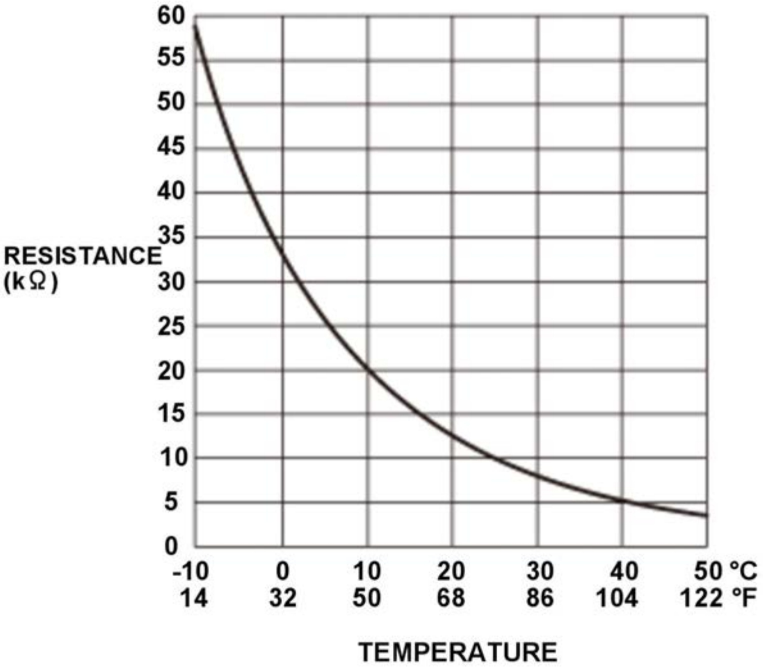
NOTE: SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1. **Driver's Airbag - Remove**
2. Steering Wheel Temperature Sensor - Test





Terminal	3		4
	○		○



1. Disconnect the connector.

2. Measure the resistance between the terminals according to the table.

3. Compare the resistance readings with the specifications shown in the graph; the resistance should be within the specifications.

4. If the resistance is not as specified, the steering wheel temperature sensor (A) is faulty; **replace the steering wheel assembly** .

3. All Remove Parts - Install

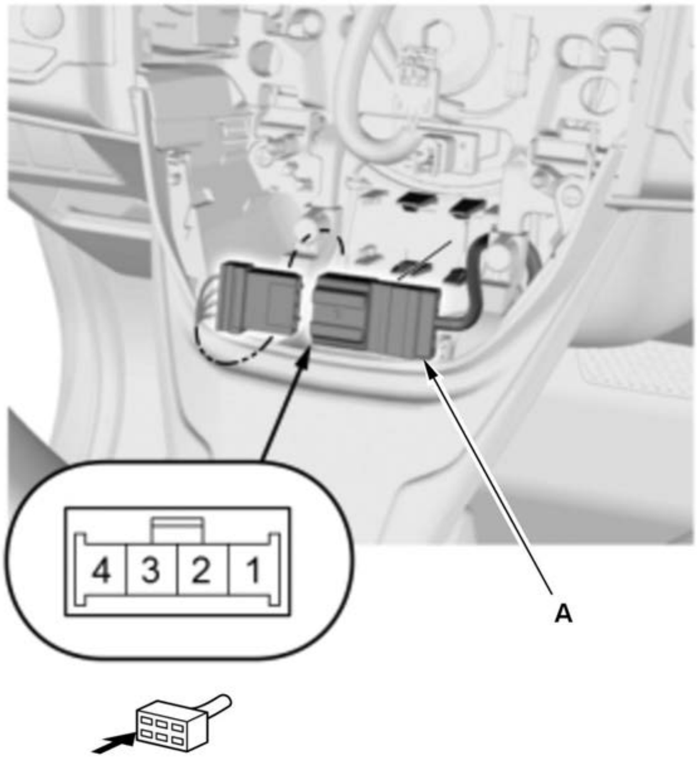
1. Install the parts in the reverse order of removal.

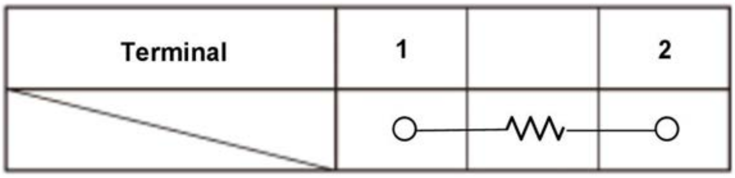
STEERING HEATER TEST

Test

NOTE: SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1. **Driver's Airbag - Remove**
2. Steering Heater - Test





Terminal	1		2
	○	—^^^^—	○

1. Disconnect the connector.

2. Check for continuity between the terminals according to the table. There should be continuity.

NOTE: When the steering heater temperature is 73 deg.F (23 deg.C), resistance value is 2.0

0.20 Ω.

3. If the continuity is not as specified, the steering heater (A) is faulty; **replace the steering wheel assembly**

.

3. All Remove Parts - Install

1. Install the parts in the reverse order of removal.

Removal and Installation

NOTE:

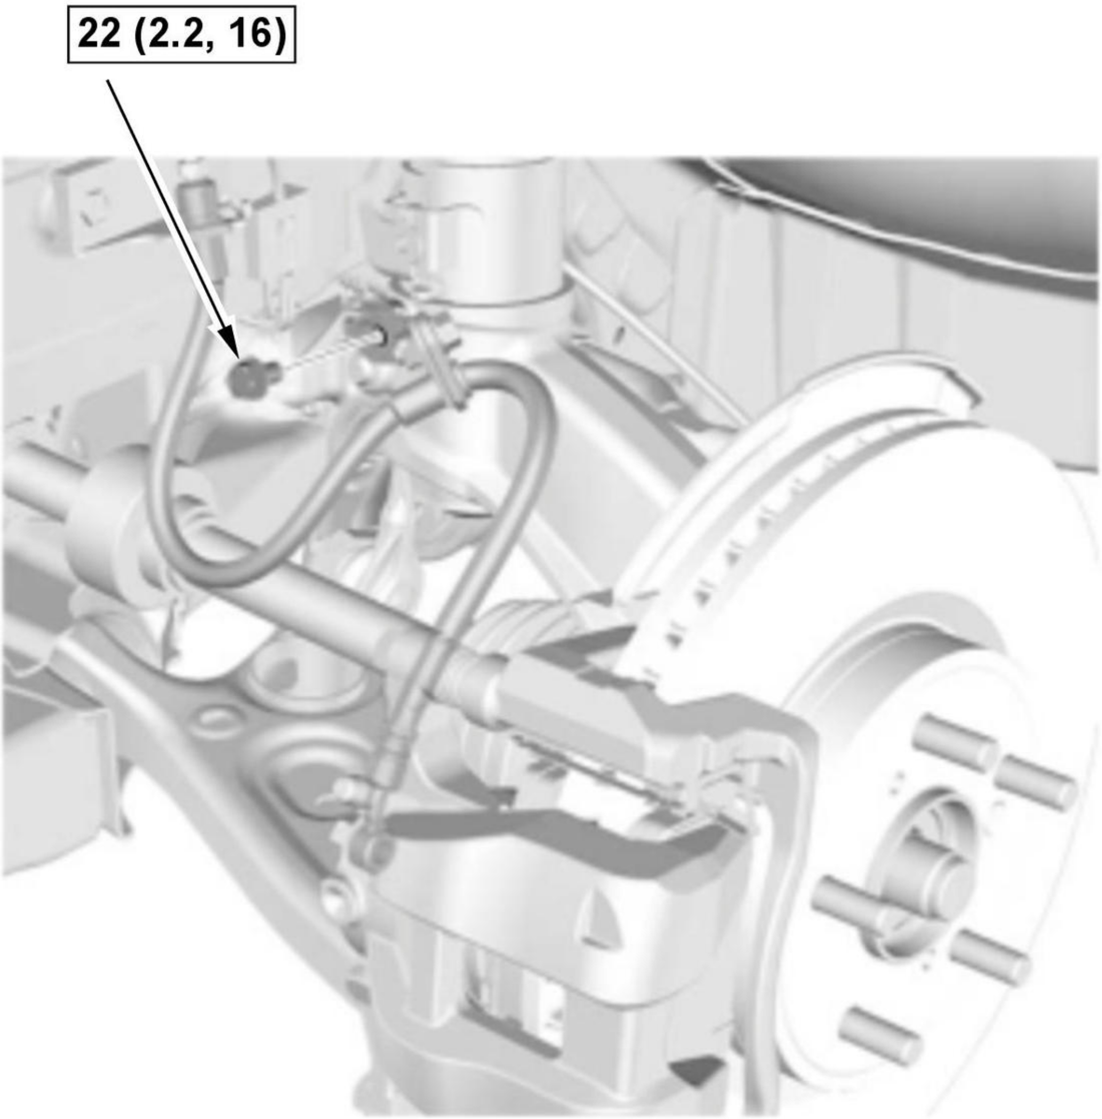
- How to read the torque specifications .
- Refer to the Exploded View as needed during the following procedures.
- Check for deterioration and damage to each part during removal.

Knuckle/Hub

1. Vehicle - Lift
2. Front Wheel - Remove
3. Front Wheel Speed Sensor - Remove

   NOTE: Do not disconnect the wheel speed sensor connector.

4. Brake Hose Bracket - Remove



5. Brake Caliper - Remove

1. Remove the caliper assembly without disconnecting the brake hose from the caliper body .

NOTE:

- **To prevent damage to the caliper assembly or brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage.**
- **Do not twist the brake**

hose excessively.

6. Front Spindle Nut - Remove
7. Front Brake Disc - Remove
8. Hub for Damage and Cracks - Check
9. Tie-Rod End Ball Joint - Disconnect
10. Lower Arm Ball Joint - Remove

    1. Disconnect the lower arm ball joint from the lower arm and the knuckle .

11. Knuckle/Hub Assembly - Remove

	1. Pull the knuckle (A) outward, and separate the outboard joint (B) from the front hub using a soft face hammer outward.**NOTE:** • Do not pull the driveshaft end outward. The inner driveshaft inboard joint may come apart. • During installation, apply specified grease to the contact area (C) of the outboard joint and the front wheel bearing . 2. Remove the damper pinch bolt (D). 3. Move the knuckle downward, and remove the knuckle from the damper. **NOTE:** **During installation, install the aligning tab (E) on the damper unit into the slot (F) of the knuckle.**

12. All Removed Parts - Install

    1. Install all removed parts in the reverse order of removal.

13. Wheel Alignment - Check

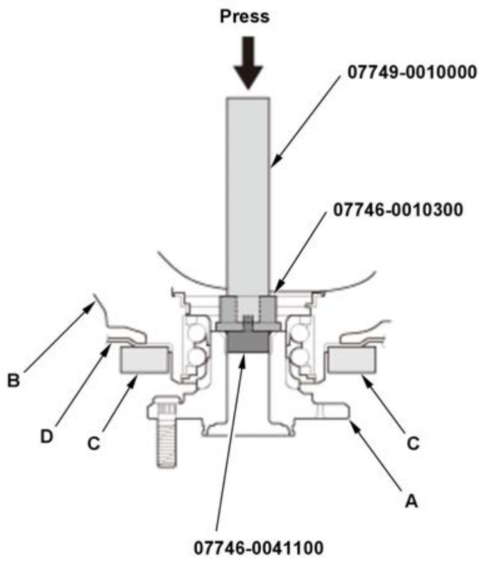
Replacement

NOTE:

- How to read the torque specifications .
- Refer to the Exploded View as needed during the following procedures.
- Check for deterioration and damage to each part during removal.

Wheel Bearing

1. Hub - Remove



Press

07746-0041100

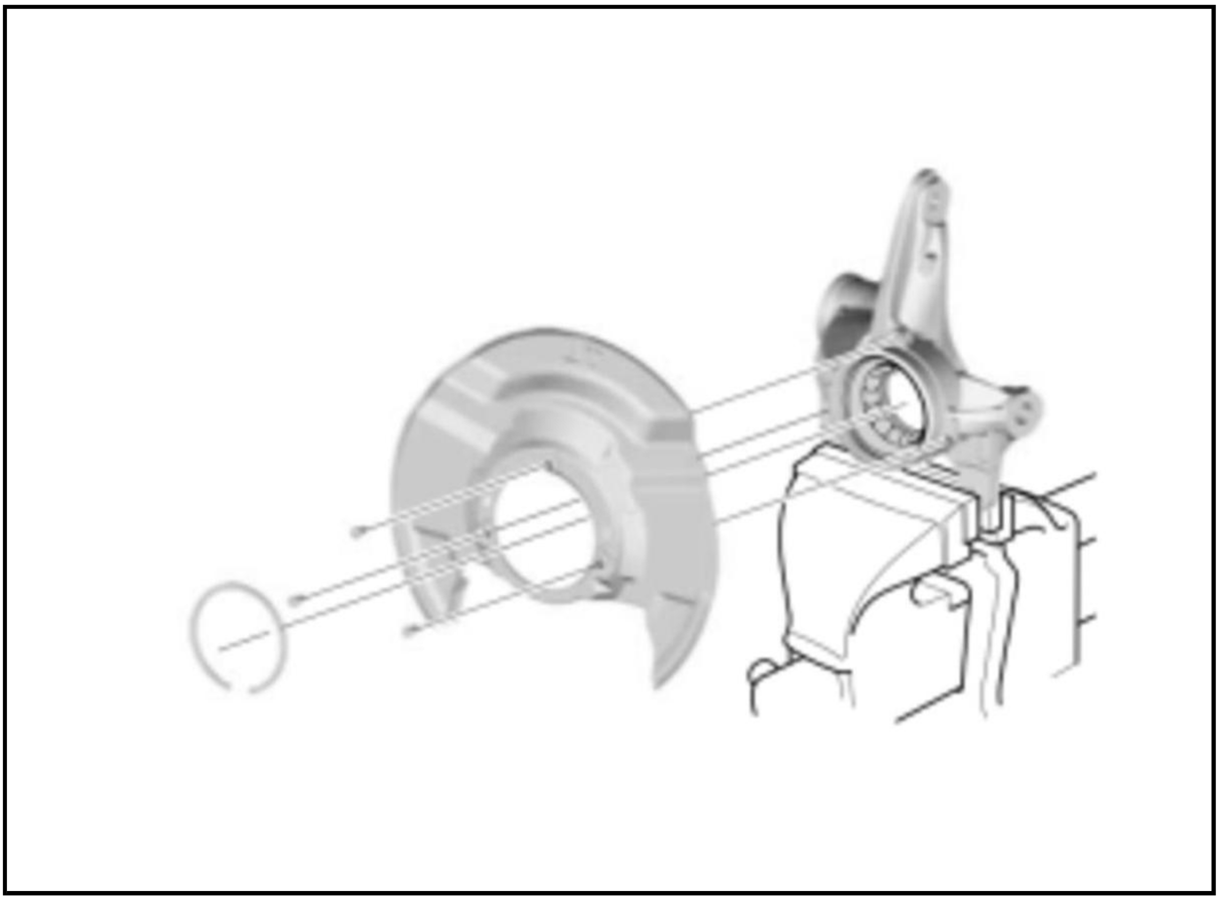
2. Press out the hub (A) from the wheel bearing inner race (B) using the driver handle, the bearing driver attachment, the pilot, a commercially available bearing separator (C), and a hydraulic press.

2. Splash Guard and Snap Ring - Remove

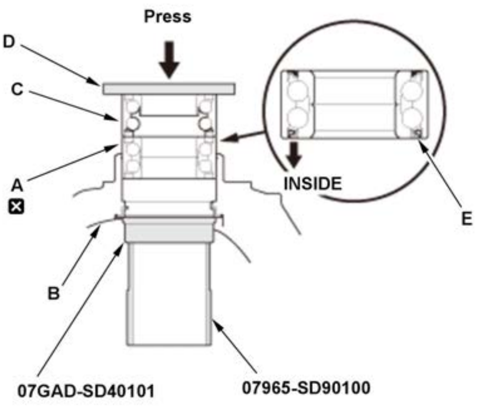


NOTE: Check for damaged or deformed snap ring, and replace it if damaged.

3. Bearing - Remove

 Press 07749-0010000 07746-0010500 B A	1. Press out the wheel bearing (A) from the knuckle (B) using the driver handle, the bearing driver attachment, and a hydraulic press.

4. Bearing - Install



1. Wash the knuckle and the hub thoroughly in high flash point solvent before reassembly.

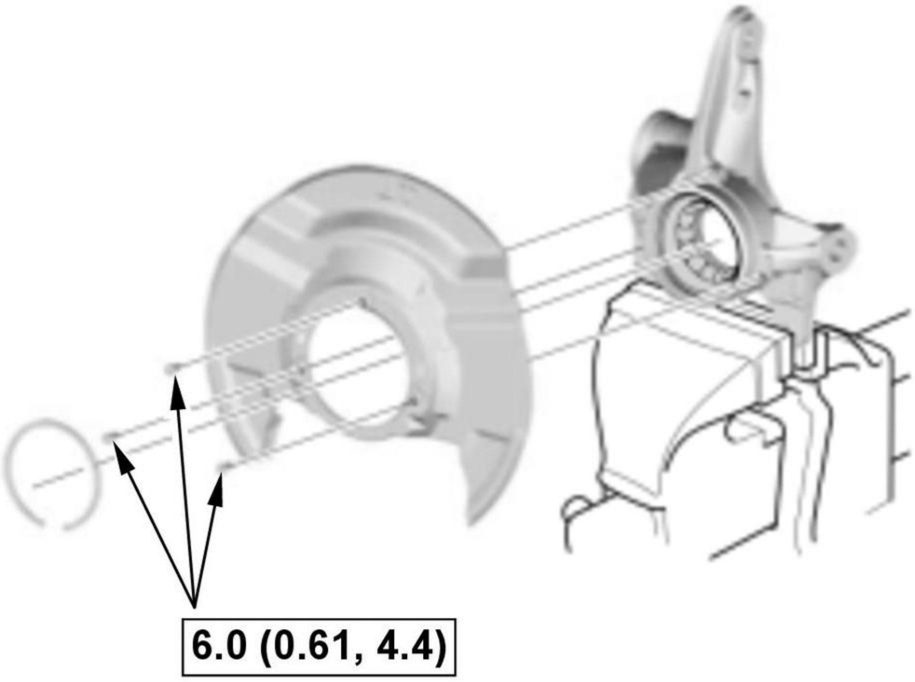
2. Press a new wheel bearing (A) into the knuckle (B) using the old bearing (C), a steel plate (D), the attachment, the support base, and a hydraulic press.

NOTE:

- **Install the wheel bearing with the wheel speed sensor magnetic encoder (E) (brown color) toward the inside of the knuckle.**
- **Remove any oil, grease, dust, metal debris, and other foreign material from the encoder surface.**
- **Keep any magnetic tools away from the encoder surface.**
- **Keep the wheel bearing and magnetic encoder away from any magnetic**

	field. The encoder can be damaged or erased. • **Be careful not to damage the encoder surface when you insert the wheel bearing.**

5. Splash Guard and Snap Ring - Install



NOTE: Check for damaged or deformed snap ring, and replace it if damaged.

6. Hub - Install

 Press 07749-0010000 07746-0010500 B C C A 07965-SD90100	1. Install the hub (A) into the wheel bearing (B) using the bearing driver attachment, the driver handle, the support base, and a hydraulic press.**NOTE:** Be careful not to damage the splash guard (C).

OVERHAUL

FRONT DAMPER/SPRING DISASSEMBLY, REASSEMBLY, AND INSPECTION

Special Tools Required

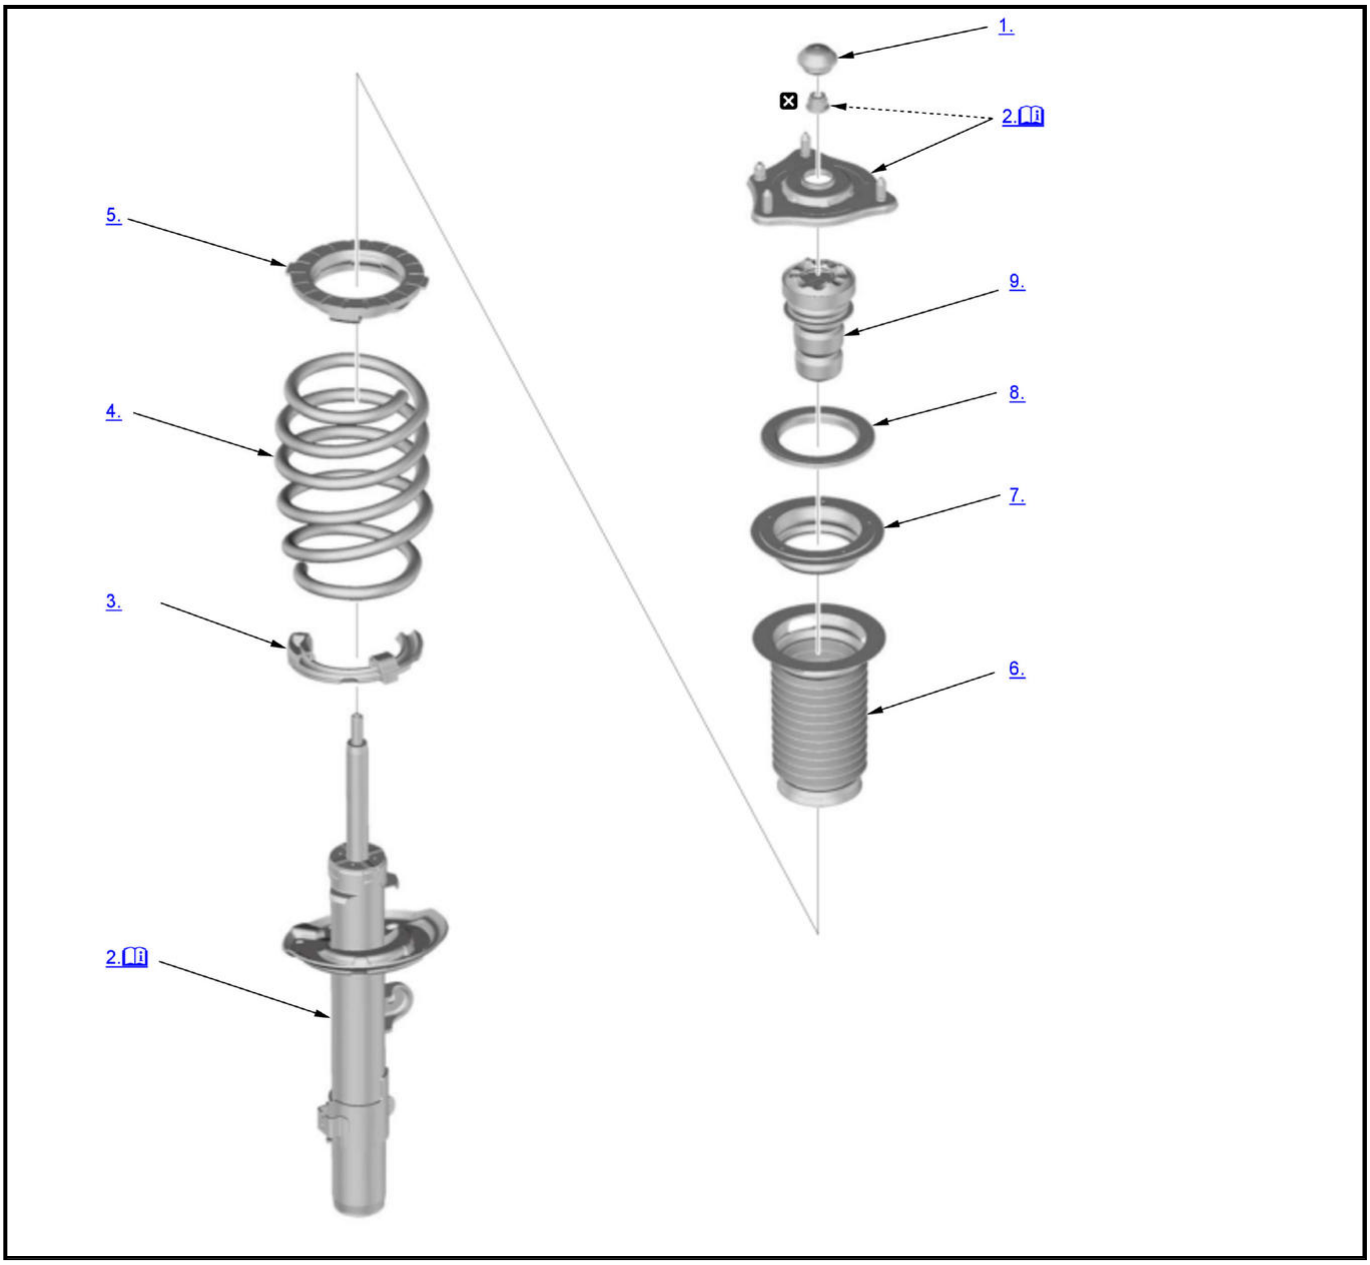
Image	Description/Tool Number
	Strut Nut Adapter 07AAA-SVAA100

Disassembly

NOTE:

- ℹ Where icon is shown, further information shown below.
- When compressing the damper spring, use a commercially available strut spring compressor according to the manufacturer's instructions.
- Check for deterioration and damage to each part during removal.

1



ℹ	Detailed information, notes, and precautions
☒	Replace

1. Damper Cap - Remove
2. Damper Unit, Damper Mounting Base - Remove

	1. Set the damper/spring to the strut spring compressor. 2. Compress the damper spring. **NOTE:** **Do not compress the spring more than necessary to remove the nut.** 3. Remove the self-locking nut (A) with the strut nut adapter (B), while holding the damper shaft with a hex wrench (C). 4. Remove the damper unit. 5. Release the pressure from the strut spring compressor. 6. Remove the damper mounting base/damper spring from the strut spring compressor.

3. Lower Spring Seat Rubber - Remove
4. Damper Spring - Remove
5. Upper Spring Seat Rubber - Remove
6. Dust Cover - Remove
7. Upper Spring Seat - Remove
8. Damper Mounting Bearing - Remove
9. Bump Stop - Remove

Inspection

1. Damper/Spring - Inspect

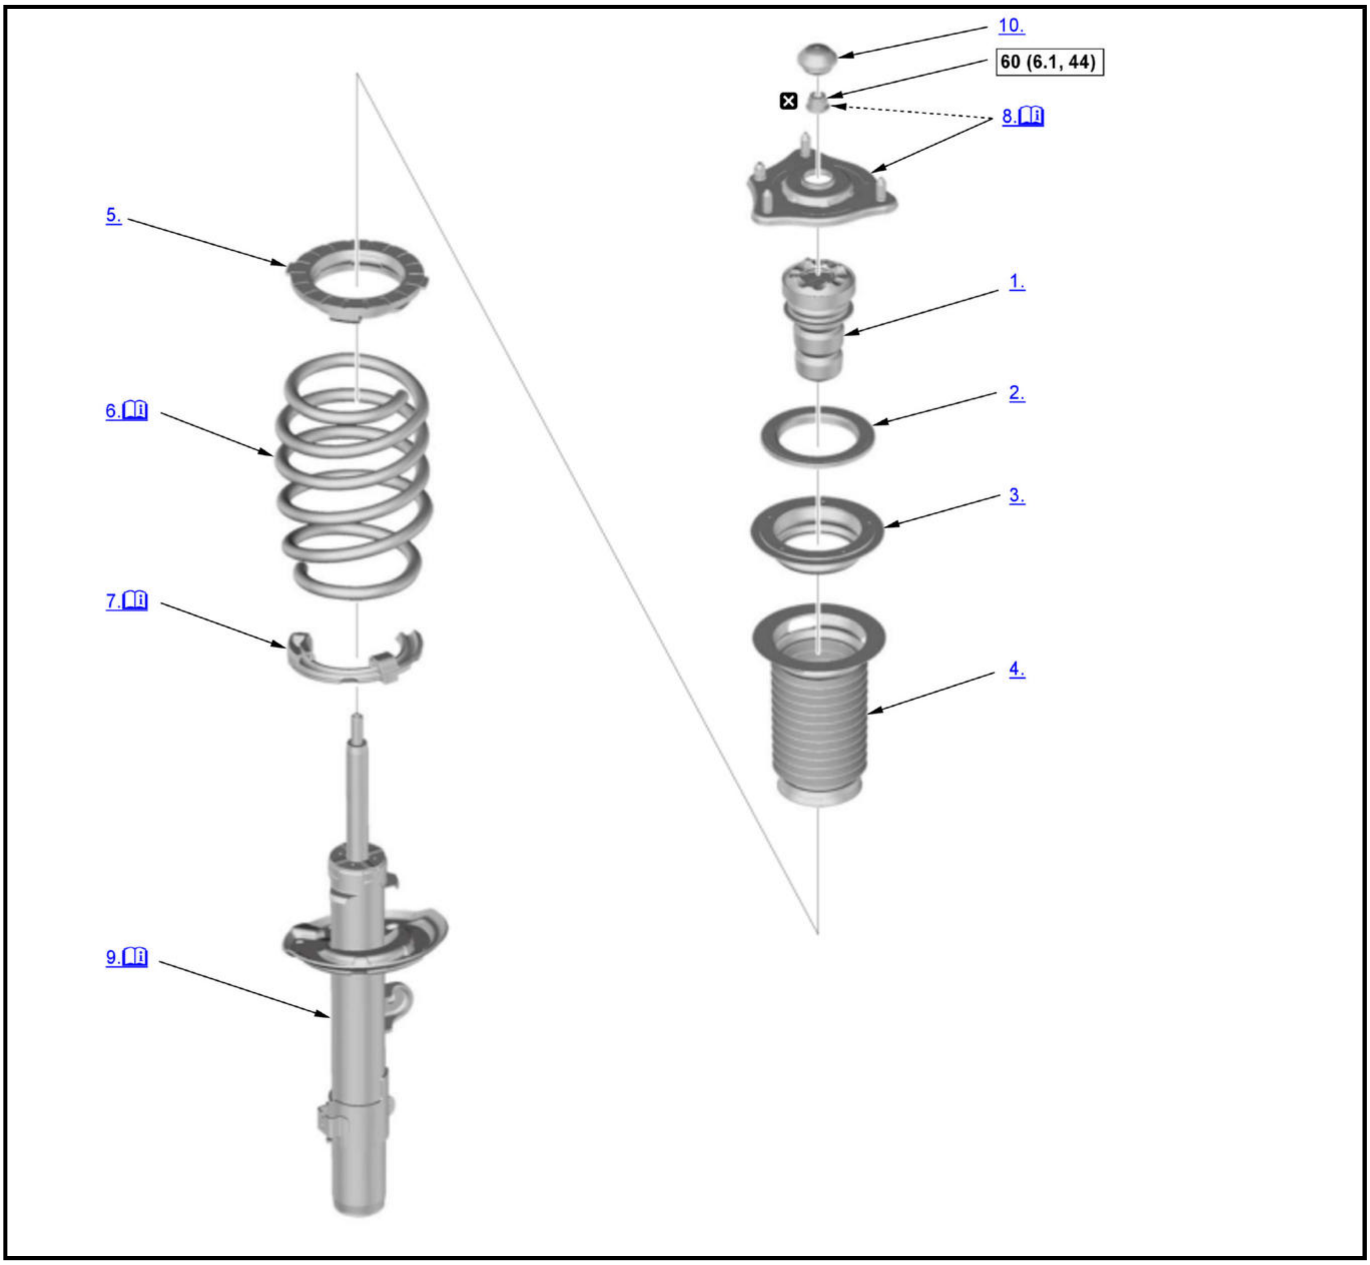
	1. Reassemble the damper mounting base and the self-locking nut. 2. Compress the damper assembly by hand, and check for smooth operation through a full stroke, both compression and extension. The damper should extend smoothly and constantly when compression is released. If it does not, the gas is leaking and the damper should be replaced. 3. Check for oil leaks, abnormal noises, or binding during these tests.

Reassembly

NOTE:

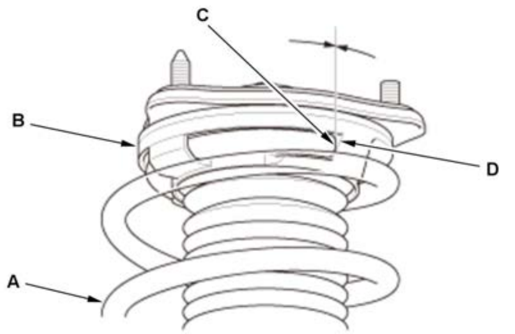
- ℹ Where icon is shown, further information shown below.
- When compressing the damper spring, use a commercially available strut spring compressor according to the manufacturer's instructions.

1



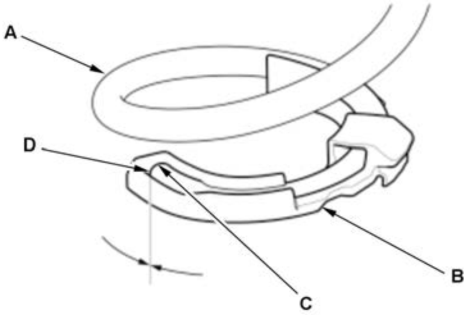
📖	Detailed information, notes, and precautions
▭	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Bump Stop - Install
2. Damper Mounting Bearing - Install
3. Upper Spring Seat - Install
4. Dust Cover - Install
5. Upper Spring Seat Rubber - Install
6. Damper Spring - Install



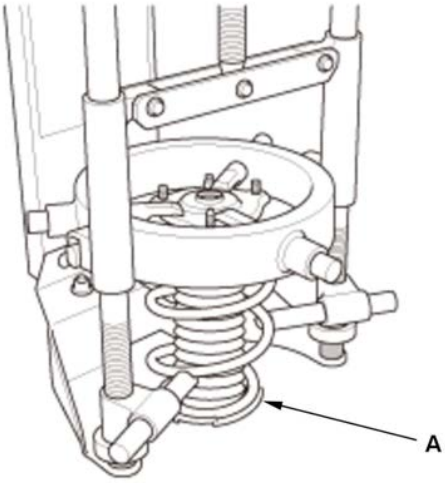
1. Install the damper spring (A) on the upper spring seat rubber (B) by aligning the upper end (C) of the damper spring with the ledge portion (D) of the upper spring seat rubber.

7. Lower Spring Seat Rubber - Remove



1. Install the damper spring (A) on the lower spring seat rubber (B) by aligning the upper end (C) of the damper spring with the ledge portion (D) of the lower spring seat.

8. Damper Mounting Base - Set



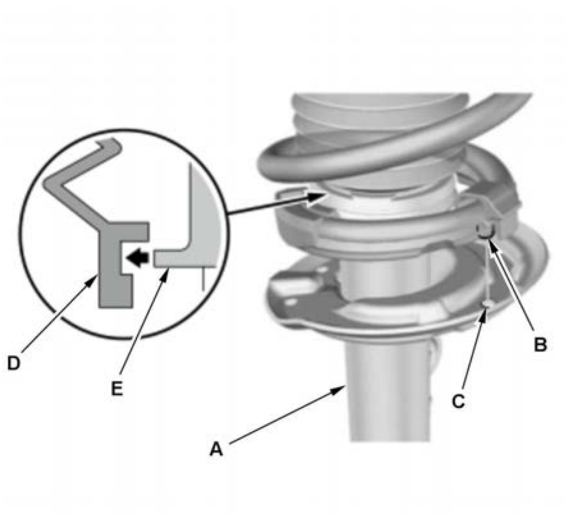
1. Set the damper mounting base/damper spring (A) to the strut spring compressor.

2. Compress the damper spring.

NOTE:

Do not compress the spring excessively.

9. Damper Unit - Install

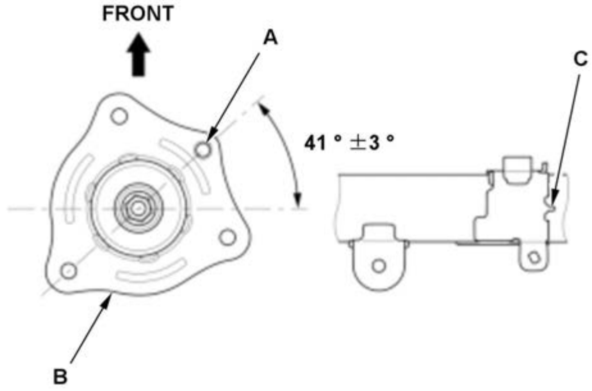


1. Install the damper unit (A) to the damper spring/damper mounting base.

2. Align the raised portion (B) of the lower spring seat rubber and the hole (C) of the lower spring seat on the damper unit.

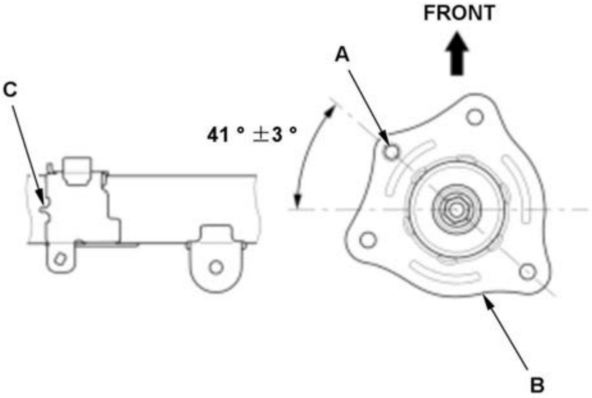
NOTE:

After reassembling the damper/spring, make sure that the dust cover (D) are properly positioned into the raised portion (E) of the damper unit.



Left side

Right side



3. Align the angle of the hole (A) on the damper mounting base (B) with the aligning tab (C) on the bottom of the damper unit as shown.

	4. Install the self-locking nut (A). 5. Hold the damper shaft using a hex wrench (B), and tighten the self-locking nut using the strut nut adapter (C) to the specified torque. 6. Remove the damper/spring from the strut spring compressor.

10. Damper Cap - Install

ADJUSTMENT

WHEEL ALIGNMENT (2017 2018 2019)

Check

1. Pre-Alignment - Check

	For proper inspection and adjustment of the wheel alignment, do these checks: 1. Release the parking brake to avoid an incorrect measurement. 2. Make sure the suspension is not modified. 3. Make sure the fuel tank is full and the spare tire, jack, and tools are in place inside the vehicle. 4. Check the tire size and tire pressure according to the tire information. 5. Set the steering column to the middle tilt position and telescopic position (if equipped). 6. Check the runout of the wheels and tires Hold a tire with your hands, and move it up and down and right and left to check for movement). 7. Check the suspension ball joints (Raise and support the vehicle 8. Before doing alignment inspections, be sure to remove all extra weight from the vehicle, and no one should be inside the vehicle (driver or passengers). 9. Lower the vehicle to the ground. Bounce the vehicle up and down several times to stabilize the suspension.

Inspection

Use a commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Caster - Inspect

1. Check the caster angle.
   - If the measurement is within the specifications, measure the camber angle.
   - If the measurement is not within the specifications, check for bent or damaged suspension components.

Caster angle:		
B	**2WD:**	**5B° 10 '+/-30 '**
B	**AWD:**	**5B° 04 '+/-30 '**

2. Camber - Inspect

1. Check the camber angle.
   - If the measurement is within the specification, measure the toe-in.
   - If the measurement for the front camber is not within specification, go to front camber adjustment.
   - If the measurement for the rear camber is not within specification, check for bent or damaged suspension components.

Camber angle:			
B	**2WD:**		
B	B	**Front:**	**-0B° 18 '+/-30 '**
B	B	**Rear:**	**-1B° 30 '+/-45 '**
B	**AWD:**		
B	B	**Front:**	**-0B° 12 '+/-30 '**
B	B	**Rear:**	**-1B° 12 '+/-45 '**
(Maximum difference between the right and left side: 0B° 45 ')			

3. Rear Toe - Inspect

NOTE: Do the rear toe inspection before the front toe inspection.

1. Release the parking brake to avoid an incorrect measurement.

2. Check the toe.

   - If adjustment is required, go to rear toe adjustment.
   - If no adjustment is required, go to front toe inspection.

Rear total toe-in:	**3.5 +1 -2 mm (0.138 +0.04 -0.08 in)**

4. Front Toe - Inspect

NOTE: Do the rear toe inspection before the front toe inspection.

1. Set the steering column to the middle tilt position and telescopic position (if equipped).

2. Center the steering wheel spokes, and hold it.

3. Check the toe with the wheels pointed straight ahead. • If adjustment is required, go to the front toe adjustment. • If no adjustment is required, remove the alignment equipment.

Front total toe-in:	**0 +/- 2 mm (0.00 +/- 0.08 in)**

5. Turning Angle - Inspect

	1. Turn the wheel right and left while applying the brake, and measure the turning angle of both wheels. • If the measurement is not within specifications, even up both sides of the tie-rod threaded section while adjusting the front toe. • If it is correct, but the turning angle is not within the specifications, check for bent or damaged suspension components.

Turning angle:			
B	**2WD:**		
B	B	**Inward:**	**37B° 20 '+/-2B°**
B	B	**Outward (reference):**	**30B° 53 '**
B	**AWD:**		
B	B	**Inward:**	**37B° 40 '+/-2B°**
B	B	**Outward (reference):**	**31B° 02 '**

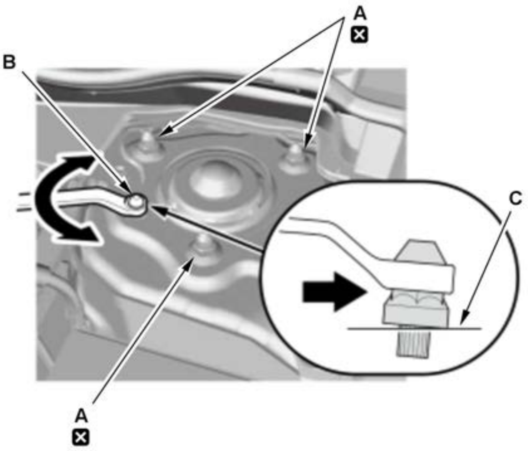
Adjustment

The suspension can be adjusted for front camber, front toe, and rear toe. However, each of these adjustments are related to each other. For example, when you adjust camber, the toe will change.

NOTE:

- **How to read the torque specifications** .
- After adjusting the wheel alignment, **do the VSA sensor neutral position memorization** .
- Unless otherwise indicated, illustrations used in the procedure are for AWD model.

1. **Vehicle - Lift**
2. Front Camber - Adjust

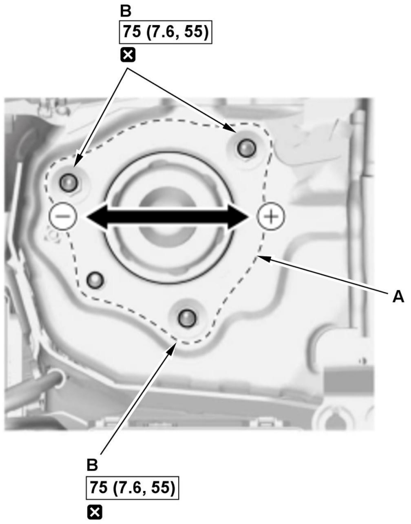


1. Replace the flange nuts (A) with new ones, and lightly tighten them.

2. If the guide pin (B) is equipped, use a wrench to rock the guide pin left and right while pulling it out from the damper mounting base (C).

NOTE:

The guide pin is for factory assembly use only and can be discarded after removal.



3. Adjust the camber angle by moving the upper part of the damper (A).**NOTE:**

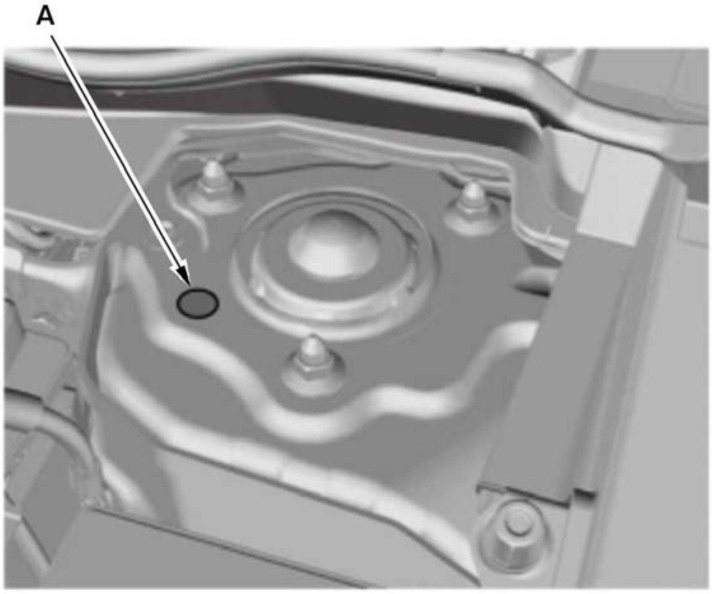
NOTE:

The camber angle can be adjusted +/-15 '.

4. Tighten the flange nuts (B) to the specified torque.

5. Lower the vehicle to the ground, and bounce the front of the vehicle up and down several times to stabilize the suspension.

6. Measure the camber angle. If the camber angle is not within specification, readjust the camber angle. If the camber measurement is correct, measure toe-in, and adjust it if necessary.

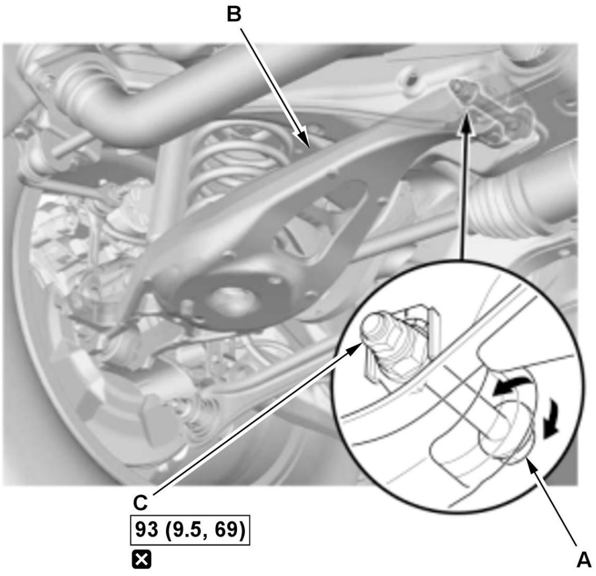


7. Install the hole seal (A) after the guide pin is removed.

NOTE:

Refer to the Parts Catalog for the hole seal.

3. Rear Toe - Adjust



NOTE: Do the rear toe adjustment before the front toe adjustment.

1. Hold the adjusting bolt (A) on lower arm B, and remove the self-locking nut (C).

2. Replace the self-locking nut with a new one, and lightly tighten it.

NOTE:

- **Always use a new self-locking nut whenever it has been loosened.**
- **Reassemble the adjusting bolt and the adjusting cam plate with the eccentric facing up.**

3. Adjust the rear toe by turning the adjusting bolt until the toe is correct.

4. Tighten the self-locking nut to the specified torque while holding the adjusting bolt.

4. Front Toe - Adjust

	**NOTE:** Do the rear toe adjustment before the front toe adjustment. 1. Loosen the tie-rod end locknuts (A) while holding the flat surface sections (B) of the tie-rod end with a wrench, and turn both tie-rods (C) until the front toe is within specifications. 2. After adjusting, tighten the tie-rod end locknuts to the specified torque. **NOTE:** **Reposition the rack-end boot if it is twisted or displaced.**

5. VSA Sensor Neutral Position - Memorize

WHEEL ALIGNMENT (2020 2021)

Check

1. Pre-Alignment - Check

	For proper inspection and adjustment of the wheel alignment, do these checks: 1. Release the parking brake to avoid an incorrect measurement. 2. Make sure the suspension is not modified. 3. Make sure the fuel tank is full and the spare tire, jack, and tools are in place inside the vehicle. 4. Check the tire size and tire pressure according to the tire information. 5. Set the steering column to the middle tilt position and telescopic position (if equipped). 6. Check the runout of the wheels and tires Hold a tire with your hands, and move it up and down and right and left to check for movement). 7. Check the suspension ball joints (Raise and support the vehicle 8. Before doing alignment inspections, be sure to remove all extra weight from the vehicle, and no one should be inside the vehicle (driver or passengers).

	9. Lower the vehicle to the ground. Bounce the vehicle up and down several times to stabilize the suspension.

Inspection

Use a commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Caster - Inspect

1. Check the caster angle.
    - If the measurement is within the specifications, measure the camber angle.
    - If the measurement is not within the specifications, check for bent or damaged suspension components.

Caster angle:		
B	**2WD:**	**5B° 10 '+/-30 '**
B	**AWD:**	**5B° 04 '+/-30 '**

2. Camber - Inspect

1. Check the camber angle.
    - If the measurement is within the specification, measure the toe-in.
    - If the measurement for the front camber is not within specification, go to front camber adjustment.
    - If the measurement for the rear camber is not within specification, check for bent or damaged suspension components.

Camber angle:			
B	**2WD:**		
B	B	**Front:**	**-0B° 18 '+/-30 '**
B	B	**Rear:**	**-1B° 30 '+/-45 '**
B	**AWD:**		
B	B	**Front:**	**-0B° 12 '+/-30 '**
B	B	**Rear:**	**-1B° 12 '+/-45 '**
(Maximum difference between the right and left side: 0B° 45 ')			

3. Rear Toe - Inspect

NOTE: Do the rear toe inspection before the front toe inspection.

1. Release the parking brake to avoid an incorrect measurement.

2. Check the toe.

- If adjustment is required, go to rear toe adjustment.
- If no adjustment is required, go to front toe inspection.

Rear total toe-in:	**3.5 +1 -2 mm (0.138 +0.04 -0.08 in)**

4. Front Toe - Inspect

NOTE: Do the rear toe inspection before the front toe inspection.

1. Set the steering column to the middle tilt position and telescopic position (if equipped). 2. Center the steering wheel spokes, and hold it. 3. Check the toe with the wheels pointed straight ahead. • If adjustment is required, go to the front toe adjustment. • If no adjustment is required, remove the alignment equipment.

Front total toe-in:	**2 +/- 2 mm (0.08 +/- 0.08 in)**

5. Turning Angle - Inspect

	1. Turn the wheel right and left while applying the brake, and measure the turning angle of both wheels. • If the measurement is not within specifications, even up both sides of the tie-rod threaded section while adjusting the front toe. • If it is correct, but the turning angle is not within the specifications, check for bent or damaged suspension components.

Turning angle:			
B	**2WD:**		
B	B	**Inward:**	**37B° 20 '+/-2B°**
B	B	**Outward (reference):**	**30B° 53 '**
B	**AWD:**		
B	B	**Inward:**	**37B° 40 '+/-2B°**
B	B	**Outward (reference):**	**31B° 02 '**

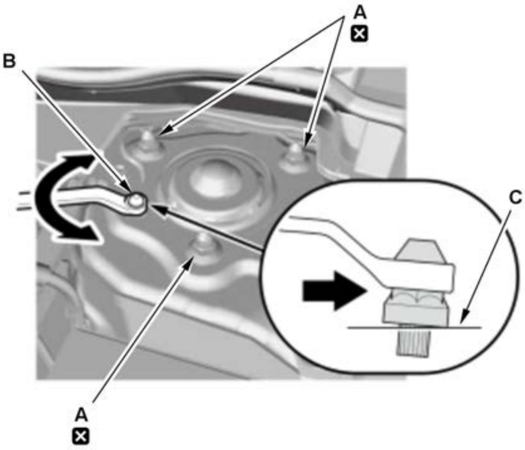
Adjustment

The suspension can be adjusted for front camber, front toe, and rear toe. However, each of these adjustments are related to each other. For example, when you adjust camber, the toe will change.

NOTE:

- **How to read the torque specifications** .
- After adjusting the wheel alignment, **do the VSA sensor neutral position memorization** .
- Unless otherwise indicated, illustrations used in the procedure are for AWD model.

1. **Vehicle - Lift**
2. Front Camber - Adjust

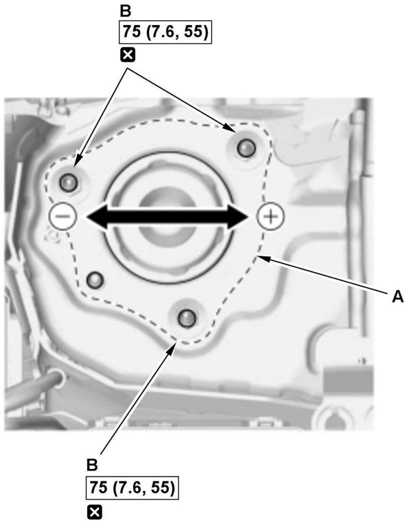


1. Replace the flange nuts (A) with new ones, and lightly tighten them.

2. If the guide pin (B) is equipped, use a wrench to rock the guide pin left and right while pulling it out from the damper mounting base (C).

NOTE:

The guide pin is for factory assembly use only and can be discarded after removal.



3. Adjust the camber angle by moving the upper part of the damper (A).

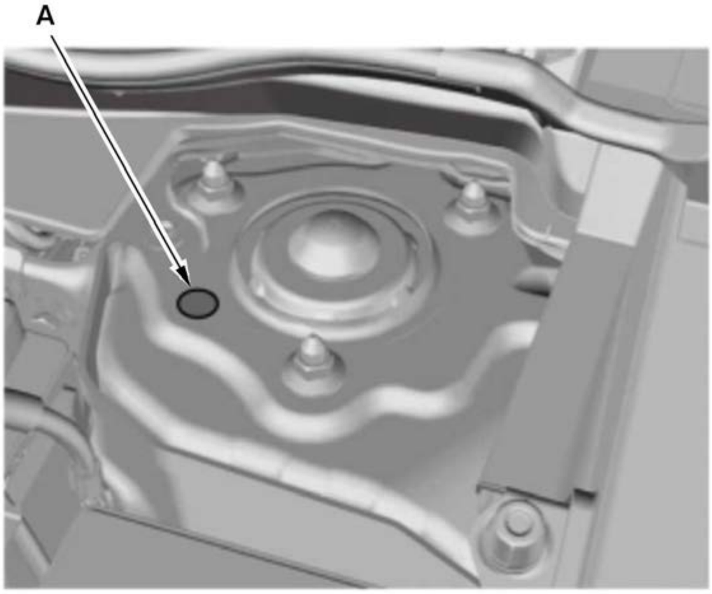
NOTE:

The camber angle can be adjusted +/-15 '.

4. Tighten the flange nuts (B) to the specified torque.

5. Lower the vehicle to the ground, and bounce the front of the vehicle up and down several times to stabilize the suspension.

6. Measure the camber angle. If the camber angle is not within specification, readjust the camber angle. If the camber measurement is correct, measure toe-in, and adjust it if necessary.

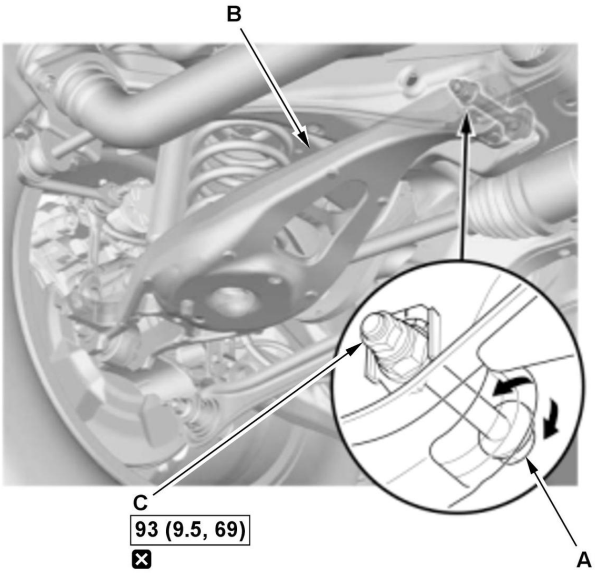


7. Install the hole seal (A) after the guide pin is removed.

NOTE:

Refer to the Parts Catalog for the hole seal.

3. Rear Toe - Adjust



NOTE: Do the rear toe adjustment before the front toe adjustment.

1. Hold the adjusting bolt (A) on lower arm B, and remove the self-locking nut (C).

2. Replace the self-locking nut with a new one, and lightly tighten it.

NOTE:

- **Always use a new self-locking nut whenever it has been loosened.**
- **Reassemble the adjusting bolt and the adjusting cam plate with the eccentric facing up.**

3. Adjust the rear toe by turning the adjusting bolt until the toe is correct.

4. Tighten the self-locking nut to the specified torque while holding the adjusting bolt.

4. Front Toe - Adjust

	**NOTE:** Do the rear toe adjustment before the front toe adjustment. 1. Loosen the tie-rod end locknuts (A) while holding the flat surface sections (B) of the tie-rod end with a wrench, and turn both tie-rods (C) until the front toe is within specifications. 2. After adjusting, tighten the tie-rod end locknuts to the specified torque. **NOTE:** **Reposition the rack-end boot if it is twisted or displaced.**

5. VSA Sensor Neutral Position - Memorize

INSPECTION

FRONT LOWER ARM BALL JOINT INSPECTION

Inspection

NOTICE:

When inspecting the ball joint, the vehicle will be shake strongly. Make sure support the front jacking bracket correctly with the suitable jack.

1. Vehicle - Lift
2. Front Wheel - Remove
3. Lower Ball Joint - Inspect

 	1. Check all bolts, nuts, and bushings on the suspension components, and make sure that there are not looseness, deteriorated or damaged. 2. Hold the outside of lower arm (A) with your hands, and move it up and down to check for abnormal noise or wobbling.**NOTE:** - If the lower ball joint is abnormal, replace the lower ball joint . - A problem on the lower ball joint may be caused by an abnormal clearance (B).

 	3. Check the ball joint boot (A) for weakness, damage, cracks, and inner boot grease leaks. **NOTE:** **If the ball joint boot is damaged, weakness, and cracks replace the lower ball joint .**

4. Front Wheel - Install

WHEEL BEARING END PLAY INSPECTION

Inspection

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Front Wheels and Rear Wheels - Remove
3. Wheel Bearing End Play - Inspect

	1. Install suitable flat washers (A). 2. Install the wheel nuts (B). 3. Tighten the nuts to the specified torque to hold the brake disc securely against the hub. 4. Attach the dial gauge (C). 5. Place the dial gauge against the hub flange. 6. Measure the bearing end play while moving the brake disc inward and outward. 7. If the bearing end play measurement is more than the standard, **replace the wheel bearing** or **the hub bearing unit** .

Wheel bearing end play:		
B	**Front/Rear:**	**0-0.05 mm (0-0.0020 in)**

4. **Front Wheels and Rear Wheels - Install**

WHEEL RUNOUT INSPECTION

Inspection

1. **Vehicle - Lift**
2. Wheel Runout - Inspect

**Axial runout**	1. Check for bent or deformed wheels. 2. Set up the dial gauge as shown. 3. Measure the axial runout by turning the wheel.

Front and rear wheel axial runout:		
B	**Standard:**	**0-0.3 mm (0-0.012 in)**
B	**Service limit:**	**2.0 mm (0.079 in)**

Radial runout 	4. Reset the dial gauge to the position shown. 5. Measure the radial runout. 6. If the wheel runout is not within the specification, **check the wheel bearing end play** , and make sure the mating surfaces between the brake disc and the inside of the wheel are clean. 7. If the bearing end play is within the specification but the wheel runout is more than the service limit, **replace the wheel** .

Front and rear wheel radial runout:		
B	**Standard:**	**0-0.3 mm (0-0.012 in)**
B	**Service limit:**	**1.5 mm (0.059 in)**

NOTE: After reassembling the damper, make sure that the dust cover are properly positioned into the raised portion of the damper unit.

Removal and Installation

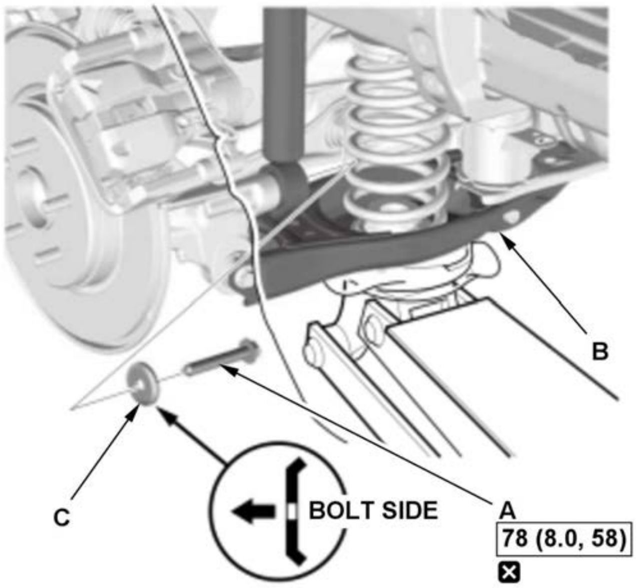
NOTE:

- **How to read the torque specifications** .
- Refer to the Exploded View as needed during the following procedures.
- Check for deterioration and damage to each part during removal.
- Unless otherwise indicated, illustrations used in the procedure are for AWD model.

1. **Vehicle - Lift**
2. **Rear Wheel - Remove**
3. Damper - Remove



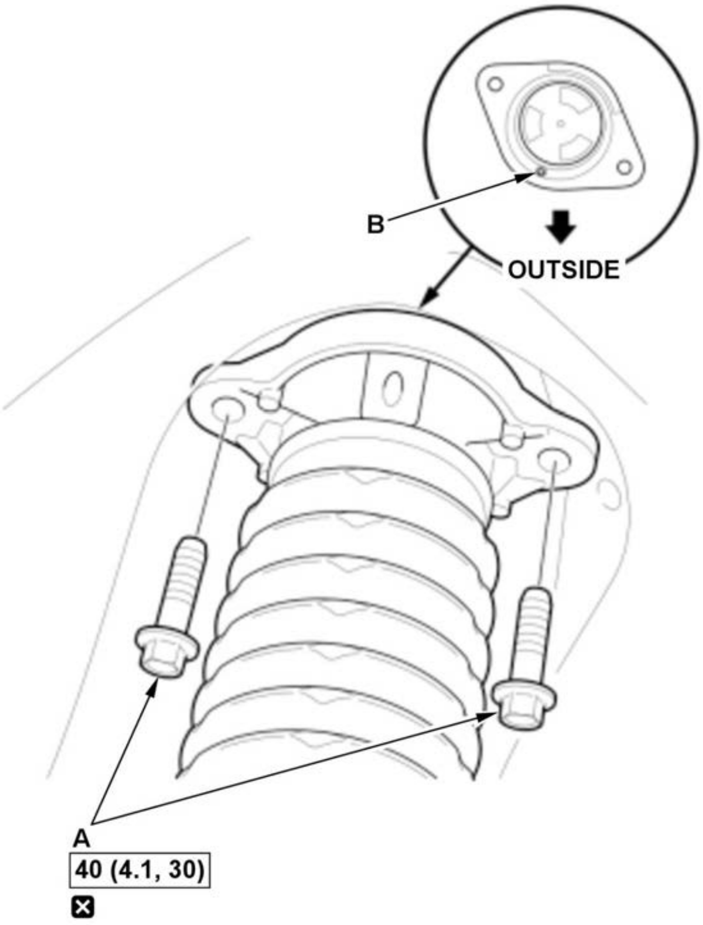
1. Position a floor jack under lower arm B.

2. Raise the floor jack until the suspension begins to compress.

3. Remove the damper lower mounting bolt (A) and the washer (C).

NOTE:

Use a new bolt during reassembly.



4. Remove the damper upper mounting bolts (A).

NOTE:

- **During installation, install the damper unit in the body with the hole (B) facing outside.**
- **Do not let the damper drop down under its own weight.**
- **Be careful not to damage the body.**
- **Use new flange bolts during reassembly.**

4. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

NOTE:

Loosely install the nuts and/or bolts to install the bushings, load the suspension with the vehicle's weight, and then tighten the nuts and/or bolts to the specified torque.

5. Wheel Alignment - Check

Inspection

1. Rear Damper - Inspect

	1. Install the damper mounting base and the self-locking nut. 2. Compress the damper assembly by hand, and check for smooth operation through a full stroke, both compression and extension. The damper should extend smoothly and constantly when compression is released. If it does not, the gas is leaking and the damper should be replaced. 3. Check for oil leaks, abnormal noises, and binding during these tests.

REMOVAL AND INSTALLATION

FRONT DAMPER/SPRING REMOVAL AND INSTALLATION

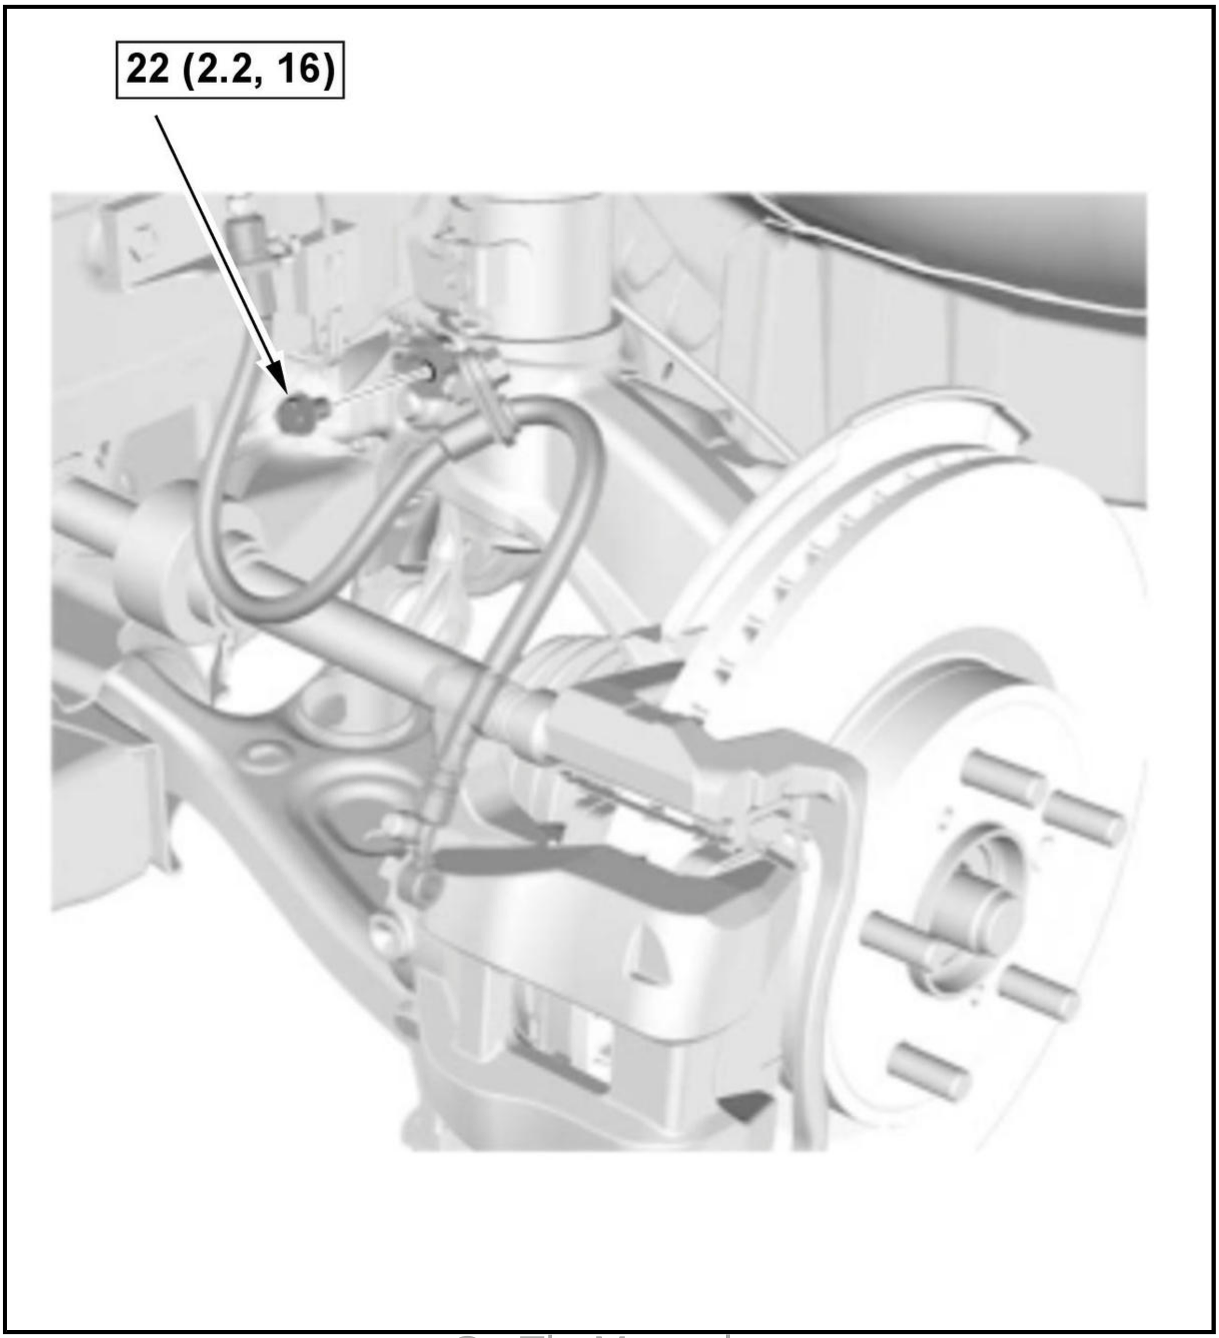
Removal and Installation

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Front Wheel - Remove
3. Front Wheel Speed Sensor - Remove

NOTE: **Do not disconnect the wheel speed sensor connector.**

4. Brake Hose Bracket - Remove



5. Brake Caliper - Remove

1. Remove the caliper assembly without disconnecting the brake hose from the caliper body .

NOTE:

- **To prevent damage to the caliper assembly or brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage.**
- **Do not twist the brake hose excessively.**

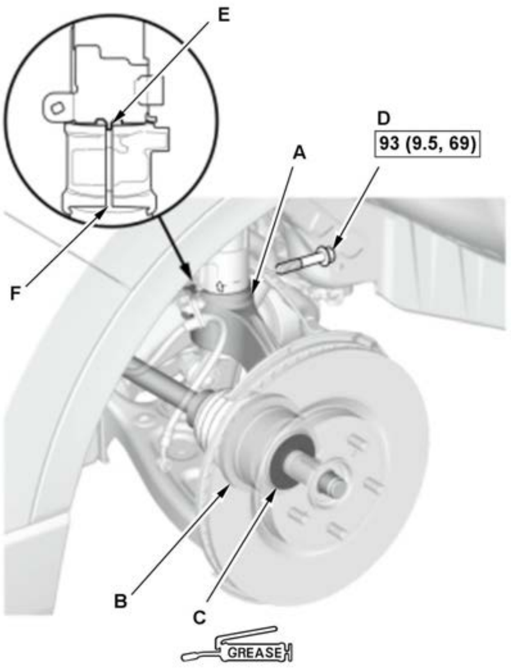
6. Stabilizer Link - Disconnect

1. Disconnect both sides of the stabilizer link from the damper.

7. Front Spindle Nut - Remove
8. Tie-Rod End Ball Joint - Disconnect
9. Lower Arm Ball Joint - Disconnect

1. Disconnect the lower arm ball joint from the lower arm.

10. Knuckle/Hub Assembly - Remove



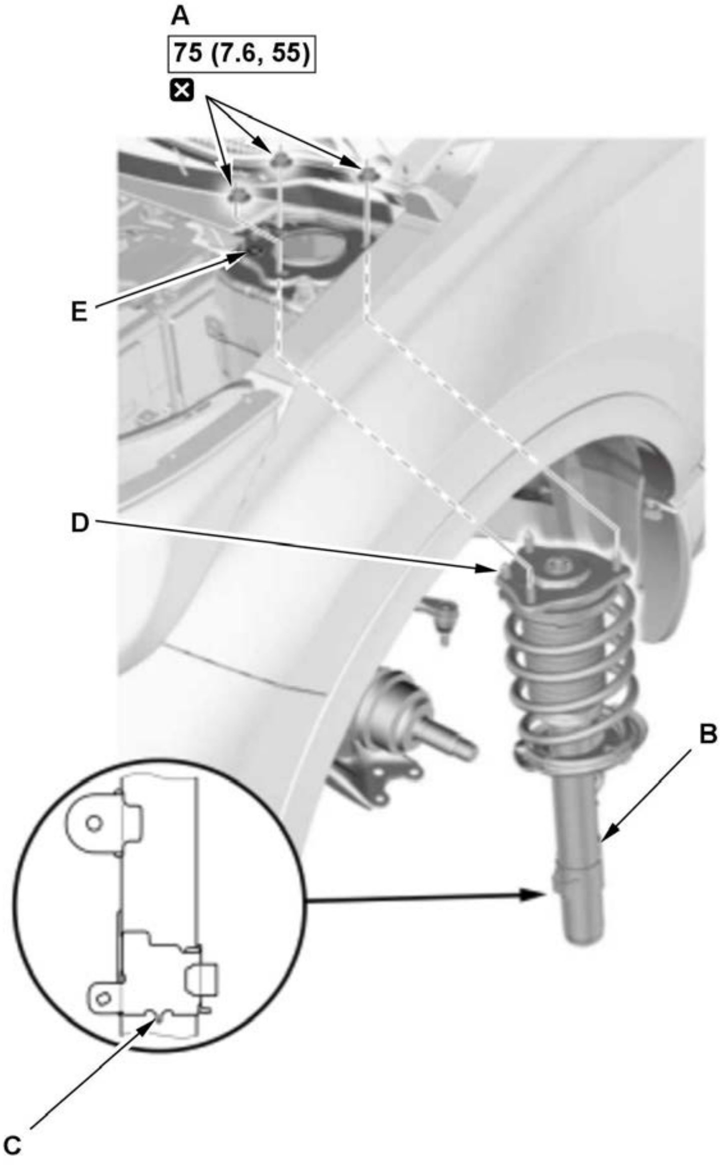
1. Pull the knuckle (A) outward, and separate the outboard joint (B) from the front hub using a soft face hammer outward.

NOTE:

- **Do not pull the driveshaft end outward. The inner driveshaft inboard joint may come apart.**
- **During installation, apply specified grease to**

	the contact area (C) of the outboard joint and the front wheel bearing . 2. Remove the damper pinch bolt (D). 3. Move the knuckle downward, and remove the knuckle from the damper. **NOTE:** **During installation, install the aligning tab (E) on the damper unit into the slot (F) of the knuckle.**

11. Damper/Spring - Remove



1. Remove the flange nuts (A).

NOTE:

- **Do not let the damper/spring drop down under its own weight.**
- **Use new flange nuts during reassembly.**

2. Remove the damper/spring (B).

NOTE:

- **Be careful not to damage the body.**
- **During installation, install the damper/spring in the body with the aligning tab (C) facing inside.**
- **During installation, if the guide pin (D) is equipped, align the guide pin with the body hole (E).**

12. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

13. Wheel Alignment - Check

FRONT LOWER ARM BALL JOINT REMOVAL AND INSTALLATION

Special Tools Required

Image	Description/Tool Number
	Ball Joint Thread Protector, 14 mm 07AAE-SJAA100
	Ball Joint Remover, 32 mm 07MAC-SL00102

Removal and Installation

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Front Wheel - Remove
3. Lower Arm Ball Joint - Disconnect

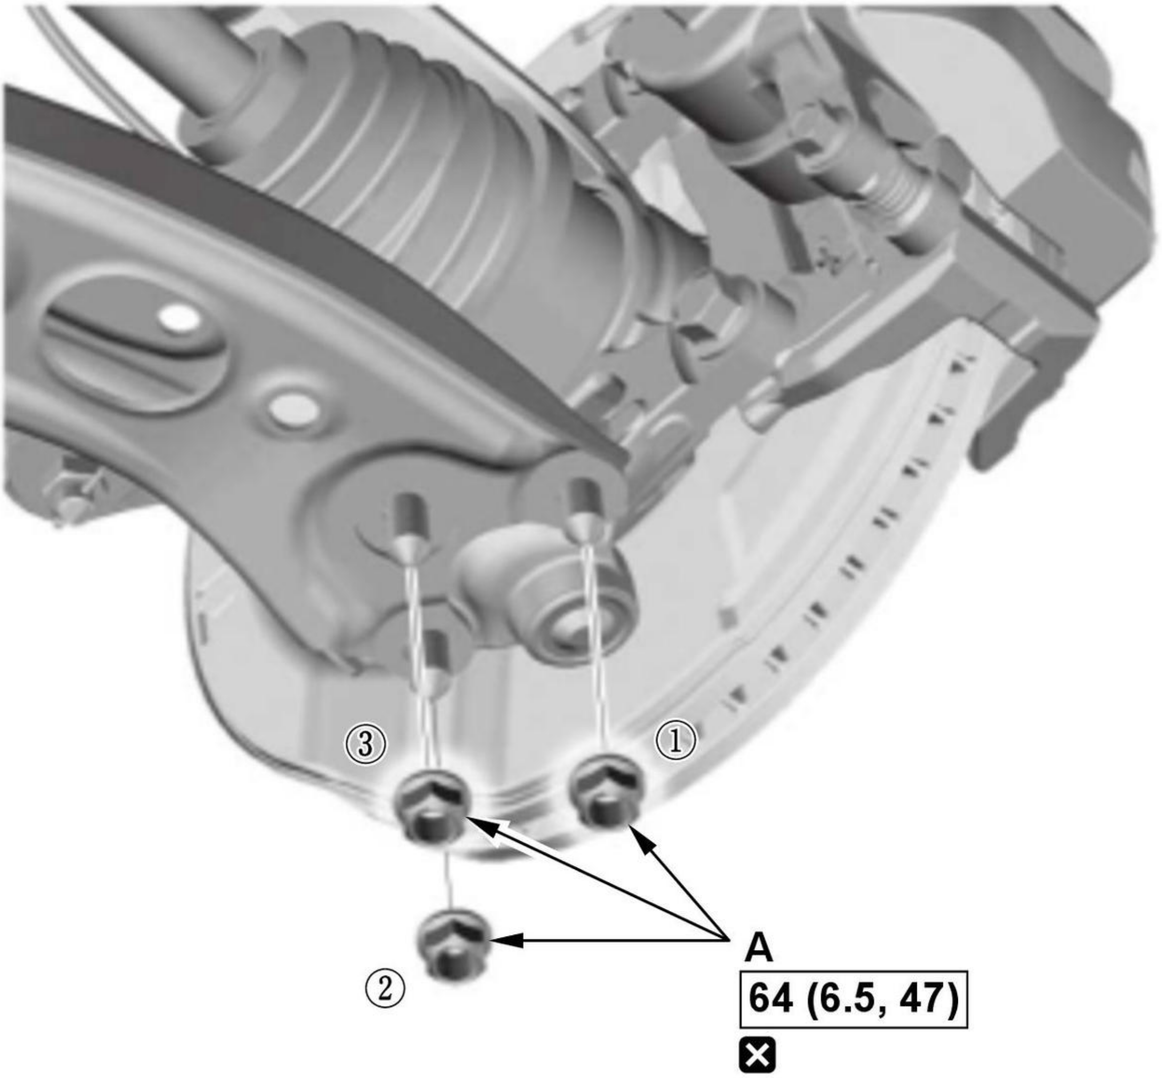


Fig. 1: Tightening Lower Arm Ball Joint Nuts With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

NOTE: During reassembly, loosely install new flange nuts (A), then tighten them to the specified torque in the numbered sequence shown in illustration.

4. **Front Spindle Nut - Remove**
5. Driveshaft - Disconnect

	1. Pull the knuckle (A) outward, and separate the outboard joint (B) from the front hub using a soft face hammer outward, then move aside the knuckle/hub. **NOTE:** - **Do not pull the driveshaft end outward. The inner driveshaft inboard joint may**

	come apart. - During installation, apply specified grease to the contact area (C) of the outboard joint and the front wheel bearing .

6. Lower Arm Ball Joint - Remove

 07AAE-SJAA100 B 78−88 (8.0−9.0, 58−65) ☒ C A 07MAC-SL00102	1. Remove the lock pin (A). **NOTE:** **During installation, install the lock pin as shown after tightening the new castle nut.** 2. Remove the castle nut (B). **NOTE:** **Use a new castle nut during reassembly.** 3. Disconnect the lower ball joint (C) from the knuckle using the ball joint thread protector and the ball joint remover .**NOTE:** Be careful not to damage the ball joint boot when installing the ball joint remover.

7. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal. **NOTE:** - **Be careful not to damage the ball joint boot when**

connecting the knuckle.

- **Before connecting the ball joint, degrease the threaded section and the tapered portion of the ball joint pin, the ball joint connecting hole, the threaded section, and the mating surfaces of the castle nut.**
- **Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.**

8. Wheel Alignment - Check

FRONT LOWER ARM COMPLIANCE BUSH REMOVAL AND INSTALLATION

Removal

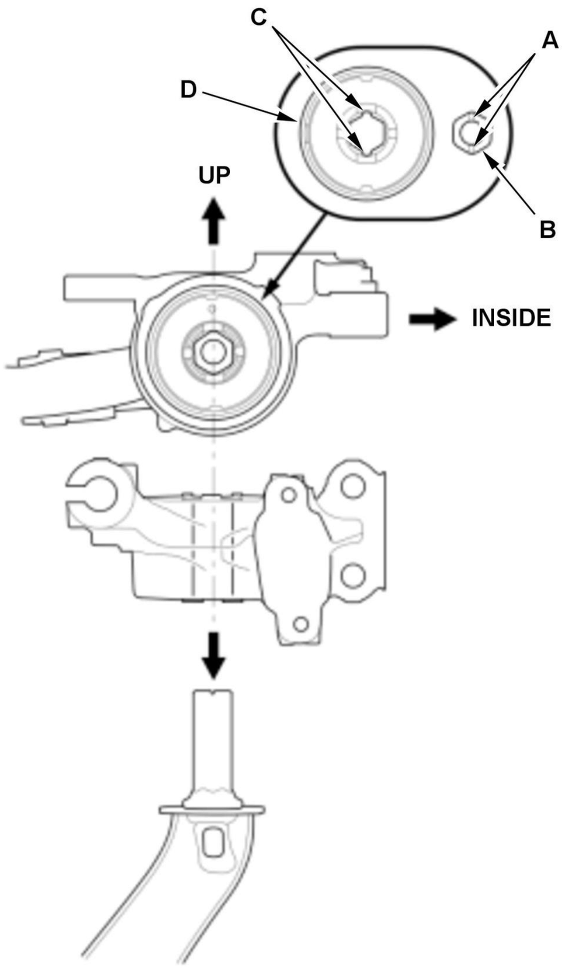
1. Vehicle - Lift
2. Front Wheel - Remove
3. Lower Arm - Remove
4. Lower Arm Compliance Bushing - Remove

	1. Make a mark (A) on the lower arm (B) right above the bushing opening. **NOTE:** **This mark will aid you during the bushing installation process.**

	2. Support the lower arm (A) on suitable bar (B) as shown in illustration. 3. Press out the lower arm with a suitable socket and a hydraulic press, and remove the lower arm from the bushing (C). **NOTE:** **Be careful not to damage the inside of the bushing hole when pressing on the bushing.**

Installation

1. Lower Arm Compliance Bushing - Install

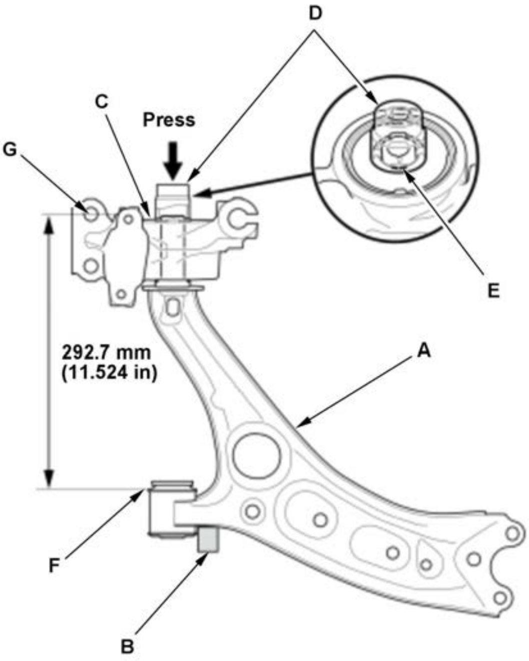


1. Clean the mating surfaces of the new bushing and the lower arm.

2. Apply a mild soap and water solution to the bushing surface.

3. Align the grooves (A) of the lower arm (B) and the groove (C) of the bushing (D).

4. Press in the bushing by hand first.



5. Support the lower arm (A) on suitable square lumber (B) as shown.

6. Press in the bushing (C) with a suitable socket (D) and a hydraulic press.

NOTE:

Press the bushing into the lower arm until the mark (E) meets the edge of the bushing opening.

7. Make sure the distance between the lower arm mounting surface (F) and the center of the bolt hole (G) is within the dimension shown.

2. Lower Arm - Install

NOTE:

- Use new bolts and nuts during reassembly.
- During installation, tighten the trailing arm mounting bolts (A) in the numbered sequence shown in illustration.

17. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

NOTE:

Loosely install nuts and/or bolts

to install the bushings, load the suspension with the vehicle's weight, and then tighten the nuts and/or bolts to the specified torque.

18. Wheel Alignment - Check

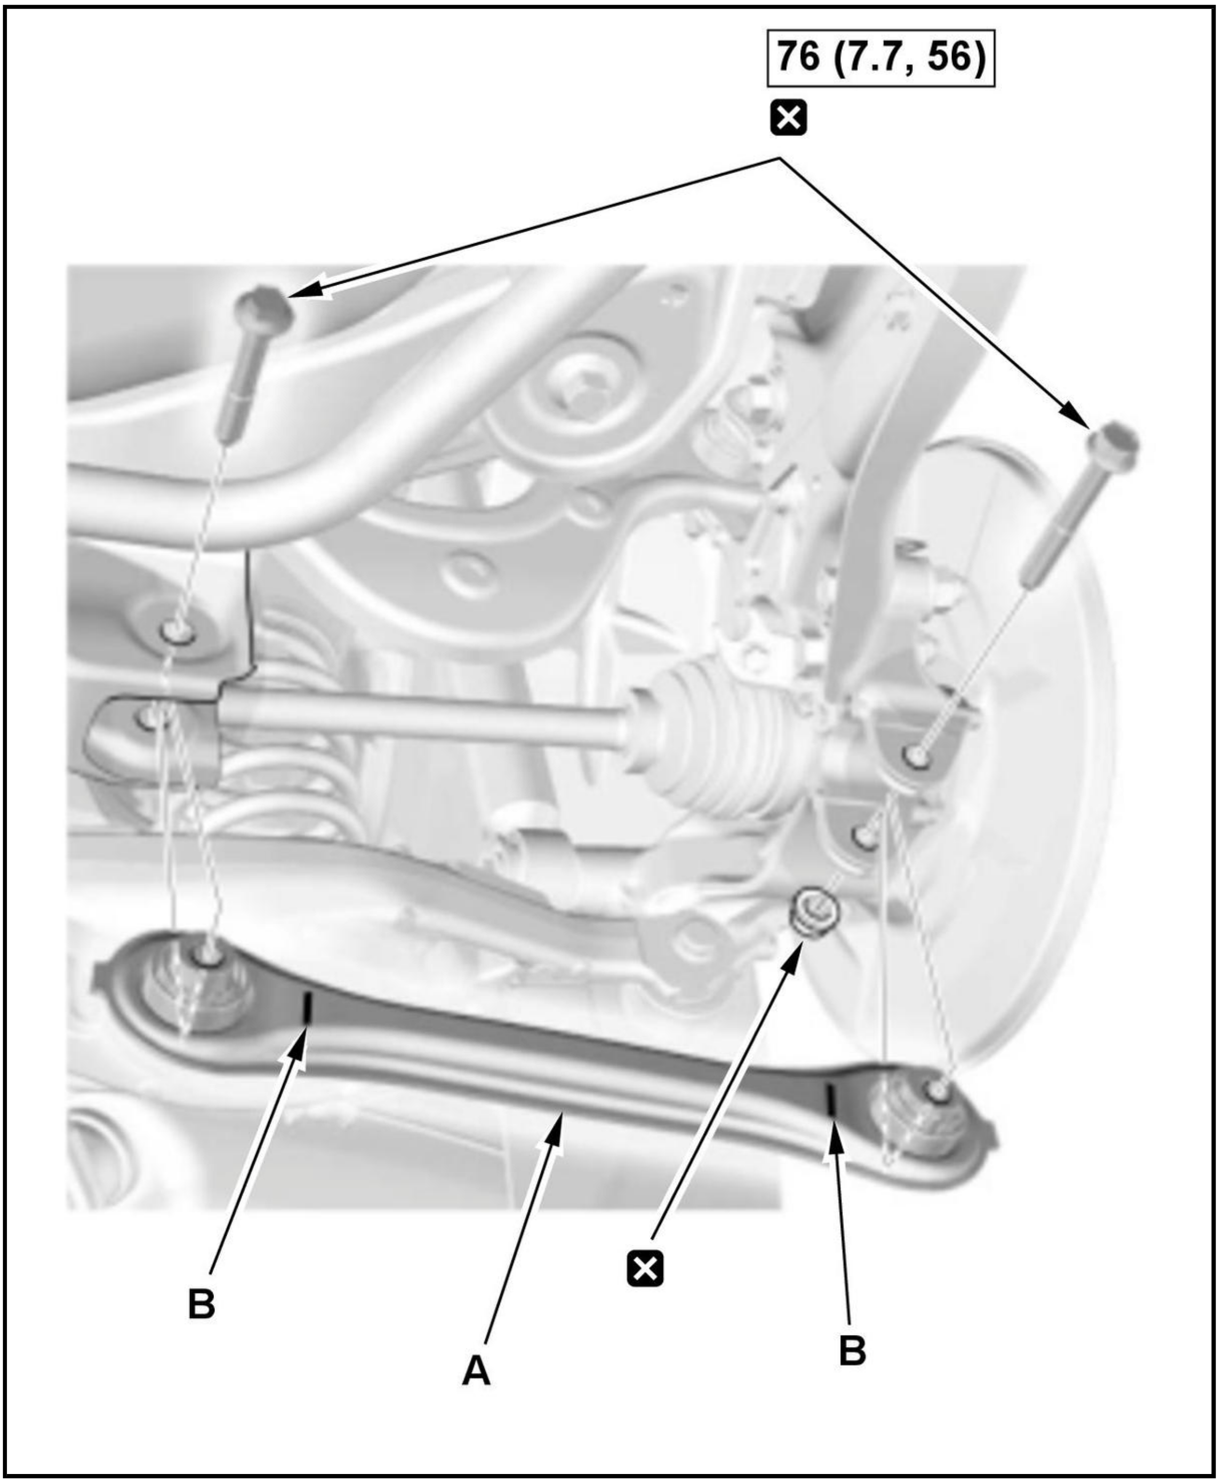
REAR LOWER ARM A REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- How to read the torque specifications .
- Unless otherwise indicated, illustrations used in the procedure are for AWD model.

1. Vehicle - Lift
2. Rear Wheel - Remove
3. Lower Arm A - Remove



NOTE:

- Use new mounting bolts and nut during reassembly.
- Rear lower arm A must be installed in the specified direction. An instruction is given in the area (B) shown in the figure. Follow the instruction to install rear lower arm A.

4. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

NOTE:

Loosely install nuts and/or bolts to install the bushings,

load the suspension with the vehicle's weight, and then tighten the nuts and/or bolts to the specified torque.

5. Wheel Alignment - Check

REAR LOWER ARM B REMOVAL AND INSTALLATION

Removal

NOTE: Unless otherwise indicated, illustrations used in the procedure are for AWD model.

1. Vehicle - Lift
2. Rear Wheel - Remove
3. Rear Spring - Remove
4. Lower Arm B - Remove

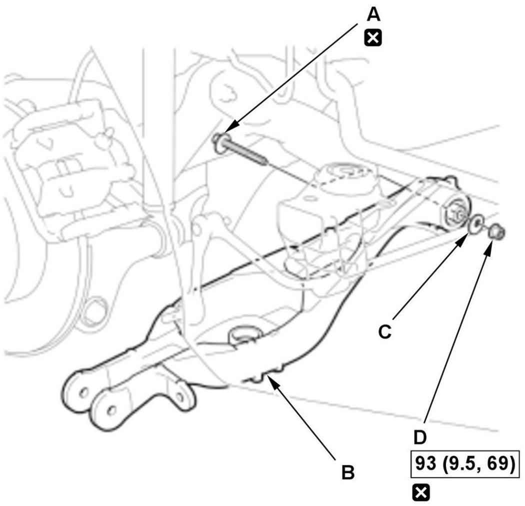
	1. Mark the cam positions of the adjusting bolt (A) and the adjusting cam plate (C). 2. Remove the self-locking nut (D), the adjusting cam plate, and the adjusting bolt. 3. Remove the lower arm B.

Installation

NOTE:

- How to read the torque specifications .
- Unless otherwise indicated, illustrations used in the procedure are for AWD model.

1. Lower Arm B - Install



1. Position lower arm B.

2. Install a new adjusting bolt (A), the adjusting cam plate (C), and a new self-locking nut (D) but do not tighten it.

NOTE:

- **Align the cam positions of the adjusting bolt and the adjusting cam plate with the marked positions on the frame when tightening the self-locking nut.**
- **Tighten the self-locking nut during the rear spring installation procedure.**

2. Rear Spring - Install
3. Rear Wheel - Install
4. Wheel Alignment - Check

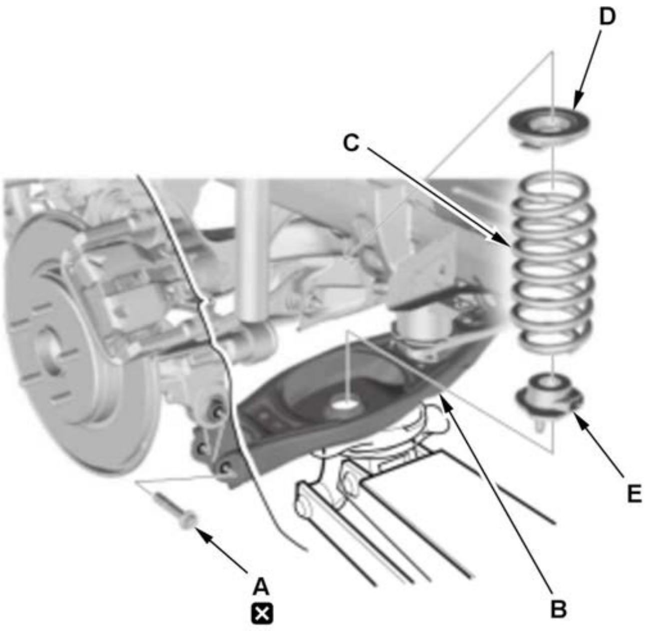
REAR SPRING REMOVAL AND INSTALLATION

Removal

1. Vehicle - Lift
2. Rear Wheel - Remove
3. Stabilizer Link - Disconnect

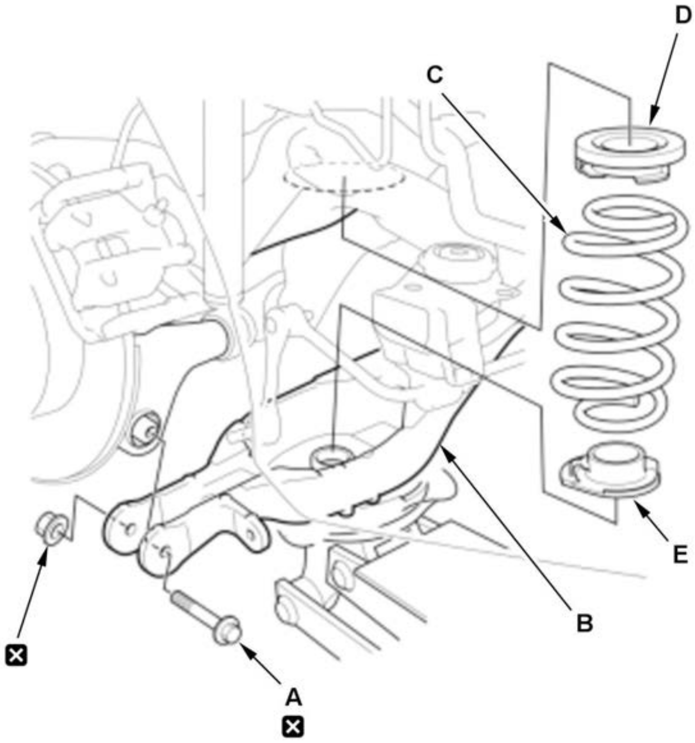
1. Disconnect both sides of the stabilizer link from lower arm B.

4. Rear Spring - Remove



2WD

AWD



1. Position a floor jack under lower arm B.

2. Raise the floor jack until the suspension begins to compress.

3. Remove lower arm B mounting bolt (A).

4. Lower the floor jack gradually.

5. Remove the spring (C), upper rubber mount (D), and lower rubber mount (E).

Installation

NOTE:

- How to read the torque specifications .
- Unless otherwise indicated, illustrations used in the procedure are for AWD model.

1. Spring - Install

	1. Install the upper rubber mount (A) on the spring (B) by aligning the upper end (C) of the spring with the ledge portion (D) of the upper rubber mount.
	2. Install the lower rubber mount (A) on the spring (B) by aligning the lower end (C) of the spring with the ledge portion (D) of the lower rubber mount.
	3. Install the tab (A) of the lower rubber mount into the groove (C) of the lower arm B and install the spring assembly. **NOTE:** - **Make sure that the tab of the lower rubber mount is properly installed into lower arm B.** - **Make sure that the spring was installed correctly.**

 **2WD** **AWD** 	4. Slowly raise the floor jack until you align the bolt hole with the holes in lower arm B and the knuckle. 5. 2WD: Loosely install new lower arm B mounting bolt (A), but do not tighten it.AWD: Loosely install new lower arm B mounting bolt (A) and a new nut (C), but do not tighten it. 6. Load the suspension with the vehicle's weight, and tighten the bolt to the specified torque. **NOTE:** **If the rear lower arm B was removed or replaced from another procedure, tighten the adjusting bolt at the same time.**

2. Stabilizer Link - Connect

1. Connect both sides of the stabilizer link to lower arm B.

3. Rear Wheel - Install
4. Wheel Alignment - Check

REAR TRAILING ARM REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- How to read the torque specifications .
- Unless otherwise indicated, illustrations used in the procedure are for AWD model.

1. Vehicle - Lift
2. Rear Wheel - Remove
3. Rear Wheel Speed Sensor - Remove

1. Remove the rear wheel speed sensor from the trailing arm .

NOTE:

Do not disconnect the wheel speed sensor connector.

4. Trailing Arm - Remove

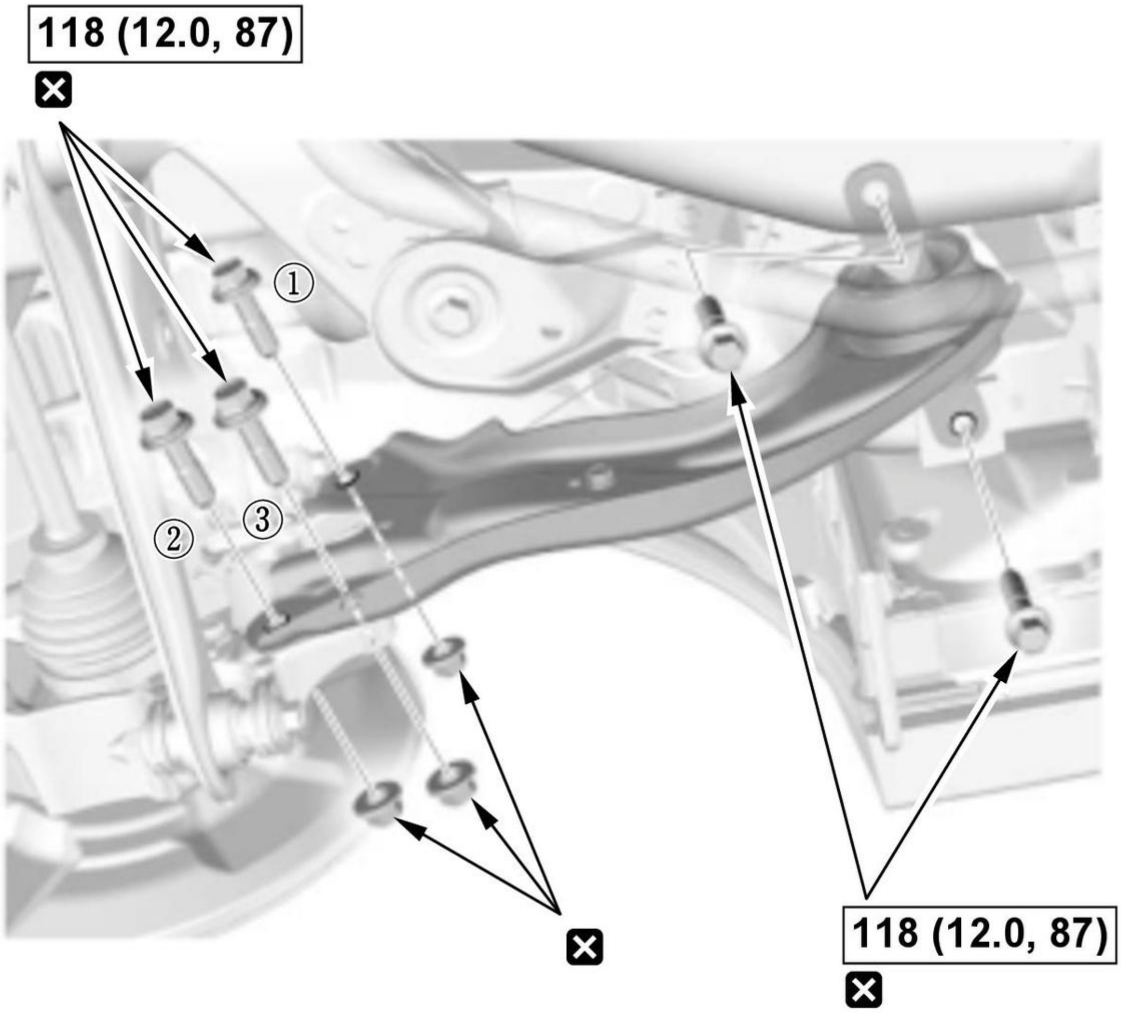

Fig. 7: Tightening Trailing Arm Bolt In Sequence With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

NOTE:

- Use new bolts and nuts during reassembly.
- Tighten the bolt side to the specified torque in the numbered sequence shown in illustration.

5. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

NOTE:

Loosely install the

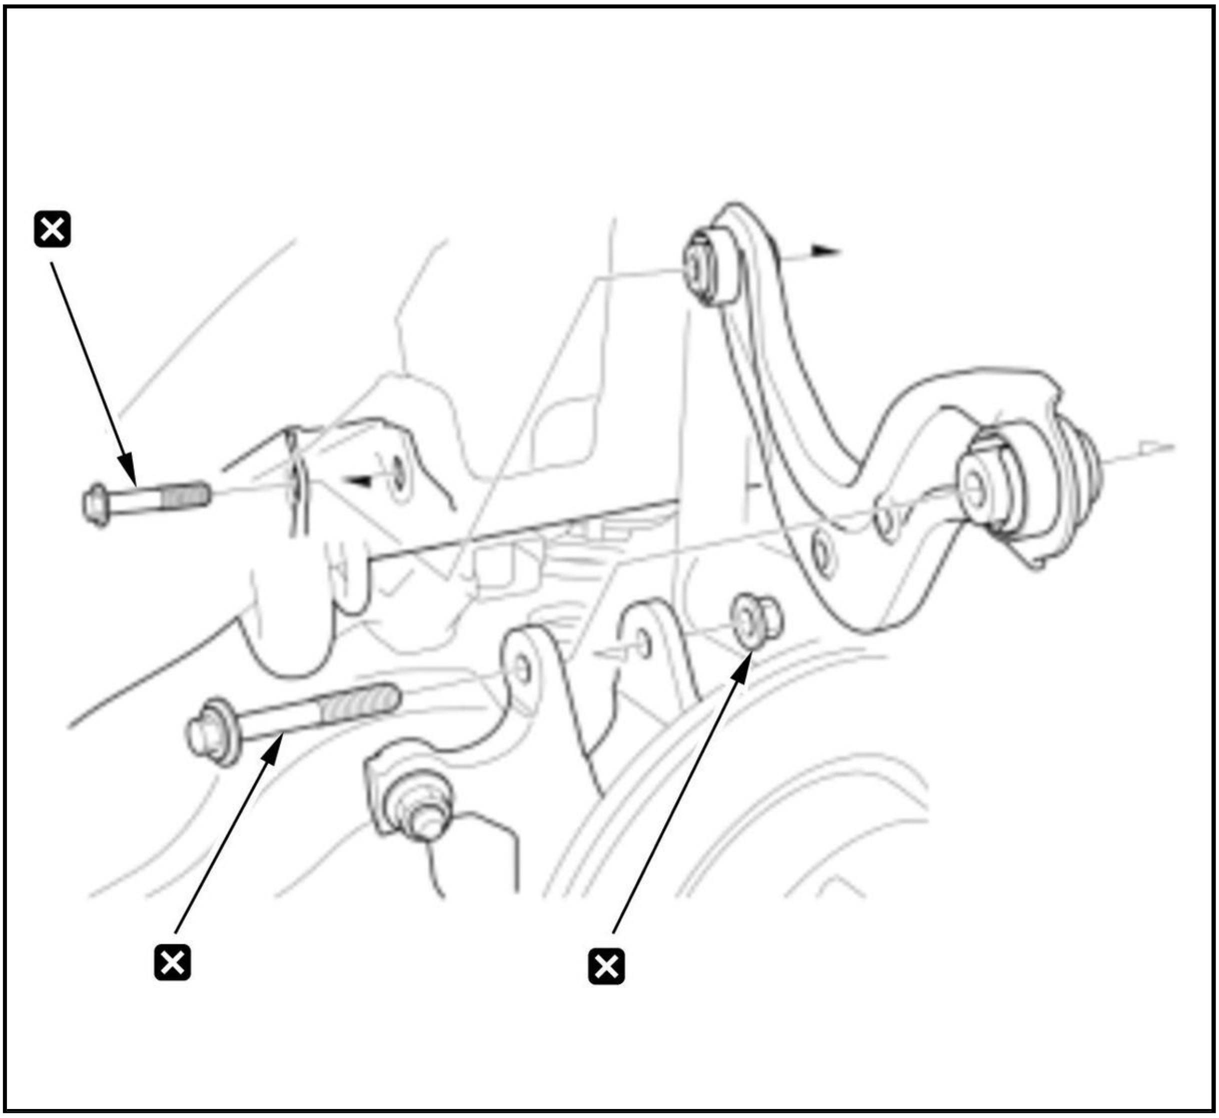
nuts and/or bolts to install the bushings, load the suspension with the vehicle's weight, and then tighten the nuts and/or bolts to the specified torque.

6. Wheel Alignment - Check

REAR UPPER ARM REMOVAL AND INSTALLATION

Removal

1. Vehicle - Lift
2. Rear Wheel - Remove
3. Upper Arm - Remove



Installation

NOTE: How to read the torque specifications .

1. Upper Arm - Install

 F D 2WD: 126.0 mm (4.96 in) AWD: 129.8 mm (5.11 in) B 76 (7.7, 56) ☒ E A B ☒ 76 (7.7, 56) C ☒	1. Loosely install the upper arm (A) with the mounting bolts (B) and the nut (C). **NOTE:** **Use new bolts and nut during reassembly.** 2. Place a floor jack under the under lower arm B. 3. Raise the suspension until the indicated clearance (D) is achieved between the hole of the upper arm (E) and the lower surface of the rear frame (F) as shown. 4. Tighten the upper arm mounting bolts to the specified torque.

2. Rear Wheel - Install
3. Wheel Alignment - Check

WHEEL BOLT REMOVAL AND INSTALLATION

Special Tools Required

Image	Description/Tool Number
	Ball Joint Remover, 28 mm 07MAC-SL00202

Removal

NOTICE:

- Do not use a hammer or impact tools (pneumatic or electric).
- Be careful not to damage the threads of the wheel bolts.

Front

1. Vehicle - Lift
2. Front Wheel - Remove
3. Front Hub - Remove
4. Wheel Bolt - Remove

	1. Separate the wheel bolt (A) from the hub (B) using a hydraulic press. **NOTE:** **Support the hub with hydraulic press attachments (C) or equivalent tools.**

Rear

5. Vehicle - Lift
6. Rear Wheel - Remove
7. Rear Brake Disc - Remove
8. Wheel Bolt - Remove

	1. Separate the wheel bolt (A) from the hub (B). **NOTE:** **If the angle of the remover against the wheel bolt is not vertical, readjust the ball joint remover by turning the head (C) of the adjusting bolt (D).**

Installation

NOTICE:

- Do not use a hammer or impact tools (pneumatic or electric).
- Be careful not to damage the threads of the wheel bolts.

Front

1. Wheel Bolt - Install

	1. Insert a new wheel bolt (A) into the hub (B) while aligning the splined surfaces (C) on the hub hole with the wheel bolt.**NOTE:** • Degrease the area around the wheel bolt. • Make sure the wheel bolt is installed vertically to the hub disc surface. • Before installing the new wheel bolt, clean the mating surfaces on the bolt and the hub. 2. Install the wheel bolt using a hydraulic press until the wheel bolt shoulder is fully seated. Support the hub with hydraulic press attachments (D) or equivalent tools.

2. **Front Hub - Install**
3. **Front Wheel - Install**

NOTE: If you cannot tighten the wheel nut to the specified torque when installing the wheel, **replace the front hub** .

Rear

4. Wheel Bolt - Install

 D 11−14 mm (0.43−0.55 in) C F G A E B	1. Insert a new wheel bolt (A) into the hub (B) while aligning the splined surfaces (C) on the hub hole with the wheel bolt.**NOTE:** • Before installing the new wheel bolt, clean the mating surfaces on the bolt and the hub. • Degrease the area around the wheel bolt and the threaded section of the nut. 2. Adjust the measurement (D) with the washers (P/N 94101-12800 or equivalent) (E). 3. Install a nut (P/N 90304-SC2-000 or equivalent) (F) hand-tight. **NOTE:** • **Make sure the wheel bolt is installed vertically to the hub disc surface.** • **Do not install the nut and the**

	- washers that have been used as tools on a vehicle. 4. Tighten the nut. **NOTE:** - Do not exceed the maximum torque limit. - Make sure there is no gap (G) between the bolt and the hub. **Limited torque: 108 N.m (11.0 kgf.m, 80 lbf.ft) max.** **NOTE:** **If you cannot tighten the wheel nut to the specified torque when installing the wheel, replace the rear hub bearing unit as an assembly.**

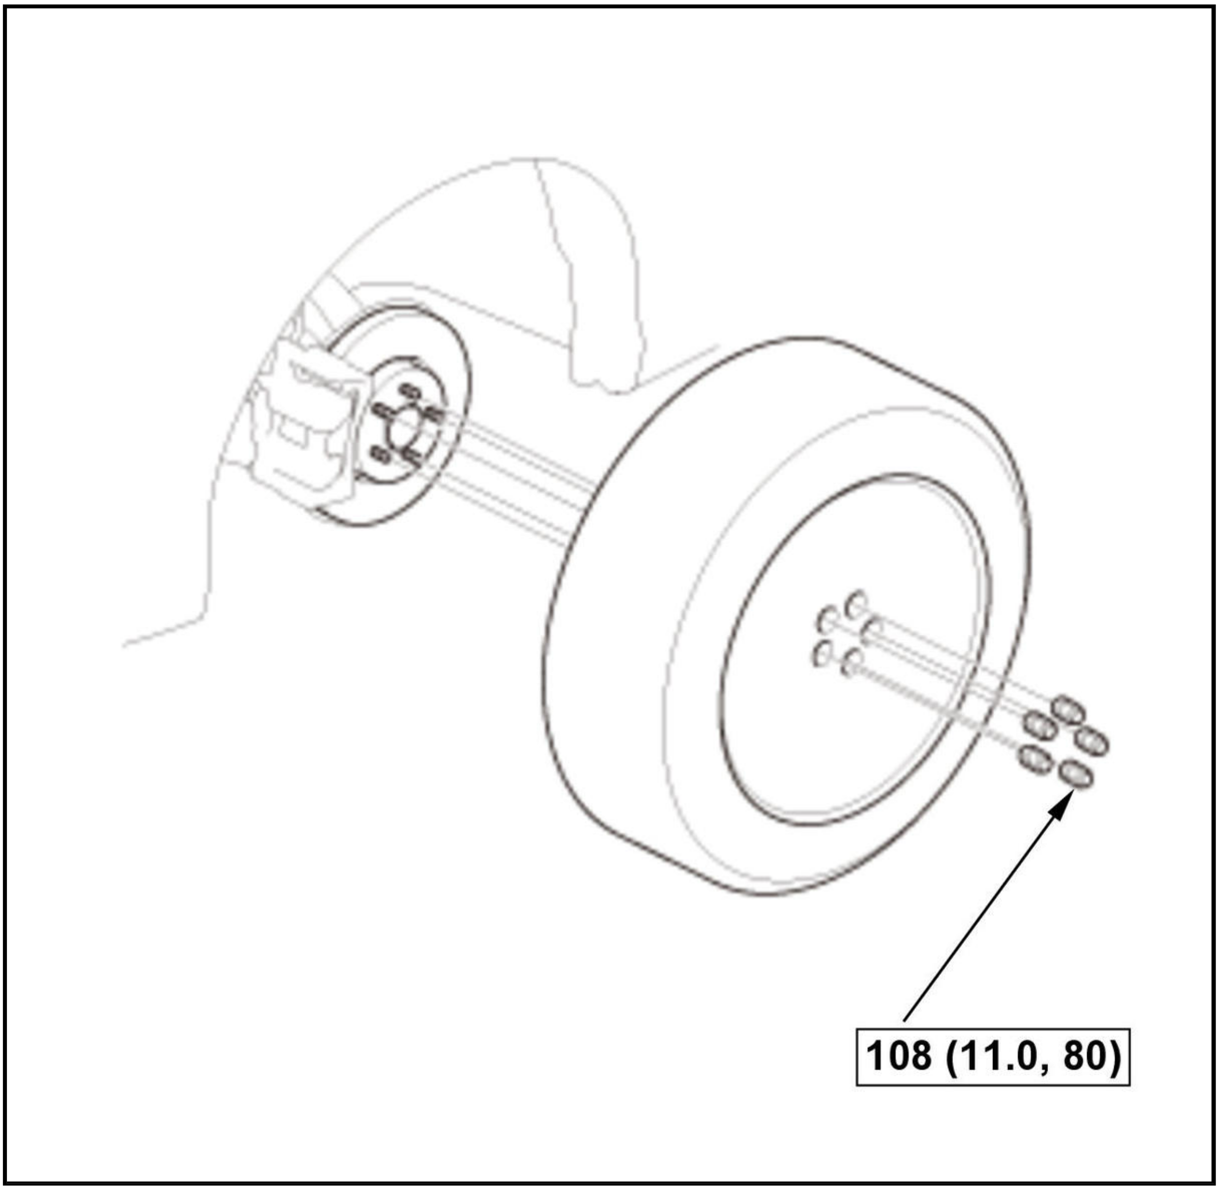
5. **Rear Brake Disc - Install**
6. **Rear Wheel - Install**

WHEEL REMOVAL AND INSTALLATION

Removal and Installation

NOTE: **How to read the torque specifications** .

1. **Vehicle - Lift**
2. Wheel - Remove



3. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

NOTE:

Before installing the wheel, clean the mating surfaces between the brake disc and the inside of the wheel.

REMOVAL AND INSTALLATION

FRONT DAMPER/SPRING REMOVAL AND INSTALLATION

Removal and Installation

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Front Wheel - Remove
3. Front Wheel Speed Sensor - Remove

   NOTE: Do not disconnect the wheel speed sensor connector.

4. Damper/Spring Items - Remove

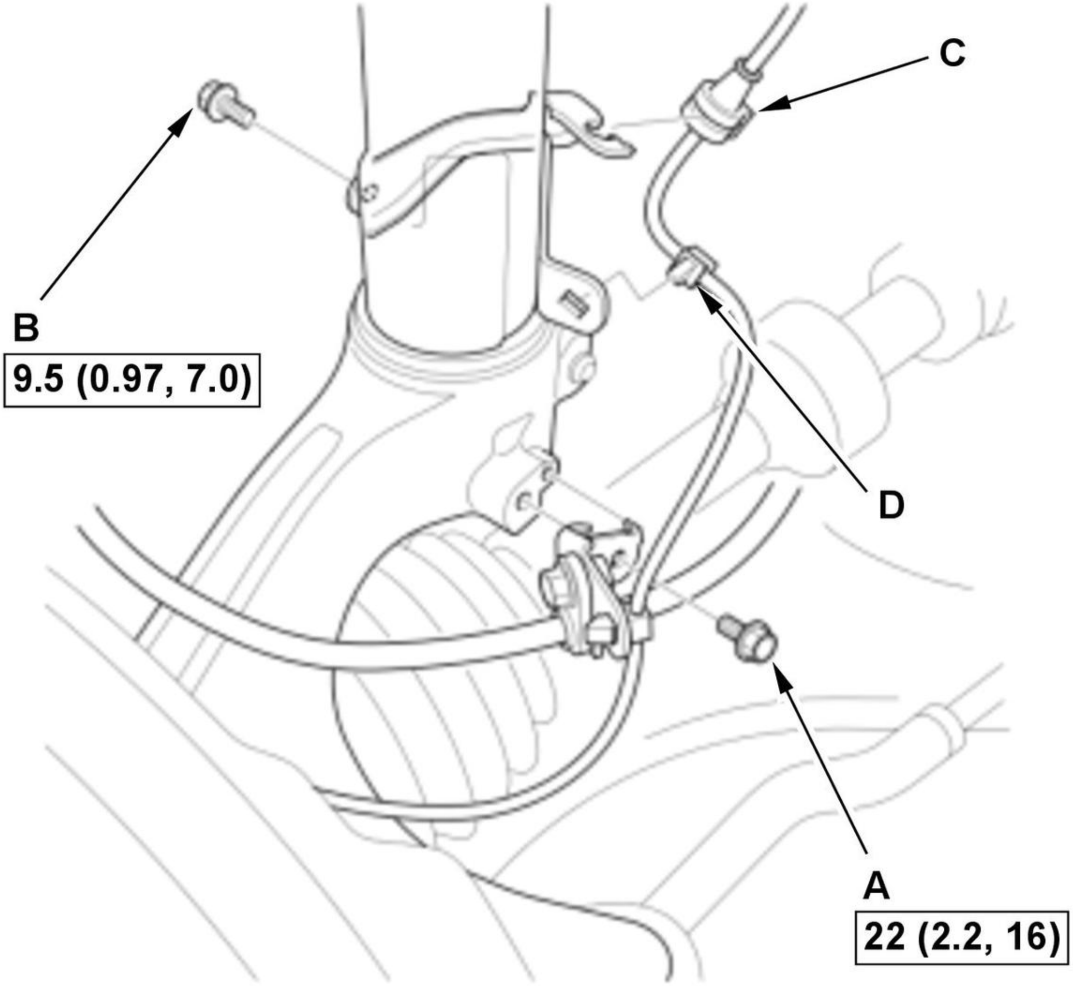


Fig. 1: Front Brake Hose Bracket And Wheel Speed Sensor Wire Bracket Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the brake hose bracket mounting bolt (A) and wheel speed sensor wire bracket mounting bolt (B).

2. Remove the wheel speed sensor wire guide rubber (C) and the clip (D).

5. Brake Caliper - Remove

   1. **Remove the caliper assembly without disconnecting the brake hose from the caliper body** .**NOTE:**
      - To prevent damage to the caliper assembly or brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage.
      - Do not twist the brake hose excessively.

6. Stabilizer Link - Disconnect

   1. **Disconnect the stabilizer link from the damper**.

7. **Front Spindle Nut - Remove**
8. **Tie-Rod End Ball Joint - Disconnect**
9. Lower Arm - Disconnect

   1. **Disconnect the lower arm from the lower arm ball joint**.

10. Knuckle/Hub Assembly - Remove

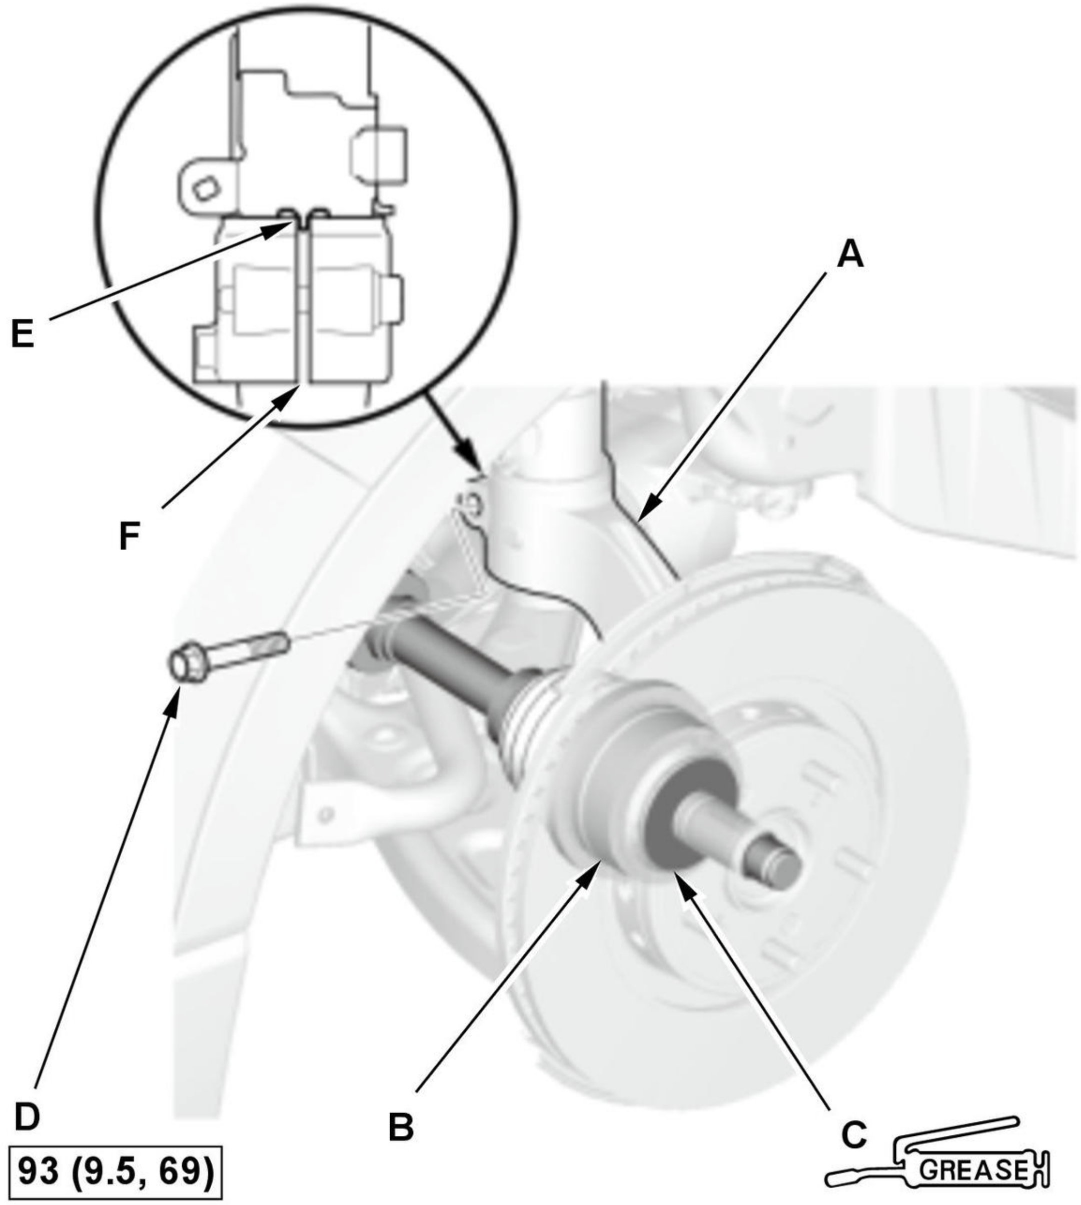

Fig. 2: Front Knuckle/Hub Assembly Components And Damper Pinch Bolt With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Pull the knuckle (A) outward, and separate the outboard joint (B) from the front hub using a soft face hammer outward.

NOTE:

- Do not pull the driveshaft end outward. The inner driveshaft inboard joint may come apart.
- During installation, **apply specified grease to the contact area (C) of the outboard joint and the front wheel bearing** .

2. Remove the damper pinch bolt (D).

3. Move the knuckle downward, and remove the knuckle from the damper.

NOTE: During installation, install the aligning tab (E) on the damper unit into the slot (F) of the knuckle.

11. Damper/Spring - Remove

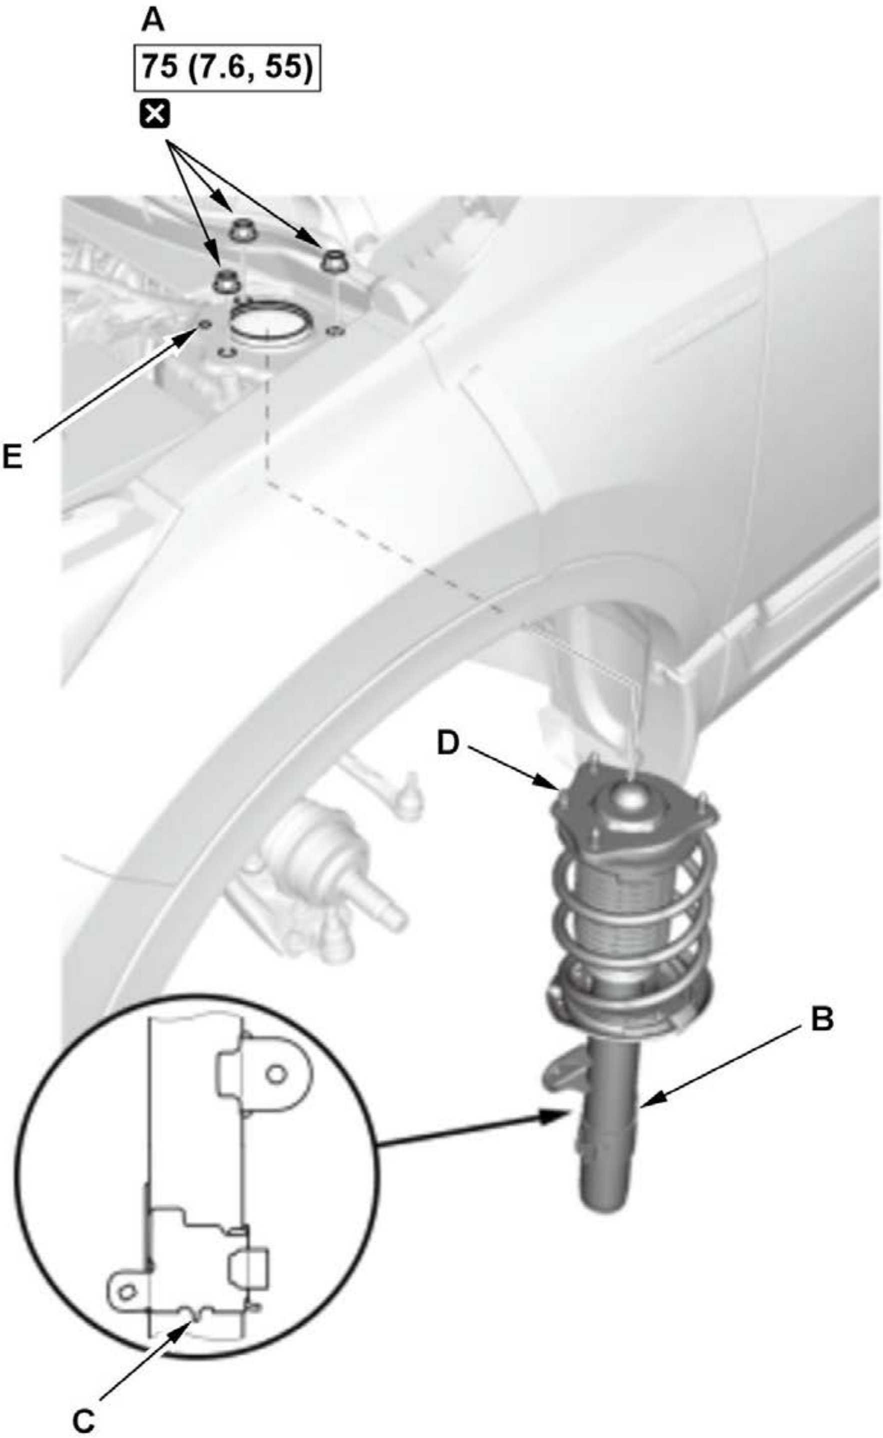

Fig. 3: Front Damper Spring Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the flange nuts (A).
NOTE:

- Do not let the damper/spring drop down under its own weight.
- Use new flange nuts during reassembly.

2. Remove the damper/spring (B).

NOTE:

- Be careful not to damage the body.

- During installation, install the damper/spring in the body with the aligning tab (C) facing inside.
- During installation, if the guide pin (D) is equipped, align the guide pin with the body hole (E).

12. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

13. Wheel Alignment - Check

FRONT LOWER ARM BALL JOINT REMOVAL AND INSTALLATION

Special Tools Required

Image	Description/Tool Number
	Ball Joint Thread Protector, 14 mm 07AAE-SJAA100
	Ball Joint Remover, 32 mm 07MAC-SL00102

Removal and Installation

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Front Wheel - Remove
3. Lower Arm - Disconnect

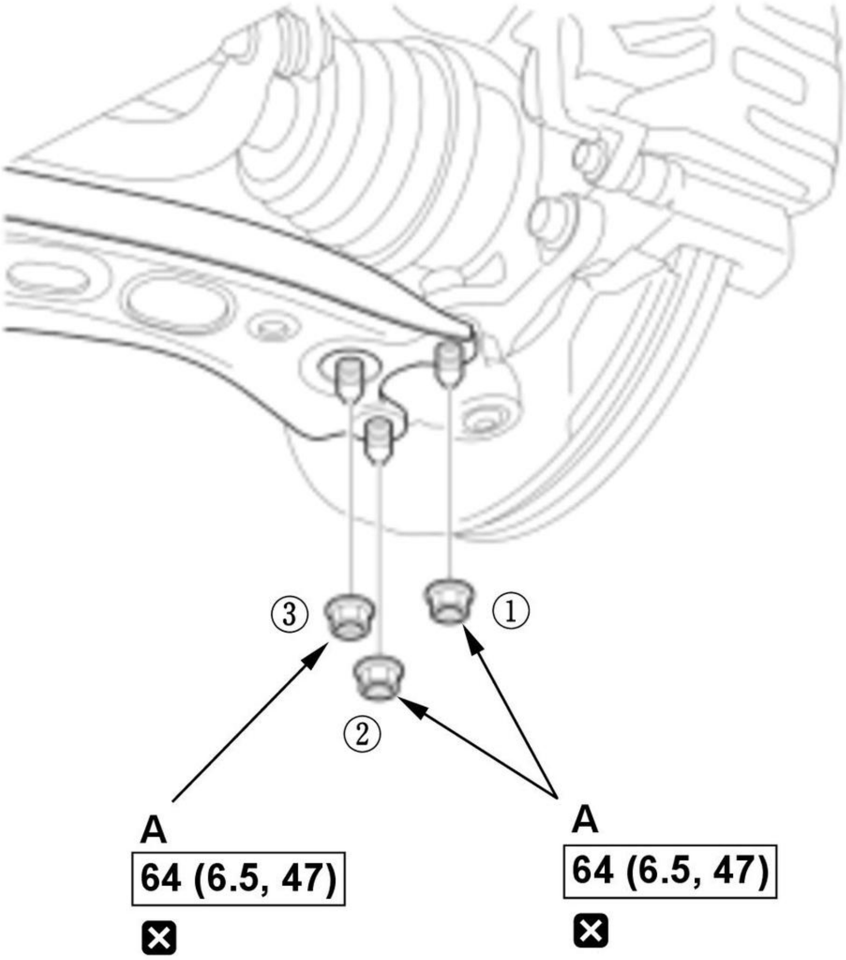

Fig. 4: Front Lower Arm Flange Nuts With Tightening Sequence And Torque Specifications
Courtesy of HONDA, U.S.A., INC.

NOTE: During reassembly, loosely install new flange nuts (A), then tighten them to the specified torque in the numbered sequence shown.

4. Front Spindle Nut - Remove
5. Driveshaft - Disconnect

	1. Pull the knuckle (A) outward, and separate the outboard joint (B) from the front hub using a soft face hammer outward, then move aside the knuckle/hub. **NOTE:** • Do not pull the driveshaft end outward. The inner driveshaft inboard joint may come apart. • During installation, apply specified grease to the contact area (C) of the outboard joint and the front wheel bearing .

6. Lower Arm Ball Joint - Remove

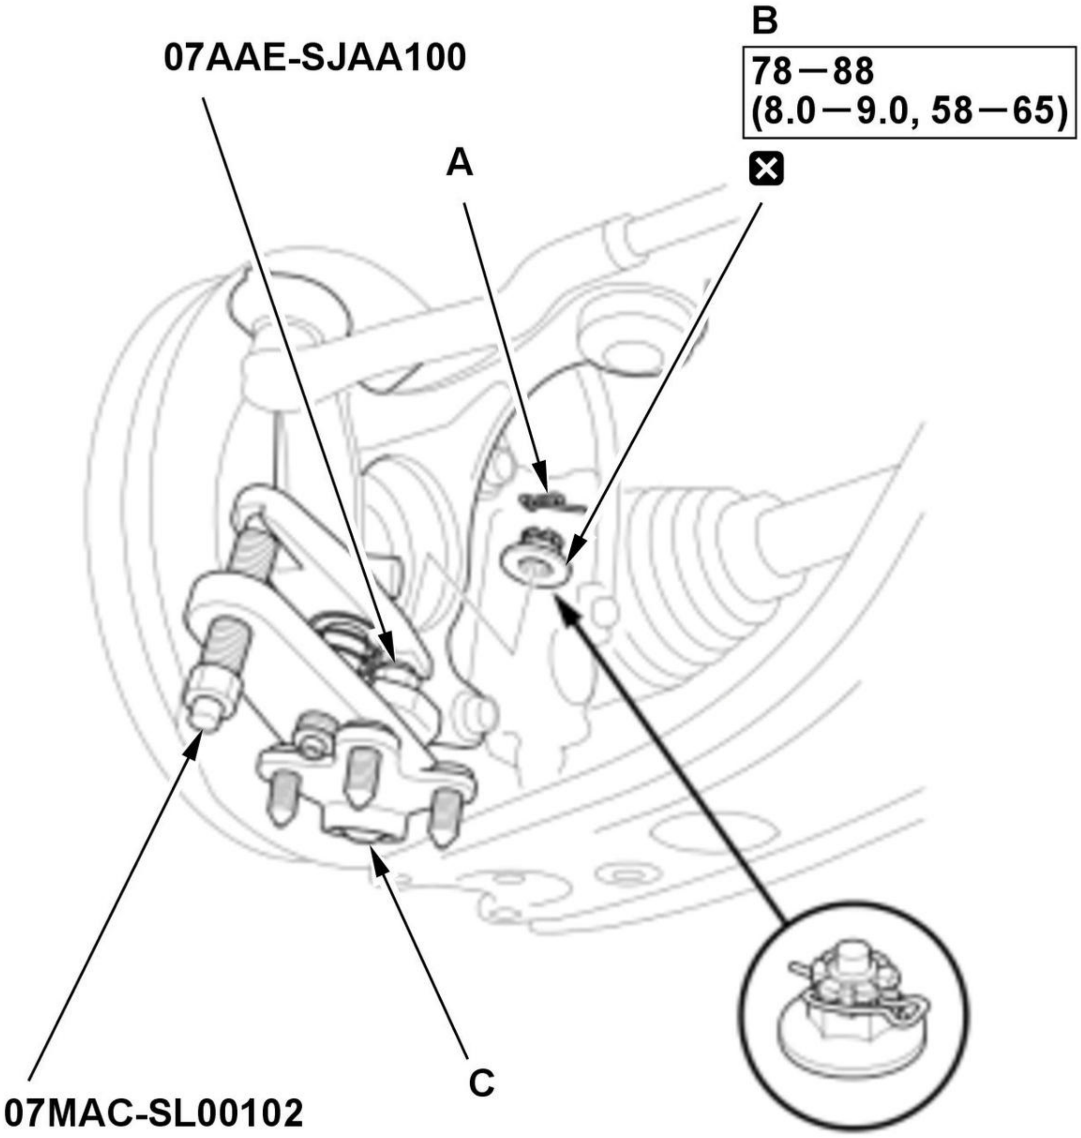

Fig. 5: Front Lower Arm Ball Joint Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the lock pin (A).

NOTE: During installation, install the lock pin as shown after tightening the new castle nut.

2. Remove the castle nut (B).

NOTE: During installation, note these items.

- Use a new castle nut.
- Torque the castle nut to the lower torque specification, then tighten it only far enough to align the slot with the ball joint pin hole. Do not align the castle nut by loosening it.

3. Disconnect the lower ball joint (C) from the knuckle using the ball joint thread protector and the ball joint

remover .

NOTE:

- Be careful not to damage the ball joint boot when installing the ball joint remover.
- During installation, note these items.
-
    - Be careful not to damage the ball joint boot when connecting the knuckle.
    - Before connecting the ball joint, degrease the threaded section and the tapered portion of the ball joint pin, the ball joint connecting hole, the threaded section, and the mating surfaces of the castle nut.

7. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

8. Wheel Alignment - Check

FRONT LOWER ARM COMPLIANCE BUSH REMOVAL AND INSTALLATION

Removal

1. Vehicle - Lift
2. Front Wheel - Remove
3. Lower Arm - Remove
4. Lower Arm Compliance Bushing - Remove

	1. Make a mark (A) on the lower arm (B) right above the bushing opening. **NOTE:** This mark will aid you during the bushing installation process.

	2. Support the lower arm (A) on suitable bar (B) as shown. 3. Press out the lower arm with a suitable socket and a hydraulic press, and remove the lower arm from the bushing (C). **NOTE:** Be careful not to damage the inside of the bushing hole when pressing on the bushing.

Installation

1. Lower Arm Compliance Bushing - Install

	1. Clean the mating surfaces of the new bushing and the lower arm. 2. Apply a mild soap and water solution to the bushing surface. 3. Align the grooves (A) of the lower arm (B) and the grooves (C) of the bushing (D). 4. Press in the bushing by hand first.

 D C Press G E 292.7 mm (11.524 in) A F B	5. Support the lower arm (A) on suitable square lumber (B) as shown. 6. Press in the bushing (C) with a suitable socket (D) and a hydraulic press. **NOTE:** Press the bushing into the lower arm until the mark (E) meets the edge of the bushing opening. 7. Make sure the distance between the lower arm mounting surface (F) and the center of the bolt hole (G) is within the dimension shown.

2. Lower Arm - Install

NOTE:

- Use new mounting bolts and nut during reassembly.
- Rear lower arm A must be installed in the specified direction. An instruction is given in the area (B) shown in the figure. Follow the instruction to install rear lower arm A.

4. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal. **NOTE:** Loosely install nuts and/or bolts to install the bushings, load the suspension with the vehicle's weight, and then tighten the nuts and/or bolts to the specified torque.

5. [Wheel Alignment - Check](#)

REAR LOWER ARM B REMOVAL AND INSTALLATION

Removal

1. **Vehicle - Lift**
2. **Rear Wheel - Remove**
3. **Rear Spring - Remove**
4. Lower Arm B - Remove

	1. Mark the cam positions of the adjusting bolt (A) and the adjusting cam plate (C). 2. Remove the self-locking nut (D), the adjusting cam plate, and the adjusting bolt. 3. Remove lower arm B.

Installation

NOTE: **How to read the torque specifications** .

1. Lower Arm B - Install

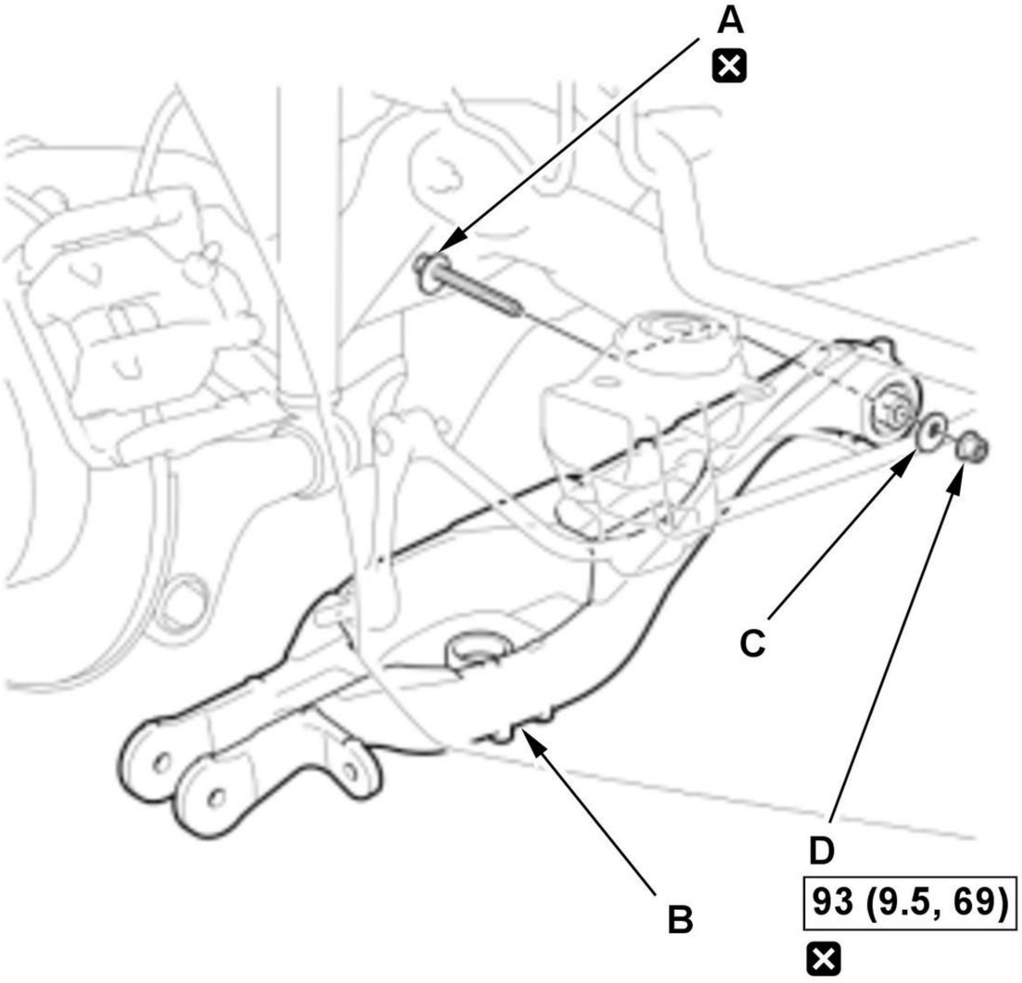

Fig. 14: Rear Lower Arm B Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Position lower arm B.

2. Install a new adjusting bolt (A), the adjusting cam plate (C), and a new self-locking nut (D) but do not tighten it.

NOTE:

- Align the cam positions of the adjusting bolt and the adjusting cam plate with the marked positions on the frame when tightening the self-locking nut.
- Tighten the self-locking nut during the rear spring installation procedure.

2. Rear Spring - Install
3. Rear Wheel - Install
4. Wheel Alignment - Check

REAR SPRING REMOVAL AND INSTALLATION

Removal

1. Vehicle - Lift
2. Rear Wheel - Remove
3. Stabilizer Link - Disconnect

1. Disconnect both sides of the stabilizer link from lower arm B.

4. Rear Spring - Remove

	1. Position a floor jack under lower arm B. 2. Raise the floor jack until the suspension begins to compress. 3. Remove the lower arm B mounting bolt (A). 4. Lower the floor jack gradually. 5. Remove the spring (C), upper rubber mount (D), and lower rubber mount (E).

Installation

NOTE: How to read the torque specifications .

1. Spring - Install

	1. Install the upper rubber mount (A) on the spring (B) by aligning the upper end (C) of the spring with the ledge portion (D) of the upper rubber mount.

	2. Install the lower rubber mount (A) on the spring (B) by aligning the lower end (C) of the spring with the ledge portion (D) of the lower rubber mount.

	3. Install the tab (A) of the lower rubber mount into the groove (C) of the lower arm B and install the spring assembly. **NOTE:** • Make sure that the tab of the lower rubber mount is properly installed into lower arm B. • Make sure that the spring was installed correctly.

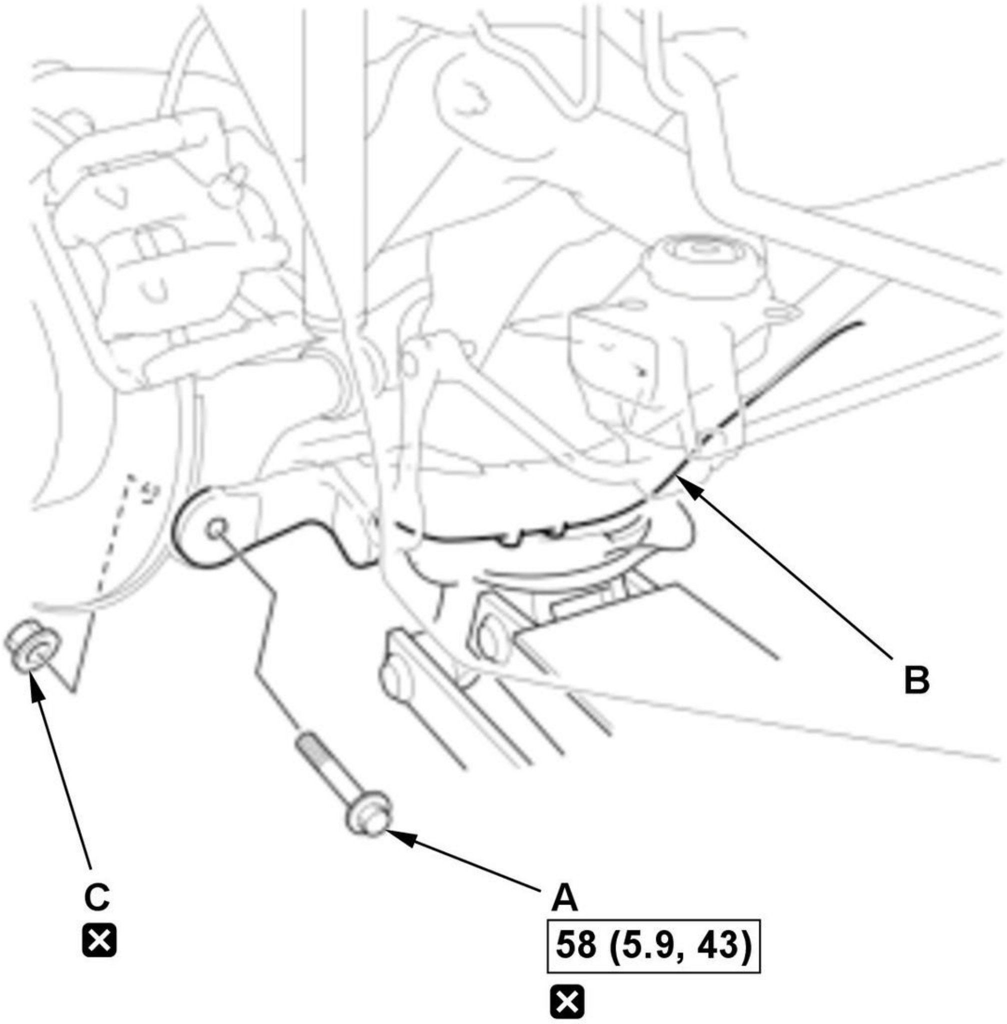

Fig. 15: Rear Lower Arm B Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

4. Slowly raise the floor jack until you align the bolt hole with the holes in lower arm B and the knuckle.

5. Loosely install new lower arm B mounting bolt (A) and a new nut (C), but do not tighten it.

6. Load the suspension with the vehicle's weight, and tighten the bolt to the specified torque.

NOTE: If the rear lower arm B was removed or replaced from another procedure, tighten the adjusting bolt at the same time.

2. Stabilizer Link - Connect

   1. Connect both sides of the stabilizer link to lower arm B.

3. Rear Wheel - Install
4. Wheel Alignment - Check

REAR STABILIZER BAR REMOVAL AND INSTALLATION

Removal and Installation

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Rear Wheels - Remove
3. Stabilizer Link - Disconnect

   1. Disconnect both sides of the stabilizer link from the stabilizer bar.

4. Stabilizer Bar - Remove

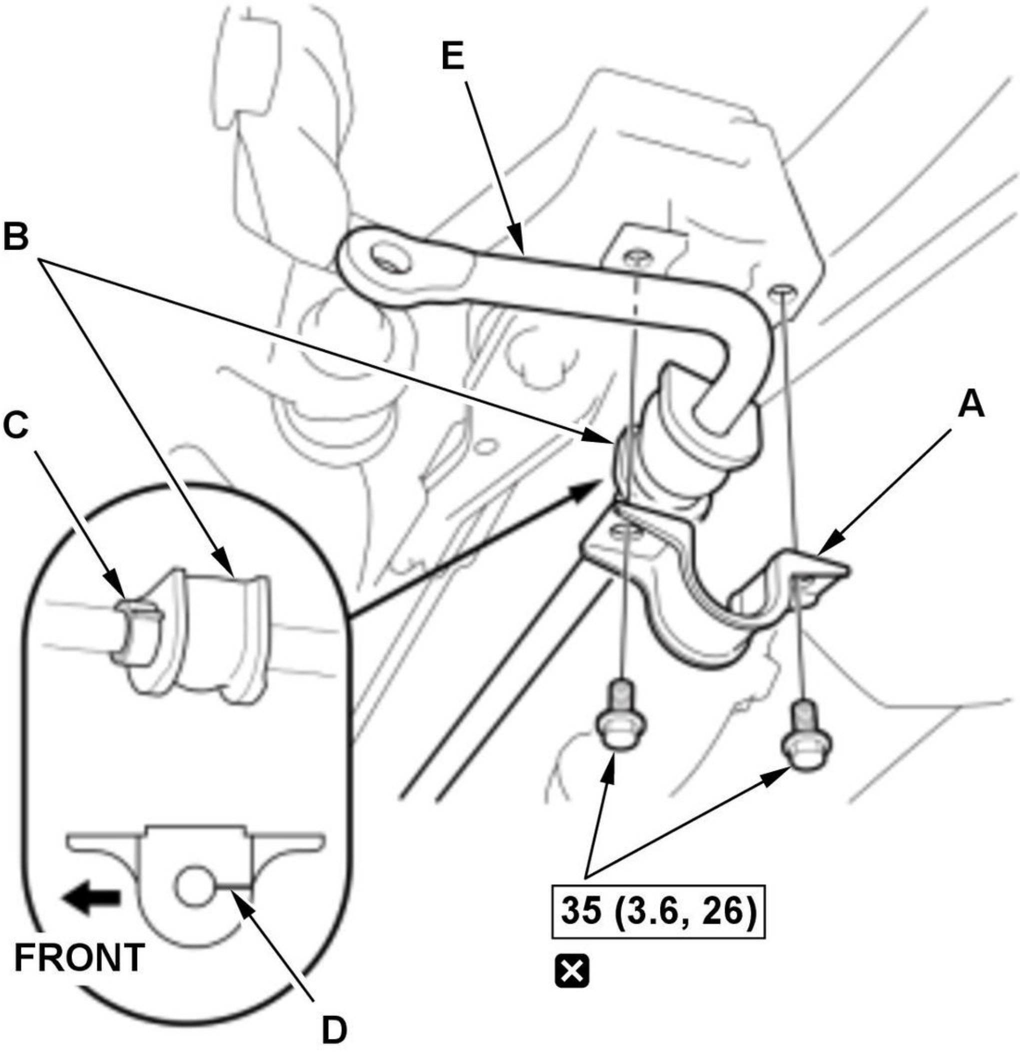

Fig. 16: Rear Stabilizer Bar Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the bushing holders (A).

NOTE: Use new bolts during reassembly.

2. Remove the stabilizer bushings (B).

NOTE: During installation, note these items.

- Align the side of the bushing with the stabilizer band clamp (C) on the stabilizer bar.
- The slit (D) of the stabilizer bushing must be directed to the vehicle rear side.

3. Remove the stabilizer bar (E).

5. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

REAR STABILIZER LINK REMOVAL AND INSTALLATION

Removal and Installation

NOTE: How to read the torque specifications .

1. Vehicle - Lift

2. Rear Wheel - Remove
3. Stabilizer Link - Remove

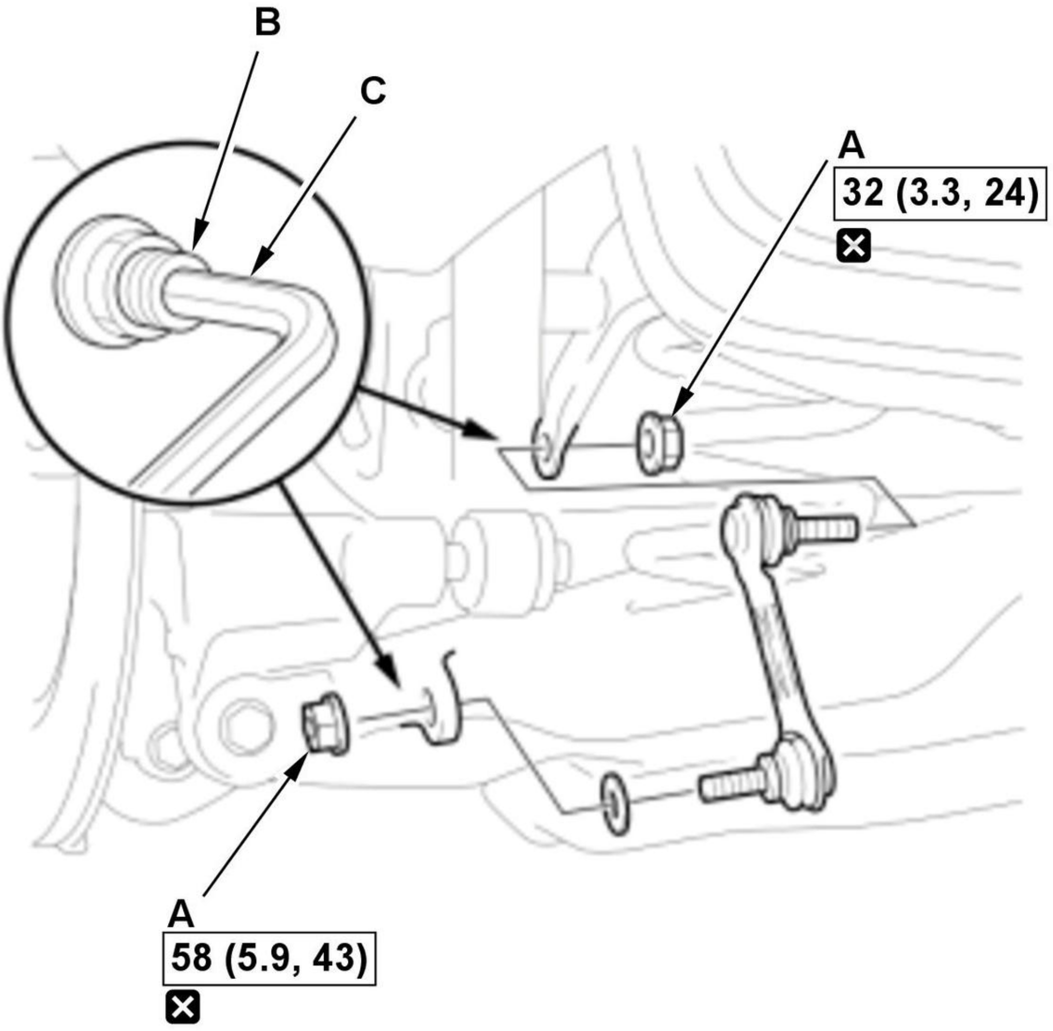

Fig. 17: Rear Stabilizer Link Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the flange nuts (A) while holding the respective joint pin (B) with a hex wrench (C).
NOTE: Use new flange nuts during reassembly.

4. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

REAR TRAILING ARM REMOVAL AND INSTALLATION

Removal and Installation

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Rear Wheel - Remove
3. Rear Wheel Speed Sensor - Remove

1. Remove the rear wheel speed sensor from the trailing arm .
NOTE: Do not disconnect the wheel speed sensor connector.

4. Trailing Arm - Remove

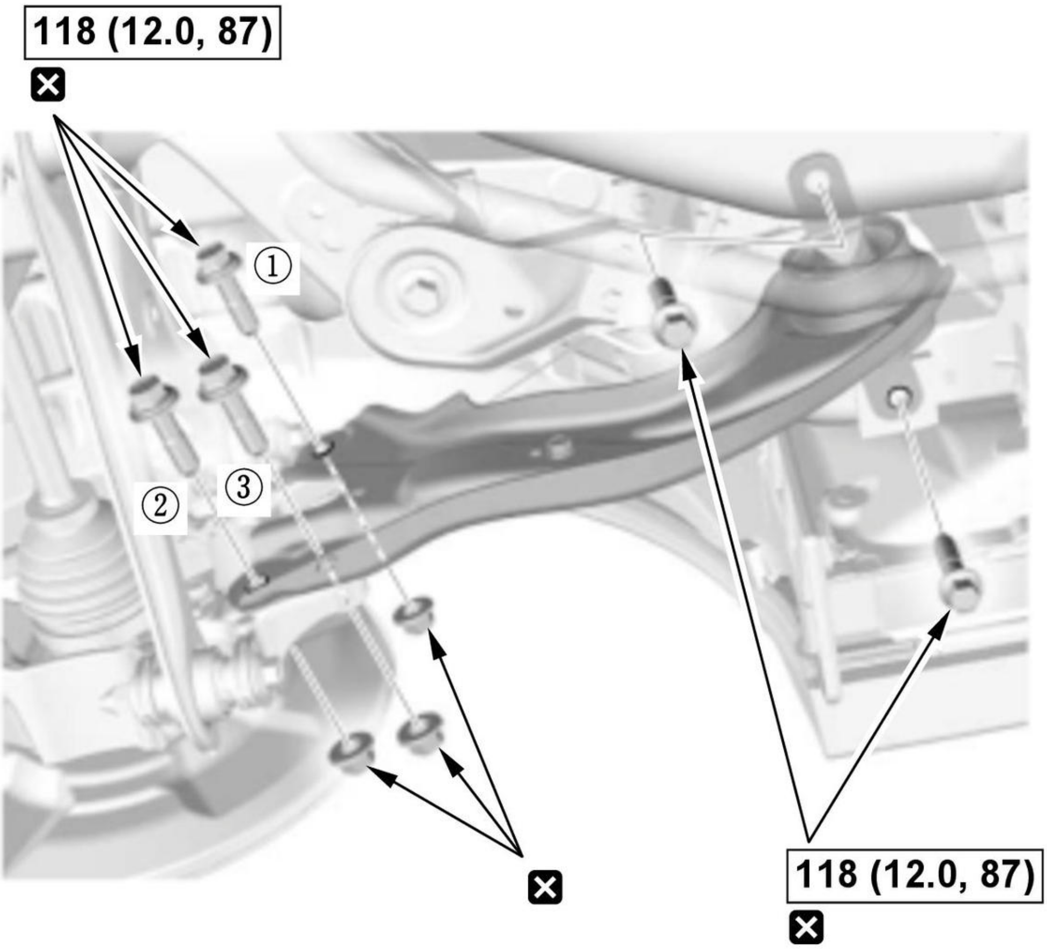

Fig. 18: Rear Trailing Arm Components With Tightening Sequence And Torque Specifications
Courtesy of HONDA, U.S.A., INC.

NOTE: During installation, note these items.

- Use new bolts and nuts.
- Tighten the knuckle mounting bolts to the specified torque in the numbered sequence shown.

5. All Removed Parts - Install

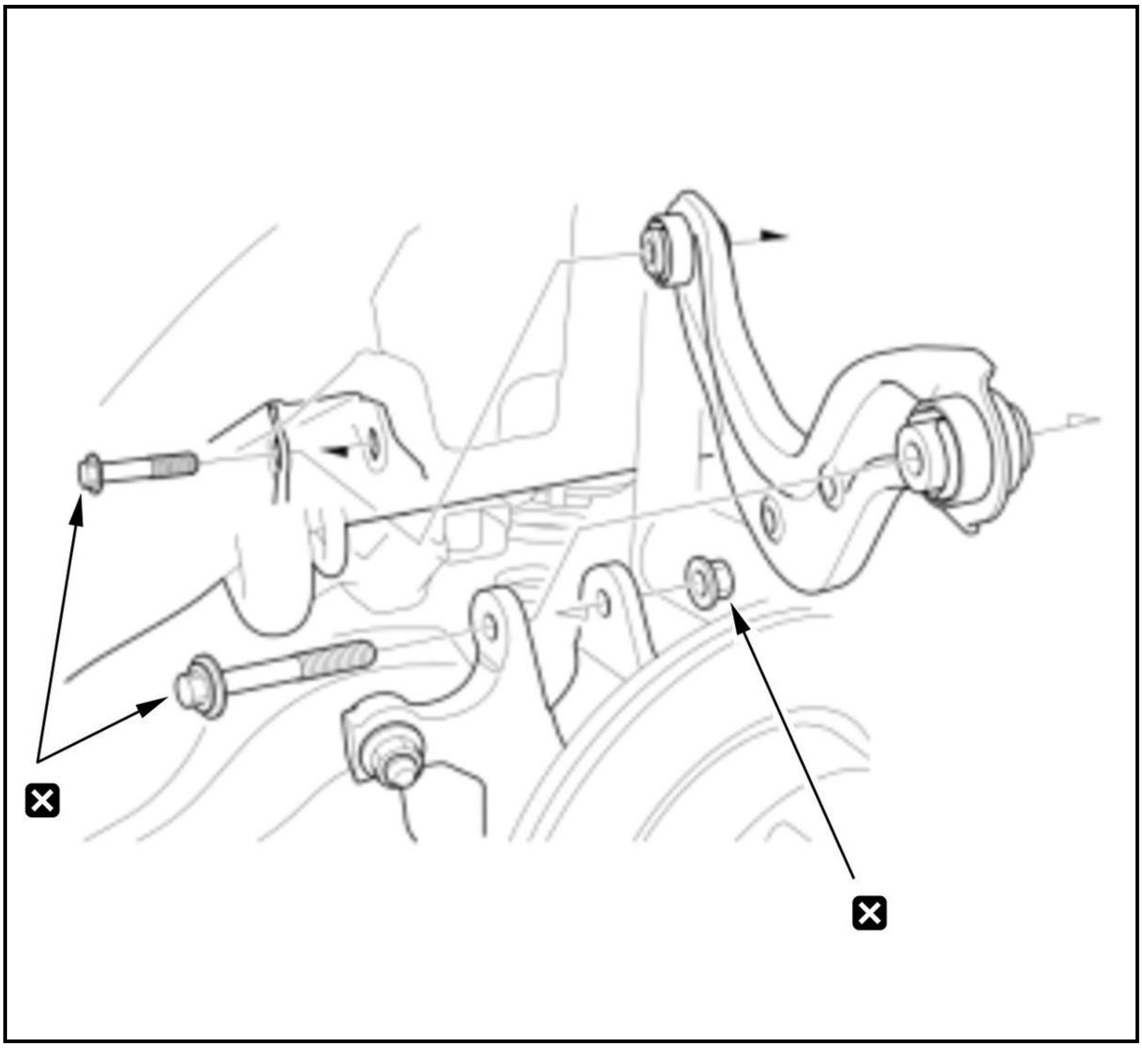
1. Install all removed parts in the reverse order of removal. **NOTE:** Loosely install the nuts and/or bolts to install the bushings, load the suspension with the vehicle's weight, and then tighten the nuts and/or bolts to the specified torque.

6. Wheel Alignment - Check

REAR UPPER ARM REMOVAL AND INSTALLATION

Removal

1. Vehicle - Lift
2. Rear Wheel - Remove
3. Upper Arm - Remove



Installation

NOTE: How to read the torque specifications .

1. Upper Arm - Install

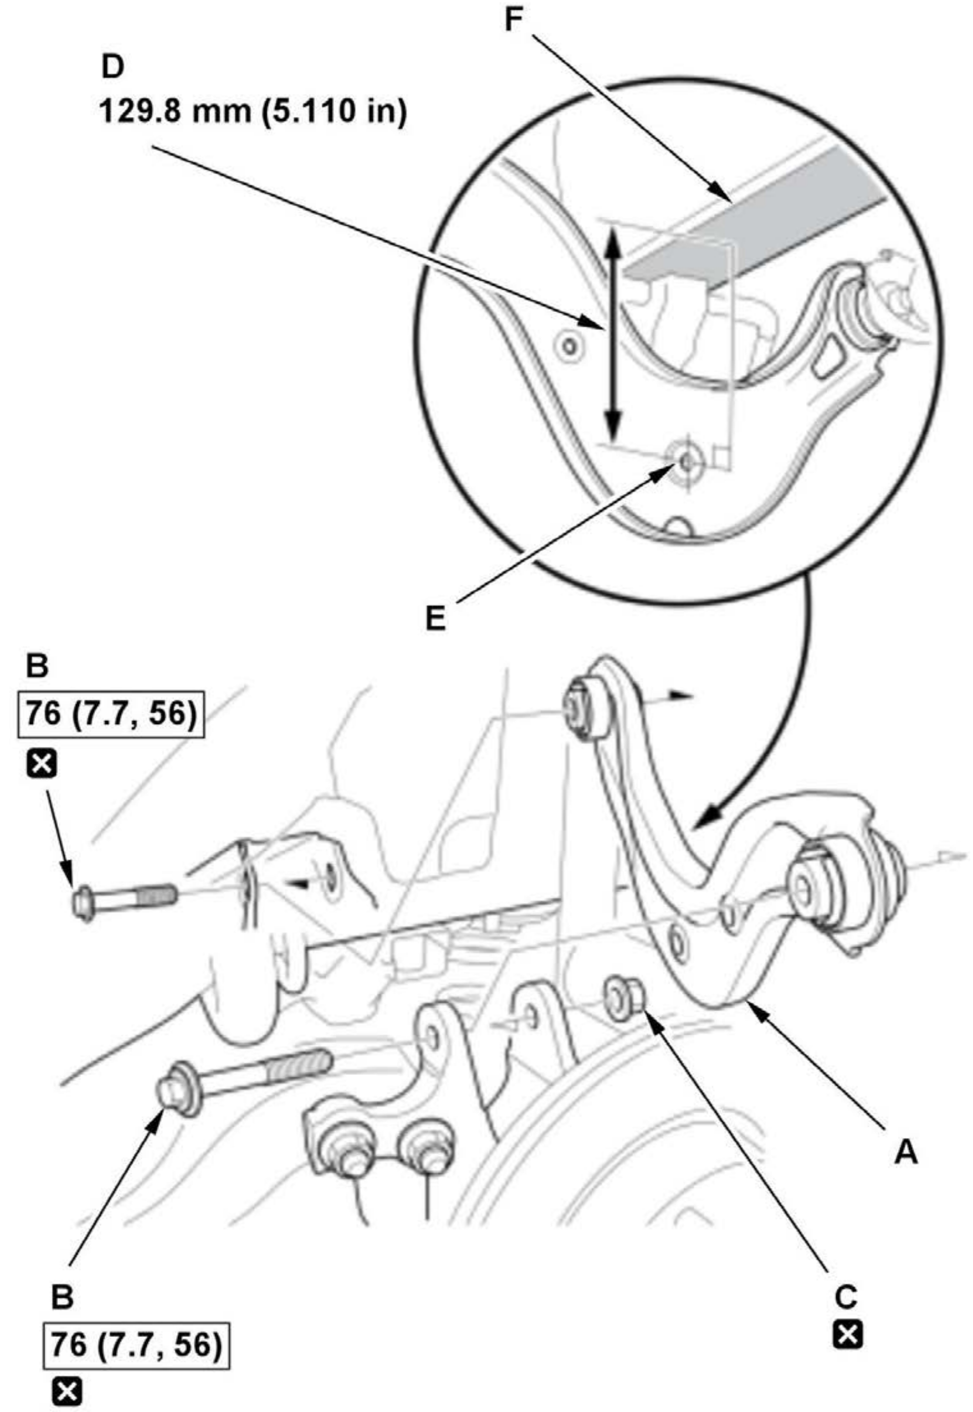


Fig. 19: Rear Upper Arm Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Loosely install the upper arm (A) with the mounting bolts (B) and the nut (C).

NOTE: Use new bolts and nut during reassembly.

2. Place a floor jack under the under lower arm B.

3. Raise the suspension until the indicated clearance (D) is achieved between the hole of the upper arm (E) and the lower surface of the rear frame (F) as shown.

4. Tighten the upper arm mounting bolts to the specified torque.

2. Rear Wheel - Install
3. Wheel Alignment - Check

WHEEL BOLT REMOVAL AND INSTALLATION

Special Tools Required

Image	Description/Tool Number
	Ball Joint Remover, 28 mm 07MAC-SL00202

Removal

NOTICE:

- Do not use a hammer or impact tools (pneumatic or electric).
- Be careful not to damage the threads of the wheel bolts.

Front

1. Vehicle - Lift
2. Front Wheel - Remove
3. Front Hub - Remove
4. Wheel Bolt - Remove

	1. Separate the wheel bolt (A) from the hub (B) using a hydraulic press. **NOTE:** Support the hub with hydraulic press attachments (C) or equivalent tools.

Rear

1. Vehicle - Lift
2. Rear Wheel - Remove
3. Rear Brake Disc - Remove

4. Wheel Bolt - Remove

	1. Attach the ball joint remover to the wheel bolt (A) as shown. **NOTE:** **Review to how to using the ball joint remover** 2. Turn the pressure bolt (B) to separate the wheel bolt from the hub (C). **NOTE:** Adjust the adjusting bolt (D) so that the angle between the wheel bolt and the jaw portion (E) of the ball joint remover is kept at perpendicular.

Installation

NOTICE:

- Do not use a hammer or impact tools (pneumatic or electric).
- Be careful not to damage the threads of the wheel bolts.

Front

1. Wheel Bolt - Install

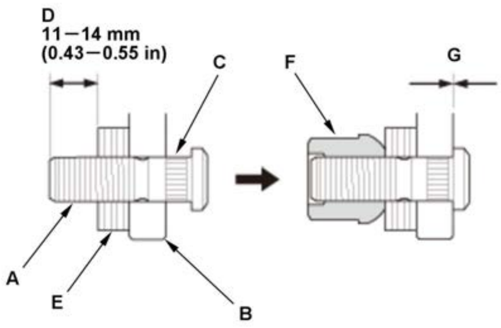
	1. Insert a new wheel bolt (A) into the hub (B) while aligning the splined surfaces (C) on the hub hole with the wheel bolt. **NOTE:** • Degrease the area around the wheel bolt. • Make sure the wheel bolt is installed vertically to the hub disc surface. • Before installing the new wheel bolt, clean the mating surfaces on the bolt and the hub. 2. Install the wheel bolt using a hydraulic press until the wheel bolt shoulder is fully seated. Support the hub with hydraulic press attachments (D) or equivalent tools.

2. **Front Hub - Install**
3. **Front Wheel - Install**

   NOTE: If you cannot tighten the wheel nut to the specified torque when installing the wheel, **replace the front hub** .

Rear

1. Wheel Bolt - Install



1. Insert a new wheel bolt (A) into the hub (B) while aligning the splined surfaces (C) on the hub hole with the wheel bolt.

NOTE:

- Before installing the new wheel bolt, clean the mating surfaces on the bolt and the hub.
- Degrease the area around the wheel bolt and the threaded section of the nut.

2. Adjust the measurement (D) with the washers (P/N 94101-12800 or equivalent) (E).

3. Install a nut (P/N 90304-SC2-000 or equivalent) (F) hand-tight.

NOTE:

- Make sure the wheel bolt is installed vertically to the hub disc surface.
- Do not install the nut and the washers that have been used as tools on a vehicle.

4. Tighten the nut.

NOTE:

- Do not exceed the maximum torque limit.
- Make sure there is no gap (G) between the bolt and the hub.

Limited torque: 108 N.m (11.0 kgf.m, 80 lbf.ft) max.

NOTE: If you cannot tighten the wheel nut to the specified torque when installing the wheel, replace the rear hub bearing unit as an assembly.

2. Rear Brake Disc - Install
3. Rear Wheel - Install

WHEEL REMOVAL AND INSTALLATION

Removal and Installation

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Wheel - Remove

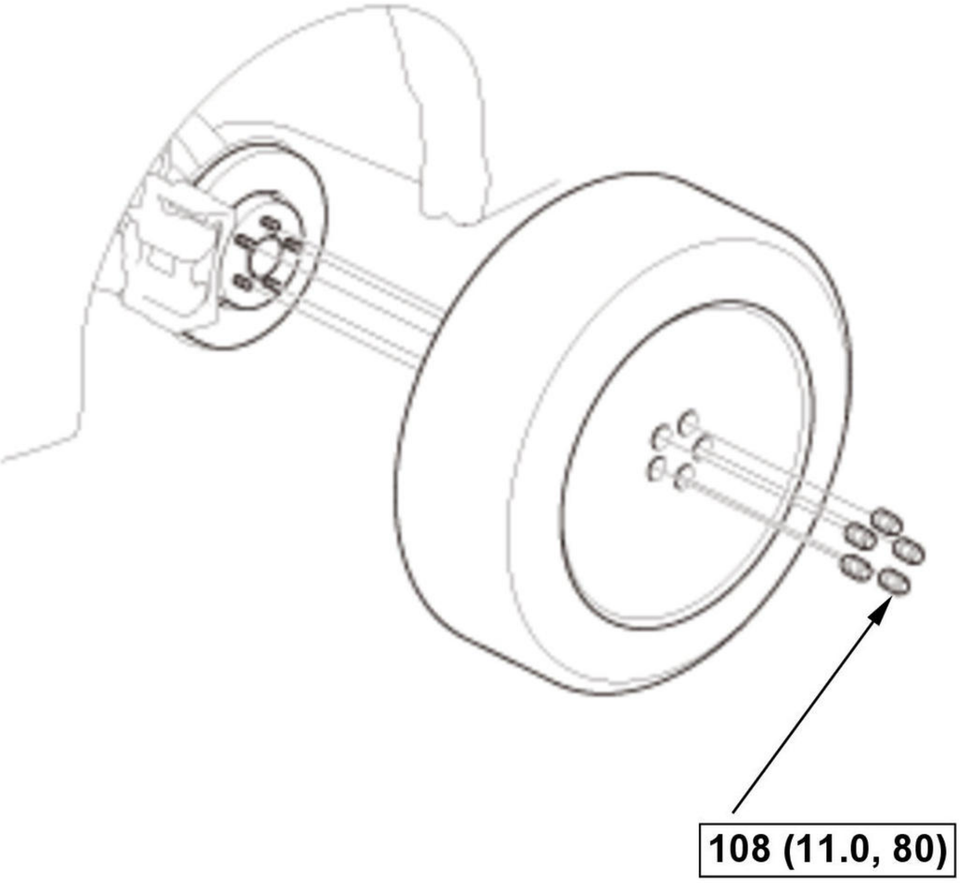


Fig. 20: Wheel Lug Nuts With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

3. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal. **NOTE:** Before installing the wheel, clean the mating surfaces between the brake disc and the inside of the wheel.

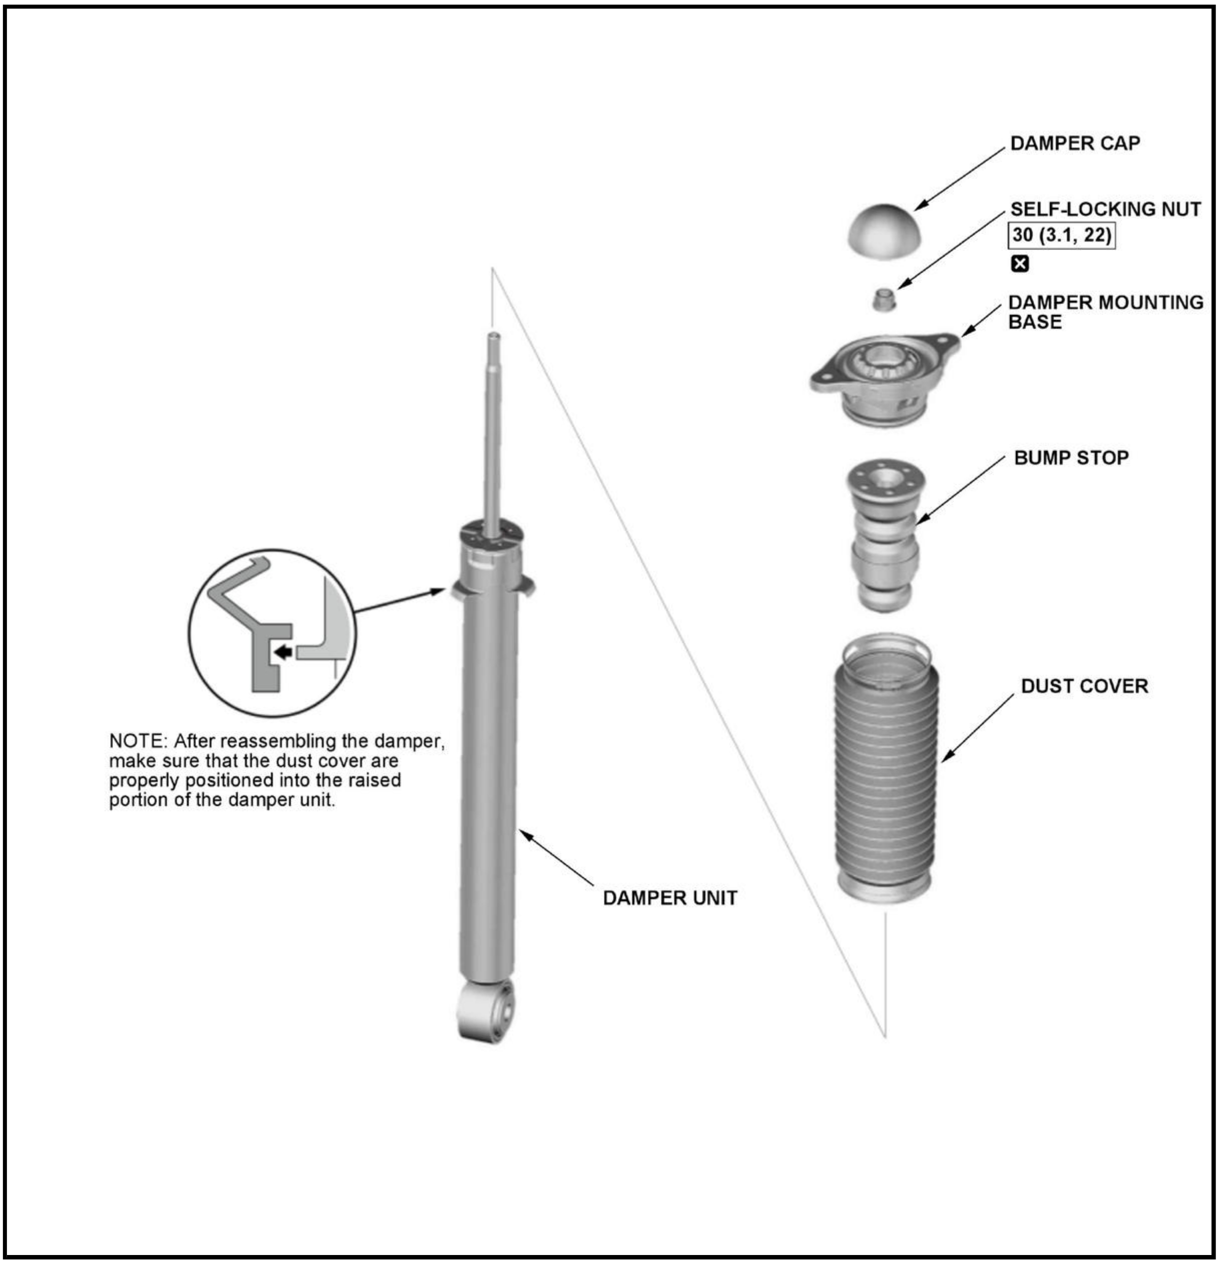
REMOVAL, INSTALLATION & INSPECTION

REAR DAMPER REMOVAL, INSTALLATION, AND INSPECTION

Exploded View

NOTE: How to read the torque specifications .

1. Rear Damper



DAMPER CAP
SELF-LOCKING NUT
30 (3.1, 22)
☒
DAMPER MOUNTING BASE
BUMP STOP
DUST COVER
DAMPER UNIT

NOTE: After reassembling the damper, make sure that the dust cover are properly positioned into the raised portion of the damper unit.

Removal and Installation

NOTE:

- How to read the torque specifications .
- Refer to the Exploded View as needed during the following procedures.
- Check for deterioration and damage to each part during removal.

1. Vehicle - Lift
2. Rear Wheel - Remove
3. Damper - Remove

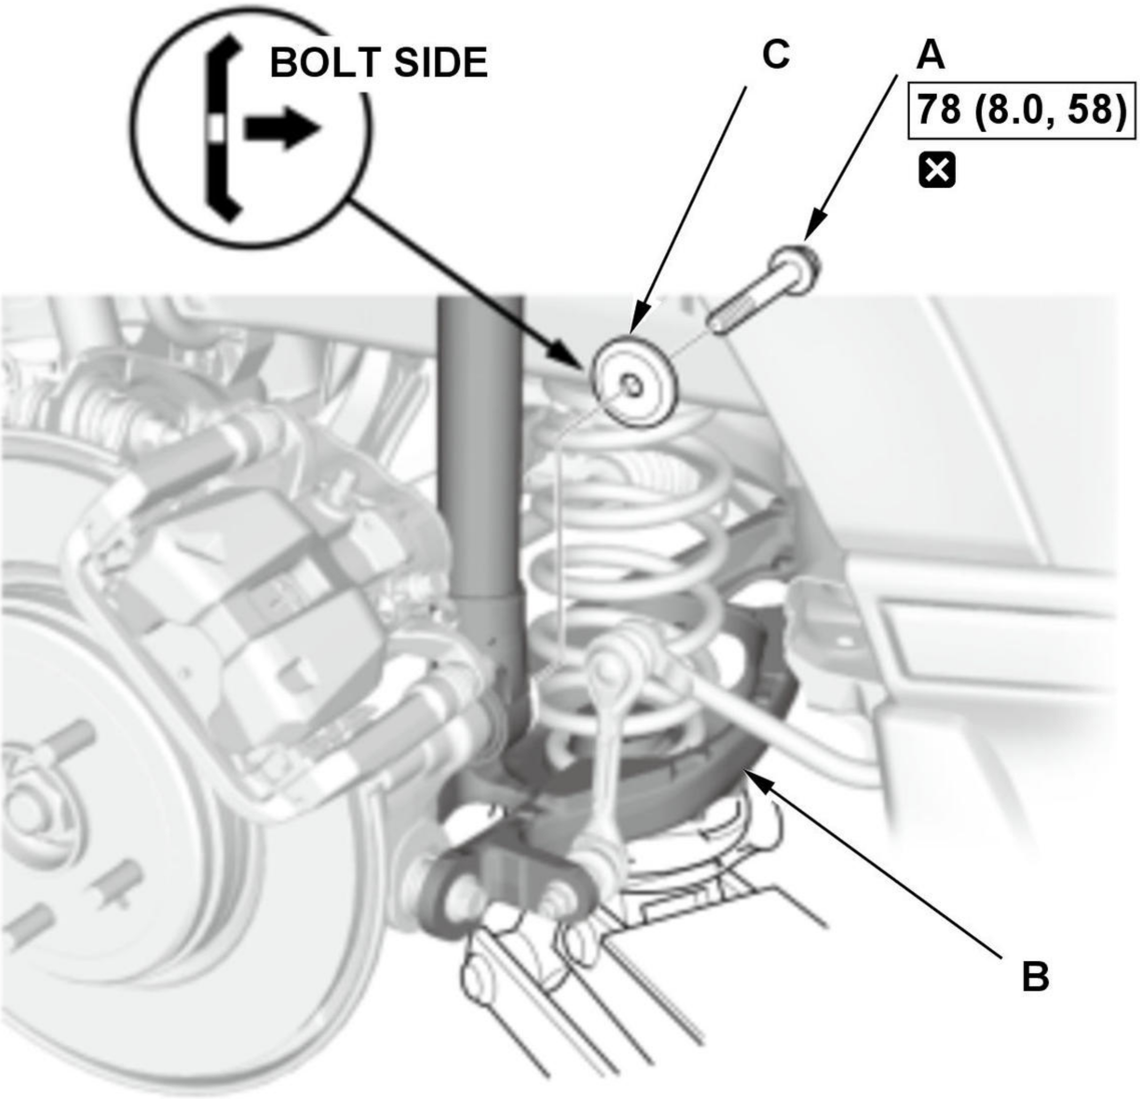


Fig. 1: Rear Damper Lower Mounting Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Position a floor jack under lower arm B.

2. Raise the floor jack until the suspension begins to compress.

3. Remove the damper lower mounting bolt (A) and the washer (C).

NOTE: Use a new bolt during reassembly.

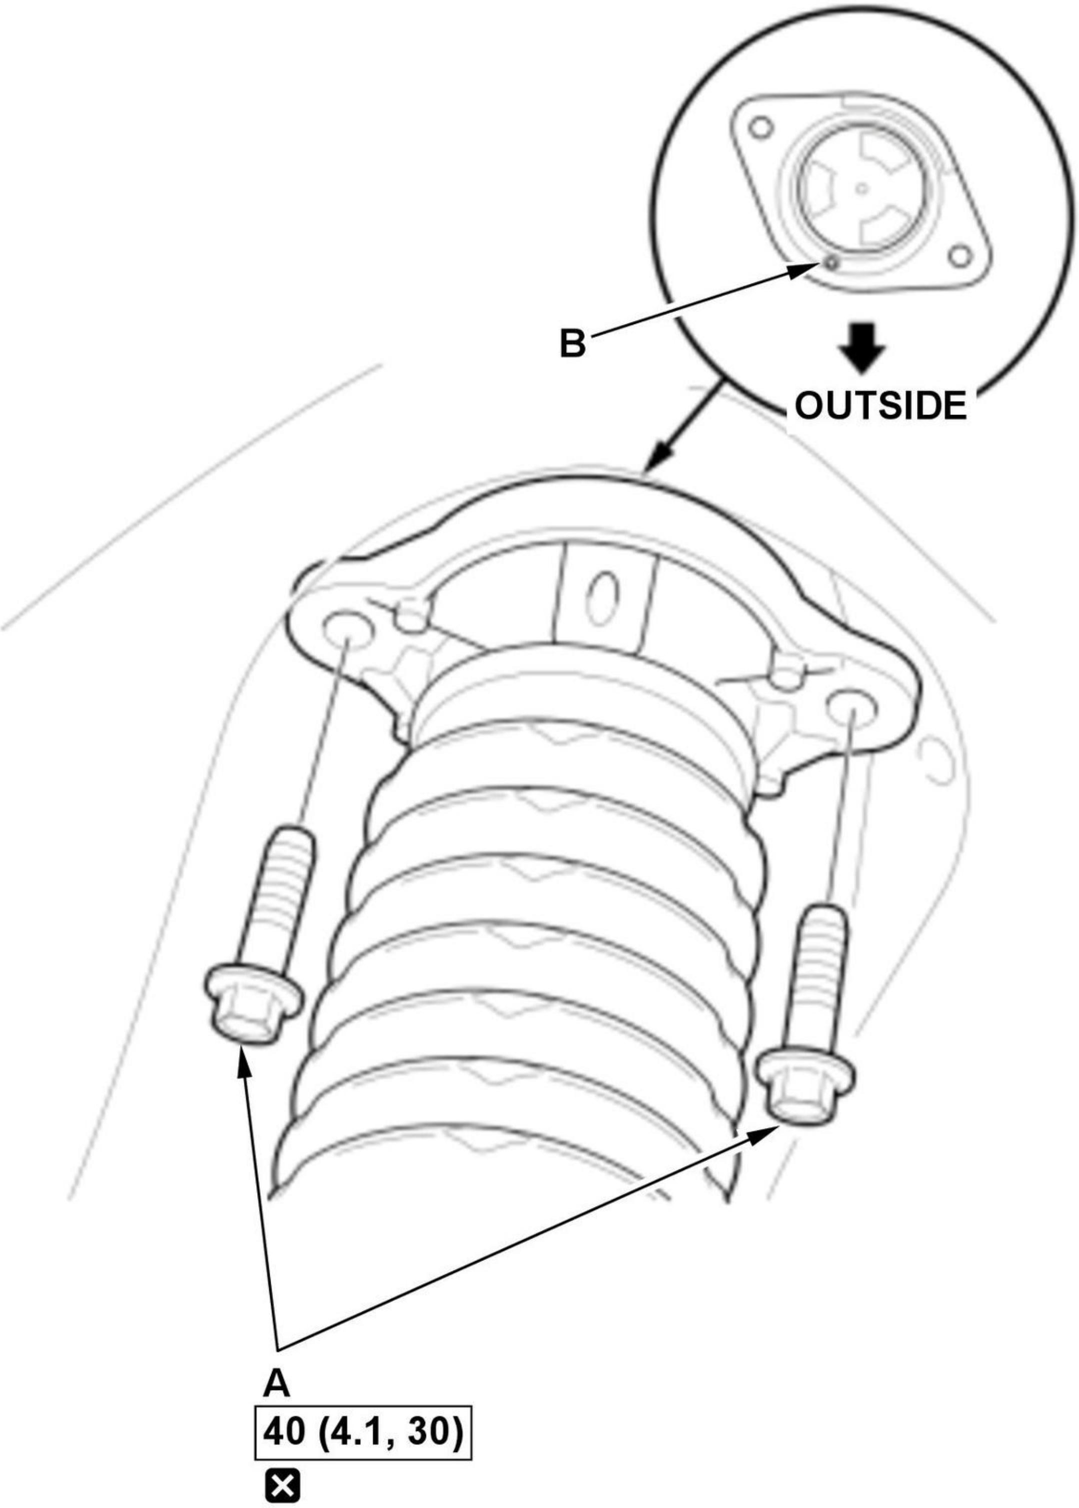

Fig. 2: Rear Damper Upper Mounting Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

4. Remove the damper upper mounting bolts (A).

NOTE:

- Be careful not to damage the body.
- Do not let the damper drop down under its own weight.
- During installation, note these items.

- Install the damper unit in the body with the hole (B) facing outside. - Use new flange bolts during reassembly.

4. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal. **NOTE:** Loosely install the nuts and/or bolts to install the bushings, load the suspension with the vehicle's weight, and then tighten the nuts and/or bolts to the specified torque.

5. **Wheel Alignment - Check**

Inspection

1. Rear Damper - Inspect

	1. Install the damper mounting base and the self-locking nut. 2. Compress the damper assembly by hand, and check for smooth operation through a full stroke, both compression and extension. The damper should extend smoothly and constantly when compression is released. If it does not, the gas is leaking and the damper should be replaced. 3. Check for oil leaks, abnormal noises, and binding during these tests.

INSPECTION

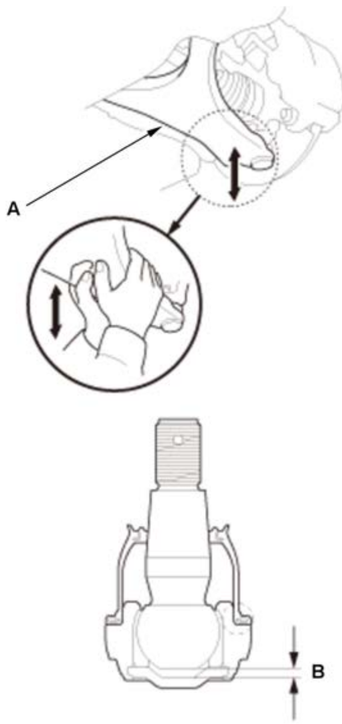
FRONT LOWER ARM BALL JOINT INSPECTION

Inspection

NOTICE:

When inspecting the ball joint, the vehicle will be shaken strongly. Make sure to support the front jacking bracket correctly with the suitable jack.

1. **Vehicle - Lift**
2. **Front Wheel - Remove**
3. Lower Ball Joint - Inspect

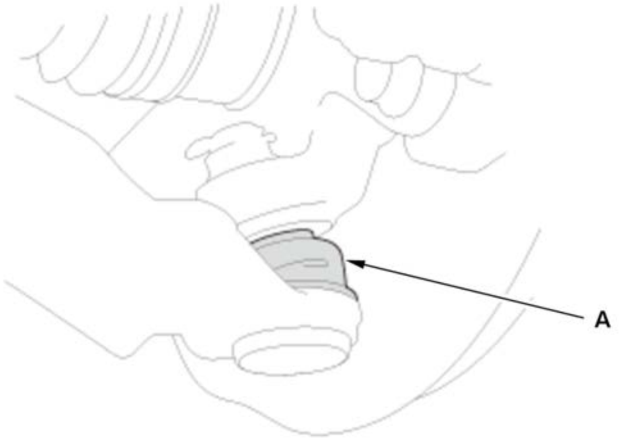


1. Check all bolts, nuts, and bushings on the suspension components, and make sure that there are not looseness, deteriorated or damaged.

2. Hold the outside of lower arm (A) with your hands, and move it up and down to check for abnormal noise or wobbling.

NOTE:

- If the lower ball joint is abnormal, **replace the lower ball joint** .
- A problem on the lower ball joint may be caused by an abnormal clearance (B).



3. Check the ball joint boot (A) for weakness, damage, cracks, and inner boot grease leaks.
NOTE: If the ball joint boot shows damage, weakness, or cracks **replace the lower ball joint** .

4. **Front Wheel - Install**

WHEEL BEARING END PLAY INSPECTION

Inspection

NOTE: **How to read the torque specifications** .

1. **Vehicle - Lift**
2. **Front Wheels and Rear Wheels - Remove**
3. Wheel Bearing End Play - Inspect

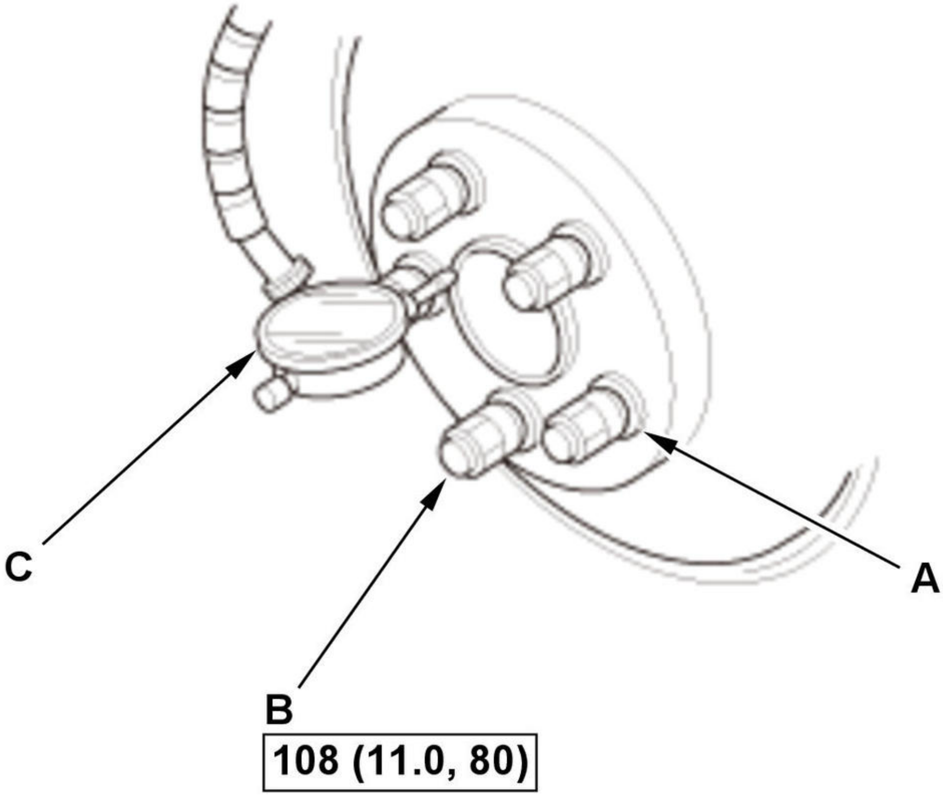


Fig. 3: Wheel Bearing End Play Inspection Components And Wheel Nuts With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Install suitable flat washers (A).

2. Install the wheel nuts (B).

3. Tighten the nuts to the specified torque to hold the brake disc securely against the hub.

4. Attach the dial gauge (C).

5. Place the dial gauge against the hub flange.

6. Measure the bearing end play while moving the brake disc inward and outward.

7. If the bearing end play measurement is more than the standard, replace the wheel bearing or the hub bearing unit .

Wheel bearing end play:		
B	**Front/Rear:**	**0-0.05 mm (0-0.0020 in)**

4. Front Wheels and Rear Wheels - Install

WHEEL RUNOUT INSPECTION

Inspection

1. Vehicle - Lift
2. Wheel Runout - Inspect

 **Axial runout**	1. Check for bent or deformed wheels. 2. Set up the dial gauge as shown. 3. Measure the axial runout by turning the wheel.

Front and rear wheel axial runout:		
B	**Standard:**	**0-0.3 mm (0-0.012 in)**
B	**Service limit:**	**2.0 mm (0.079 in)**

Radial runout 	4. Reset the dial gauge to the position shown. 5. Measure the radial runout. 6. If the wheel runout is not within the specification, check the wheel bearing end play , and make sure the mating surfaces between the brake disc and the inside of the wheel are clean. 7. If the bearing end play is within the specification but the wheel runout is more than the service limit, replace the wheel .

Front and rear wheel radial runout:		
B	**Standard:**	**0-0.3 mm (0-0.012 in)**
B	**Service limit:**	**1.5 mm (0.059 in)**

REPLACEMENT

FRONT KNUCKLE/HUB/WHEEL BEARING REPLACEMENT

Special Tools Required

DAMPER PINCH BOLT
93 (9.5, 69)
KNUCKLE
SNAP RING
SPLASH GUARD
6.0 (0.61, 4.4)
BRAKE DISC
WHEEL BEARING
(With a built-in magnetic encoder)
☒
FRONT HUB
FLATHEAD SCREW
9.5 (0.97, 7.0)

Removal and Installation

NOTE:

- **How to read the torque specifications** .
- Refer to the Exploded View as needed during the following procedures.
- Check for deterioration and damage to each part during removal.

Knuckle/Hub

1. **Vehicle - Lift**
2. **Front Wheel - Remove**
3. **Front Wheel Speed Sensor - Remove**

   NOTE: Do not disconnect the wheel speed sensor connector.

4. Brake Hose Bracket - Remove

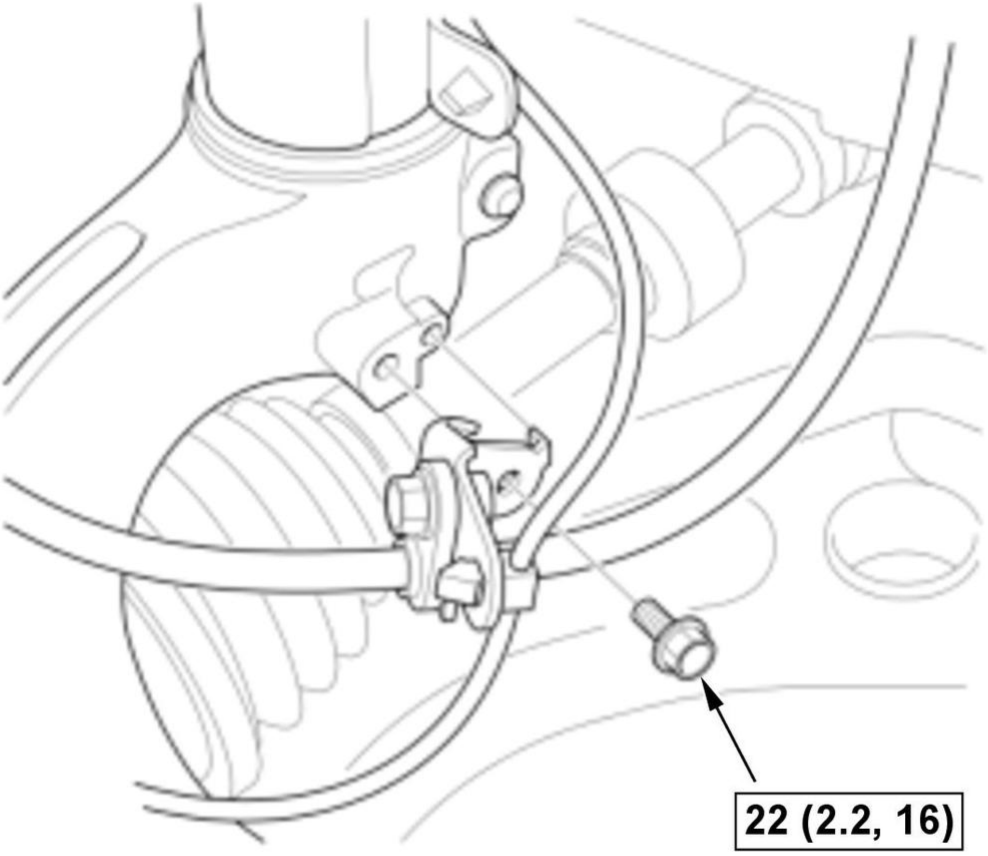

Fig. 4: Front Brake Hose Bracket Bolt With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

5. Brake Caliper - Remove

> 1. Remove the caliper assembly without disconnecting the brake hose from the caliper body .
> **NOTE:**
>
> - To prevent damage to the caliper assembly or brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage.
> - Do not twist the brake hose excessively.

6. Front Spindle Nut - Remove
7. Front Brake Disc - Remove
8. Hub for Damage and Cracks - Check
9. Tie-Rod End Ball Joint - Disconnect
10. Lower Arm Ball Joint - Remove
11. Knuckle/Hub Assembly - Remove

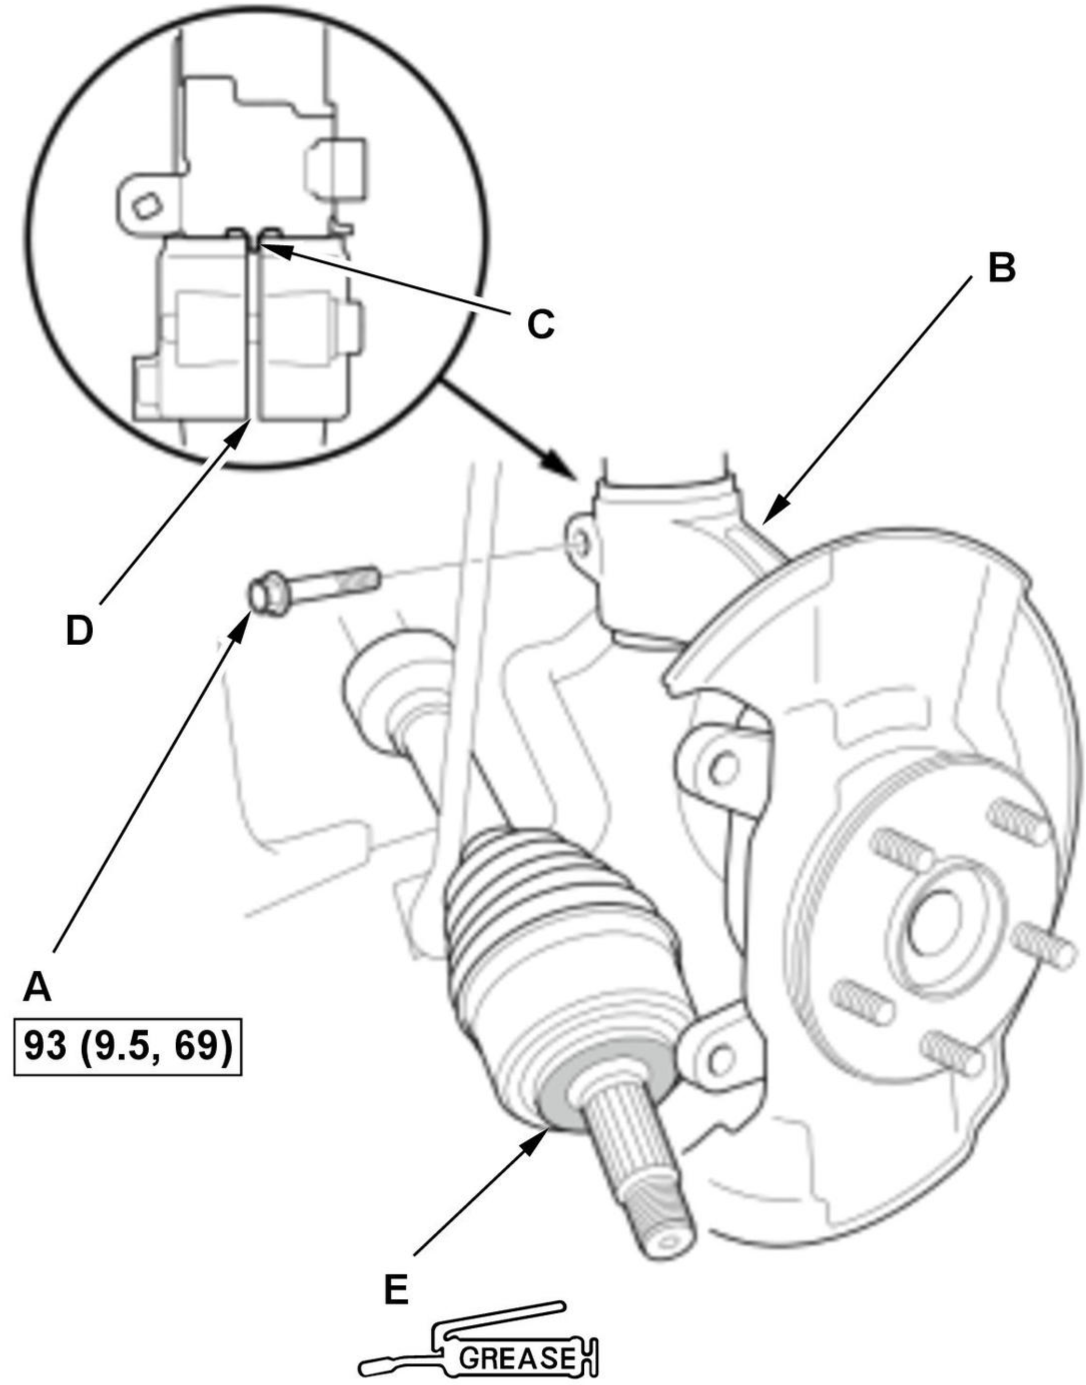

Fig. 5: Front Knuckle/Hub Assembly Components And Damper Pinch Bolt With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the damper pinch bolt (A).

2. Move the knuckle (B) downward, and remove the knuckle from the damper.

NOTE:

- Do not pull the driveshaft end outward. The inner driveshaft inboard joint may come apart.
- During installation, note these items.
-

- Install the aligning tab (C) on the damper unit into the slot (D) of the knuckle.
- **Apply specified grease to the contact area (E) of the outboard joint and the front wheel bearing** .

12. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

13. **Wheel Alignment - Check**

Replacement

NOTE:

- **How to read the torque specifications** .
- Refer to the Exploded View as needed during the following procedures.
- Check for deterioration and damage to each part during removal.

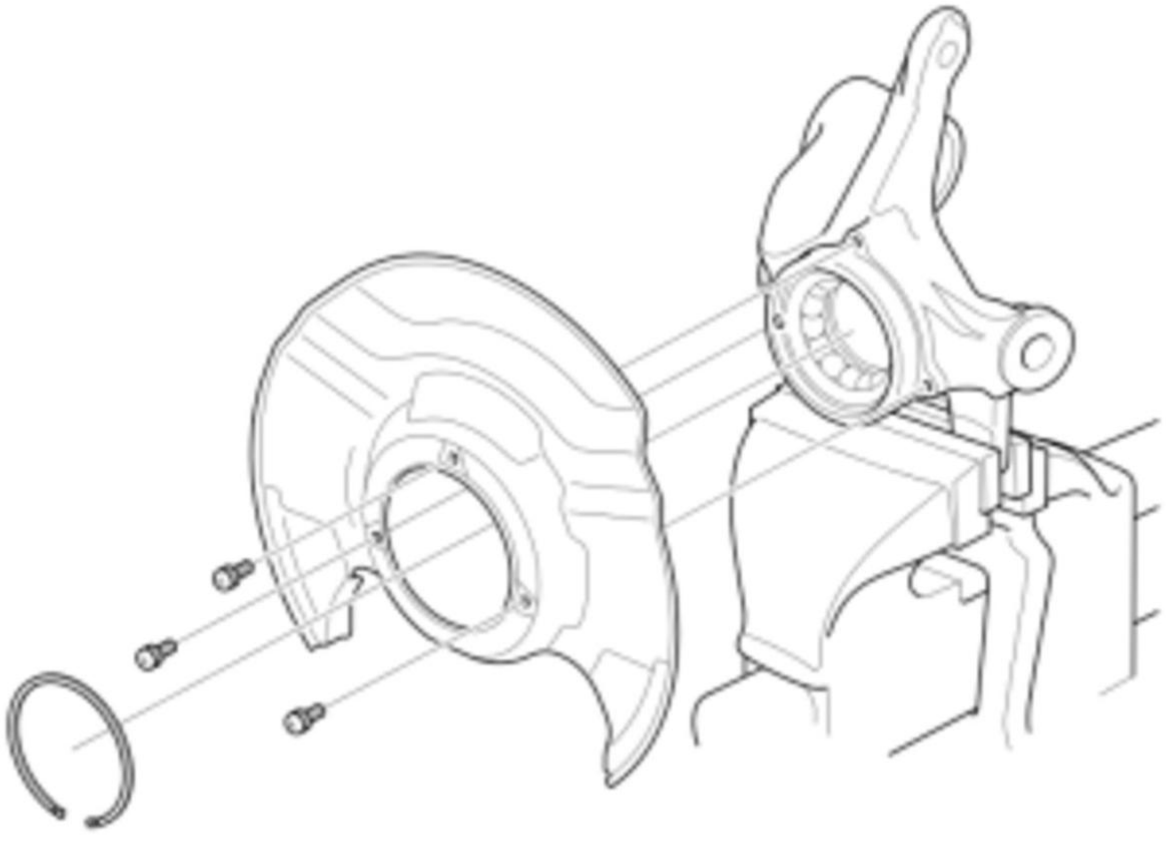
Wheel Bearing

1. Hub - Remove

 Press 07749-0010000 07746-0010300 B D C C A 07746-0041100	1. Separate the hub (A) from the knuckle (B) using the driver handle, the bearing driver attachment, the pilot, and a hydraulic press. **NOTE:** - Hold the knuckle with the attachment (C) of the hydraulic press or equivalent tool. - Be careful not to damage or deform the splash guard (D). - Hold onto the hub to keep it from falling when pressed clear.

 Press 07749-0010000 07746-0010300 B C C A 07746-0041100	2. Press out the hub (A) from the wheel bearing inner race (B) using the driver handle, the bearing driver attachment, the pilot, a commercially available bearing separator (C), and a hydraulic press.

2. Splash Guard and Snap Ring - Remove

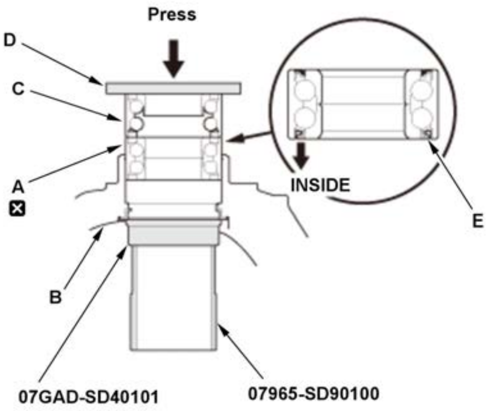


NOTE: Check for damaged or deformed snap ring, and replace it if damaged.

3. Wheel Bearing - Remove

 Press 07749-0010000 07746-0010500 B A ☒	1. Press out the wheel bearing (A) from the knuckle (B) using the driver handle, the bearing driver attachment, and a hydraulic press.

4. Wheel Bearing - Install



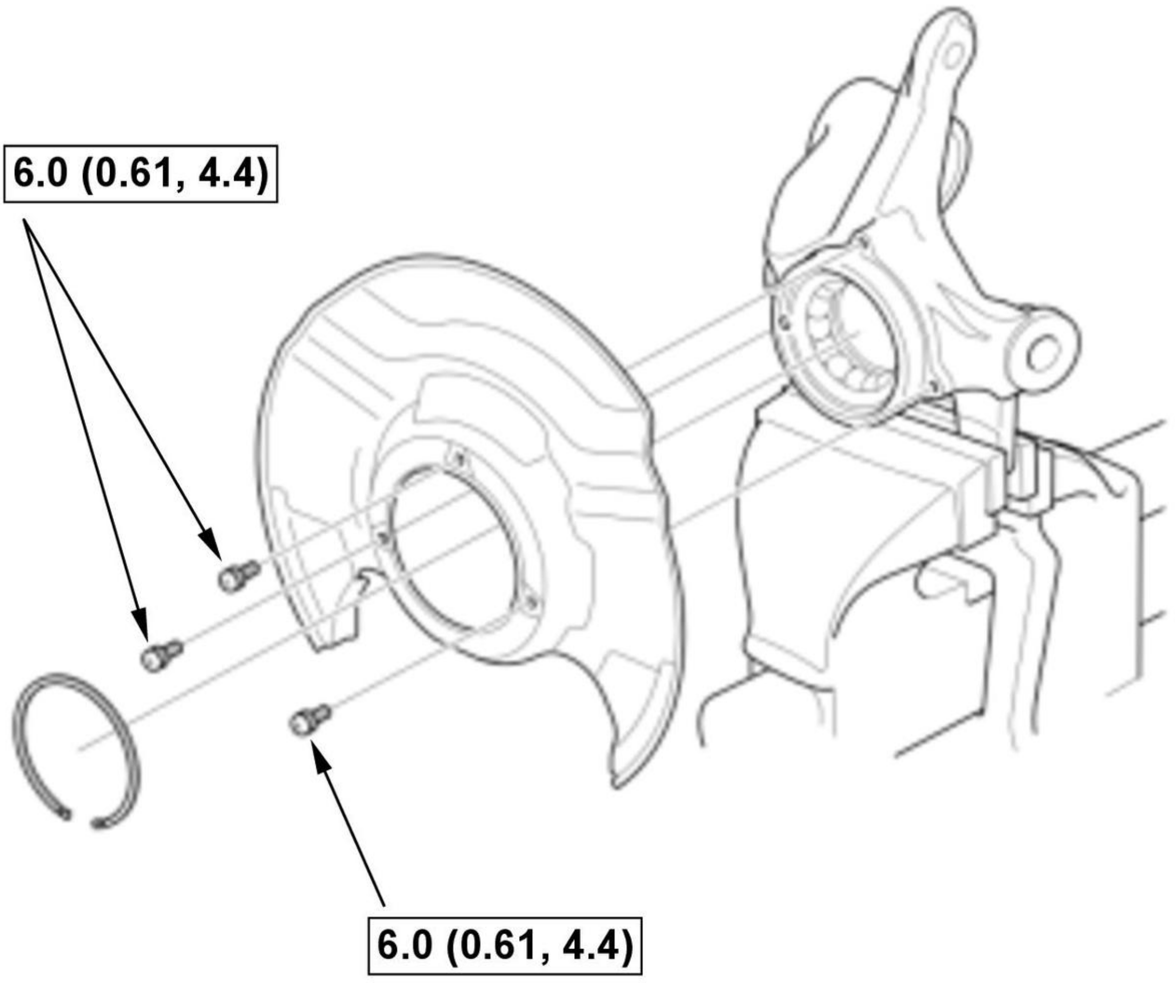
1. Wash the knuckle and the hub thoroughly in high flash point solvent before reassembly.

2. Press a new wheel bearing (A) into the knuckle (B) using the old bearing (C), a steel plate (D), the attachment, the support base, and a hydraulic press.

NOTE:

- Install the wheel bearing with the wheel speed sensor magnetic encoder (E) (brown color) toward the inside of the knuckle.
- Remove any oil, grease, dust, metal debris, and other foreign material from the encoder surface.
- Keep any magnetic tools away from the encoder surface.
- Keep the wheel bearing and magnetic encoder away from any magnetic field. The encoder can be damaged or erased.
- Be careful not to damage the encoder surface when you insert the wheel bearing.

5. Splash Guard and Snap Ring - Install



NOTE: Check for damaged or deformed snap ring, and replace it if damaged.

6. Hub - Install

 Press 07749-0010000 07746-0010500 B C C A 07965-SD90100	1. Install the hub (A) into the wheel bearing (B) using the bearing driver attachment, the driver handle, the support base, and a hydraulic press. **NOTE:** Be careful not to damage the splash guard (C).

TIRE SEALANT BOTTLE REPLACEMENT

Replacement

1. Tire Sealant Bottle - Remove

	1. Remove the cover (A). 2. Rotate the sealant bottle (B) as shown. 3. Disconnect the joint (C), then remove the tire sealant bottle.

2. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

SERVICING

BALL JOINT DISCONNECTION

Special Tools Required

Image	Description/Tool Number
	Ball Joint Thread Protector, 14 mm 07AAE-SJAA100
	Ball Joint Thread Protector, 12 mm 07AAF-SDAA100
	Ball Joint Remover, 32 mm 07MAC-SL00102
	Ball Joint Remover, 28 mm 07MAC-SL00202

Removal

NOTICE:

Always use a ball joint remover to disconnect a ball joint. Do not strike the housing or any other part of the ball joint connection to disconnect it.

1. Ball Joint - Disconnection

	1. Install a hex nut (A) or the ball joint thread protector onto the threads of the ball joint (B). **NOTE:** When using a hex nut, make sure the nut is flush with the ball joint pin end to prevent damage to the threaded end of the ball joint pin.

	2. Apply multipurpose grease to the ball joint remover on the areas as shown (A). This will ease the installation of the tool, and prevent damage to the pressure bolt (B) threads.

	3. Loosen the pressure bolt (A), and install the ball joint remover as shown. **NOTE:** - Insert the jaws carefully, making sure not to damage the ball joint boot. - Fasten the safety chain (B) securely to a suspension arm or the subframe (C). Do not fasten it to a brake line or wire harness. 4. Adjust the jaw spacing by turning the adjusting bolt (D). 5. Make sure the head of the adjusting bolt is in the position shown to allow the jaw (E) to pivot. 6. Tighten the pressure bolt until the ball joint pin pops loose from the ball joint connecting hole. If necessary, apply penetrating type lubricant to loosen the ball joint pin. **NOTE:** Do not use pneumatic or electric tools on the pressure bolt. 7. Remove the ball joint remover.

	8. Remove the nut or the ball joint thread protector. 9. Pull the ball joint out of the ball joint connecting hole. 10. Inspect the ball joint boot, and replace it if damaged.

FRONT DAMPER/SPRING DISASSEMBLY, REASSEMBLY, AND INSPECTION

Special Tools Required

Image	Description/Tool Number
	Strut Nut Adapter 07AAA-SVAA100

Disassembly

NOTE:

- When compressing the damper spring, use a commercially available strut spring compressor according to the manufacturer's instructions.
- Check for deterioration and damage to each part during removal.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

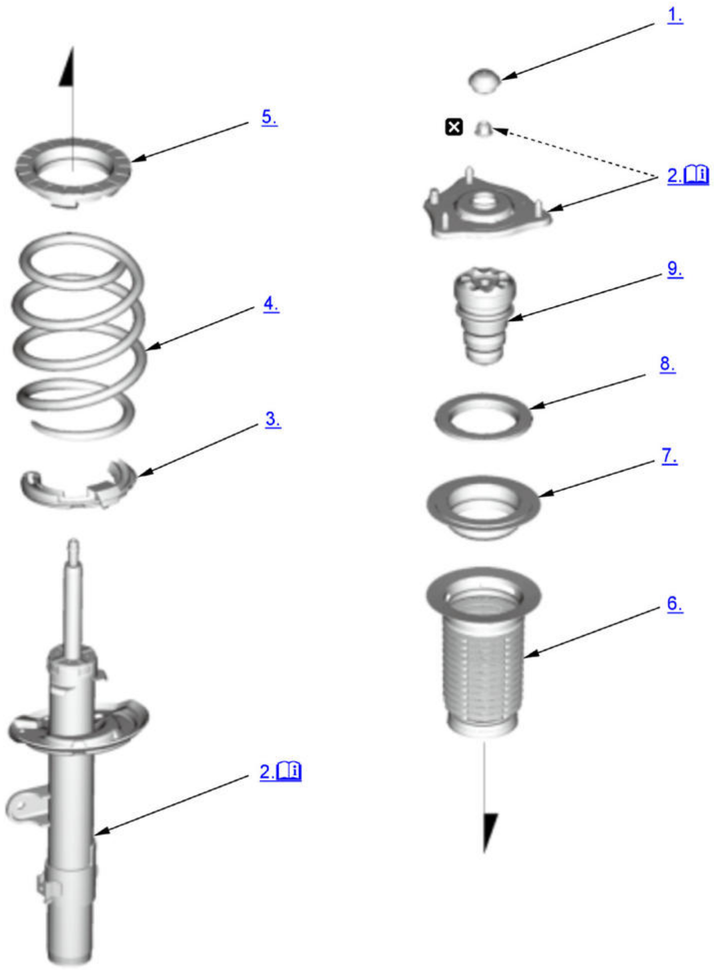


Fig. 6: Exploded View Of Front Damper/Spring Disassembly Components
Courtesy of HONDA, U.S.A., INC.

☒	Replace

1. Damper Cap - Remove
2. Damper Unit, Damper Mounting Base - Remove

	1. Set the damper/spring to the strut spring compressor. 2. Compress the damper spring. **NOTE:** Do not compress the spring more than necessary to remove the nut. 3. Remove the self-locking nut (A) with the strut nut adapter (B), while holding the damper shaft with a hex wrench (C). 4. Remove the damper unit. 5. Release the pressure from the strut spring compressor. 6. Remove the damper mounting base/damper spring from the strut spring compressor.

3. Lower Spring Seat Rubber - Remove
4. Damper Spring - Remove
5. Upper Spring Seat Rubber - Remove
6. Dust Cover - Remove
7. Upper Spring Seat - Remove
8. Damper Mounting Bearing - Remove
9. Bump Stop - Remove

Inspection

1. Damper/Spring - Inspect

	1. Reassemble the damper mounting base and the self-locking nut. 2. Compress the damper assembly by hand, and check for smooth operation through a full stroke, both compression and extension. The damper should extend smoothly and constantly when compression is released. If it does not, the gas is leaking and the damper should be replaced. 3. Check for oil leaks, abnormal noises, or binding during these tests.

Reassembly

NOTE:

- When compressing the damper spring, use a commercially available strut spring compressor according to the manufacturer's instructions.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

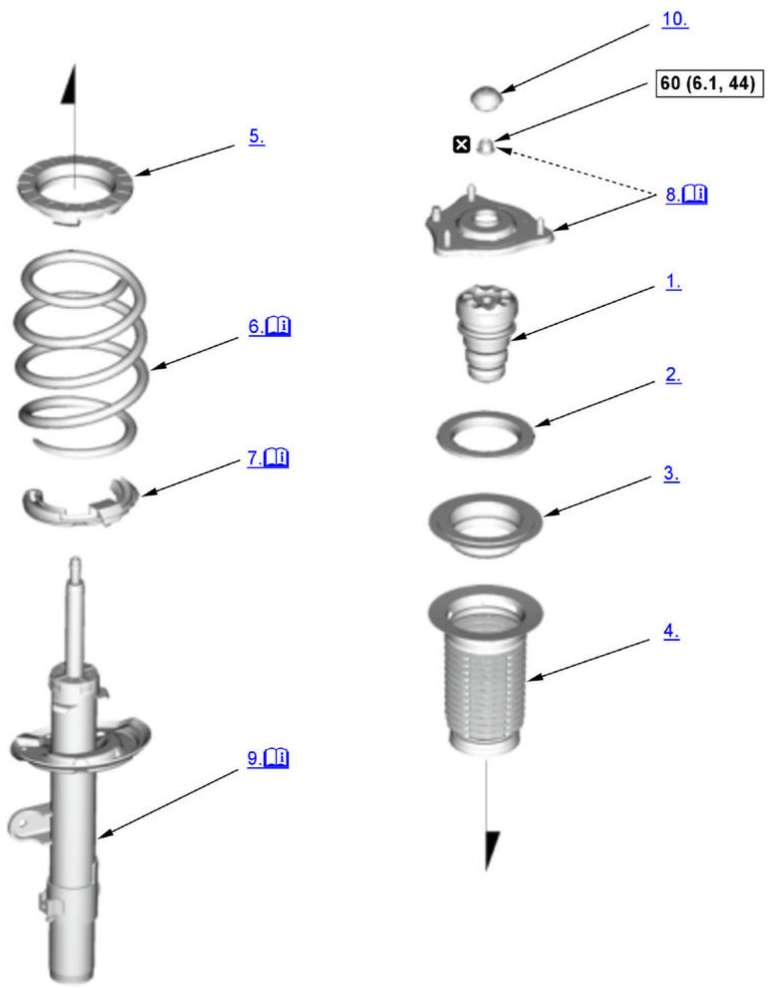

Fig. 7: Exploded View Of Front Damper/Spring Reassembly Components With Torque Specifications
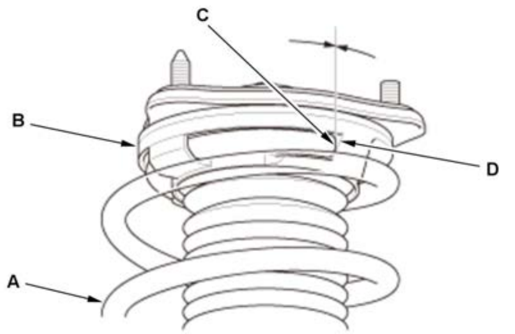
Courtesy of HONDA, U.S.A., INC.

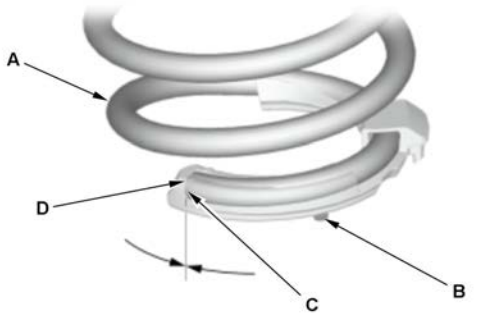
☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Bump Stop - Install
2. Damper Mounting Bearing - Install
3. Upper Spring Seat - Install
4. Dust Cover - Install
5. Upper Spring Seat Rubber - Install
6. Damper Spring - Install



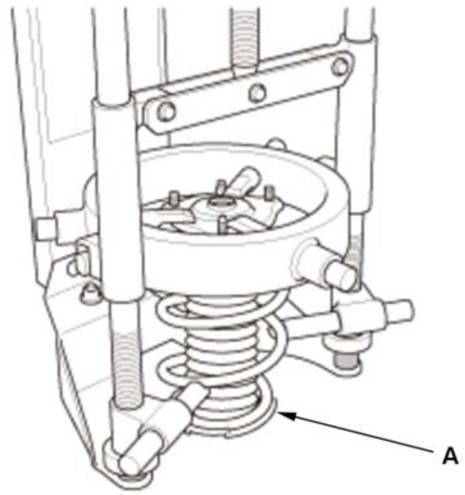
1. Install the damper spring (A) on the upper spring seat rubber (B) by aligning the upper end (C) of the damper spring with the ledge portion (D) of the upper spring seat rubber.

7. Lower Spring Seat Rubber - Remove



1. Install the damper spring (A) on the lower spring seat rubber (B) by aligning the upper end (C) of the damper spring with the ledge portion (D) of the lower spring seat.

8. Damper Mounting Base - Set

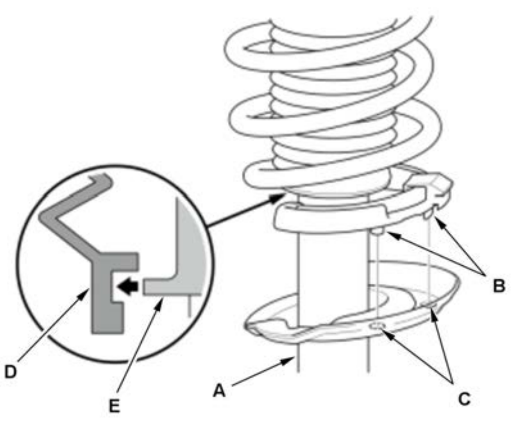


1. Set the damper mounting base/damper spring (A) to the strut spring compressor.

2. Compress the damper spring.

NOTE: Do not compress the spring excessively.

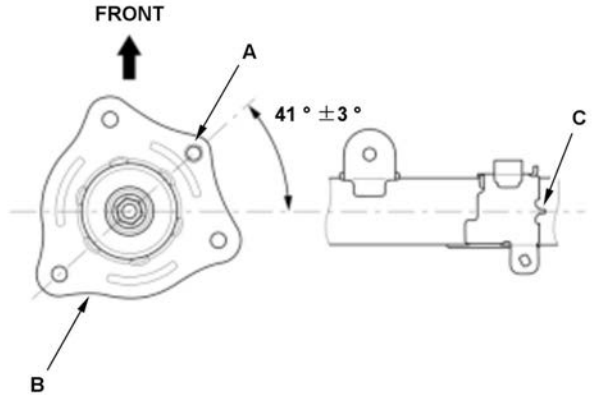
9. Damper Unit - Install



1. Install the damper unit (A) to the damper spring/damper mounting base.

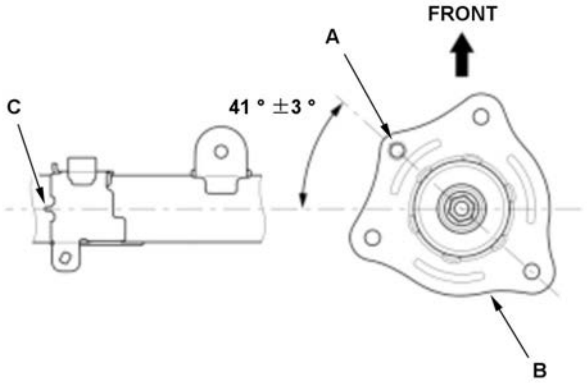
2. Align the raised portions (B) of the lower spring seat rubber and the holes (C) of the lower spring seat on the damper unit.

NOTE: After reassembling the damper/spring, make sure that the dust cover (D) are properly positioned into the raised portion (E) of the damper unit.

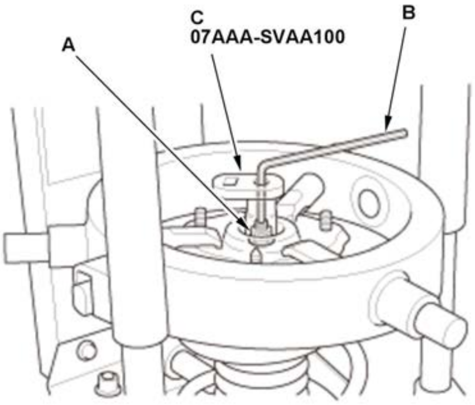


Left side

Right side



3. Align the angle of the stud (A) on the damper mounting base (B) with the aligning tab (C) on the bottom of the damper unit as shown.



4. Install the self-locking nut (A).

5. Hold the damper shaft using a hex wrench (B), and tighten the self-locking nut using the strut nut adapter (C) to the specified torque.

6. Remove the damper/spring from the strut spring compressor.

10. Damper Cap - Install

TIRE SEALANT REMOVAL

Removal

NOTE:

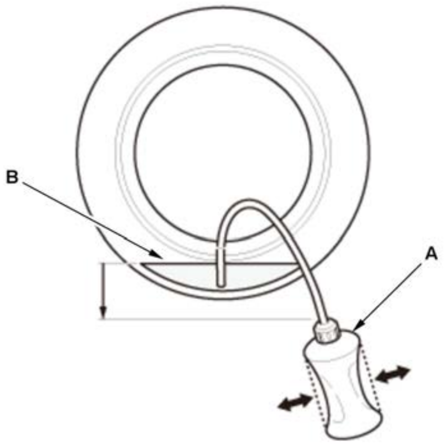
- This procedure is only to be used with the temporary tire repair kit.
- The tire inflator and temporary repair sealant are used on vehicles without a spare tire.
- The temporary repair sealant used to repair the tire must be removed before the tire is permanently repaired.
- The temporary repair sealant (once used or past the expiration date) is considered hazardous waste, and must be disposed of in an environmentally safe manner (such as used engine oil and coolant). Check with your local regulations for proper disposal.
- The expiration date of the temporary repair sealant is printed on the container.

NOTICE:

Do not dispose a tire with the fluid sealant filled.

1. Vehicle - Lift
2. Wheel - Remove
3. Tire Sealant - Remove

	1. Deflate the tire. 2. Place the wheel and tire assembly upright with the tire valve hole at the 6 o'clock position. 3. Cut off the valve (A) at its base. 4. Push the remaining rubber portion of the valve into the tire. **NOTICE:** Avoid damage to the wheel when using the tools. **NOTE:** Replace the valve with a new one when reassembling the tire. 5. Put the tire on the working table, and set it up. **NOTE:** Be careful not to spill the fluid sealant from the drain hole (B).



6. Use a commercially available squeeze bottle (A), a siphon gun, or a hand vacuum tool with a proper tube to remove the tire sealant.

7. Insert the tube into the tire through the drain hole, and aim it down until the end of the tube is immersed into the fluid sealant (B).

8. Remove the tire sealant.

NOTE: If using the bottle with the tube, set the bottle in a lower position than the tire and squeeze the bottle to siphon the tire sealant into the bottle.

9. Completely seal and dispose of the bottle containing the tire sealant in the proper manner for hazardous waste. Check with your local regulations.

10. If you are going to reuse the tire, completely remove the fluid sealant and replace the tire valve.

- Wipe the fluid sealant completely so that the beaded edge of the tire and the mating portion of the wheel rim and the bead are clean.
- Tire damaged such as punctures may be filled with the fluid sealant, and can be difficult to locate depending on the extent of the damage.
- When you drive with a flat tire with fluid sealant, check the tire pressure often until the vehicle can be safely taken to a repair facility.

4. Wheel - Install

1. Inflate the tire to the specified tire pressure listed on the doorjamb label.

2. **Install the wheel**

.

ADJUSTMENT

WHEEL ALIGNMENT

Check

1. Pre-Alignment - Check

	For proper inspection and adjustment of the wheel alignment, do these checks: 1. Release the parking brake to avoid an incorrect measurement. 2. Make sure the suspension is not modified. 3. Make sure the fuel tank is full and the spare tire or tire repair kit, jack, and tools are in place inside the vehicle. 4. Check the tire size and tire pressure according to the tire information. 5. Set the steering column to the middle tilt position and telescopic position (if equipped). 6. **Check the runout of the wheels and tires**. 7. Check the suspension ball joints (**Raise and support the vehicle** . Hold a tire with your hands, and move it up and down and right and left to check for movement). 8. Before doing alignment inspections, be sure to remove all extra weight from the vehicle, and no one should be inside the vehicle (driver or passengers). 9. Lower the vehicle to the ground. Bounce the vehicle up and down several times to stabilize the suspension.

Inspection

Use a commercially available computerized four wheel alignment equipment to measure wheel alignment (caster, camber, toe, and turning angle). Follow the equipment manufacturer's instructions.

1. Caster - Inspect

1. Check the caster angle. - If the measurement is within the specifications, measure the camber angle. - If the measurement is not within the specifications, check for bent or damaged suspension components.

Caster angle:	**5 B° 04 ' +/-30 '**

2. Camber - Inspect

1. Check the camber angle. - If the measurement is within the specification, measure the toe-in. - If the measurement for the front camber is not within specification, go to front camber adjustment. - If the measurement for the rear camber is not within specification, check for bent or damaged suspension components.

Camber angle:

B	**Front:**	**-0 B° 12 ' +/-30 '**
B	**Rear:**	**-1 B° 12 ' +/-45 '**
(Maximum difference between the right and left side: 0 B° 45 ')		

3. Rear Toe - Inspect

NOTE: Do the rear toe inspection before the front toe inspection.

1. Release the parking brake to avoid an incorrect measurement.

2. Check the toe.

- If adjustment is required, go to rear toe adjustment.
- If no adjustment is required, go to front toe inspection.

Rear total toe-in:	**3.5^{+1}_{-2} mm ($0.138^{+0.04}_{-0.08}$ in)**

4. Front Toe - Inspect

NOTE: Do the rear toe inspection before the front toe inspection.

1. Set the steering column to the middle tilt position and telescopic position (if equipped).

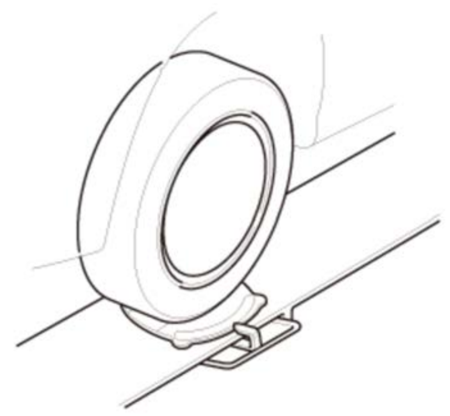
2. Center the steering wheel spokes, and hold it.

3. Check the toe with the wheels pointed straight ahead.

- If adjustment is required, go to the front toe adjustment.
- If no adjustment is required, remove the alignment equipment.

Front total toe-in:	**2 +/- 2 mm (0.08 +/- 0.08 in)**

5. Turning Angle - Inspect



1. Turn the wheel right and left while applying the brake, and measure the turning angle of both wheels.

- If the measurement is not within specifications, even up both sides of the tie-rod threaded section while adjusting the front toe.
- If it is correct, but the turning angle is not within the specifications, check for bent or damaged suspension components.

Turning angle:		
B	**Inward:**	**37 B° 38 ' +/-2 B°**
B	**Outward (reference):**	**31 B° 01 '**

Adjustment

The suspension can be adjusted for front camber, front toe, and rear toe. However, each of these adjustments are related to each other. For example, when you adjust camber, the toe will change.

NOTE:

- **How to read the torque specifications** .
- After adjusting the wheel alignment, **do the VSA sensor neutral position memorization** .

1. **Vehicle - Lift**
2. Front Camber - Adjust

	1. Replace the flange nuts (A) with new ones, and lightly tighten them. 2. If the guide pin (B) is equipped, use a wrench to rock the guide pin left and right while pulling it out from the damper mounting base (C). **NOTE:** The guide pin is for factory assembly use only and can be discarded after removal.

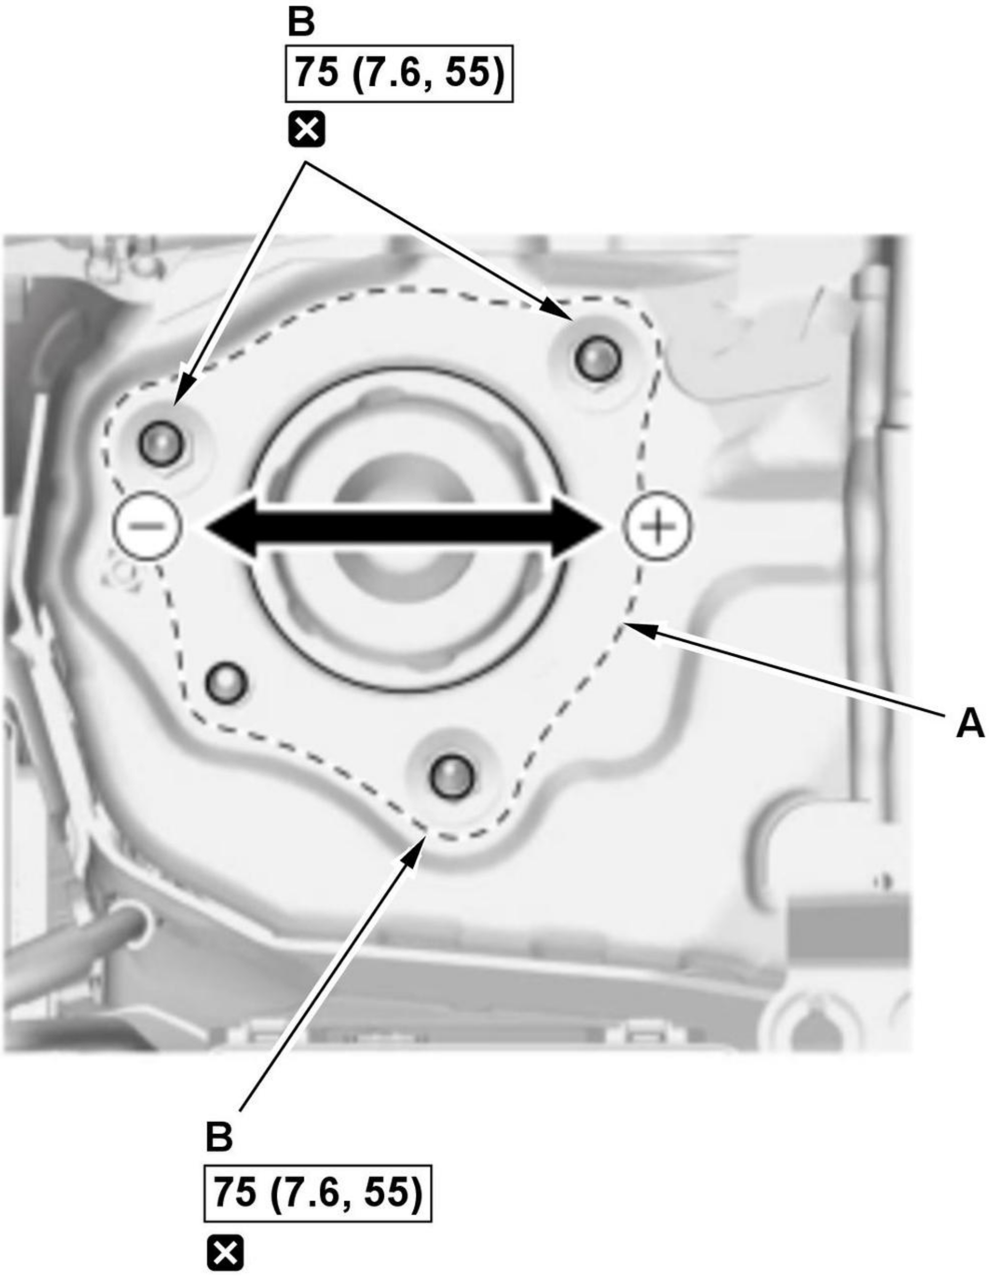


Fig. 8: Front Damper Flange Nuts With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

3. Adjust the camber angle by moving the upper part of the damper (A).
NOTE: The camber angle can be adjusted B± 15 '.

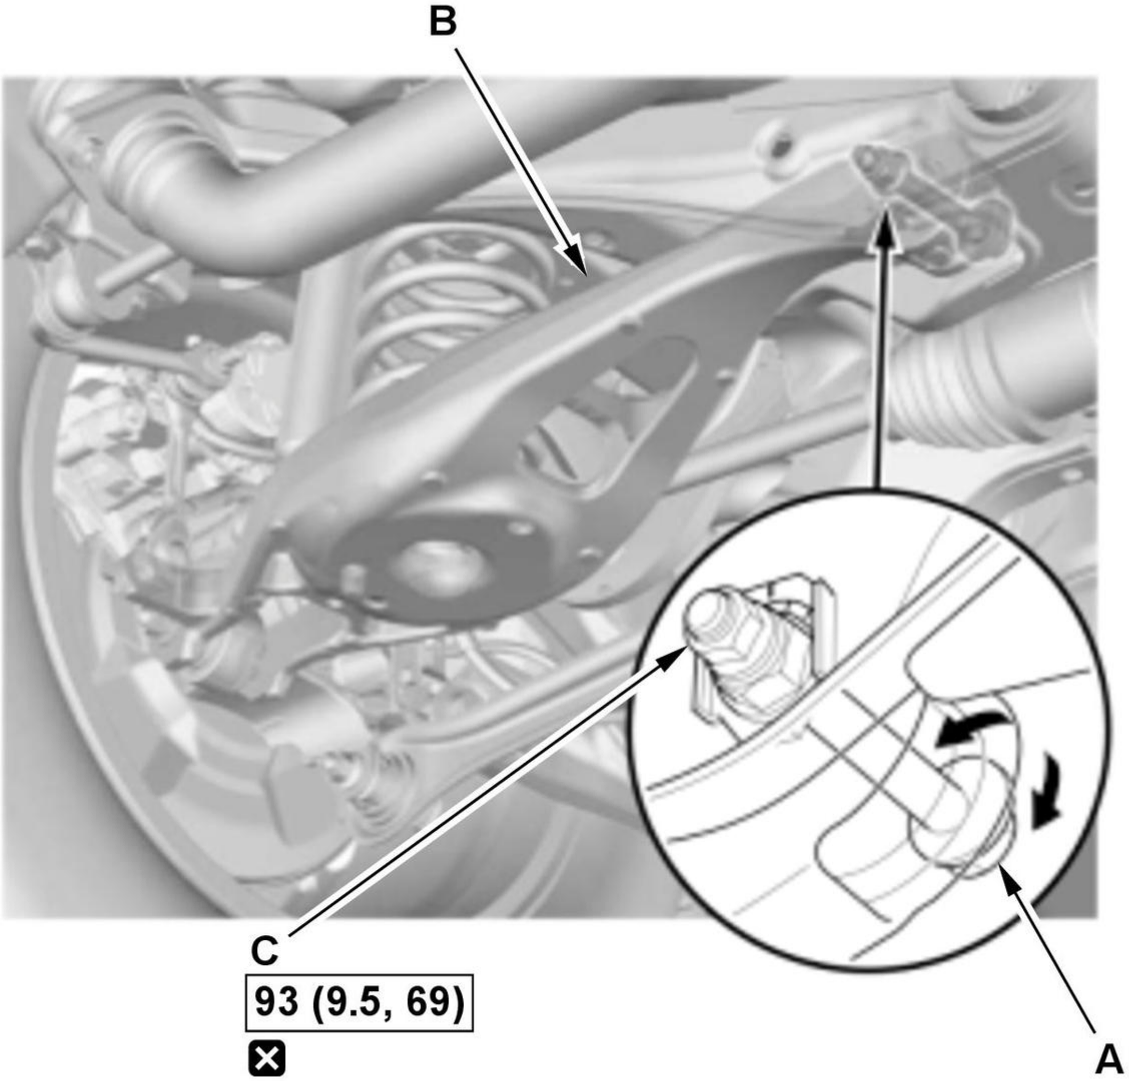
4. Tighten the flange nuts (B) to the specified torque.

5. Lower the vehicle to the ground, and bounce the front of the vehicle up and down several times to stabilize the suspension.

6. Measure the camber angle. If the camber angle is not within specification, readjust the camber angle. If the camber measurement is correct, measure toe-in, and adjust it if necessary.

	7. Install the hole seal (A) after the guide pin is removed. **NOTE:** Refer to the Parts Catalog for the hole seal.

3. Rear Toe - Adjust



[Fig. 9: Rear Toe Adjusting Bolt And Nut With Torque Specifications](#)

Courtesy of HONDA, U.S.A., INC.

NOTE: Do the rear toe adjustment before the front toe adjustment.

1. Hold the adjusting bolt (A) on lower arm B, and remove the self-locking nut (C).

2. Replace the self-locking nut with a new one, and lightly tighten it.

NOTE:

- Always use a new self-locking nut whenever it has been loosened.
- Reassemble the adjusting bolt and the adjusting cam plate with the eccentric facing up.

3. Adjust the rear toe by turning the adjusting bolt until the toe is correct.

4. Tighten the self-locking nut to the specified torque while holding the adjusting bolt.

4. Front Toe - Adjust

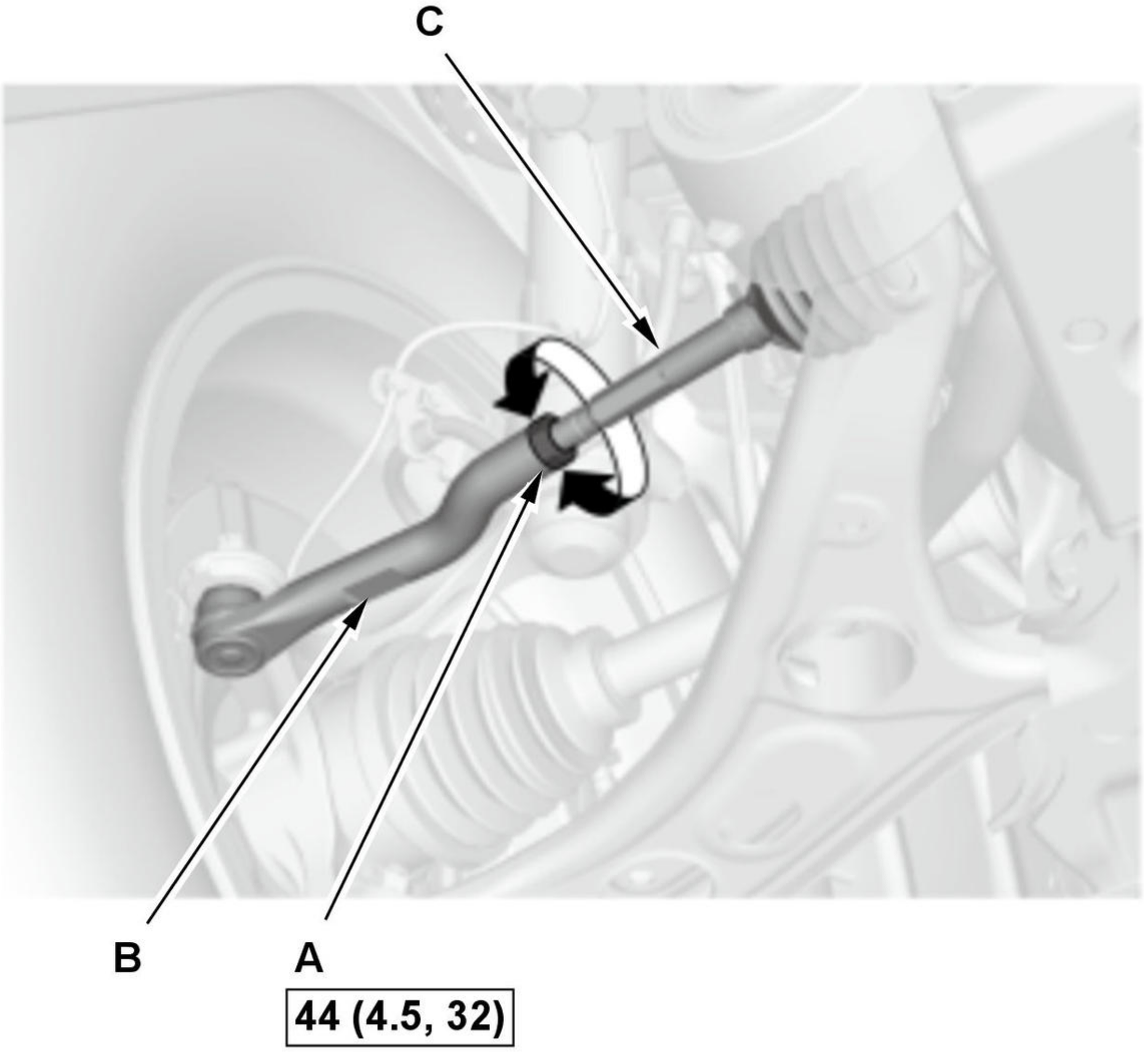


Fig. 10: Front Tie-Rod End And Locknut With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

NOTE: Do the rear toe adjustment before the front toe adjustment.

1. Loosen the tie-rod end locknuts (A) while holding the flat surface sections (B) of the tie-rod end with a wrench, and turn both tie-rods (C) until the front toe is within specifications.

2. After adjusting, tighten the tie-rod end locknuts to the specified torque.

NOTE: Reposition the rack-end boot if it is twisted or displaced.

5. VSA Sensor Neutral Position - Memorize

DESCRIPTION & OPERATION

TPMS SYSTEM DESCRIPTION

Overview

The Indirect Tire Pressure Monitoring System (TPMS) establishes a baseline tire pressure reading using the wheel speed sensors and indirectly monitors tire pressure to detect pressure loss in any of the four tires. The low tire pressure/TPMS indicator turns ON appear when the tire pressure of any tire, or tires, falls below the specified threshold or a system malfunction is detected.

The system is controlled by the VSA modulator-control unit.

The TPMS consists of the following primary components:

- VSA modulator-control unit
- Wheel speed sensors
- Outside air temperature sensor
- System indicator

For locations of each component on vehicle, **refer to Component Location Index**, and for functions of indicator, **refer to How to Troubleshoot the TPMS** .

Control

The Indirect TPMS establishes a baseline tire pressure reading using the wheel speed sensors and indirectly monitors tire pressure to detect pressure loss in any of the four tires. The system does not monitor the tires when driving at low speed.

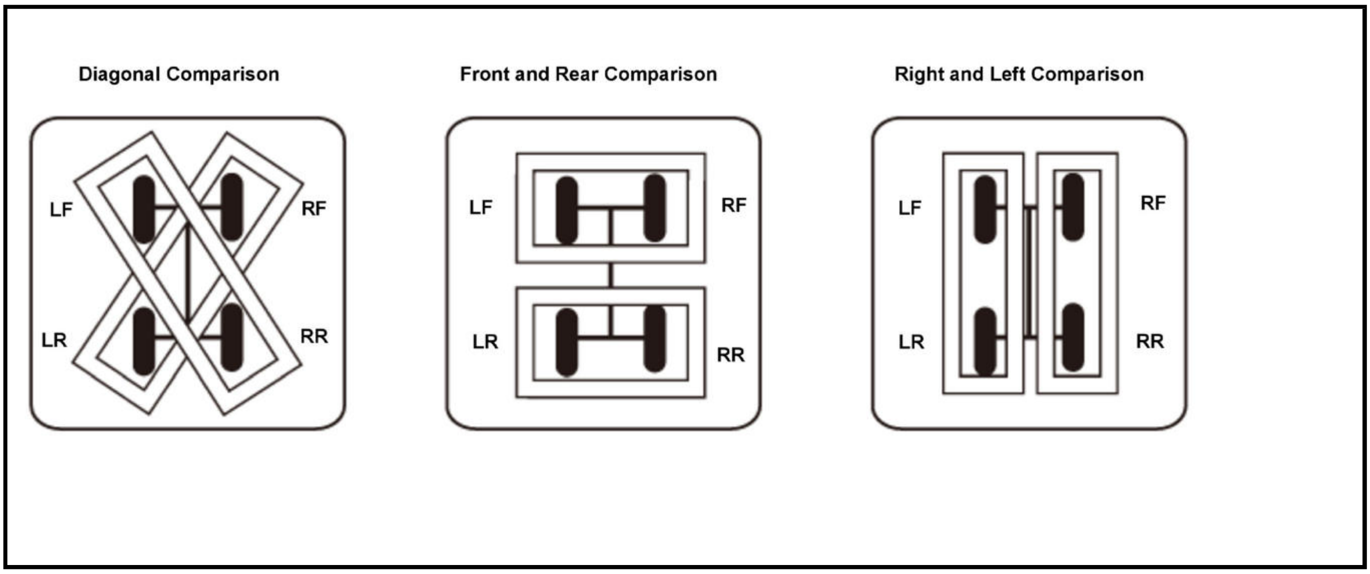
The system uses these two methods to determine loss of tire pressure:

- Wheel speed differential
- Peak tire resonance

Wheel Speed Differential

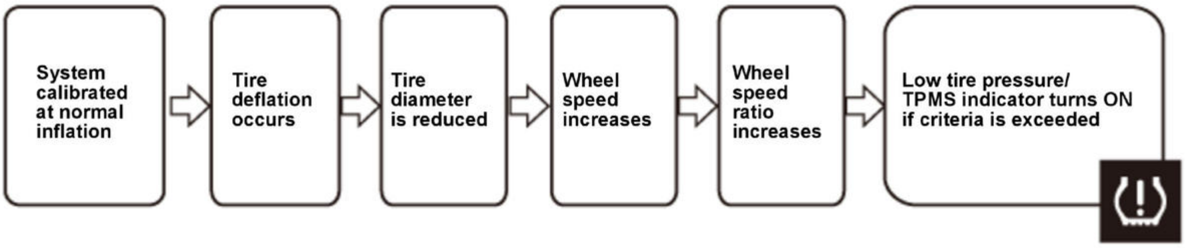
When monitoring tire pressure using the wheel speed differential method, the TPMS module compares the speed of the wheels in three different configurations:

- Diagonal comparison between the front and rear wheels
- Comparison between the two front and two rear wheels
- Comparison between the two right and two left wheels



Diagonal Comparison
LF
RF
LR
RR
Front and Rear Comparison
LF
RF
LR
RR
Right and Left Comparison
LF
RF
LR
RR

Tire diameter shrinks as the tire deflates, causing the wheel speed to increase.Consequently, if the difference in wheel speeds exceeds the threshold, the low tire pressure/TPMS indicator turns on as shown in the step-to-step diagram below.

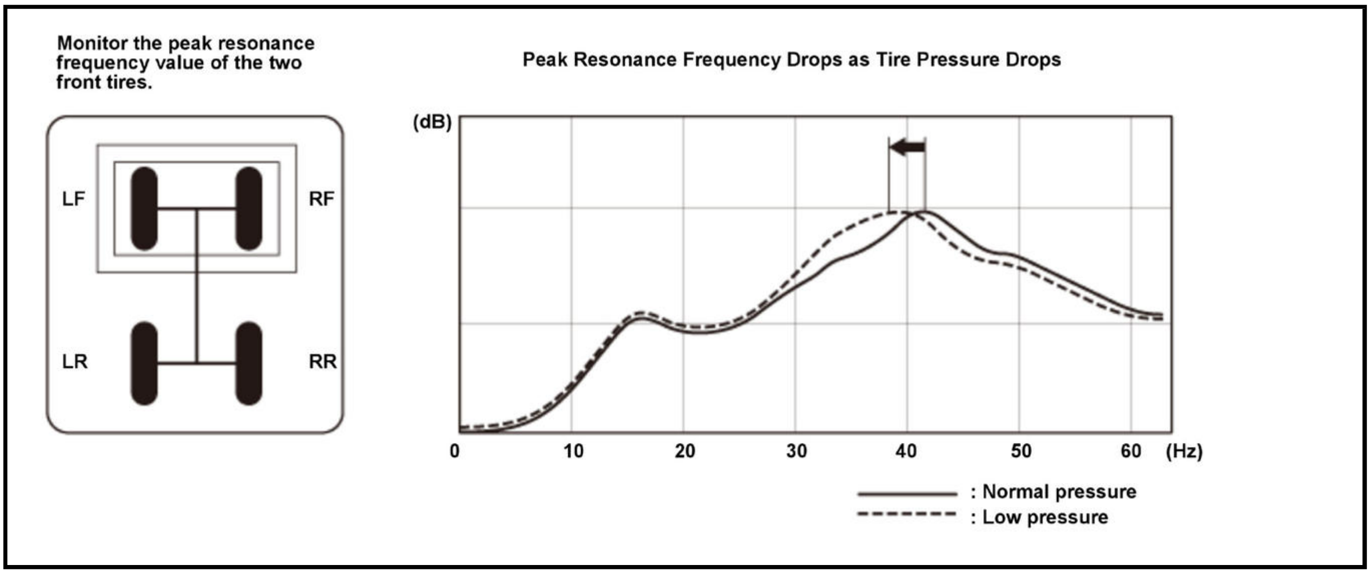


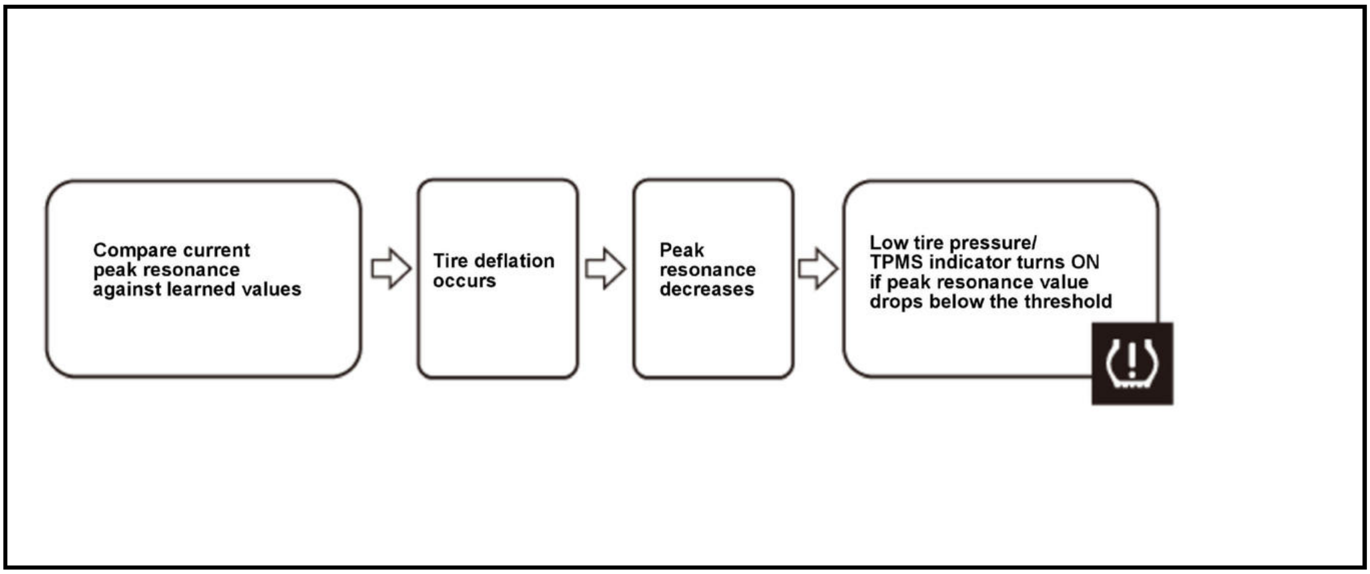
System calibrated at normal inflation
Tire deflation occurs
Tire diameter is reduced
Wheel speed increases
Wheel speed ratio increases
Low tire pressure/ TPMS indicator turns ON if criteria is exceeded

Peak Tire Resonance

Peak resonance frequency value learned during calibration becomes the initial value. The peak resonance frequency method compares the initial peak resonance frequency value of the two front tires and the present peak resonance frequency value of the two front tires, and detects reduced pressure of the tires. If the present peak resonance value drops below the threshold, the low tire pressure/TPMS indicator turns ON as shown in the step-to-step diagram below.

Resonance frequency is corrected based on the outside air temperature sensor information, because resonance frequency is changed by the outside air temperature.





Compare current peak resonance against learned values
Tire deflation occurs
Peak resonance decreases
Low tire pressure/ TPMS indicator turns ON if peak resonance value drops below the threshold

The TPMS module compares the peak resonance values learned at calibration. If the value drops below the threshold, the low tire pressure/TPMS indicator turns on.

Temporary Suspension

Certain situations, such as when the vehicle is turning, accelerating, decelerating, or braking will temporarily prevent the system from monitoring tire pressures due to varying tire loads.

Calibration

A calibration process is required for the TPMS module to learn the initial rolling radii of the four tires and peak tire resonance values. The calibration procedure must be performed any time the tire pressures are adjusted, or when the tires are rotated or replaced. The TPMS calibration procedure is initiated by pressing the TPMS switch (if equipped) or doing customization (without TPMS switch).Upon the completion of system calibration, vehicle mileage and calibration data is stored in the VSA modulator-control unit. If larger diameter accessory wheels have been installed, the TPMS system needs to be calibrated to recognize the new wheel size. This procedure is performed using the HDS threshold rewriting function.

TPMS SYSTEM DESCRIPTION - SYSTEM DIAGRAM

The TPMS module is integrated into the VSA modulator-control unit. In order to control tire pressure monitoring, the TPMS module first receives inputs from the VSA system, which includes the wheel speed sensors, the hydraulic pressure sensor, the PCM, the SRS unit, the EPS control unit, and the gauge control module. Then, the TPMS module sends commands to the gauge control module through the VSA modulator-control unit and issues warnings to the driver.

For locations of each component on vehicle, refer to Component Location Index:

CALIBRATION CORRECTION

TPMS CALIBRATION

Procedure

NOTE:

- Make sure the tire pressure is properly adjusted to the specified tire pressure listed on the doorjamb label before doing the TPMS calibration.
- The calibration begins when the calibration is selected through the Multi-information display or the TPMS switch is pressed. The calibration is completed after driving in an ideal driving condition (28 to 65 mph (45 to 105 km/h), driving steadily without much acceleration or deceleration) for about 20 minutes. Full functionality of the system cannot be performed properly if the calibration is not completed.
- Do the TPMS calibration after doing the following items.
-
    - -

      Adjust the tire pressure.

    - -

    Rotating the tires.

  - -

    Replacing the tire(s).

  - -

    Update the VSA modulator-control unit.

  - -

    Replace the VSA modulator-control unit.

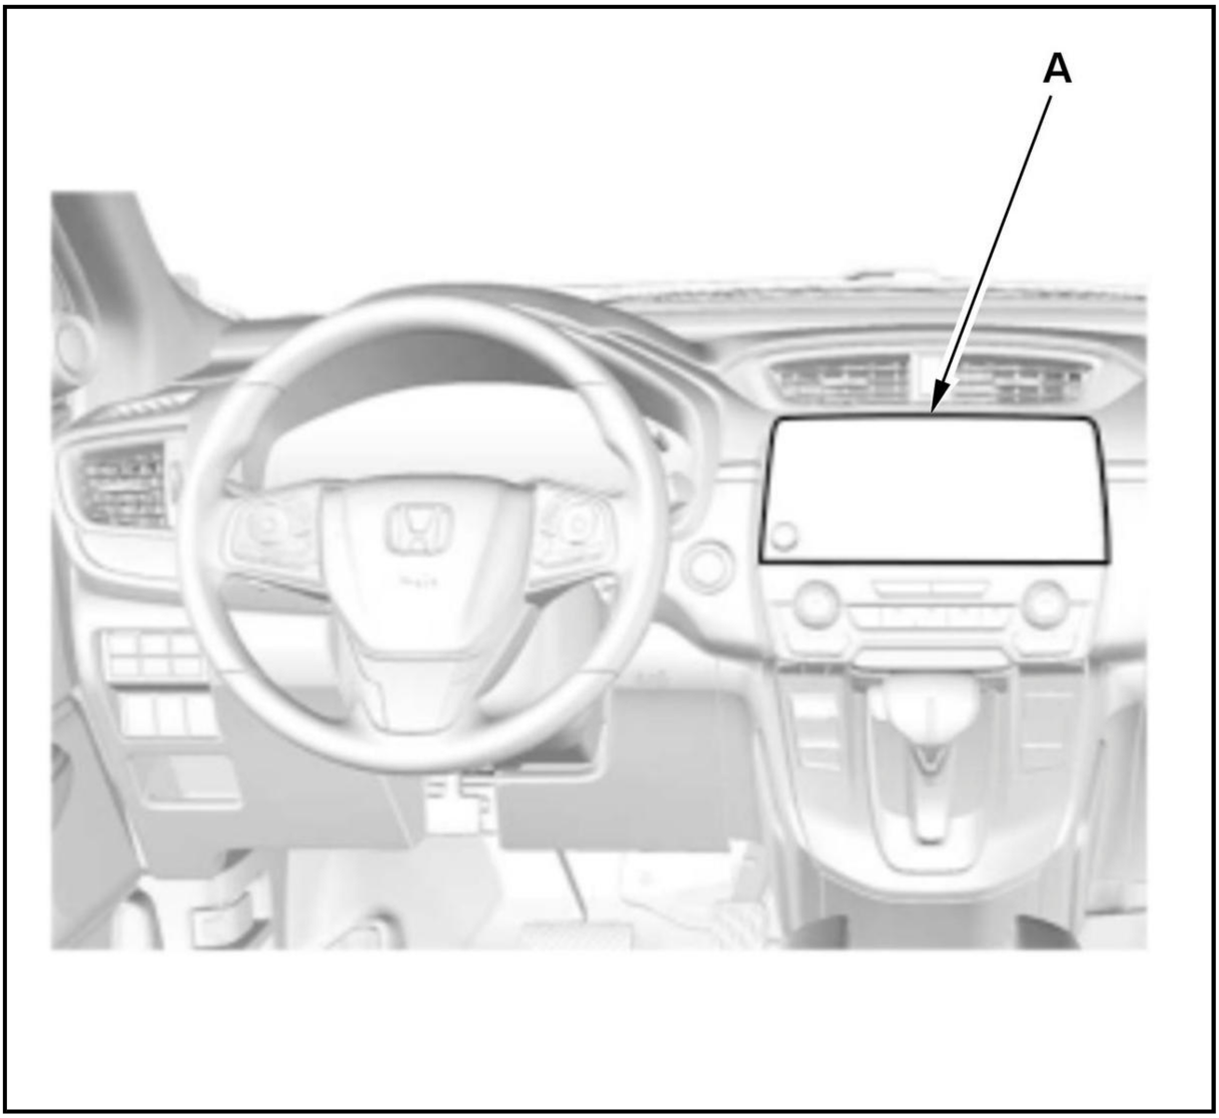
- Calibration check method.

  Check if the calibration is completed by doing the following items.

-
  - Stop the vehicle and shift into P or N position/mode.
  - Turn the vehicle to the OFF (LOCK) mode.
  - Turn the vehicle to the ON mode and wait to see the low pressure/TPMS indicator come on for 2 seconds and then off.
  - Do not drive the vehicle and wait for 45 seconds as is.
  - If the calibration is completed, the indicator does not come on. If the calibration is not yet completed, then the indicator comes on for 2 seconds and then goes off.

The calibration check process gets interrupted if the vehicle moves. Do the troubleshooting if the indicator does not go off after 2 seconds, keeps blinking or stays on when the vehicle is in the ON mode.

1. TPMS - Calibrate (Without TPMS Switch)



With display audio type (7-inch screen)

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label.

2. Turn the vehicle to the ON mode.**NOTE:**

Vehicle must be stopped with the transmission in P or N position/mode.

3. Select the HOME button on the screen (A).

4. Select the SETTINGS.

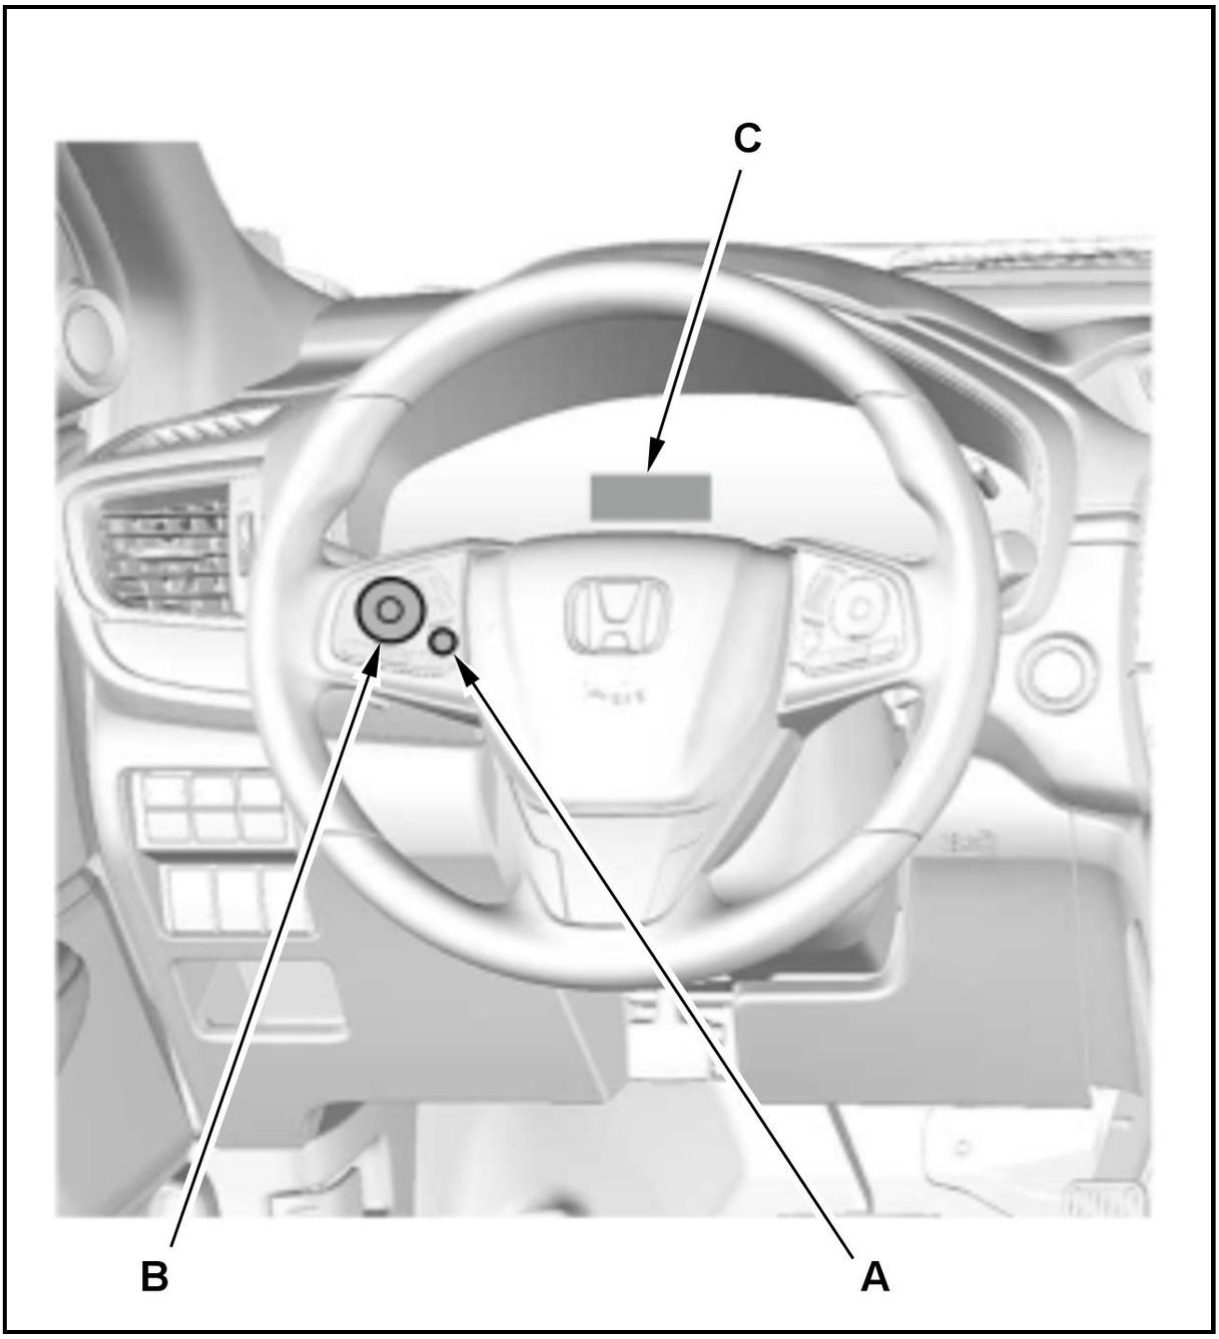
5. Select the VEHICLE.

6. Select the TPMS CALIBRATION.

7. Select the CALIBRATE.

8. When the calibration successfully begins, "Calibration Started" is displayed on the screen when the system received the calibration.**NOTE:**

If the calibration does not begin successfully, "Unable to initialize TPMS" is displayed on the screen and **do the TPMS symptom troubleshooting**.



With color audio type (5-inch screen)

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label.

2. Turn the vehicle to the ON mode.**NOTE:**

Vehicle must be stopped with the transmission in P or N position/mode.

3. Press the information button (A), then press the audio remote button (B) to select the VEHICLE SETTINGS.

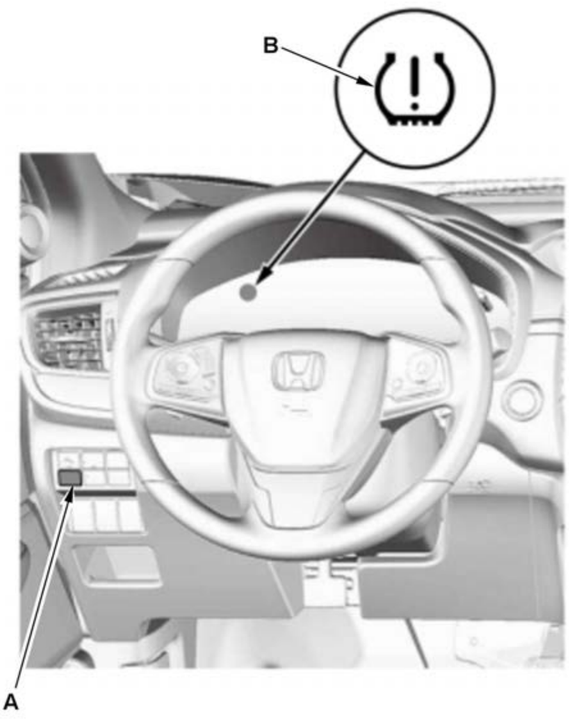
4. Press the audio remote button to select TPMS CALIBRATION.

5. Press the audio remote button to select CALIBRATE.

6. When the calibration successfully begins, "Calibration Started" is displayed on Multi-information display (C) when the system received the calibration.**NOTE:**

If the calibration does not begin successfully, "Calibration Failed to Start" is displayed on Multi-information display and **do the TPMS symptom troubleshooting**.

2. TPMS - Calibrate (With TPMS Switch)



1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label.

2. Turn the vehicle to the ON mode.**NOTE:**

Vehicle must be stopped with the transmission in P or N position/mode.

3. Press and hold the TPMS switch (A) for 3 seconds.

4. When the calibration successfully begins, the indicator (B) blinks twice.**NOTE:**

If the indicator does not blink, **do the TPMS symptom troubleshooting**.

SYMPTOM TROUBLESHOOTING

TPMS SYMPTOM TROUBLESHOOTING - CALIBRATION CANNOT BE STARTED(WITH TPMS SWITCH)

Calibration cannot be started

NOTE:

- If any gauge control module or VSA system DTCs are indicated, do the troubleshooting for these DTCs first.
- Check the number of miles on the gauge control module. After proceeding TPMS calibration, DATA LIST with the HDS shows the same number of miles on the gauge control module. When TPMS switch is not working, DATA LIST with the HDS shows the number of miles of the last TPMS calibration previously done.

1. TPMS calibration check

   -1. Turn the vehicle to the ON mode.

   -2. Check the number of miles on the gauge control module.

   -3. Make sure that all four tires are the correct size, specified tire pressure, same speed rating, same brand/model, and are evenly worn.

   -4. **Do the TPMS calibration**.

   -5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
INITIALIZED ODOMETER	B	B

   Does the value on the HDS match the number of miles on the gauge control module?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   Go to step 2.

2. TPMS switch check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Check the TPMS switch** .

   Is the TPMS switch OK?

   YES

   Go to step 3.

   NO

   Replace the TPMS switch .

3. Determine possible failure area (TPMS SW line, GND line)

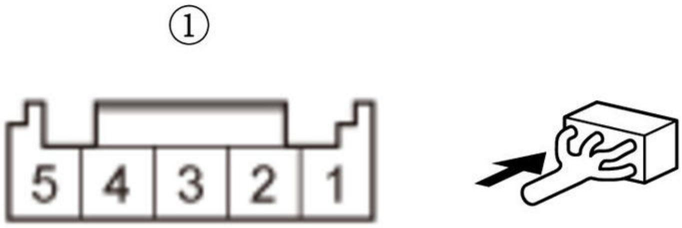
-1. Disconnect the following connector.

TPMS switch 5P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	TPMS switch 5P connector: disconnected
Test point 1	TPMS switch 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

Repair an open in the wire between the TPMS switch and body ground (G401).

NO

Go to step 4.

4. Shorted wire check (TPMS SW line)

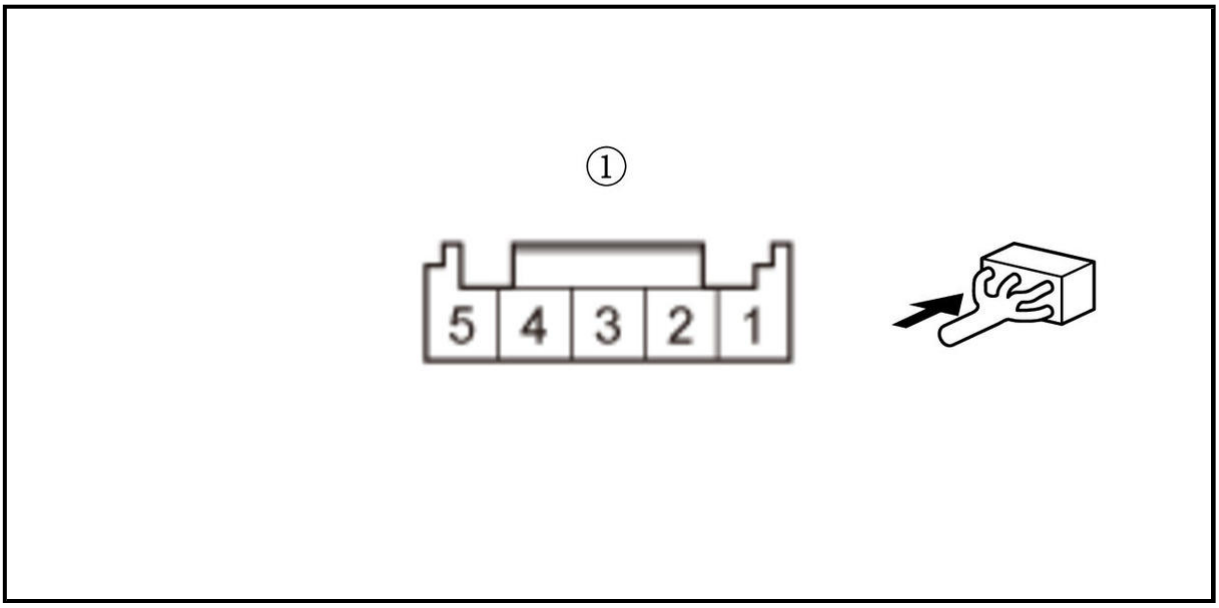
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Gauge control module connector A (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	TPMS switch 5P connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	TPMS switch 5P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to body ground in the wire between the gauge control module and the TPMS switch.

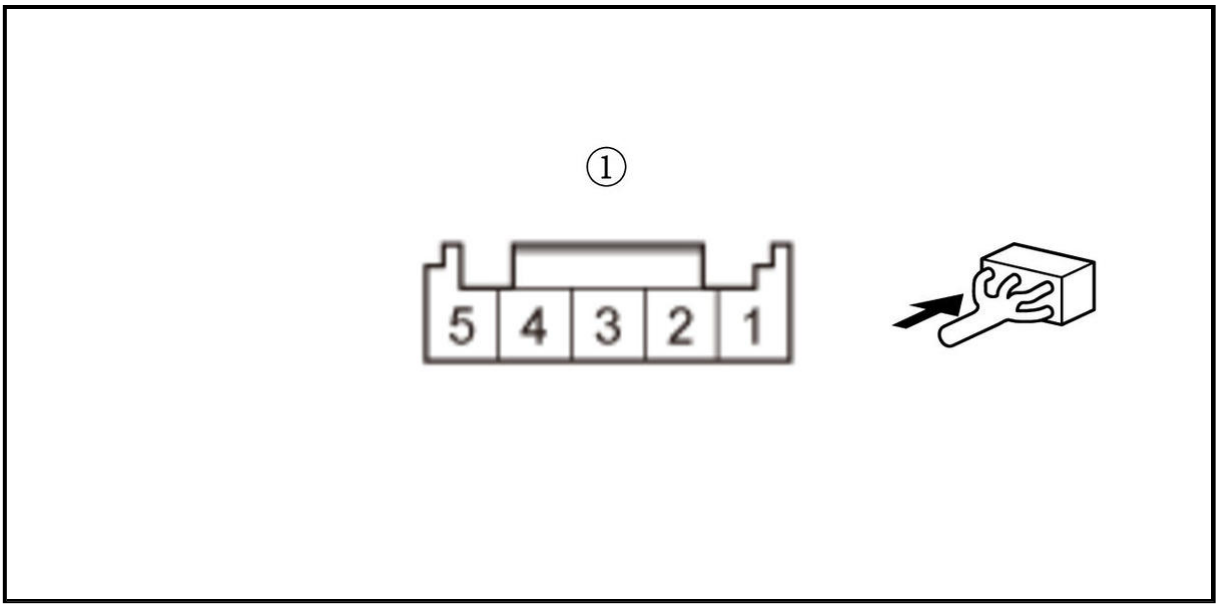
NO

Go to step 5.

5. Open wire check (TPMS SW line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	TPMS switch 5P connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	TPMS switch 5P connector (female terminals) No. 2: ①
Test point 2	**Gauge control module connector A (32P) No. 23**



Is there continuity?

YES

The TPMS SW wire is OK. **Replace the gauge control module** .

NO

Repair an open in the wire between the gauge control module and the TPMS switch.

TPMS SYMPTOM TROUBLESHOOTING - CALIBRATION CANNOT BE STARTED(WITHOUT TPMS SWITCH)

Calibration cannot be started

NOTE:

- If any gauge control module or VSA system DTCs are indicated, do the troubleshooting for these DTCs first.
- Check the number of miles on the gauge control module. After proceeding TPMS calibration, DATA LIST with the HDS shows the same number of miles on the gauge control module. When TPMS switch is not working, DATA LIST with the HDS shows the number of miles of the last TPMS calibration previously done.

1. TPMS calibration check

   -1. Turn the vehicle to the ON mode.

   -2. Check the number of miles on the gauge control module.

   -3. Make sure that all four tires are the correct size, specified tire pressure, same speed rating, same brand/model, and are evenly worn.

   -4. **Do the TPMS calibration**.

   -5. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Values	Unit
INITIALIZED ODOMETER	B	B

Does the value on the HDS match the number of miles on the gauge control module?

YES

Intermittent failure, the system is OK at this time.

NO

Replace the gauge control module .

DESCRIPTION & OPERATION

TPMS SYSTEM DESCRIPTION

Overview

The Indirect Tire Pressure Monitoring System (TPMS) establishes a baseline tire pressure reading using the wheel speed sensors and indirectly monitors tire pressure to detect pressure loss in any of the four tires. The low tire pressure/TPMS indicator turns ON appear when the tire pressure of any tire, or tires, falls below the specified threshold or a system malfunction is detected.

The system is controlled by the VSA modulator-control unit.

The TPMS consists of the following primary components:

- VSA modulator-control unit
- Wheel speed sensors
- Outside air temperature sensor
- System indicator

For locations of each component on vehicle, **refer to Component Location Index**, and for functions of indicator, **refer to How to Troubleshoot the TPMS** .

Control

The Indirect TPMS establishes a baseline tire pressure reading using the wheel speed sensors and indirectly monitors tire pressure to detect pressure loss in any of the four tires. The system does not monitor the tires when driving at low speed.

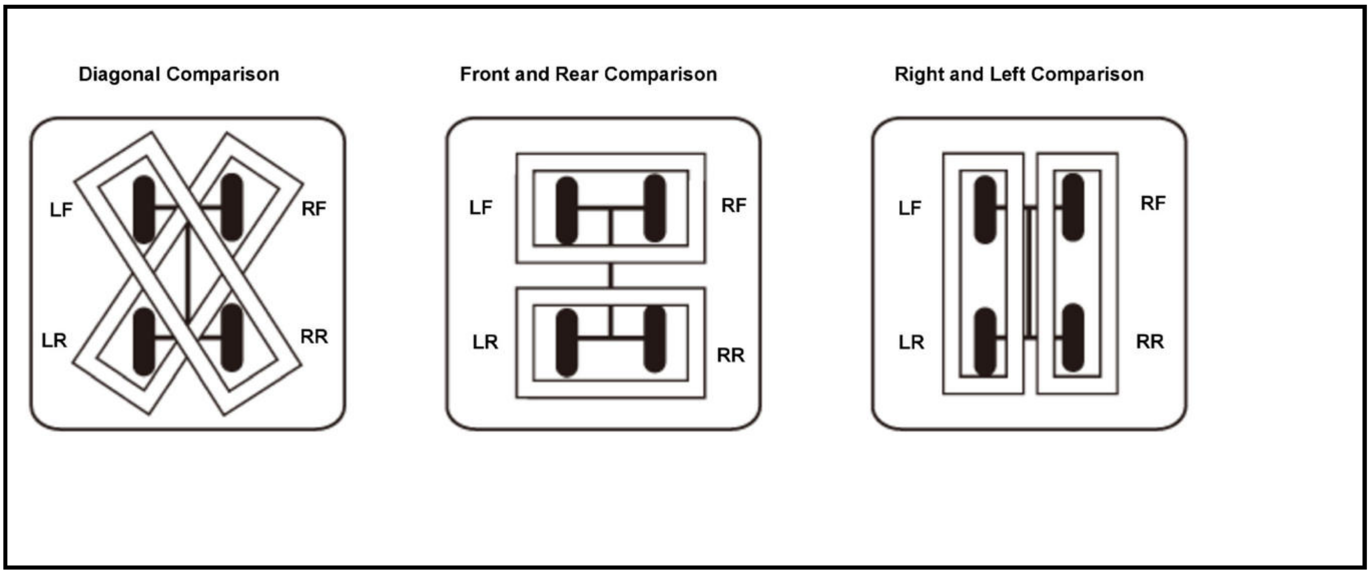
The system uses these two methods to determine loss of tire pressure:

- Wheel speed differential
- Peak tire resonance

Wheel Speed Differential

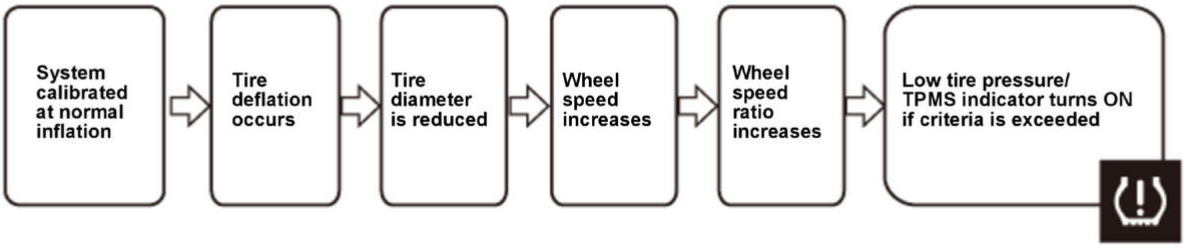
When monitoring tire pressure using the wheel speed differential method, the TPMS module compares the speed of the wheels in three different configurations:

- Diagonal comparison between the front and rear wheels
- Comparison between the two front and two rear wheels
- Comparison between the two right and two left wheels



Tire diameter shrinks as the tire deflates, causing the wheel speed to increase.

Consequently, if the difference in wheel speeds exceeds the threshold, the low tire pressure/TPMS indicator turns on as shown in the step-to-step diagram below.

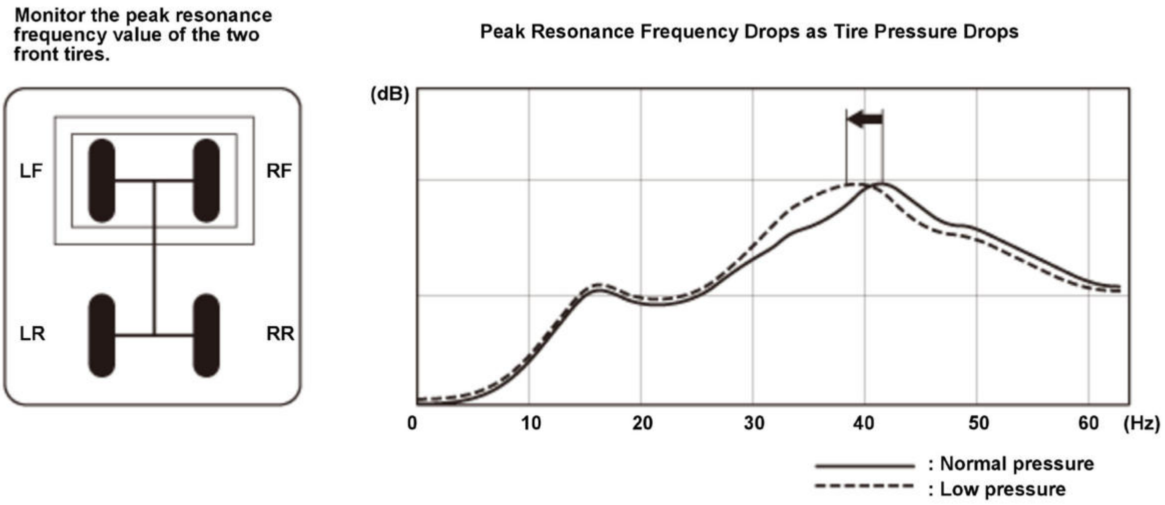


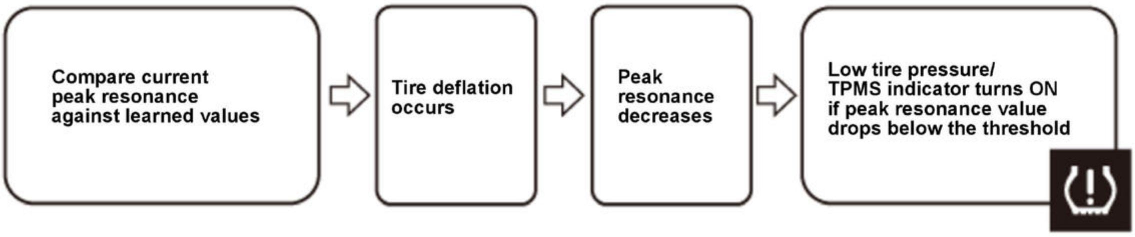
System calibrated at normal inflation
Tire deflation occurs
Tire diameter is reduced
Wheel speed increases
Wheel speed ratio increases
Low tire pressure/ TPMS indicator turns ON if criteria is exceeded

Peak Tire Resonance

Peak resonance frequency value learned during calibration becomes the initial value. The peak resonance frequency method compares the initial peak resonance frequency value of the two front tires and the present peak resonance frequency value of the two front tires, and detects reduced pressure of the tires. If the present peak resonance value drops below the threshold, the low tire pressure/TPMS indicator turns ON as shown in the step-to-step diagram below.

Resonance frequency is corrected based on the outside air temperature sensor information, because resonance frequency is changed by the outside air temperature.





Compare current peak resonance against learned values
Tire deflation occurs
Peak resonance decreases
Low tire pressure/ TPMS indicator turns ON if peak resonance value drops below the threshold

The TPMS module compares the peak resonance values learned at calibration. If the value drops below the threshold, the low tire pressure/TPMS indicator turns on.

Temporary Suspension

Certain situations, such as when the vehicle is turning, accelerating, decelerating, or braking will temporarily prevent the system from monitoring tire pressures due to varying tire loads.

Calibration

A calibration process is required for the TPMS module to learn the initial rolling radii of the four tires and peak tire resonance values. The calibration procedure must be performed any time the tire pressures are adjusted, or when the tires are rotated or replaced. The TPMS calibration procedure is initiated by pressing the TPMS switch (if equipped) or doing customization (without TPMS switch).

Upon the completion of system calibration, vehicle mileage and calibration data is stored in the VSA modulator-control unit. If larger diameter accessory wheels have been installed, the TPMS system needs to be calibrated to recognize the new wheel size. This procedure is performed using the HDS threshold rewriting function.

TPMS SYSTEM DESCRIPTION - SYSTEM DIAGRAM

The TPMS module is integrated into the VSA modulator-control unit. In order to control tire pressure monitoring, the TPMS module first receives inputs from the VSA system, which includes the wheel speed sensors, the hydraulic pressure sensor, the PCM, the SRS unit, the EPS control unit, and the gauge control module. Then, the TPMS module sends commands to the gauge control module through the VSA modulator-control unit and issues warnings to the driver.

CALIBRATION CORRECTION

TPMS CALIBRATION

Procedure

NOTE:

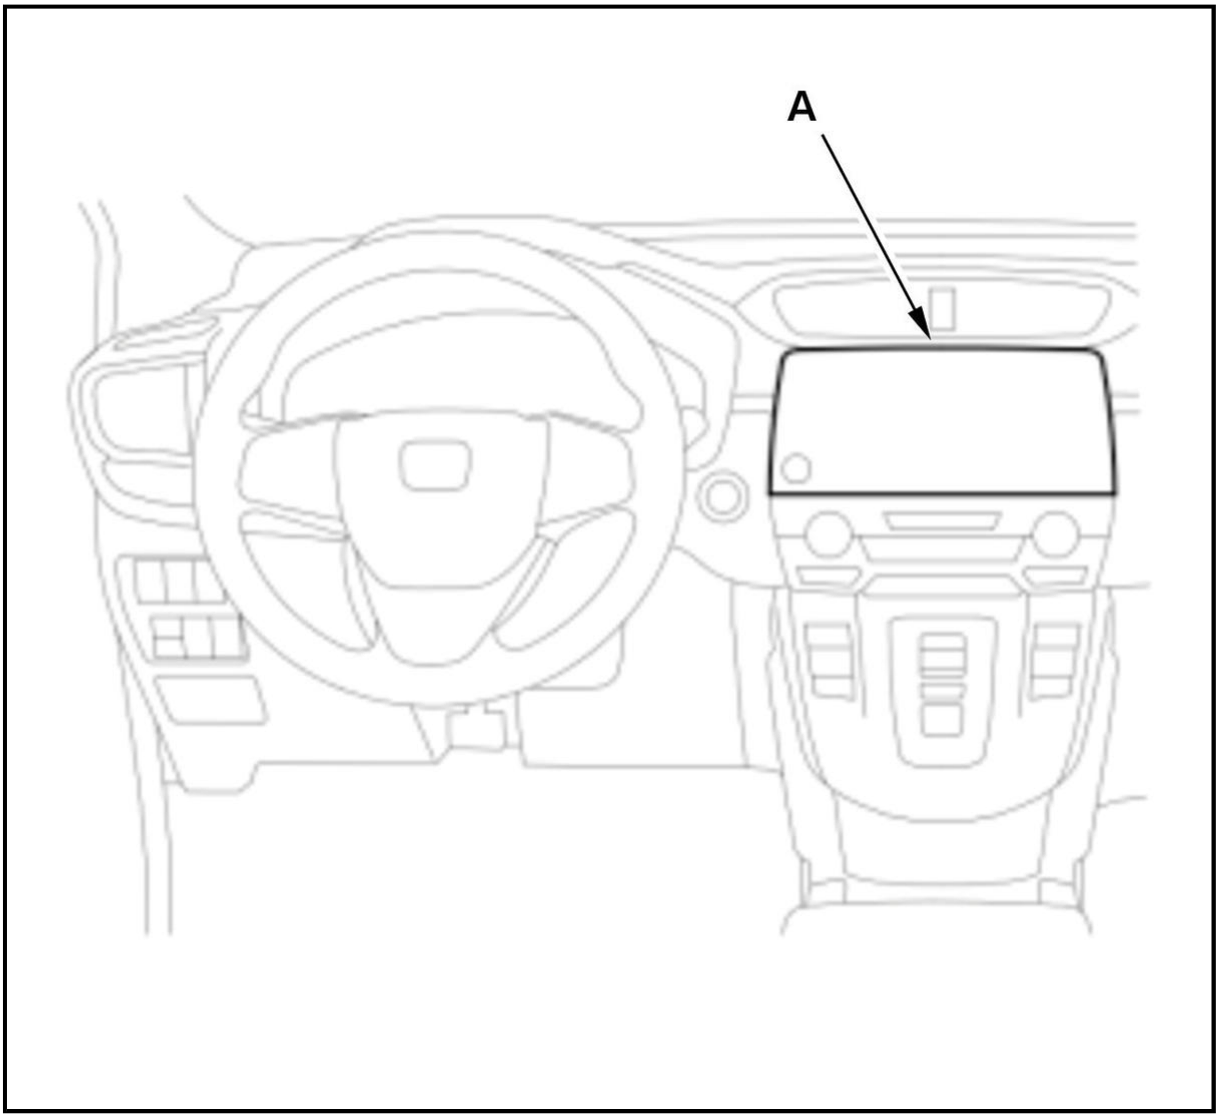
- Make sure the tire pressure is properly adjusted to the specified tire pressure listed on the doorjamb label before doing the TPMS calibration.
- The calibration begins when the calibration is selected through the Multi-information display. The calibration is completed after driving in an ideal driving condition (28 to 65 mph (45 to 105 km/h), driving steadily without much acceleration or deceleration) for about 18 minutes. Full functionality of the system cannot be performed properly if the calibration is not completed.
- Do the TPMS calibration after doing the following items.
-
    - Adjust the tire pressure.
    - Rotating the tires.
    - Replacing the tire(s).
    - Updating the VSA modulator-control unit.
    - Replacing the VSA modulator-control unit.
- Calibration check method.

  Check if the calibration is completed by doing the following items.
-
    - Stop the vehicle and shift into P or N position/mode.
    - Turn the vehicle to the OFF (LOCK) mode.

- Turn the vehicle to the ON mode and wait to see the low tire pressure/TPMS indicator come on for 2 seconds and then off.
- Do not drive the vehicle and wait for 45 seconds as is.
- If the calibration is completed, the indicator does not come on. If the calibration is not yet completed, then the indicator comes on for 2 seconds and then goes off.

The calibration check process gets interrupted if the vehicle moves. Do the troubleshooting if the indicator does not go off after 2 seconds, keeps blinking or stays on when the vehicle is in the ON mode.

1. TPMS - Calibrate



With display audio type (7-inch screen)

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label.

2. Turn the vehicle to the ON mode.

NOTE: Vehicle must be stopped with the transmission in P or N position/mode.

3. Select the HOME button on the screen (A).

4. Select the SETTINGS.

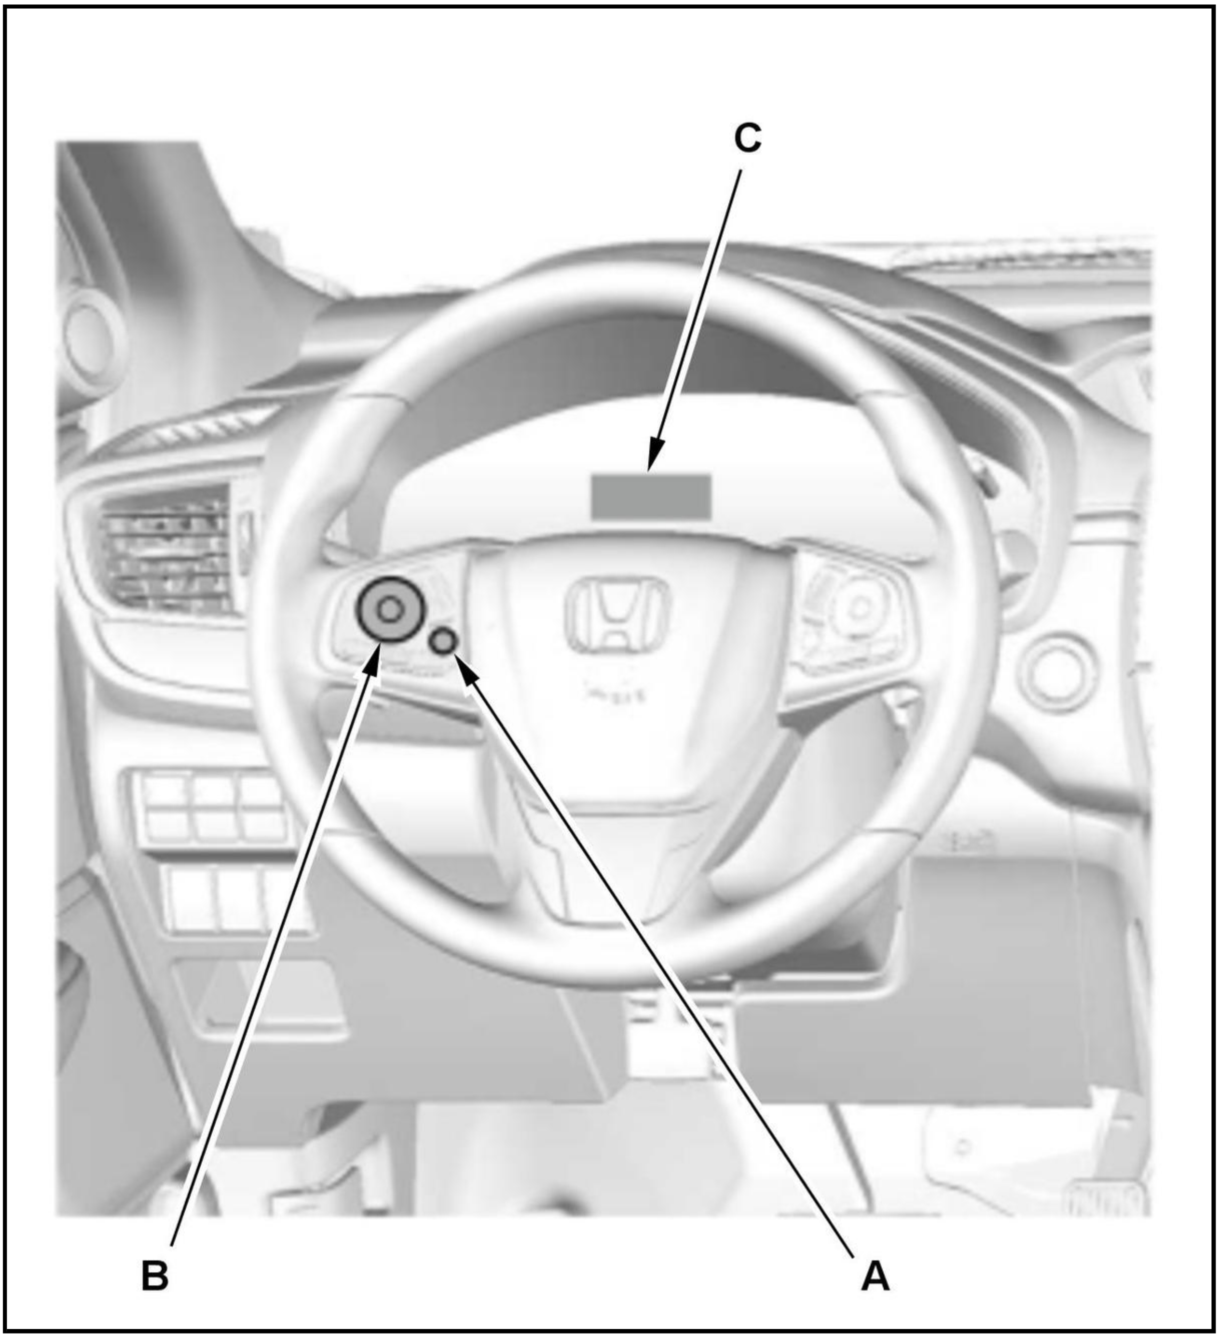
5. Select the VEHICLE.

6. Select the TPMS CALIBRATION.

7. Select the CALIBRATE.

8. When the calibration successfully begins, "Calibration Started" is displayed on the screen when the system received the calibration.

NOTE: If the calibration does not begin successfully, "Unable to initialize TPMS" is displayed on the screen and **do the TPMS symptom troubleshooting**.



With color audio type (5-inch screen)

1. Make sure the tires are inflated to the specified tire pressure listed on the doorjamb label.

2. Turn the vehicle to the ON mode.

NOTE: Vehicle must be stopped with the transmission in P or N position/mode.

3. Press the information button (A), then press the audio remote button (B) to select the VEHICLE SETTINGS.

4. Press the audio remote button to select TPMS CALIBRATION.

5. Press the audio remote button to select CALIBRATE.

6. When the calibration successfully begins, "Calibration Started" is displayed on Multi-information display (C) when the system received the calibration.

NOTE: If the calibration does not begin successfully, "Calibration Failed to Start" is displayed on Multi-information display and do the TPMS symptom troubleshooting.

SYMPTOM TROUBLESHOOTING INDEX

TPMS SYMPTOM TROUBLESHOOTING INDEX (TPMS)

Symptom	Diagnostic procedure	Also check for
HDS does not communicate with the VSA modulator-control unit or the vehicle	Go to the DTC troubleshooting index .	B
Calibration cannot be started	• Symptom troubleshooting. • Replace the VSA modulator-control unit .	B
TPMS warning is indicated	• Check for VSA system DTCs . • Check for the VSA indicator. If VSA indicator turns on, do the VSA system symptom troubleshooting "ABS indicator, brake system indicator (red), VSA indicator, and brake system indicator (amber) do not go off" . • Replace the VSA modulator-control unit .	B
Low tire pressure/TPMS indicator comes on	• Check the tire size and tire pressure according to tire information. • Make sure all four tires are the same brand/model, and have the same speed rating. • Inspect all four tires for even wear. • Do the TPMS calibration.	B
Low tire pressure/TPMS indicator does not come on when the tire pressure has decreased	• See general troubleshooting information "condition for data rejection, and case TPMS cannot operate normally" (Even if a system is normal, there is a possibility that cannot detect low tire pressure) . • Do the gauge control module self-diagnostic function . • Do the TPMS calibration. • Replace the VSA modulator-control unit .	B

TPMS SYMPTOM TROUBLESHOOTING

CALIBRATION CANNOT BE STARTED

NOTE:

- If any gauge control module or VSA system DTCs are indicated, do the troubleshooting for these DTCs first.
- Check the number of miles on the gauge control module. After proceeding TPMS calibration, DATA LIST with the HDS shows the same number of miles on the gauge control module. When TPMS switch is not working, DATA LIST with the HDS shows the number of miles of the last TPMS calibration previously done.

1. TPMS calibration check

   -1. Turn the vehicle to the ON mode.

   -2. Check the number of miles on the gauge control module.

   -3. Make sure that all four tires are the correct size, specified tire pressure, same speed rating, same brand/model, and are evenly worn.

   -4. **Do the TPMS calibration**.

   -5. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Values	**Unit**
INITIALIZED ODOMETER	B	B

   Does the value on the HDS match the number of miles on the gauge control module?

   YES

   Intermittent failure, the system is OK at this time.

   NO

   Replace the gauge control module .

TRACTION CONTROL DISABLE

WARNING: **Placing a non-compatible vehicle on a single-axle dynamometer could result in a safety hazard to technicians and damage to vehicle. Vehicles which use All-Wheel Drive (AWD) or traction control may not be clearly marked. Use common sense and take all necessary precautions when placing any vehicle on the dynamometer. Determine between full-time 4WD and All-Wheel Drive (AWD) for testing purposes. The following tables include information related to full-time 4WD and AWD vehicles, and how to disable the traction control system (if disengageable).**

WARNING: **DO NOT operate vehicle on a 2-wheel dynamometer if the DO NOT TEST column is marked.**

(1) Press TCS (or VSA) switch near left side vent. TCS indicator light will illuminate when system is disabled.

(2) Press VSA switch to the left of the steering wheel until a beep is heard. VSA indicator light will illuminate when system is disabled.

(3) On A/T models, locate disengagement plate on rear of transaxle case behind the right front wheel. Loosen lock bolt on plate. Turn middle bolt on plate. Turn middle bolt counterclockwise until plate rotates about 150 degrees and is stopped by lock bolt. Tighten lock bolt. On M/T models, locate Orange disengagement lever at rear of engine. Loosen lock bolt at slotted lever. Turn middle bolt on lever counterclockwise and tighten lock bolt.

(4) Cannot be shifted to 2WD.

(5) Shift transfer case lever into 2WD position. Ensure 4WD indicator light is off.

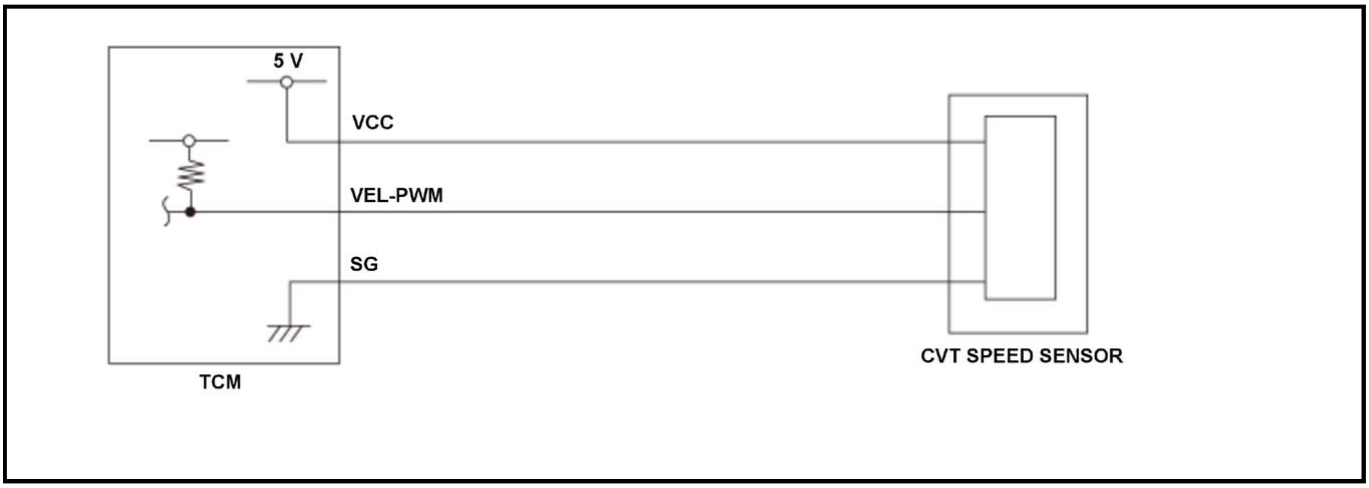
(6) Shift transfer case lever into HIGH position. The 4WD button is located on left side of dash. Ensure 4WD indicator light is off.

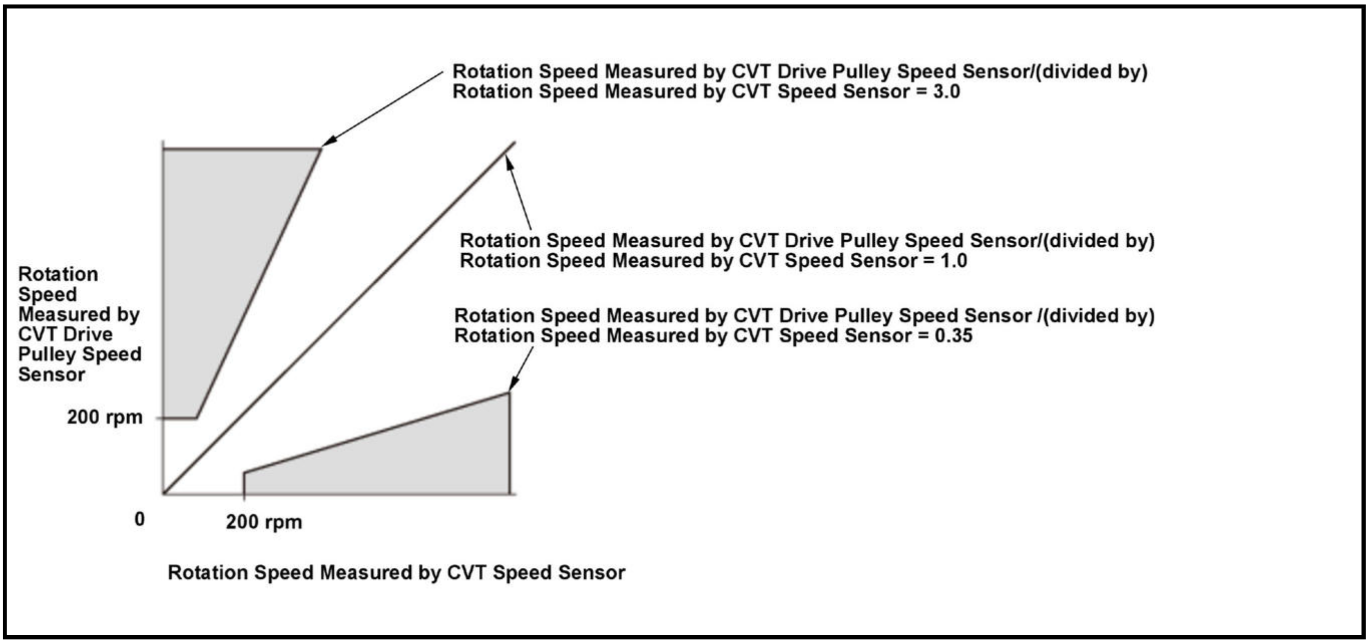
ADVANCED DIAGNOSTICS

DTC P0501 (CVT (TCM))

DTC P0501: CVT Speed Sensor Circuit Range/Performance

General Description





The CVT speed sensor is attached to the outside of the torque converter housing. The CVT speed sensor detects the number of revolutions of the secondary driven gear and sends a pulsing signal to the transmission control module (TCM). The TCM converts the pulsing signal into vehicle speed. If no pulses occur with the secondary driven gear rotating, the TCM detects a malfunction that may be caused by an open, an intermittent open, or a short to ground. Based on the correlation between the CVT speed sensor and the CVT drive pulley speed sensor, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	4 seconds or more

DTC Type	One drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	500 rpm	-
Drive pulley speed [Input Shaft (Drive Pulley) Speed rpm]	200 rpm	-
12 volt battery voltage [Battery Voltage]	10.0 V	-
Shift lever position/mode	D, S, L	
Other	Rotation speed [Secondary Shaft Speed 1 (rpm)] measured by CVT speed sensor is 200 rpm or more	
	No electrical noise in the CVT speed sensor output circuit	
	Decelerate and fuel cut-off for at least 3 seconds	

[ ]:HDS Parameter

Malfunction Threshold

One of these conditions is met:

- The rotation speed [Secondary Shaft Speed 1 (rpm)] measured by the CVT speed sensor is less than the rotation speed [Input Shaft (Drive Pulley) Speed rpm] measured by the CVT drive pulley speed sensor by a factor of 0.33 for at least 4 seconds.
- The rotation speed [Secondary Shaft Speed 1 (rpm)] measured by the CVT speed sensor is more than the rotation speed [Input Shaft (Drive Pulley) Speed rpm] measured by the CVT drive pulley speed sensor by a factor of 2.85 for at least 4 seconds.

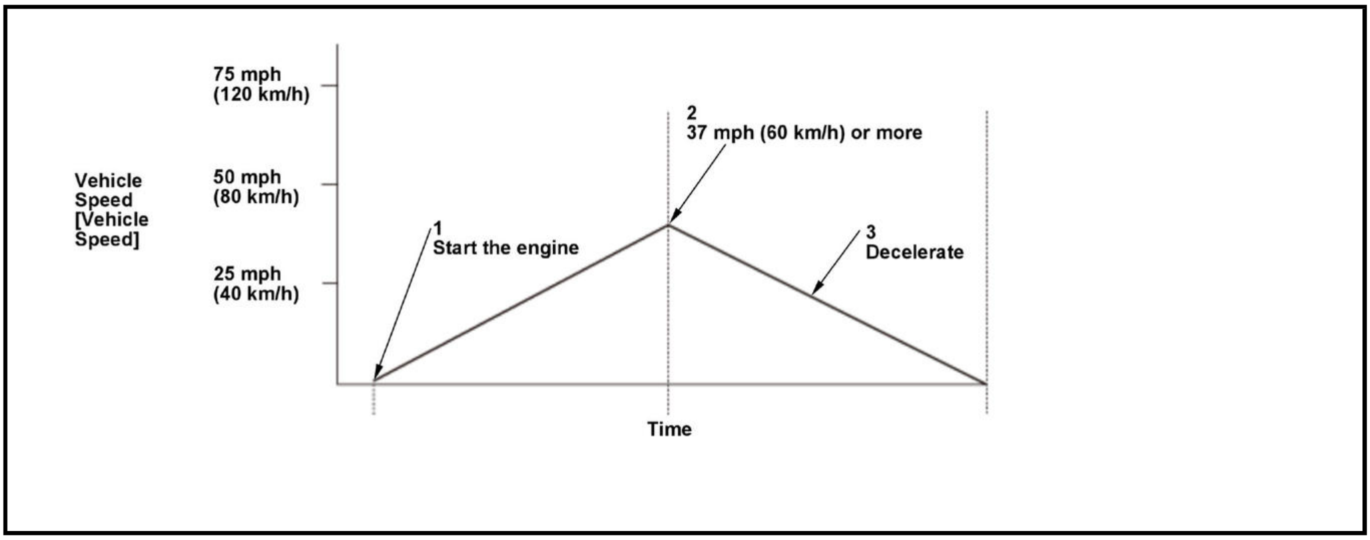
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT speed sensor VEL-PWM line open (includes connector loose connection or disconnection)
- CVT speed sensor VEL-PWM line short to ground
- CVT speed sensor failure
- TCM internal circuit failure

Confirmation Procedure

Operating Condition



- Start the engine.
- Drive the vehicle at a speed of 37 mph (60 km/h) or more.
- Release the accelerator pedal, and slow the vehicle.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

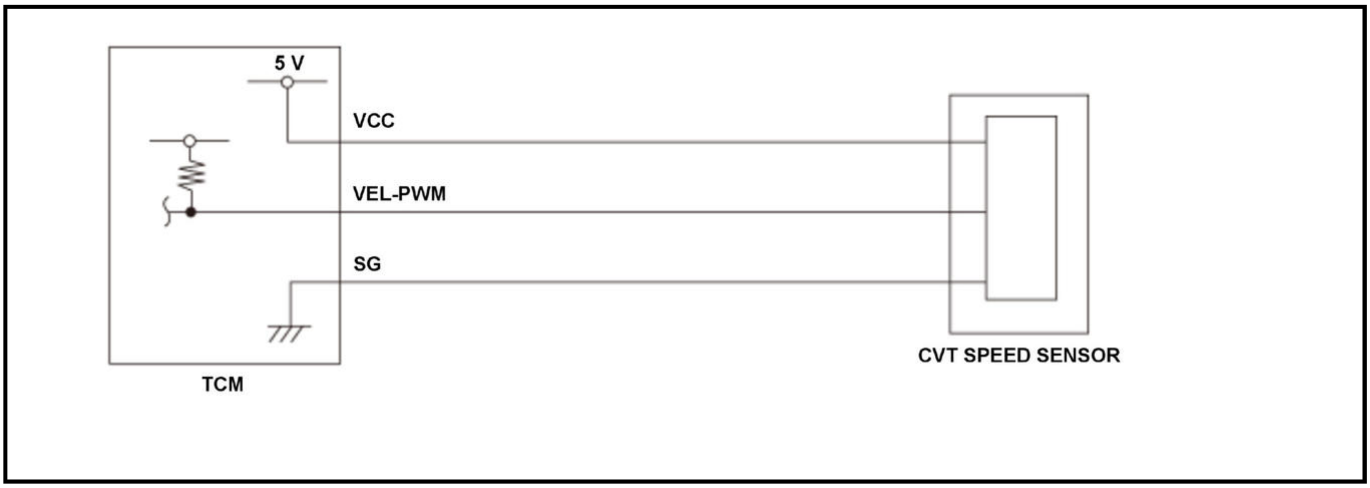
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0502 (CVT (TCM))

DTC P0502: CVT Speed Sensor Circuit Open/Short

General Description



The CVT speed sensor is attached to the outside of the torque converter housing. The CVT speed sensor detects the number of revolutions of the secondary driven gear and sends a pulsing signal to the transmission control module (TCM). The TCM converts the pulsing signal into vehicle speed. If no pulses occur with the secondary driven gear rotating, the TCM detects a malfunction that may be caused by an open, an intermittent open, or a short to ground. If no signal from the CVT speed sensor is received for a set time, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	4 seconds or more
DTC Type	One drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	500 rpm	-
Drive pulley speed [Input Shaft (Drive Pulley) Speed rpm]	200 rpm	-
12 volt battery voltage [Battery Voltage]	10.0 V	-
Shift lever position/mode	D, S, L	
Other	No electrical noise in the CVT speed sensor output circuit	
	Decelerate and fuel cut-off for at least 3 seconds	

[ ]: HDS Parameter

Malfunction Threshold

No signal from the CVT speed sensor is detected for at least 4 seconds.

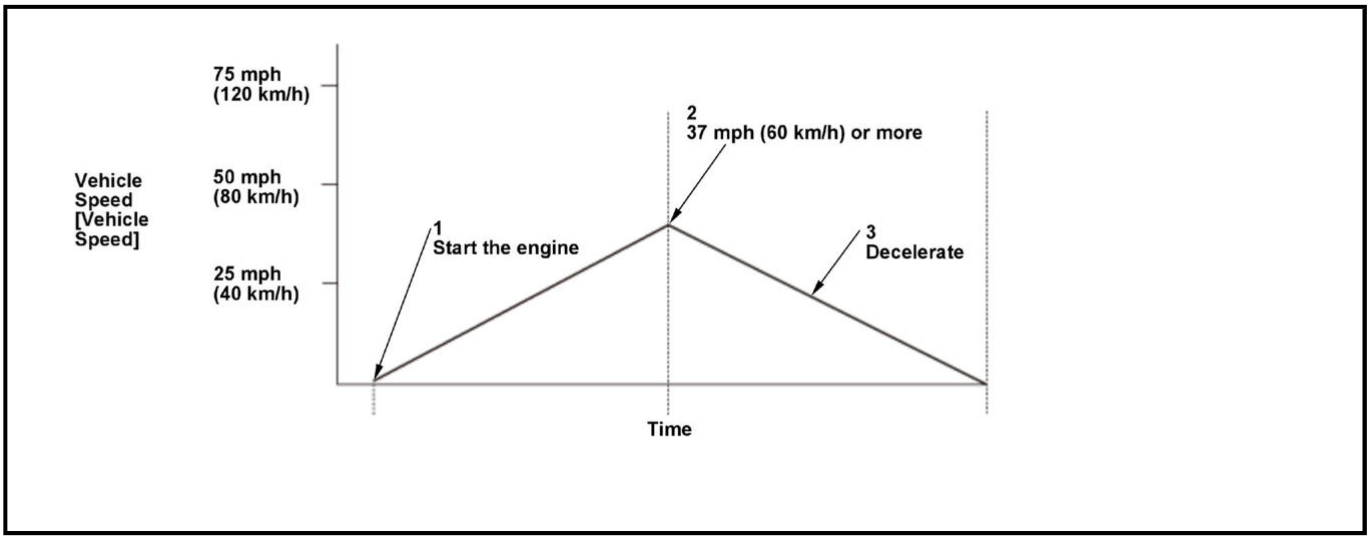
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT speed sensor VEL-PWM line open (includes connector loose connection or disconnection)
- CVT speed sensor VCC line open (includes connector loose connection or disconnection)
- CVT speed sensor SG line open (includes connector loose connection or disconnection)
- CVT speed sensor VEL-PWM line short to ground
- CVT speed sensor failure
- TCM internal circuit failure

Confirmation Procedure

Operating Condition



- Start the engine.
- Drive the vehicle at a speed of 37 mph (60 km/h) or more.
- Release the accelerator pedal, and slow the vehicle.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

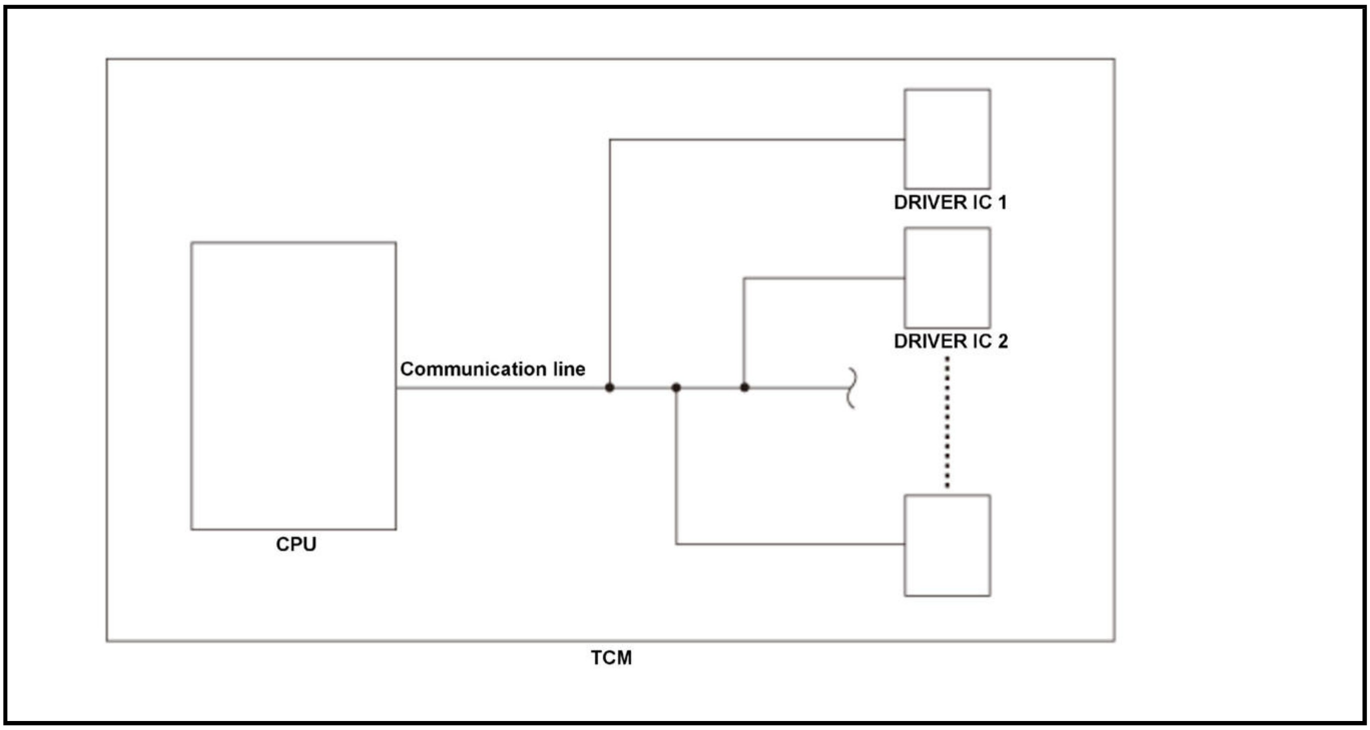
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0600 (CVT (TCM))

DTC P0600: Serial Communication

General Description



The driver IC which has diagnostic function and the CPU are built into the transmission control module (TCM). If the CPU cannot receive diagnostic information from the driver IC for a specified duration due to occurrence of communication abnormality between the driver IC and the CPU, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	One drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	B
Other	When the vehicle is turned to the ON or OFF (LOCK) mode

Malfunction Threshold

One of the conditions is met for at least 5 seconds:

- The CPU does not receive signal from the driver IC via the communication lines.
- The signal sent from the driver IC is abnormal.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- TCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

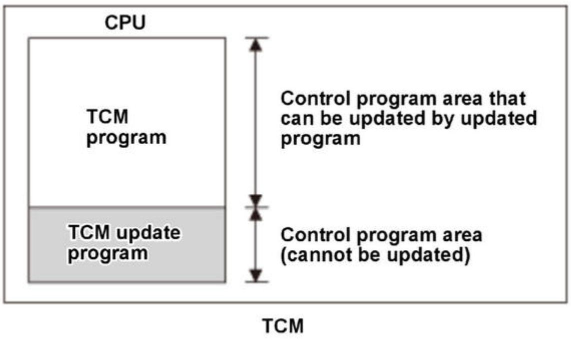
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0602 (CVT (TCM))

DTC P0602: Boot Mode(Programming Error)

General Description



CPU
TCM program
TCM update program
Control program area that can be updated by updated program
Control program area (cannot be updated)
TCM

The transmission control module (TCM) is equipped with an update program to update its control program. The programs in the CPU of the TCM are classified as a TCM program (update-capable program) and a program for the update function (non-updatable program). The program update only updates the TCM program. When the TCM power is turned off during an update, the power for the update function is lost, and the update process stops. When the program update is stopped before it is completed, the TCM stores a DTC that indicates the update is not finished.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or less
DTC Type	One drive cycle, MIL on, Shift position indicator off

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The TCM program update stops 1 second before it is finished.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- TCM program unwritten
- TCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When the TCM program is not written in the TCM, the MIL comes on and a Pending DTC and a Confirmed DTC are stored in the TCM memory. The shift position indicator does not blink.

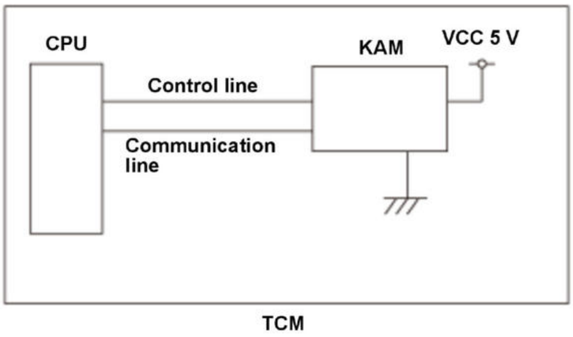
Conditions for clearing the DTC

The MIL, the Pending DTC, and the Confirmed DTC are cleared when the TCM program update is completed.

DTC P062F (CVT (TCM))

DTC P062F: TCM Internal Control Module Error

General Description



The transmission control module (TCM) is equipped with a keep alive memory (KAM). The data (control learn data, etc.) for powertrain control and information (vehicle identification number (VIN), etc.) related to the vehicle control is stored in the KAM, so that it can be maintained even when power is not supplied to the TCM, such as when the 12 volt battery is disconnected. When powered up, the CPU retrieves the stored information from the KAM, as well as writes data to the KAM (control related data is written when the vehicle condition is turned to the ON mode, and vehicle information when commanded from the HDS). When the data retrieval or data writing process is not finished normally, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	B
Other	When the vehicle is turned to the ON or OFF (LOCK) mode

Malfunction Threshold

A malfunction is detected whenever the keep alive data retrieval and writing process is not completed normally.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- TCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

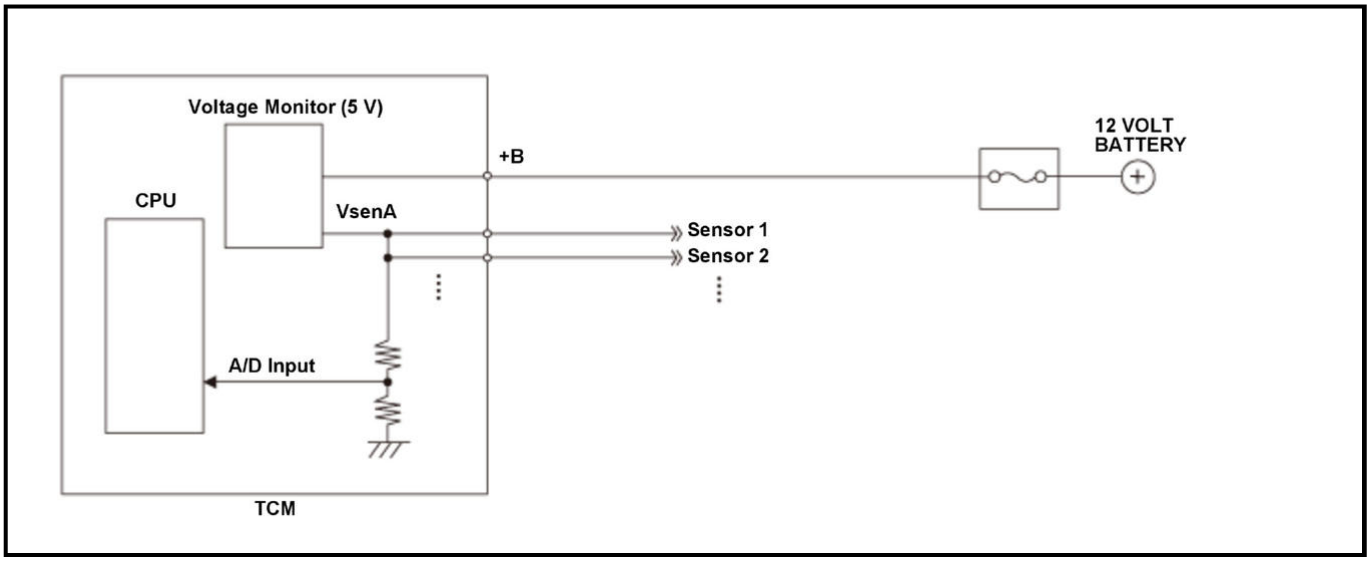
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0641 (CVT (TCM))

DTC P0641: Sensor Reference Voltage 1 Circuit Malfunction

General Description



The transmission control module (TCM) is equipped with a voltage monitor (5 V power source) to supply a stable 5 V to each sensor as reference voltage. The correct voltages for the sensors are loaded in the CPU of the TCM (A/D input) and when the sensor power voltage is a set value (high or low) for a certain time, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The sensor power voltage is specified value or more, or specified value or less, for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT drive pulley speed sensor VCC line short to power
- CVT driven pulley pressure sensor VCC line short to power
- CVT drive pulley speed sensor VCC line short to ground
- CVT driven pulley pressure sensor VCC line short to ground
- TCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

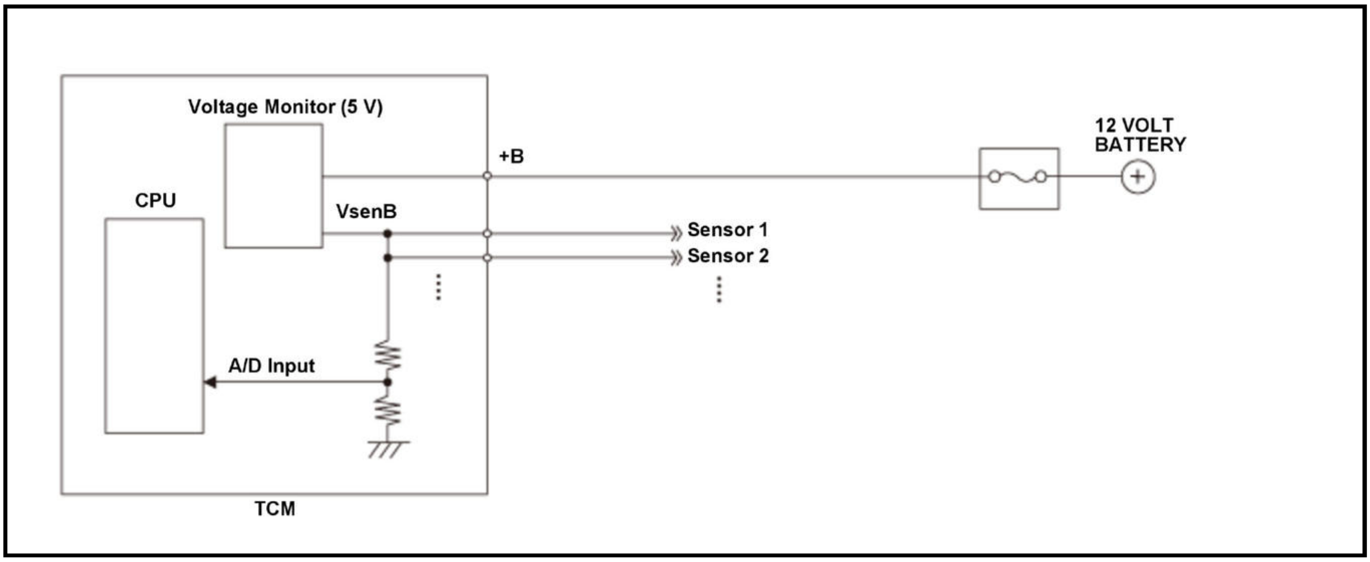
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0651 (CVT (TCM))

DTC P0651: Sensor Reference Voltage 2 Circuit Malfunc

General Description



The transmission control module (TCM) is equipped with a voltage monitor (5 V power source) to supply a stable 5 V to each sensor as reference voltage. The correct voltages for the sensors are loaded in the CPU of the TCM (A/D input) and when the sensor power voltage is a set value (high or low) for a certain time, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The sensor power voltage is specified value or more, or specified value or less, for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT speed sensor VCC line short to power
- Torque converter turbine speed sensor VCC line short to power
- CVT speed sensor VCC line short to ground
- Torque converter turbine speed sensor VCC line short to ground
- TCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

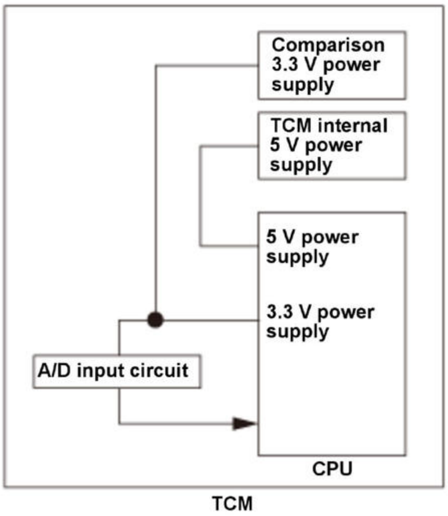
Conditions for clearing the DTC

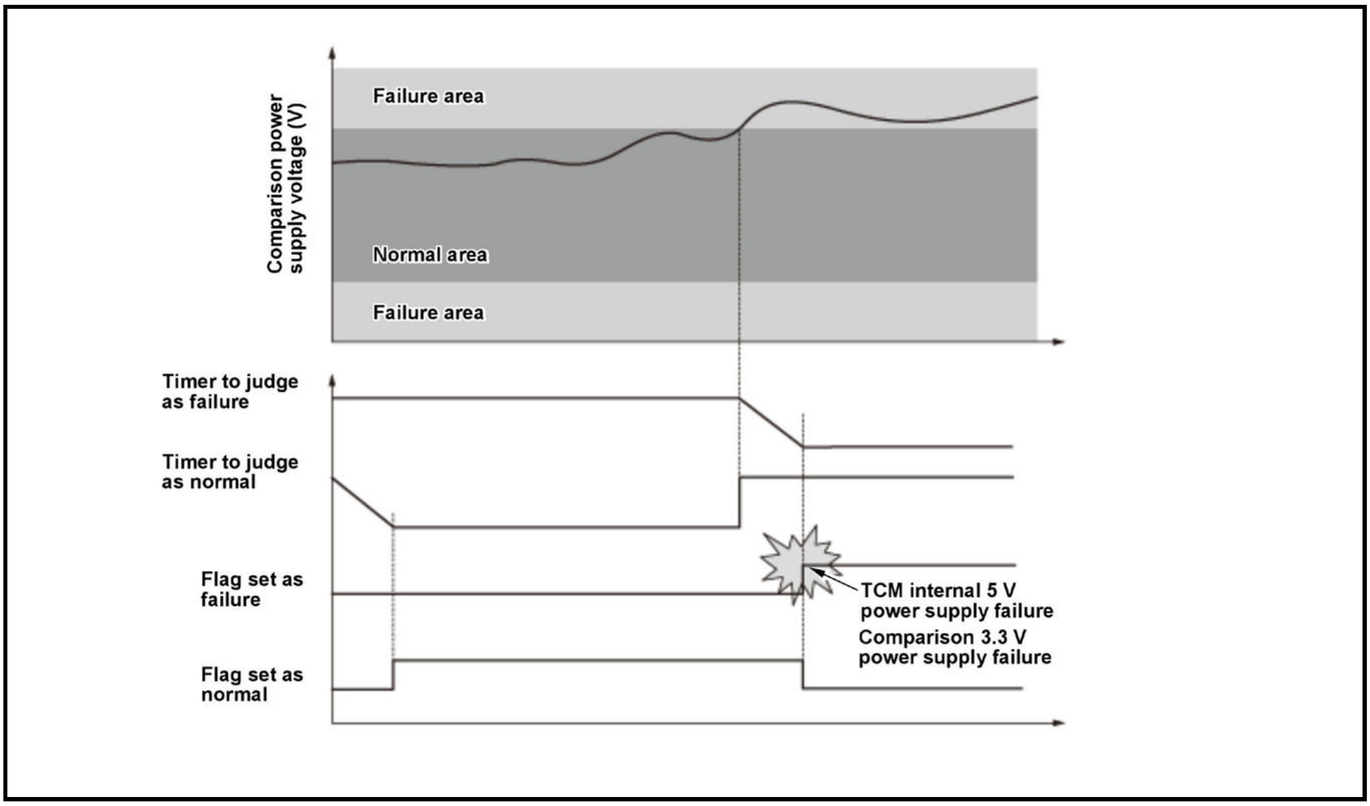
The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P06A8 (CVT (TCM))

DTC P06A8: Internal VCC Power Malfunction

General Description





Comparison power supply voltage (V)
Failure area
Normal area
Failure area
Timer to judge as failure
Timer to judge as normal
Flag set as failure
Flag set as normal
TCM internal 5 V power supply failure
Comparison 3.3 V power supply failure

The transmission control module (TCM) monitors the internal 5 V power supply by comparing it to the A/D input power supply voltage (3.3 V). When the 5 V power supply is normal, the comparison power supply voltage (3.3 V) falls within a normal area. But if the 5 V power supply malfunctions, the comparison power supply voltage (3.3 V) exceeds the range of normal area. If the comparison power supply voltage is out of permissible range for a set time, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	One drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The TCM internal comparison power supply voltage is specified value or less, specified value or more for at least 2 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- TCM (internal 3.3 V or 5 V power supply circuit) failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

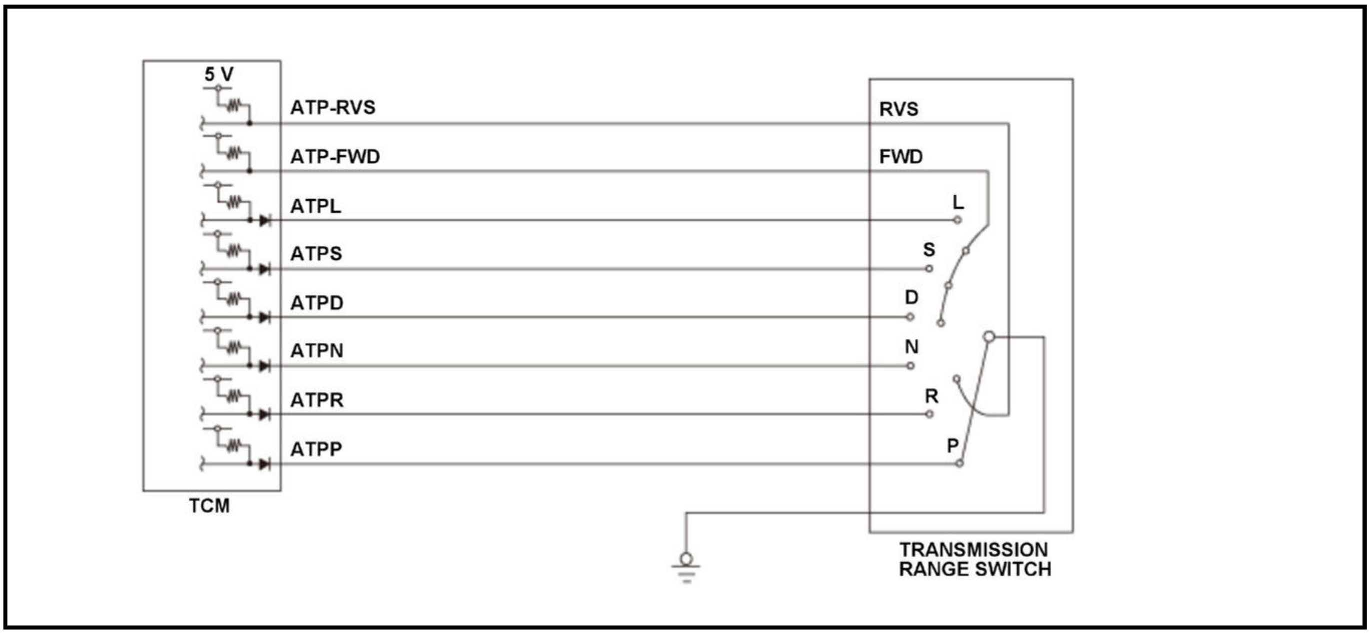
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0705(CVT (TCM))

DTC P0705: Transmission Range Switch Multiple Shift Position Input

General Description



Transmission range switch contact point input matrix

Shift lever position/mode	Input per switch							
	ATPP	ATPR	ATP-RVS	ATPN	ATPD	ATPS	ATPL	ATP-FWD
P	O	X	X	X	X	X	X	X
R	X	O	O	X	X	X	X	X
N	X	X	X	O	X	X	X	X
D	X	X	X	X	O	X	X	O
S	X	X	X	X	X	O	X	O
L	X	X	X	X	X	X	O	O

The transmission range switch is attached to a control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The shift position indicator shows which position is selected according to the Low/High signal combinations, which vary based on the control shaft rotational angle. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is high (5 V or 12 V) at the transmission control module (TCM) input terminal when each transmission range switch position is open, and it is low (0 V) when each switch is closed. If the TCM detects multiple switch inputs instead of the correct switch input for the selected range at that time, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	One drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions occurs.

- The TCM detects the selected range switch input and another range switch input (except FWD switch input [Forward Switch]) simultaneously for at least 1 second.
- The TCM detects the P, R, or N range switch input [A/T P, R, or N Switch] and the FWD switch input [Forward Switch] simultaneously for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Transmission range switch line short to ground
- Transmission range switch failure
- TCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine.
- With the brake pedal pressed, place the shift lever in each position/mode for at least 1 second.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

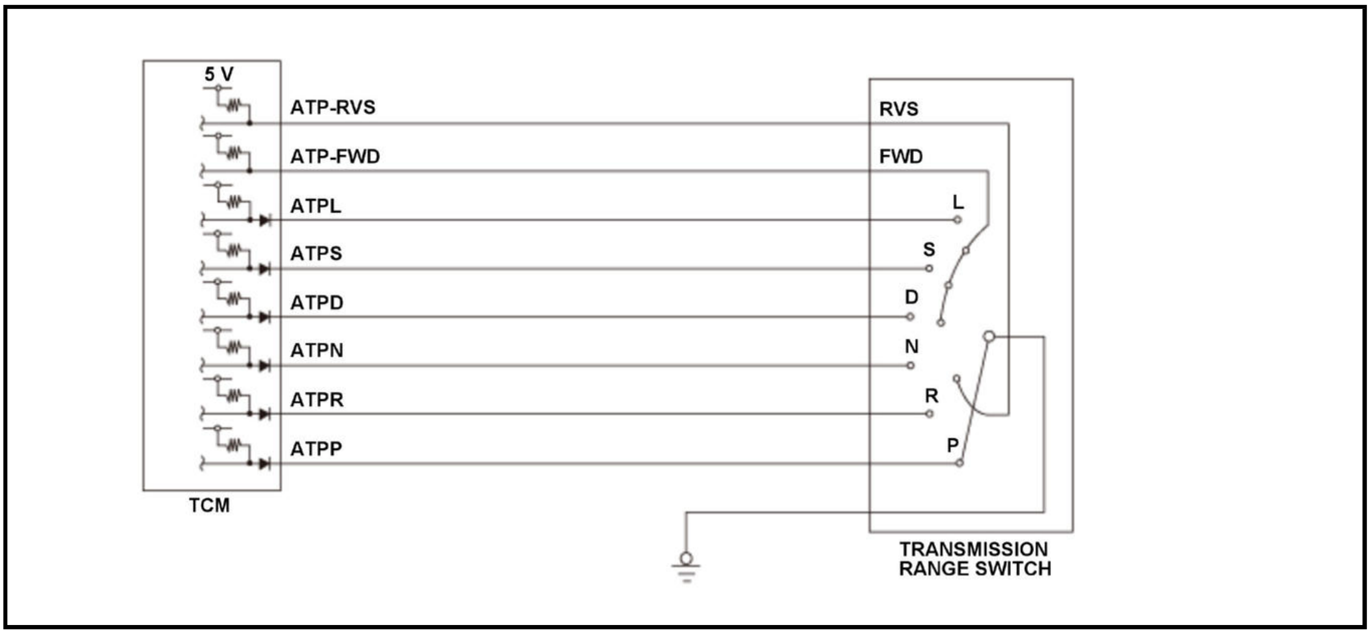
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0706(CVT (TCM))

DTC P0706: Transmission Range Switch Open

General Description



Transmission range switch contact point input matrix

Shift lever position/mode	Input per switch							
	ATPP	ATPR	ATP-RVS	ATPN	ATPD	ATPS	ATPL	ATP-FWD
P	O	X	X	X	X	X	X	X

The transmission range switch is attached to a control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The shift position indicator shows which position is selected according to the Low/High signal combinations, which vary based on the control shaft rotational angle. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is high (5 V or 12 V) at the transmission control module (TCM) input terminal when each transmission range switch position is open, and it is low (0 V) when each switch is closed. If the TCM detects multiple switch inputs instead of the correct switch input for the selected range at that time, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on, Shift position indicator off

Enable Conditions

Condition	B
Shift lever position/mode	D, S, L

Malfunction Threshold

No FWD position signal [Forward Switch] is detected when the vehicle speed [Vehicle Speed] changes from 6 mph (10 km/h) -> 25 mph (40 km/h) -> 6 mph (10 km/h) in D, S, and L position/mode.

[ ]: HDS Parameter

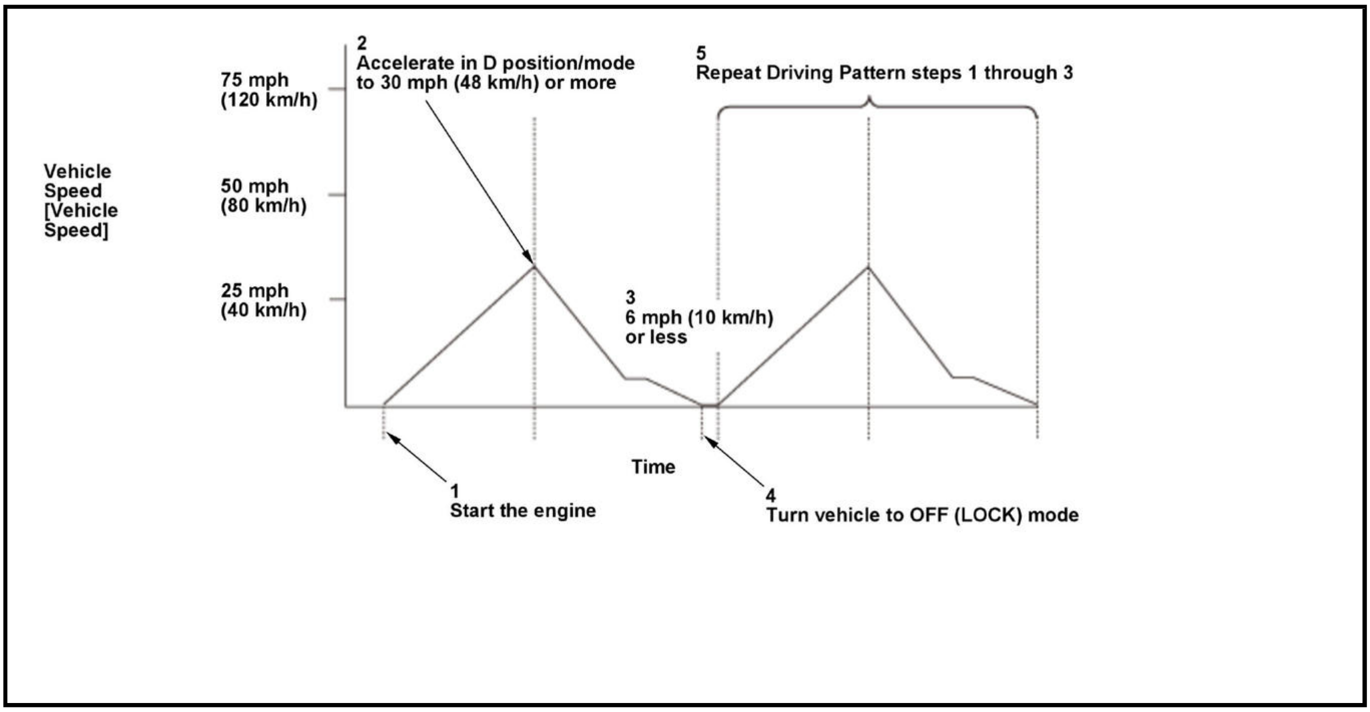
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Transmission range switch ATP-FWD line open (includes connector loose connection or disconnection)
- Transmission range switch failure
- Shift cable adjustment failure
- TCM internal circuit failure

Confirmation Procedure

Operating Condition



- Start the engine.
- Accelerate the vehicle in D position/mode to 30 mph (48 km/h) or more.
- Slow down to 6 mph (10 km/h) for several seconds.
- Stop the vehicle, and turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 3.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored. The shift position indicator does not blink.

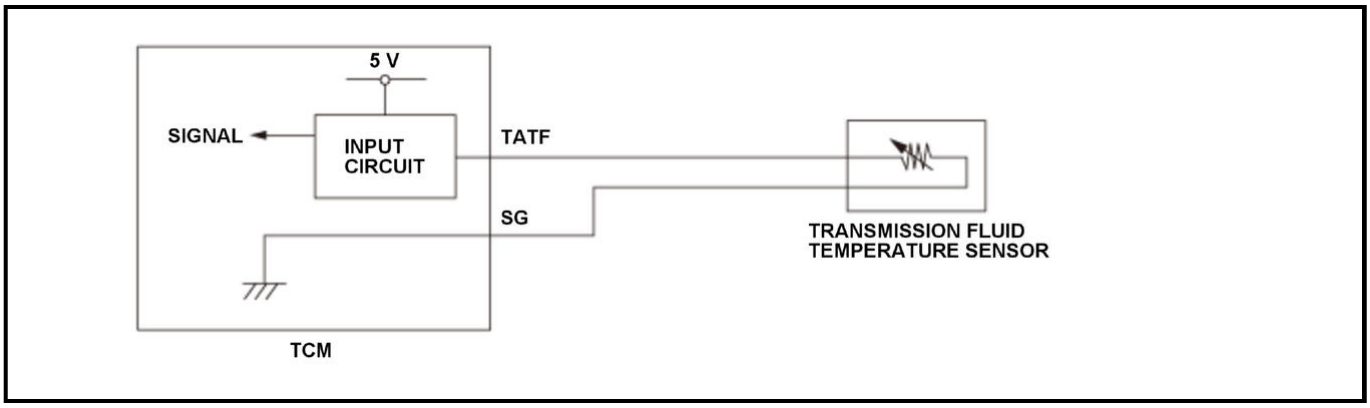
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0710 (CVT (TCM)) (2018 2019 2020 2021)

DTC P0710: CVT Fluid Temperature Sensor (Out of Range)

General Description



The transmission fluid temperature sensor is a thermistor type sensor that changes resistance according to the change in transmission fluid temperature. The transmission control module (TCM) sends a 5 V reference signal to the sensor through a pull-up resistor. When the transmission fluid temperature is low, the sensor resistance increases and the TCM detects a high signal voltage. As the transmission fluid temperature rises, the sensor resistance decreases and the TCM detects a low signal voltage. When the transmission fluid temperature sensor signal voltage to the TCM is a specified range for a specified time, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

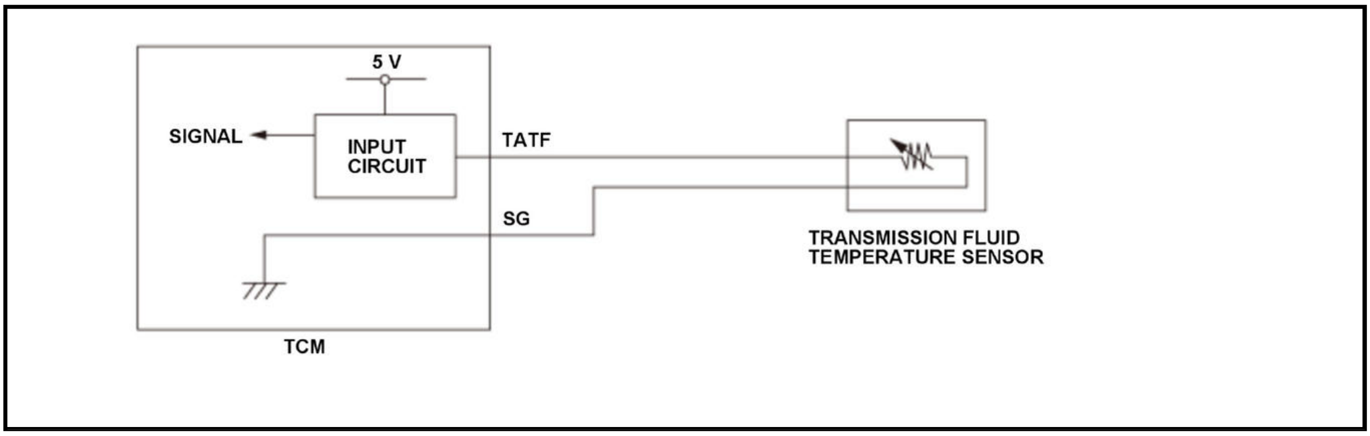
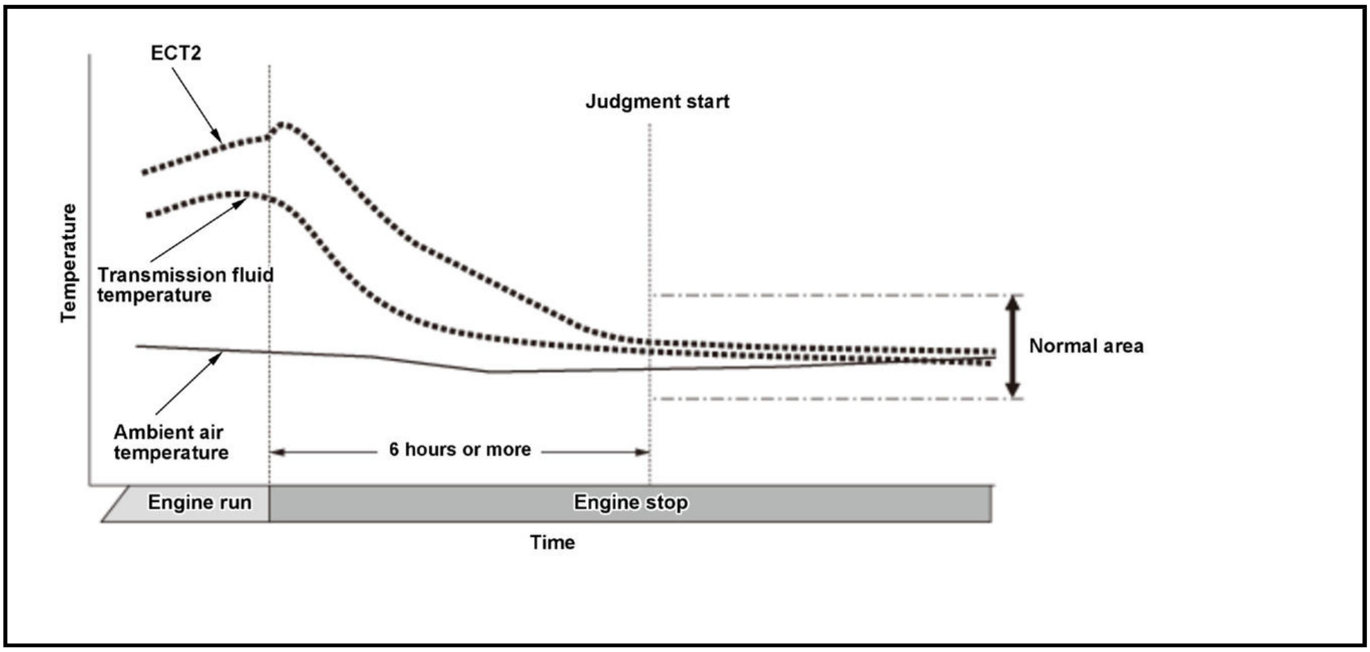
DTC P0714 (CVT (TCM))

DTC P0714: CVT Fluid Temperature Sensor (Intermittent Failure)

General Description





The transmission fluid temperature sensor is a thermistor type sensor that changes resistance according to the change in transmission fluid temperature. The transmission control module (TCM) sends a 5 V reference signal to the sensor through a pull-up resistor. When the transmission fluid temperature is low, the sensor resistance increases and the TCM detects a high signal voltage. As the transmission fluid temperature rises, the sensor resistance decreases and the TCM detects a low signal voltage. When the engine is stopped and enough time has passed, the transmission fluid temperature will equalize to the engine coolant temperature. When the temperature in the transmission fluid temperature sensor deviates from the temperature in engine coolant temperature (ECT) sensor 2 after the engine is stopped and enough time has passed, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	P0111, P0112, P0113, P0116, P0117, P0118, P011A, P011B, P0125, P0128, P2183, P2184, P2185 are judged as OK
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the OFF (LOCK) mode	6 hours	-
Other	Not to be towed during engine stop	

Malfunction Threshold

The temperature in the transmission fluid temperature sensor deviates from the temperature in ECT sensor 2, less than -43 deg.F (-24 deg.C) or greater than 57 deg.F (32 deg.C)*.

*: Greater than 108 deg.F (60 deg.C) if engine block heater is equipped.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Transmission fluid temperature sensor failure

- TCM internal circuit failure

Confirmation Procedure

Operating Condition

- Turn the vehicle to the OFF (LOCK) mode in P position/mode, and wait for at least 6 hours.
- Start the engine in P position/mode, and wait for at least 10 seconds.

With the HDS

None.

Diagnosis Details

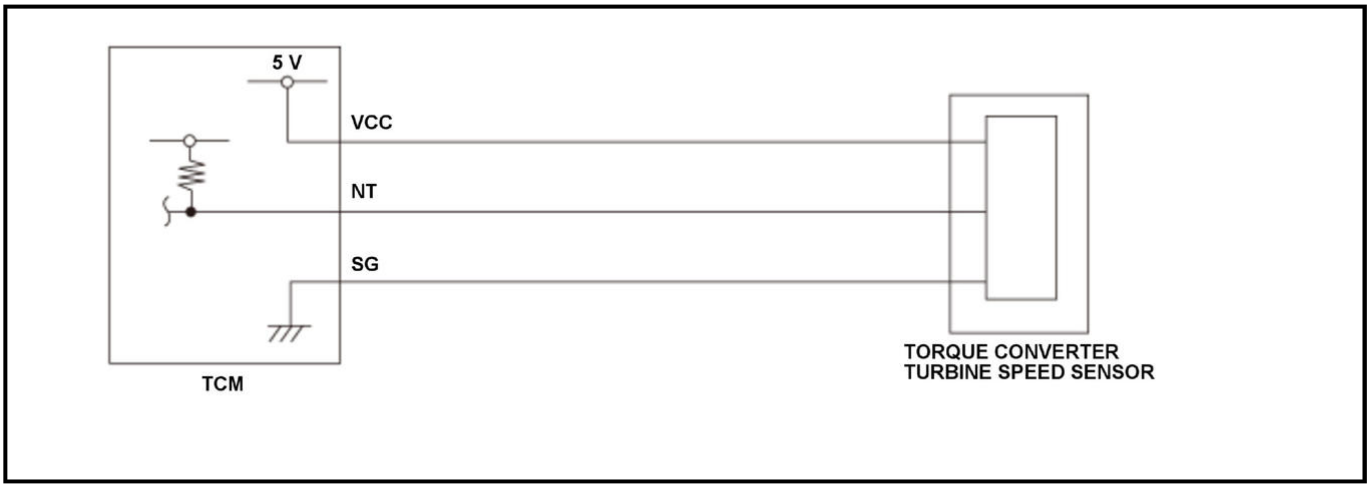
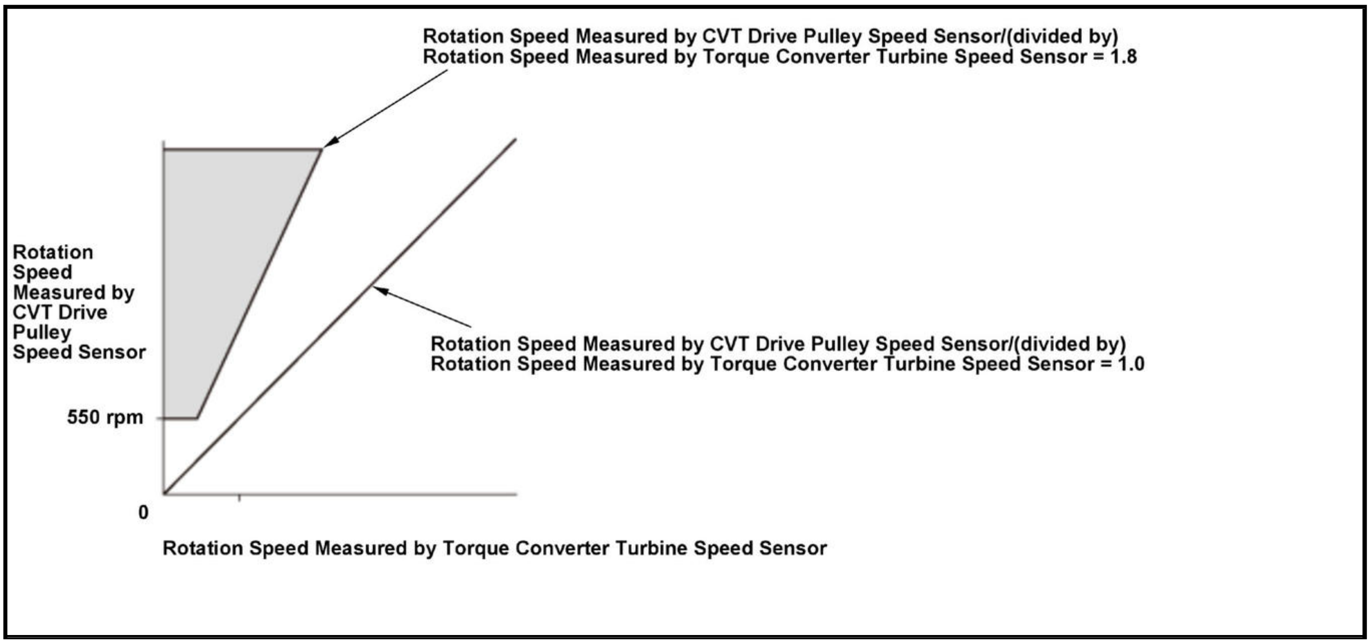
The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0716 (CVT (TCM))

DTC P0716: CVT Input Shaft (Drive Pulley) Speed Sensor A Circuit Range/Performance / Input/Turbine Speed Sensor A Circuit Range/Performance

General Description





The torque converter turbine speed sensor is attached to the outside of the transmission housing. The torque converter turbine speed sensor detects the number of revolutions of the gear on the input shaft and sends a pulsing signal to the transmission control module (TCM). The TCM converts the pulses to torque converter turbine speed. If no pulses occur with the input shaft rotating, the TCM detects a malfunction that may be caused by an open, an intermittent open, or a short to ground. Based on the correlation between the torque converter turbine speed sensor and the CVT drive pulley speed sensor, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	One drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	500 rpm	-
Drive pulley speed [Input Shaft (Drive Pulley) Speed rpm]	550 rpm	-
Torque converter turbine speed [Torque Converter Turbine Speed]	500 rpm	-
12 volt battery voltage [Battery Voltage]	10.0 V	-
Shift lever position/mode	D, S, L	
Other	Not when the shift lever is being shifted	
	No electrical noise in the torque converter turbine speed sensor output circuit	
	When the accelerator pedal is pressed	

[ ]:HDS Parameter

Malfunction Threshold

The rotation speed [Torque Converter Turbine Speed] measured by the torque converter turbine speed sensor is less than the rotation speed [Input Shaft (Drive Pulley) Speed rpm] measured by the CVT drive pulley speed sensor by a factor of 0.56 for at least 10 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Torque converter turbine speed sensor NT line open (includes connector loose connection or disconnection)
- Torque converter turbine speed sensor NT line short to ground
- Torque converter turbine speed sensor failure
- TCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine.
- Drive the vehicle at a speed of 19 mph (30 km/h) or more for at least 30 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

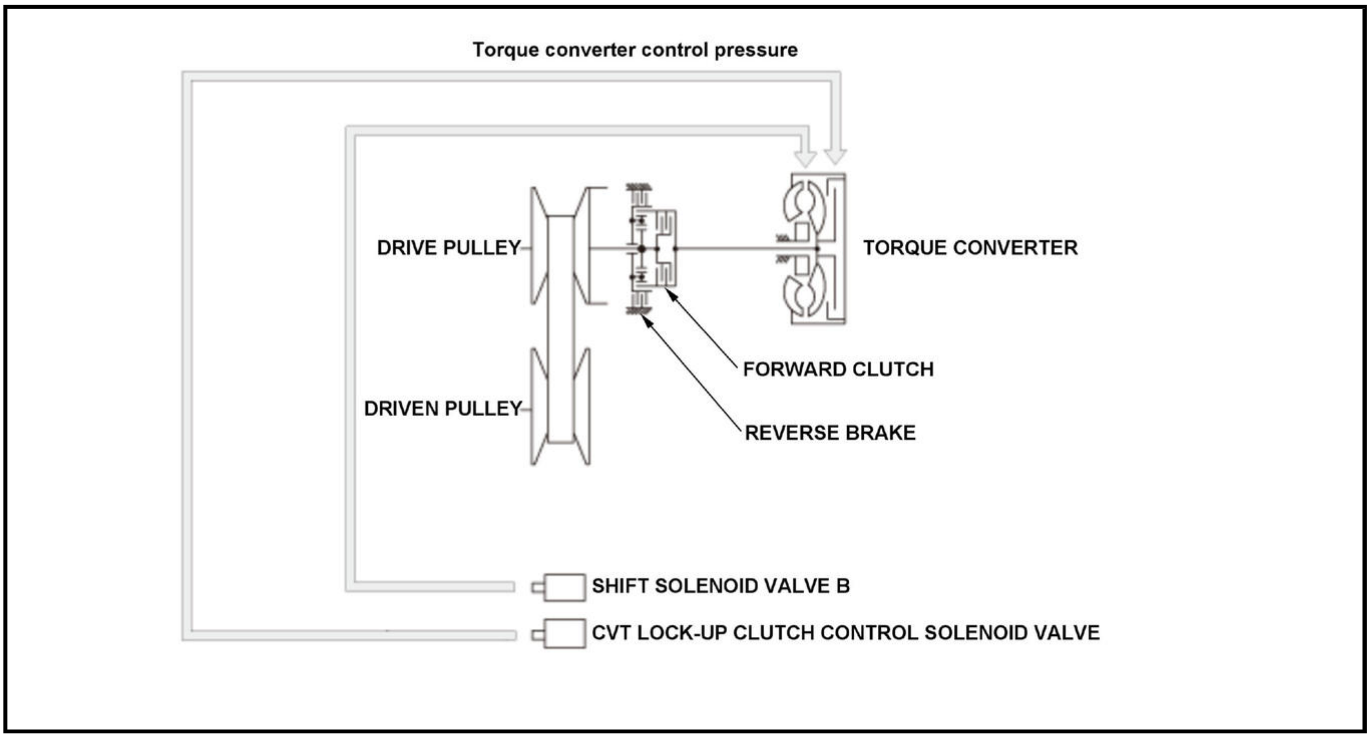
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0741(CVT (TCM))

DTC P0741: Torque Converter Clutch Circuit Performance or Stuck OFF

General Description



The power transfer capacity of the torque converter clutch is controlled by the balance of transmission fluid supply to and discharge from the torque converter. When hydraulic pressure is applied internally, the torque converter clutch turns ON, and when hydraulic pressure is applied from the back pressure side, the torque converter clutch turns OFF. As the hydraulic pressure from the internal pressure side increases, the power transfer capacity of the torque converter clutch increases. The direction of hydraulic pressure supply is switched by shift solenoid valve B and the LC shift valve. Transmission fluid is supplied from the internal pressure side to shift solenoid valve B when the signal from the transmission control module (TCM) is ON (12 V), and transmission fluid is supplied from the back pressure side when it is OFF (0 V). The balance of internal pressure and back pressure is controlled by the CVT lock-up clutch control solenoid valve and the LC control valve. The CVT lock-up clutch control solenoid valve maximizes the power transfer capacity of the torque converter clutch when the signal from the TCM is ON (1 A), and it minimizes the power transfer capacity of the torque converter clutch when the signal from the TCM is OFF (0 A). If the ratio of engine speed and input shaft speed is not about 1:1 while the TCM is issuing the command to turn shift solenoid valve B and the CVT lock-up clutch control solenoid valve ON, the TCM detects a faulty lock-up control system and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	30 seconds or more
DTC Type	Two drive cycles, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	1, 000 rpm	-
Vehicle speed [Vehicle Speed]	28 mph (45 km/h)	-
Accelerator pedal position variation	-	13 deg./1 second
Shift lever position/mode	D, S, L	

[ ]: HDS Parameter

Malfunction Threshold

Difference between target torque converter slip rate and actual torque converter slip rate is more than 15 % for at least 30 seconds or more.

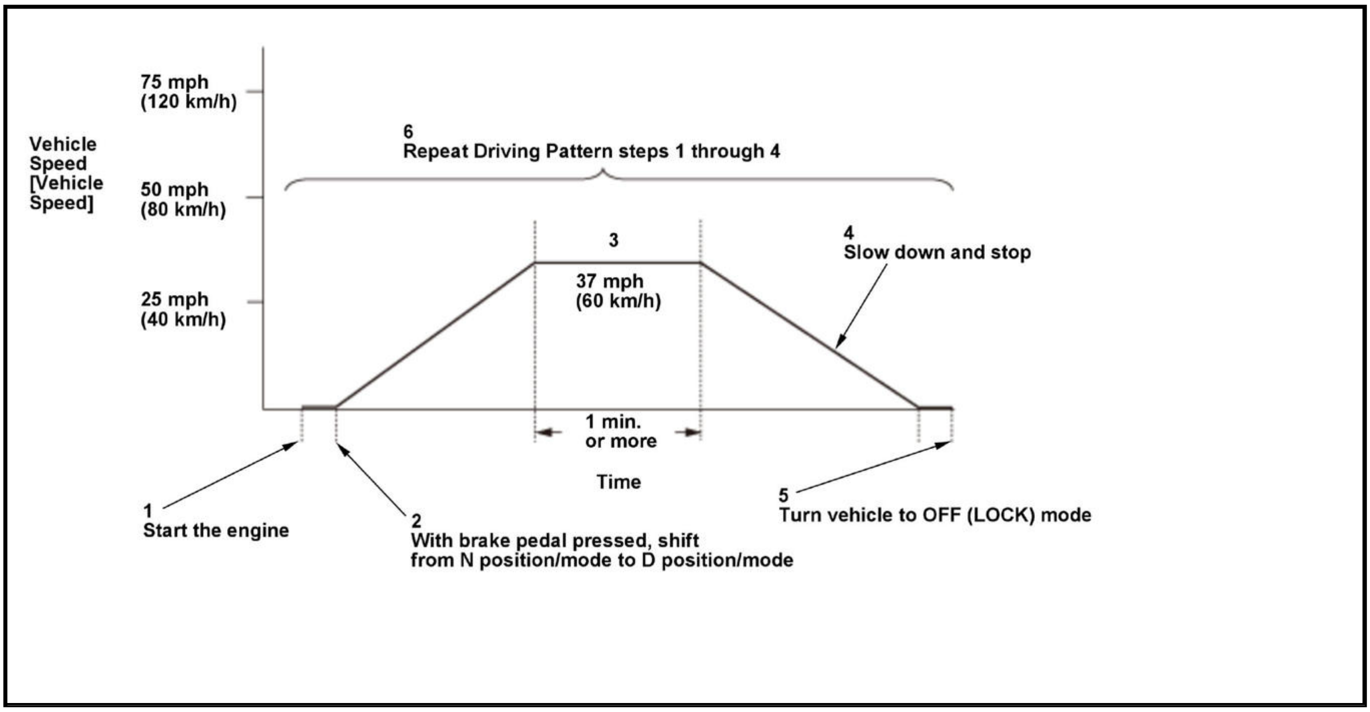
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Torque converter clutch failure
- CVT lock-up clutch control solenoid valve stuck off
- Shift solenoid valve B stuck off
- LC shift valve stuck
- LC control valve stuck

Confirmation Procedure

Operating Condition



- Start the engine.
- With the brake pedal pressed, place the shift lever in from N position/mode to D position/mode.
- Drive the vehicle at a steady speed of 37 mph (60 km/h), for at least 1 minute.
- Slow down and stop the vehicle.
- Turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 4.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on, the shift position indicator blinks, and a Confirmed DTC and the freeze data are stored.

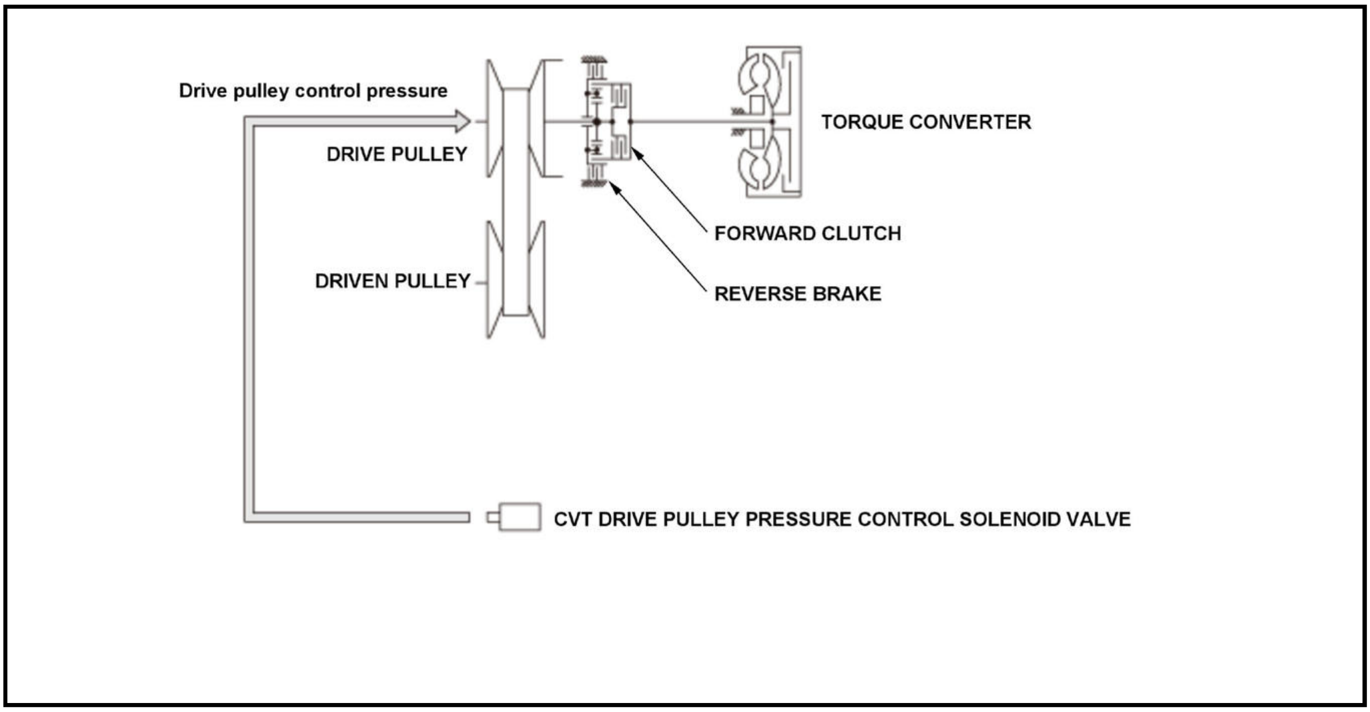
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

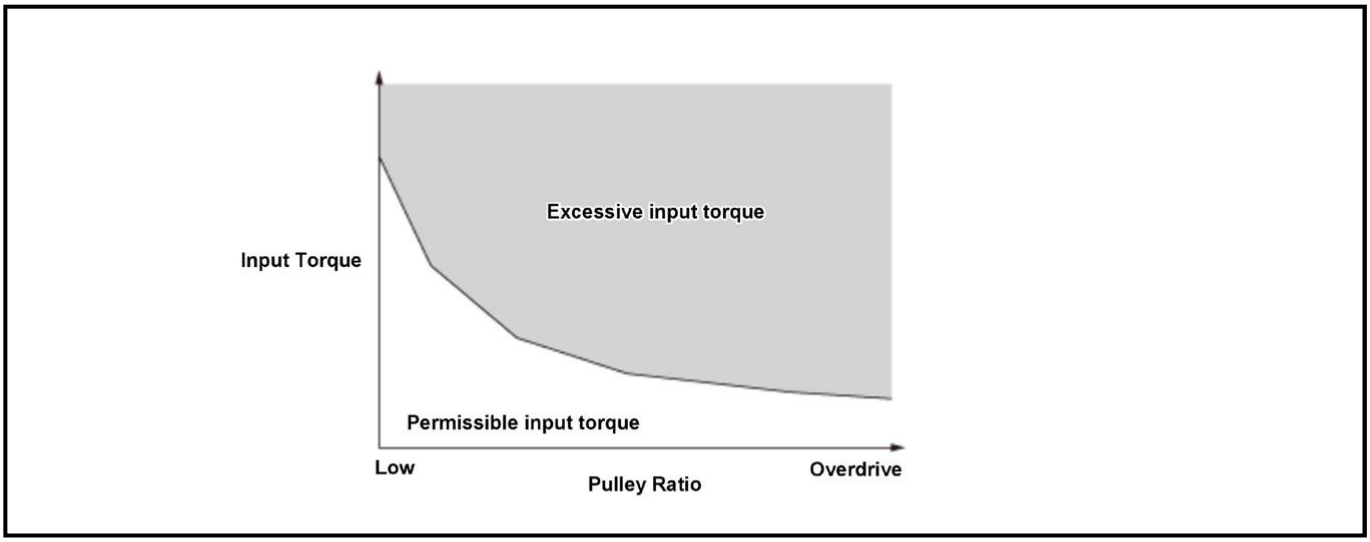
DTC P0746 (CVT (TCM))

DTC P0746: CVT Drive Pulley Pressure Control Solenoid Valve Stuck OFF

General Description



Drive pulley control pressure
DRIVE PULLEY
TORQUE CONVERTER
FORWARD CLUTCH
DRIVEN PULLEY
REVERSE BRAKE
CVT DRIVE PULLEY PRESSURE CONTROL SOLENOID VALVE



The CVT drive pulley pressure control solenoid valve controls hydraulic pressure to the drive pulley. The CVT drive pulley pressure control solenoid valve is controlled by duty cycle output. The spool in the CVT drive pulley pressure control solenoid valve moves the valve according to the current, and produces hydraulic pressure in proportion to the current. To shift the transmission properly, the transmission control module (TCM) outputs a drive pulley hydraulic pressure control signal. If the pulley ratio is overdrive while the vehicle is stopped with the forward clutch engaged, and the estimated input torque when starting is a specified value or more and belt slippage does not occur when driving, the TCM detects a CVT drive pulley pressure control solenoid valve stuck OFF failure and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous

Condition	Minimum	Maximum
Engine speed [Engine Speed]	500 rpm	-
Drive pulley speed [Input Shaft (Drive Pulley) Speed rpm]	500 rpm	-

Condition	Minimum	Maximum
Torque converter turbine speed [Torque Converter Turbine Speed]	550 rpm	-
12 volt battery voltage [Battery Voltage]	10.0 V	-
Shift lever position/mode	D, S, L	
Other	Not when the shift lever is being shifted	
	No electrical noise in the CVT drive pulley speed sensor output circuit	
	Accelerator pedal pressed	

[ ]:HDS Parameter

Malfunction Threshold

The rotation speed [Input Shaft (Drive Pulley) Speed rpm] measured by the CVT drive pulley speed sensor is less than the rotation speed [Torque Converter Turbine Speed] measured by the torque converter turbine speed sensor by a factor of 0.53 for at least 10 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT drive pulley speed sensor NDR-PWM line open (includes connector loose connection or disconnection)
- CVT drive pulley speed sensor NDR-PWM line short to ground
- CVT drive pulley speed sensor failure
- TCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine.
- Drive the vehicle at a speed of 19 mph (30 km/h) or more for at least 30 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

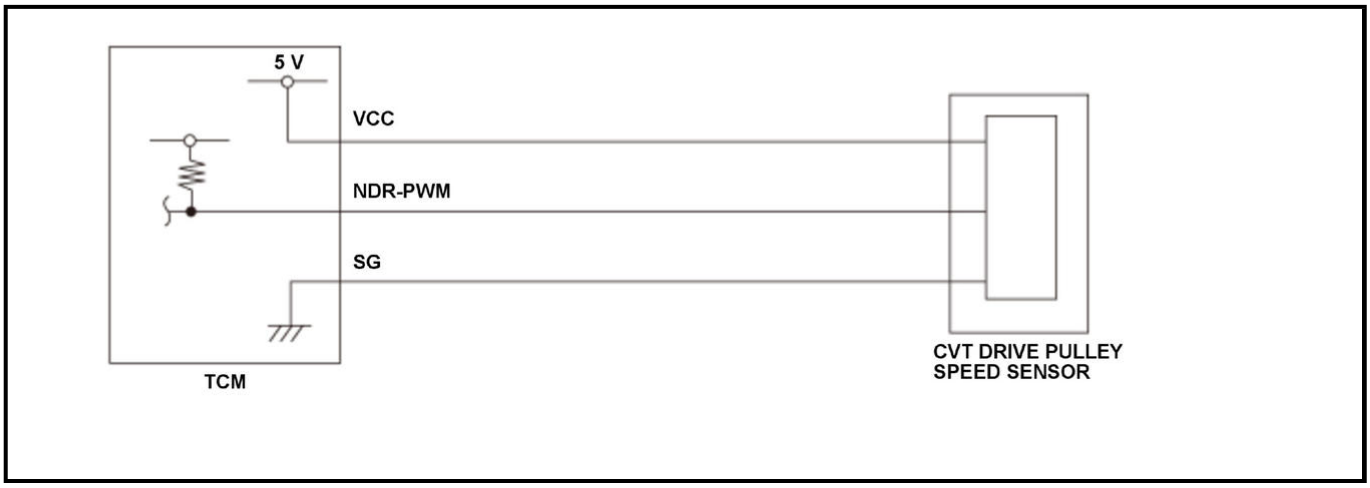
Conditions for clearing the DTC

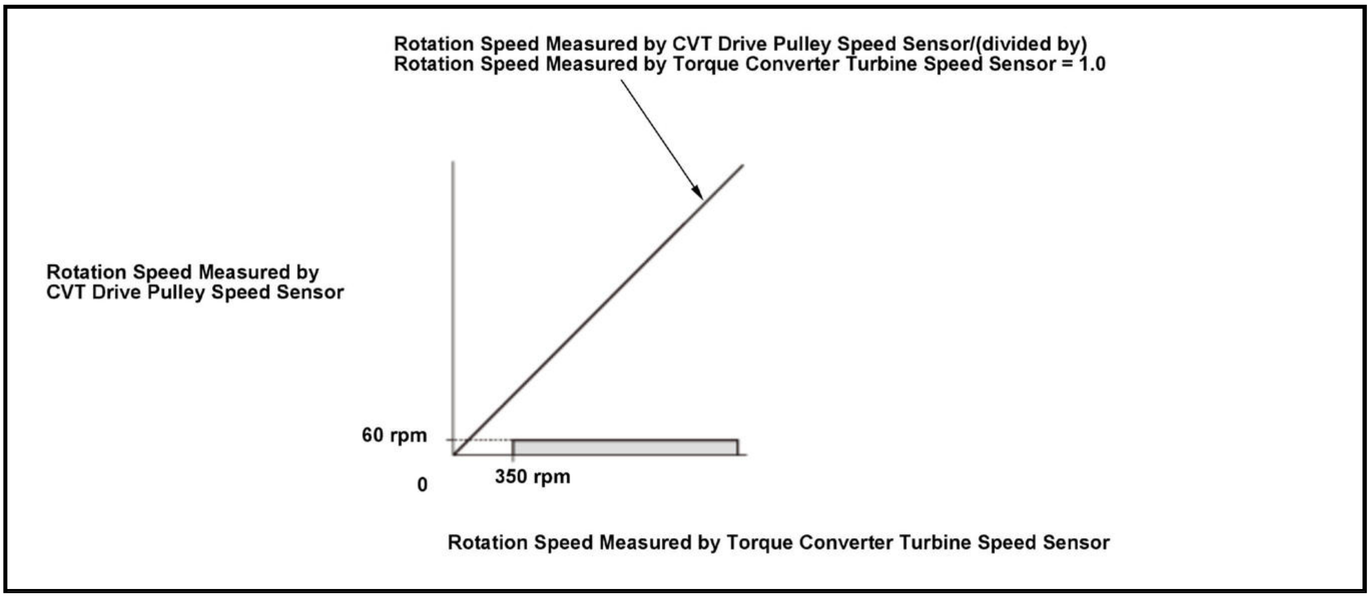
The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0793 (CVT (TCM))

DTC P0793: Intermediate Shaft Speed Sensor A Circuit No Signal

General Description





The CVT drive pulley speed sensor is attached to the outside of the end cover. The CVT drive pulley speed sensor detects the number of revolutions of the gear on the drive pulley and sends a pulsing signal to the transmission control module (TCM). The TCM converts the pulses to drive pulley speed. If no pulses occur with the drive pulley rotating, the TCM detects a malfunction that may be caused by an open, an intermittent open, or a short to ground. Based on the correlation between the CVT drive pulley speed sensor and the torque converter turbine speed sensor, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	One drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	550 rpm	-
Torque converter turbine speed [Torque Converter Turbine Speed]	350 rpm	-

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	10.0 V	-
Shift lever position/mode	D, S, L	
Other	Not when the shift lever is being shifted	
	Rotation speed [Secondary Shaft Speed 1 (rpm)] measured by CVT speed sensor is 350 rpm or more	
	No electrical noise in the CVT drive pulley speed sensor output circuit	

[ ]:HDS Parameter

Malfunction Threshold

The rotation speed [Input Shaft (Drive Pulley) Speed rpm] measured by the CVT drive pulley speed sensor is 60 rpm or less for at least 10 seconds when the rotation speed [Torque Converter Turbine Speed] measured by the torque converter turbine speed sensor is 350 rpm or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT drive pulley speed sensor NDR-PWM line open (includes connector loose connection or disconnection)
- CVT drive pulley speed sensor VCC line open (includes connector loose connection or disconnection)
- CVT drive pulley speed sensor SG line open (includes connector loose connection or disconnection)
- CVT drive pulley speed sensor NDR-PWM line short to ground
- CVT drive pulley speed sensor failure
- TCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine.
- Drive the vehicle at a speed of 19 mph (30 km/h) or more for at least 30 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

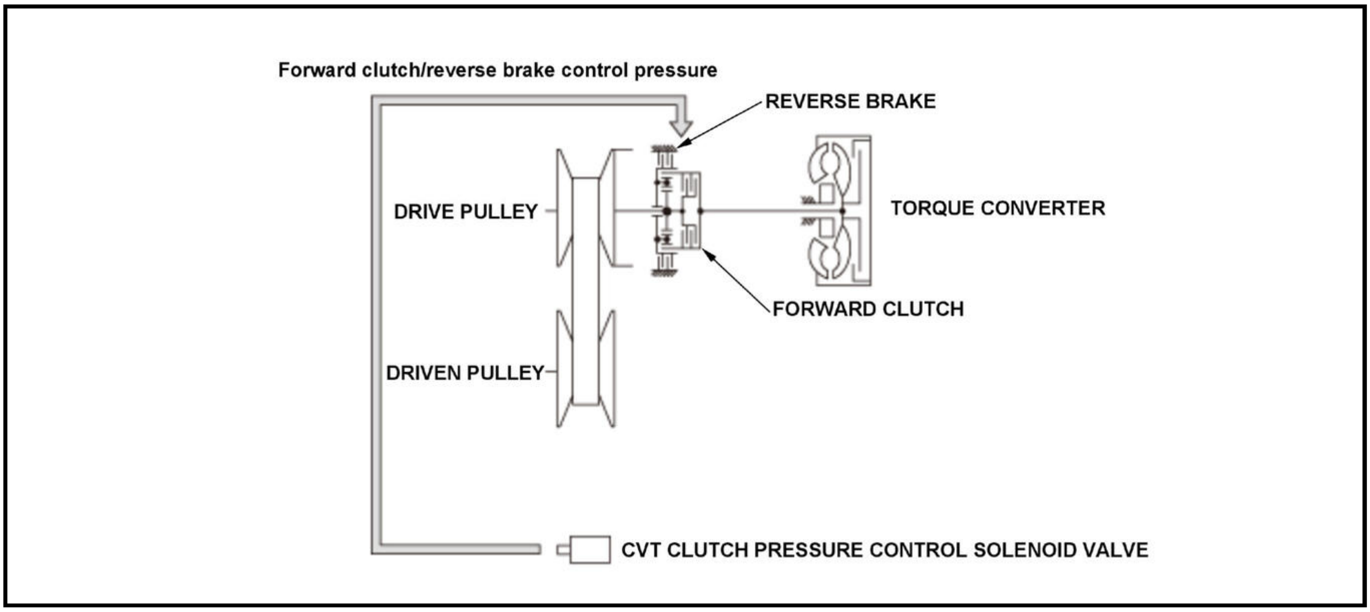
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0796 (CVT (TCM))

DTC P0796: Pressure Control Solenoid Valve C Performance or Stuck OFF

General Description



Forward clutch/reverse brake control pressure
REVERSE BRAKE
DRIVE PULLEY
TORQUE CONVERTER
FORWARD CLUTCH
DRIVEN PULLEY
CVT CLUTCH PRESSURE CONTROL SOLENOID VALVE

The CVT clutch pressure control solenoid valve controls hydraulic pressure to the forward clutch and the reverse brake. The CVT clutch pressure control solenoid valve is controlled by duty cycle output. The spool in the CVT clutch pressure control solenoid valve moves the valve according to the current, and produces hydraulic pressure in proportion to the current. To supply proper forward clutch/reverse brake hydraulic pressure, the transmission control module (TCM) outputs a CVT clutch pressure control solenoid valve hydraulic pressure control signal. If the torque converter turbine speed and drive pulley speed does not match when forward clutch/reverse brake is engaged at a specified vehicle speed condition, the TCM detects a CVT clutch pressure control solenoid valve stuck OFF failure and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	30 seconds or less
DTC Type	Two drive cycles, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	500 rpm	-
Forward clutch/reverse brake commanded pressure	206 kPa (2.1 kgf/cm 2, 29.9 psi)	-
Vehicle speed [Vehicle Speed]	-	1 mph (3 km/h)
Shift lever position/mode	D, S, L, R	

[ ]: HDS Parameter

Malfunction Threshold

The rotation speed between the torque converter turbine speed [Torque Converter Turbine Speed] and the drive pulley speed [Input Shaft (Drive Pulley) Speed rpm] is 250 rpm or more.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT clutch pressure control solenoid valve stuck off

Confirmation Procedure

Operating Condition

- Start the engine.
- With the brake pedal pressed, place the shift lever in from N position/mode to D position/mode, and wait for at least 30 seconds.
- Turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 2.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on, the shift position indicator blinks, and a Confirmed DTC and the freeze data are stored.

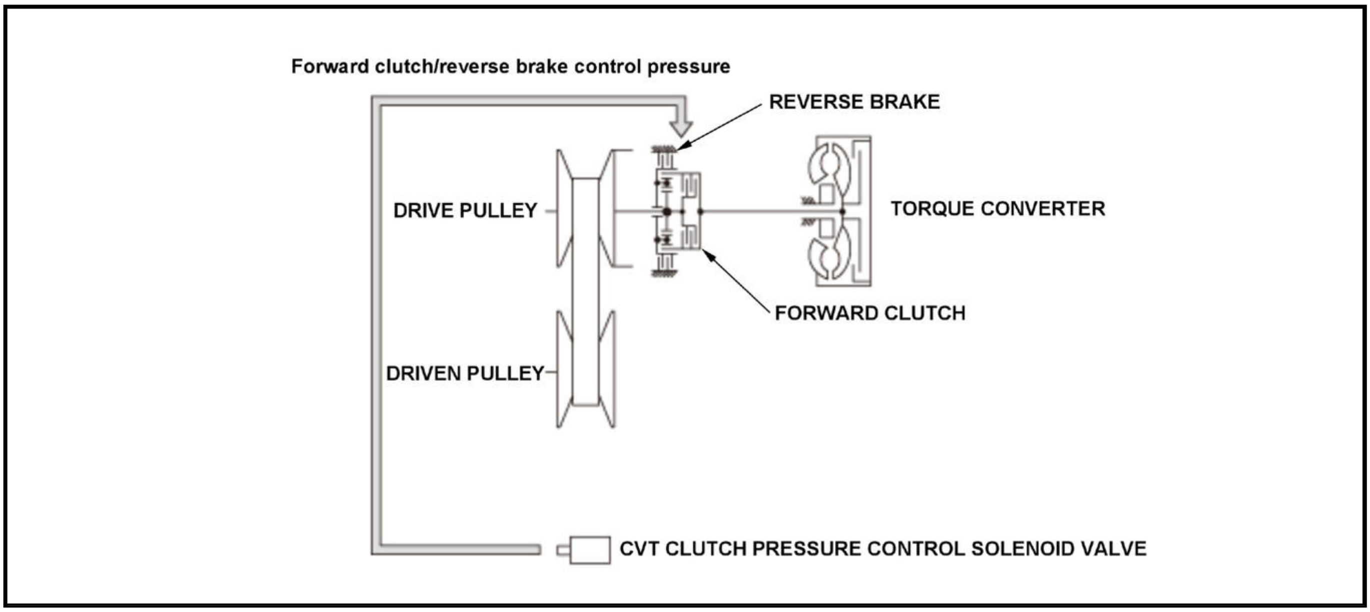
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0797 (CVT (TCM))

DTC P0797: Pressure Control Solenoid Valve C Stuck ON

General Description



Forward clutch/reverse brake control pressure
REVERSE BRAKE
DRIVE PULLEY
TORQUE CONVERTER
FORWARD CLUTCH
DRIVEN PULLEY
CVT CLUTCH PRESSURE CONTROL SOLENOID VALVE

The CVT clutch pressure control solenoid valve controls hydraulic pressure to the forward clutch and the reverse brake. The CVT clutch pressure control solenoid valve is controlled by duty cycle output. The spool in the CVT clutch pressure control solenoid valve moves the valve according to the current, and produces hydraulic pressure in proportion to the current. To supply proper forward clutch/reverse brake hydraulic pressure, the transmission control module (TCM) outputs a CVT clutch pressure control solenoid valve hydraulic pressure control signal. If the duration of the forward clutch/reverse brake engage operation from start to completion is short, the TCM detects a CVT clutch pressure control solenoid valve stuck ON failure and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	500 rpm	-
Vehicle speed [Vehicle Speed]	-	1 mph (3 km/h)
Accelerator pedal position	-	0.6 deg.
Shift lever position/mode	D, S, L	

[ ]: HDS Parameter

Malfunction Threshold

Forward clutch engagement when shifted from N position/mode to D position/mode takes less than 0.4 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT clutch pressure control solenoid valve stuck on

Confirmation Procedure

Operating Condition

- Start the engine.
- With the brake pedal pressed, place the shift lever in from N position/mode to D position/mode, then shift to N position/mode, and wait for at least 2 seconds.
- Repeat Driving Pattern step 2, five times.
- Turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 3.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on, the shift position indicator blinks, and a Confirmed DTC and the freeze data are stored.

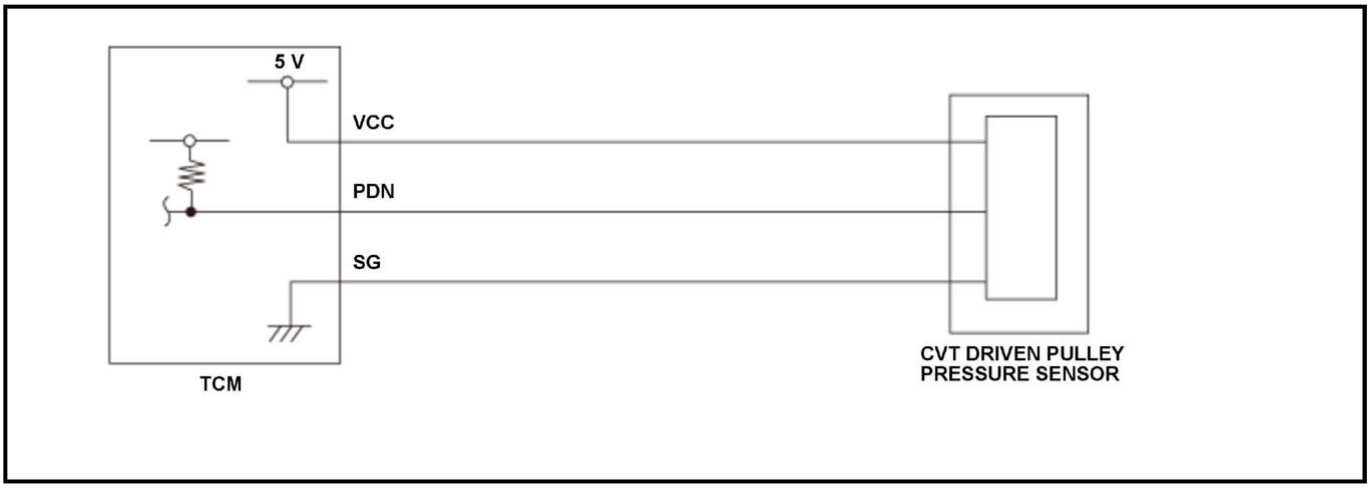
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0842, P0843(CVT (TCM))

DTC P0842: Transmission Fluid Pressure Sensor/Switch A Circuit Low **DTC P0843:** Transmission Fluid Pressure Sensor/Switch A Circuit High

General Description



The CVT driven pulley pressure sensor uses a strain gauge. The output voltage changes depending on the driven pulley pressure. The transmission control module (TCM) sends a 5 V reference voltage to the sensor through a pull-up resistor. When the driven pulley pressure is low, the sensor resistance decreases and the TCM detects a low signal voltage. Conversely, when the driven pulley pressure is high, the sensor resistance increases and the TCM detects a high signal voltage. If the CVT driven pulley pressure sensor signal voltage is a specified voltage for a set time, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	10 seconds or more
DTC Type	Two drive cycles, MIL off, Shift position indicator blinks

Enable Conditions

Condition	B
State of the engine	Running

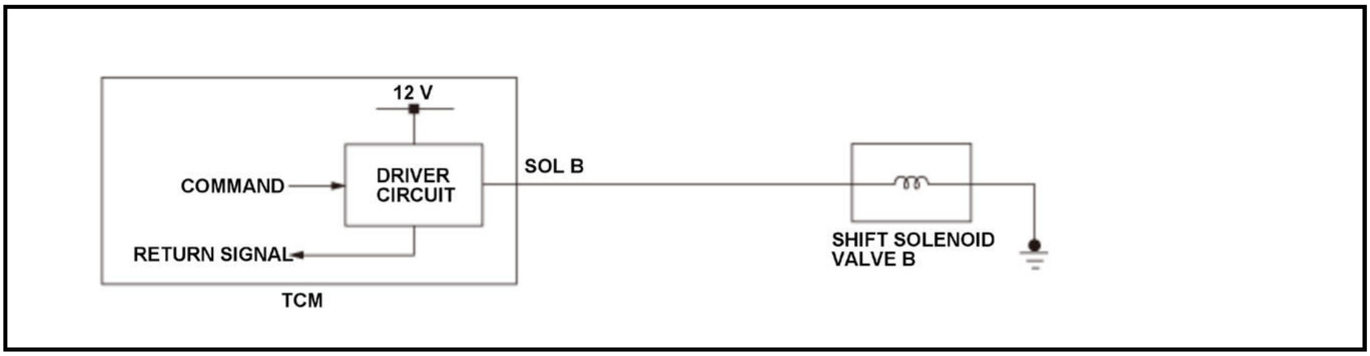
DTC P0976(CVT (TCM))

DTC P0976: Shift Solenoid Valve B Circuit Low

General Description



Torque converter clutch status by shift solenoid valve B output

Torque Converter Clutch	Shift Solenoid Valve B
OFF	OFF
ON	ON

Shift solenoid valve B controls the drain circuit close/open commanded by the transmission control module (TCM) ON/OFF commands. Fluid passages which supply/discharge the hydraulic pressure to torque converter clutch is switched by shift solenoid valve B ON/OFF control. The TCM commands the driver circuit to turn on shift solenoid valve B. The circuit diagnoses malfunctions such as a circuit short or open, and sends back a return signal during the TCM's command. When the return signal does not match the TCM command to turn ON shift solenoid valve B, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more
DTC Type	Two drive cycles, MIL on, Shift position indicator blinks

Malfunction Threshold

The return signal does not match the command to turn ON shift solenoid valve B [Shift Sol B] for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve B SOL B line short to ground
- Shift solenoid valve B internal circuit short
- TCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine, and warm it up to normal operating temperature (the radiator fan comes on twice).
- Drive the vehicle in D position/mode at a steady speed of 37 mph (60 km/h), for at least 10 seconds.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on, the shift position indicator blinks, and a Confirmed DTC and the freeze data are stored.

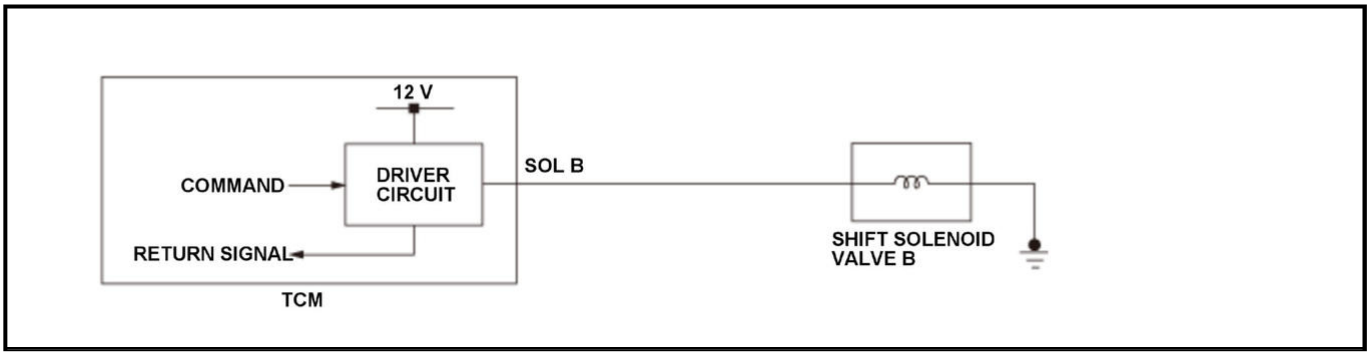
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0977 (CVT (TCM))

DTC P0976: Shift Solenoid Valve B Circuit High

General Description



Torque converter clutch status by shift solenoid valve B output

Torque Converter Clutch	Shift Solenoid Valve B
OFF	OFF
ON	ON

Shift solenoid valve B controls the drain circuit close/open commanded by the transmission control module (TCM) ON/OFF commands. Fluid passages which supply/discharge the hydraulic pressure to torque converter clutch is switched by shift solenoid valve B ON/OFF control. The TCM commands the driver circuit to turn on shift solenoid valve B. The circuit diagnoses malfunctions such as a circuit short or open, and sends back a return signal during the TCM's command. When the return signal does not match the TCM command to turn OFF shift solenoid valve B, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1 second or more

DTC Type	Two drive cycles, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

The return signal does not match the command to turn OFF shift solenoid valve B [Shift Sol B] for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Shift solenoid valve B SOL B line open (includes connector loose connection or disconnection)
- Shift solenoid valve B internal circuit open
- TCM internal circuit failure

Confirmation Procedure

Operating Condition

- Shift the transmission to P position/mode.
- Start the engine, and wait for at least 10 seconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on, the shift position indicator blinks, and a Confirmed DTC and the freeze data are stored.

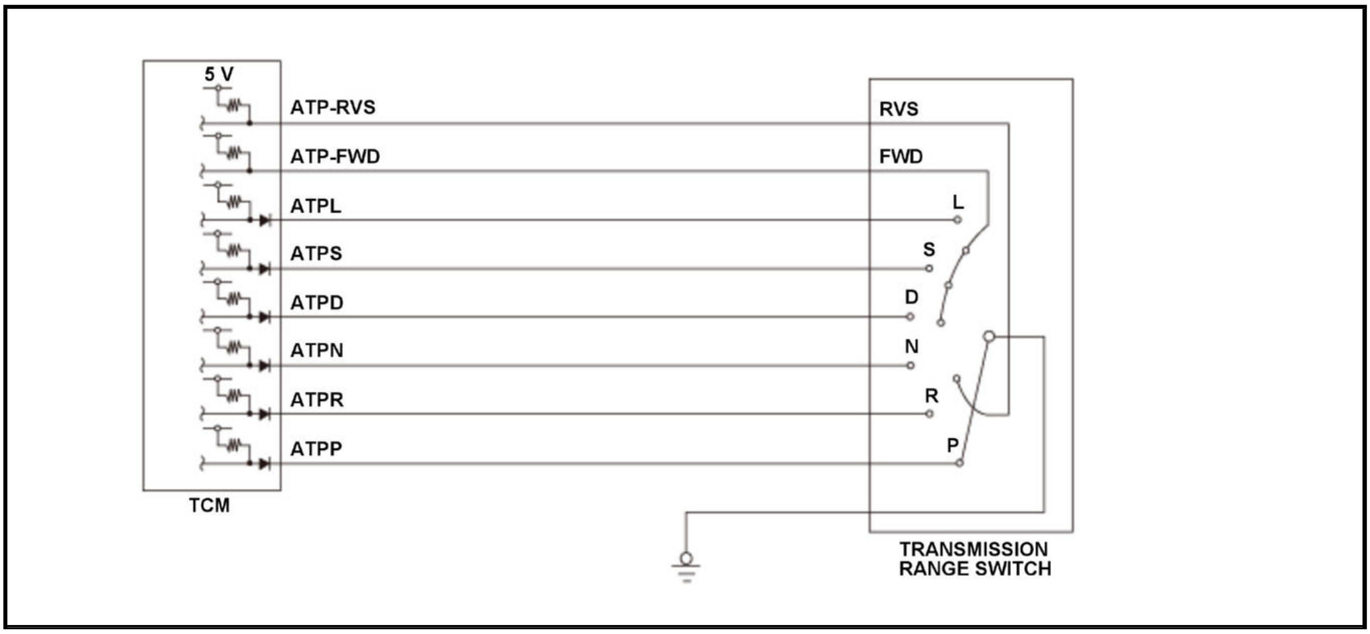
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P1717 (CVT (TCM))

DTC P1717: Transmission Range Switch ATP RVS Switch (Open or Short)

General Description



Transmission range switch contact point input matrix

Shift lever position/mode	Input per switch							
	ATPP	ATPR	ATP-RVS	ATPN	ATPD	ATPS	ATPL	ATP-FWD
P	O	X	X	X	X	X	X	X
R	X	O	O	X	X	X	X	X
N	X	X	X	O	X	X	X	X
D	X	X	X	X	O	X	X	O
S	X	X	X	X	X	O	X	O
L	X	X	X	X	X	X	O	O

The transmission range switch is attached to a control shaft. Operating the shift lever makes the control shaft rotate via the shift cable. The shift position indicator shows which position is selected according to the Low/High signal combinations, which vary based on the control shaft rotational angle. The control shaft changes the position of the transmission range switch, activates the manual valve, and switches hydraulic pressure to shift the transmission through forward/neutral/reverse. The transmission range switch signal is used to determine the shift schedule. The voltage is high (5 V or 12 V) at the transmission control module (TCM) input terminal when each transmission range switch position is open, and it is low (0 V) when each switch is closed. If the TCM detects multiple switch inputs instead of the correct switch input for the selected range at that time, it detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	320 milliseconds or more
DTC Type	Two drive cycles, MIL off, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	11 V	-

[ ]: HDS Parameter

Malfunction Threshold

No RVS signal [Reverse Switch(ATPRVS)] is detected with the shift lever in R position/mode while shifting between P, R, and N position/mode.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Transmission range switch ATP-RVS line open (includes connector loose connection or disconnection)
- Transmission range switch failure
- Shift cable adjustment failure
- TCM internal circuit failure

Confirmation Procedure

Operating Condition

- Start the engine.
- With the brake pedal pressed, shift to P, R, through N position/mode, then shift to R position/mode again, and wait for at least 320 milliseconds.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

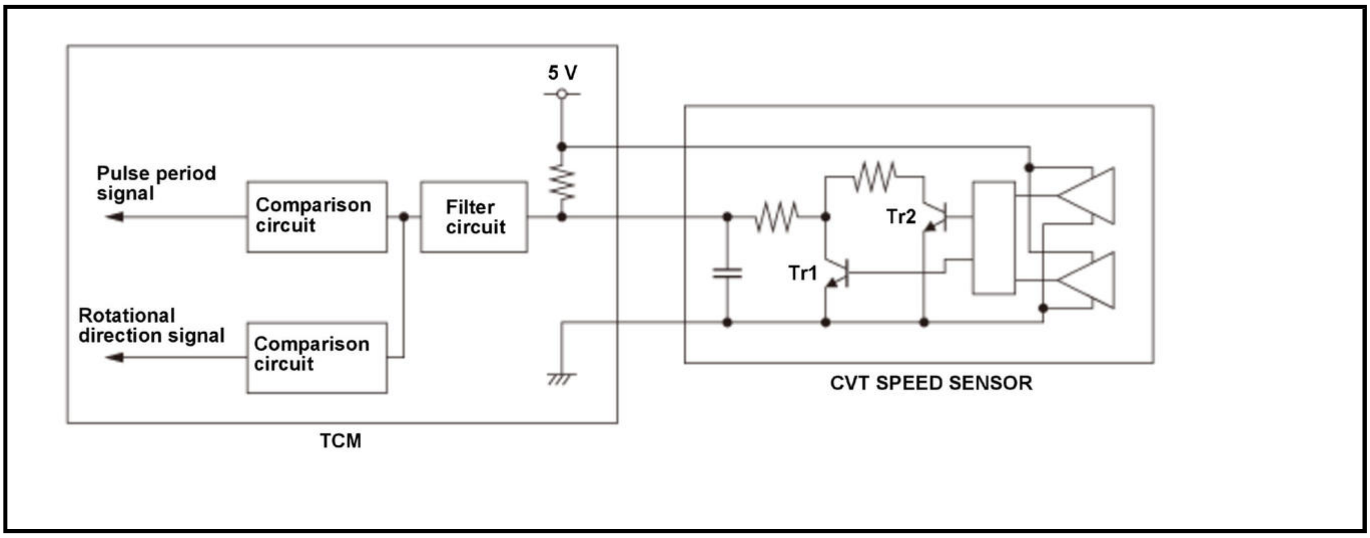
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P1840 (CVT (TCM))

DTC P1840: CVT Speed Sensor Circuit Forward Rotation Range/Performance

General Description



5 V
Pulse period signal

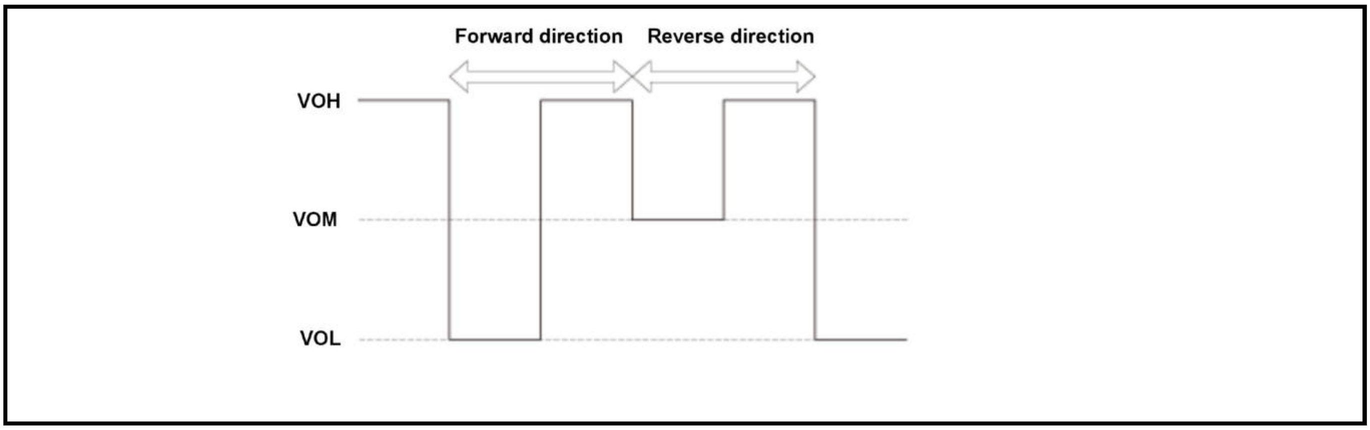
Filter circuit
Rotational direction signal
Comparison circuit
TCM
Tr2
Tr1
CVT SPEED SENSOR



Tr1	Tr2	Pulse signal voltage level
OFF	OFF	VOH
OFF	ON	VOM
ON	OFF	VOL

The CVT speed sensor is attached to the outside of the torque converter housing. The CVT speed sensor consists of a semiconductor to detect the position of the secondary driven gear. When the secondary driven gear rotates, the magnetic flux in the CVT speed sensor changes. The changes of magnetic flux are converted into pulsing signals to the transmission control module (TCM). The rotational direction of the secondary driven gear is detected by the voltage level of the pulsing signals. If the driving condition and the detected voltage level of the pulsing signals do not match, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	Two drive cycles, MIL off, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after forward clutch engage completion	3 seconds	-
Engine speed [Engine Speed]	500 rpm	-
Drive pulley speed [Input Shaft (Drive Pulley) Speed rpm]	500 rpm	-

Condition	Minimum	Maximum
Forward clutch commanded pressure	295 kPa (3.0 kgf/cm 2, 42.7 psi)	-
Vehicle speed [Vehicle Speed]	19 mph (30 km/h)	-
Shift lever position/mode	D, S, L	
Drive pulley rotational direction [Direction of Drive Pulley Rotation]	Forward direction	
Other	Not when the shift lever is being shifted	

[ ]: HDS Parameter

Malfunction Threshold

The CVT speed sensor outputs [Direction of Secondary-shaft Rotation] a reverse direction signal for at least 2 seconds when driving in forward position.

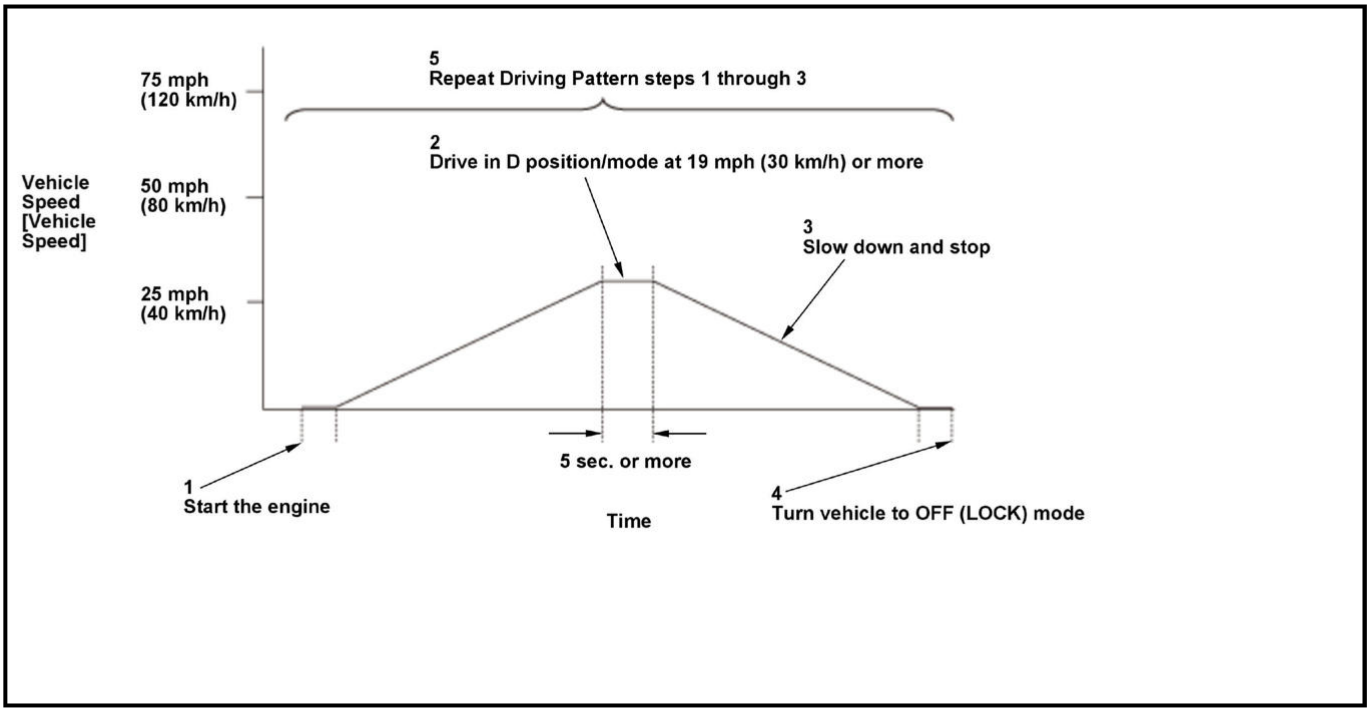
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT speed sensor failure
- TCM internal circuit failure

Confirmation Procedure

Operating Condition



- Start the engine.
- Drive the vehicle in D position/mode at a speed of 19 mph (30 km/h) or more for at least 5 seconds.
- Slow down and stop the vehicle.
- Turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 3.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

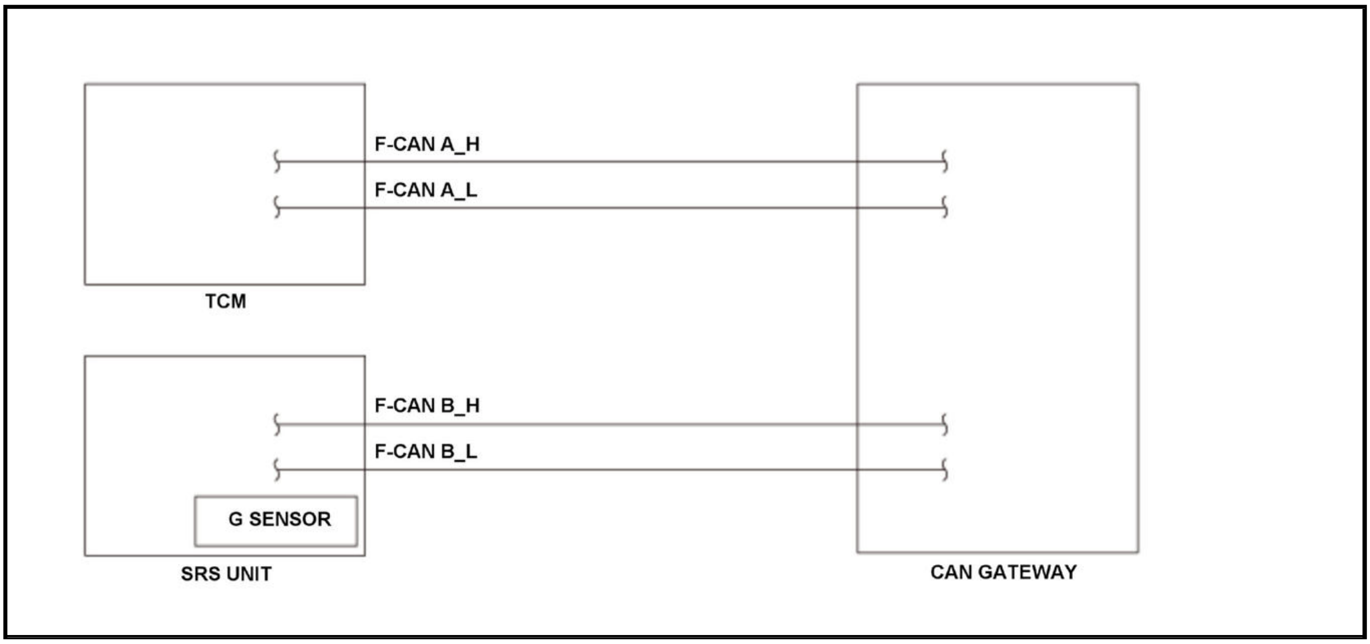
DTC P1855 (CVT (TCM)) (2020 2021)

DTC P1855: Inclination Sensor Circuit Range/Performance

General Description



The G sensor is built into the SRS unit. The G sensor detects the road gradient at the time of vehicle stop and outputs information to the transmission control module (TCM). The TCM uses the G sensor output received by F-CAN lines for vehicle creeping torque switching. If the G sensor output voltage is less changed during the condition there is a forward and backward acceleration, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL off, Shift position indicator off

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	500 rpm	-
Difference of front wheel right-and-left average speed and rear wheel right-and-left average speed	-	3 mph (5 km/h)
Shift position/mode	D, S, L	

[ ]: HDS Parameter

Malfunction Threshold

The G sensor output voltage change width is less than 0.03 V after the vehicle is driven at following conditions:

- Drive the vehicle at accelerator pedal position 1/16 or more and vehicle speed more than 4 mph (5 km/h) for at least 1 second.
- Reach the vehicle speed [Vehicle Speed] to 14 mph (21 km/h) or more.
- Decelerate to more than 4 mph (5 km/h) with throttle fully closed for at least 1 second.
- Stop the vehicle.

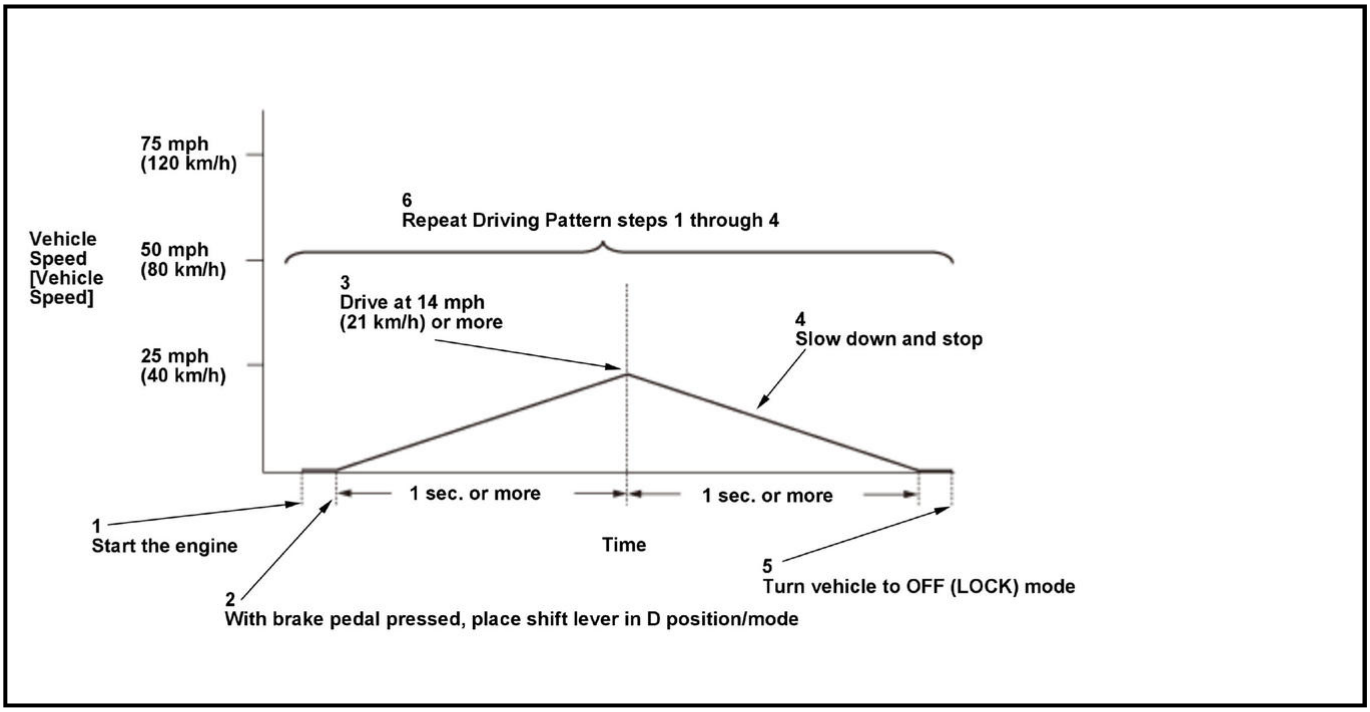
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- SRS unit internal failure (G sensor)

Confirmation Procedure

Operating Condition



- Start the engine.
- With the brake pedal pressed, place the shift lever in D position/mode.
- Drive the vehicle at a speed of 14 mph (21 km/h) or more. (Accelerate for at least 1 second.)
- Release the accelerator pedal, and slow down the vehicle. (Take at least 1 second to decelerate to more than 4 mph (5 km/h).)
- Turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 4.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, a Confirmed DTC and the freeze data are stored. The MIL does not come on and the shift position indicator does not blink.

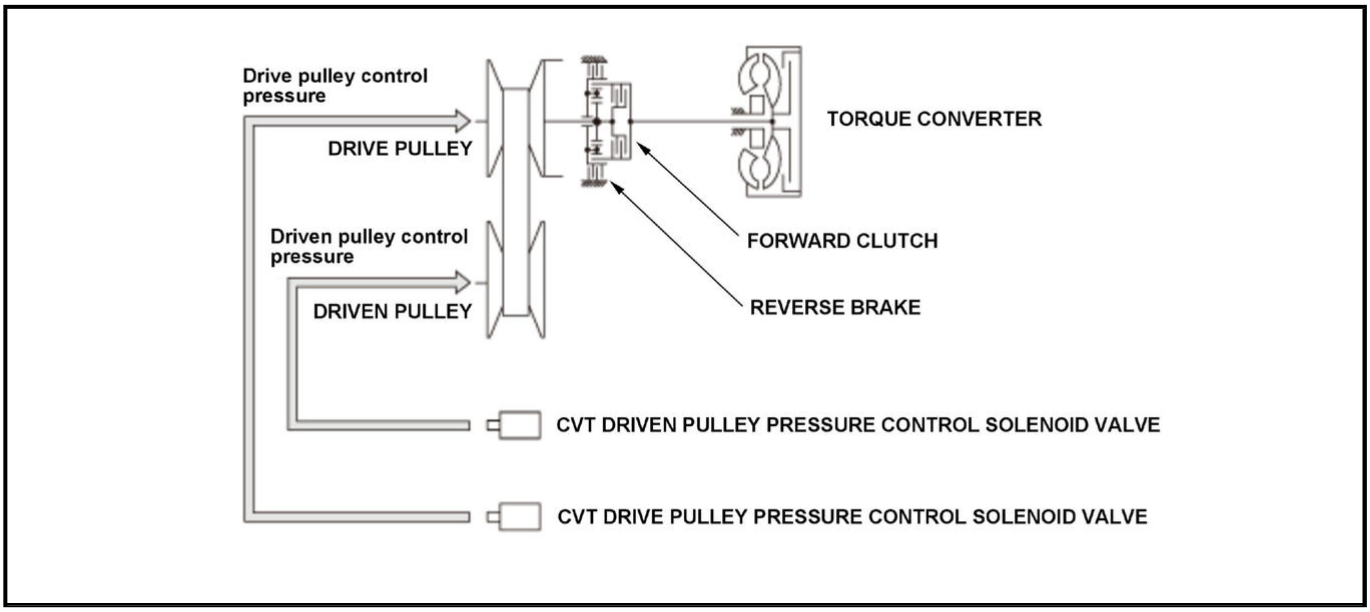
Conditions for clearing the DTC

The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P1890 (CVT (TCM))

DTC P1890: CVT Speed Control System

General Description



Drive pulley control pressure
DRIVE PULLEY
Driven pulley control pressure
DRIVEN PULLEY
TORQUE CONVERTER
FORWARD CLUTCH
REVERSE BRAKE
CVT DRIVEN PULLEY PRESSURE CONTROL SOLENOID VALVE
CVT DRIVE PULLEY PRESSURE CONTROL SOLENOID VALVE

The shift control system controls each gear position using a map stored in the transmission control module (TCM) memory. The shift control system controls the CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve based on vehicle speed and the throttle position to keep the drive pulley speed close to the target rpm. It does this by varying the hydraulic pressure applied to the drive and driven pulleys and providing feedback on the difference between the target drive pulley speed and the actual drive pulley speed when driving. It supplies high hydraulic pressure to the driven pulley and enlarges the driven pulley belt diameter when shifting to a lower ratio. It supplies high hydraulic pressure to the drive pulley and enlarges the drive pulley belt diameter when shifting to a higher ratio. If the difference between the target drive pulley speed and the actual drive pulley speed falls within a certain range when in D, S, L, or R position/mode, the TCM detects a malfunction in the CVT shift function and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	18 seconds or more
DTC Type	One drive cycle, MIL off, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Drive pulley speed [Input Shaft (Drive Pulley) Speed rpm]	576 rpm	-
Vehicle speed [Vehicle Speed]	9 mph (14 km/h)	-
Accelerator pedal position	4.7 deg.	-
Shift lever position/mode	D, S, L, R	

[ ]: HDS Parameter

Malfunction Threshold

The difference between the target drive pulley speed and the actual drive pulley speed [Input Shaft (Drive Pulley) Speed rpm] is 500 rpm or more for at least 18 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT shift function failure

Confirmation Procedure

Operating Condition

- Start the engine.
- Accelerate gradually to 37 mph (60 km/h) and drive at least 1 minute at 37 mph (60 km/h).

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the shift position indicator blinks and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory. The MIL does not come on.

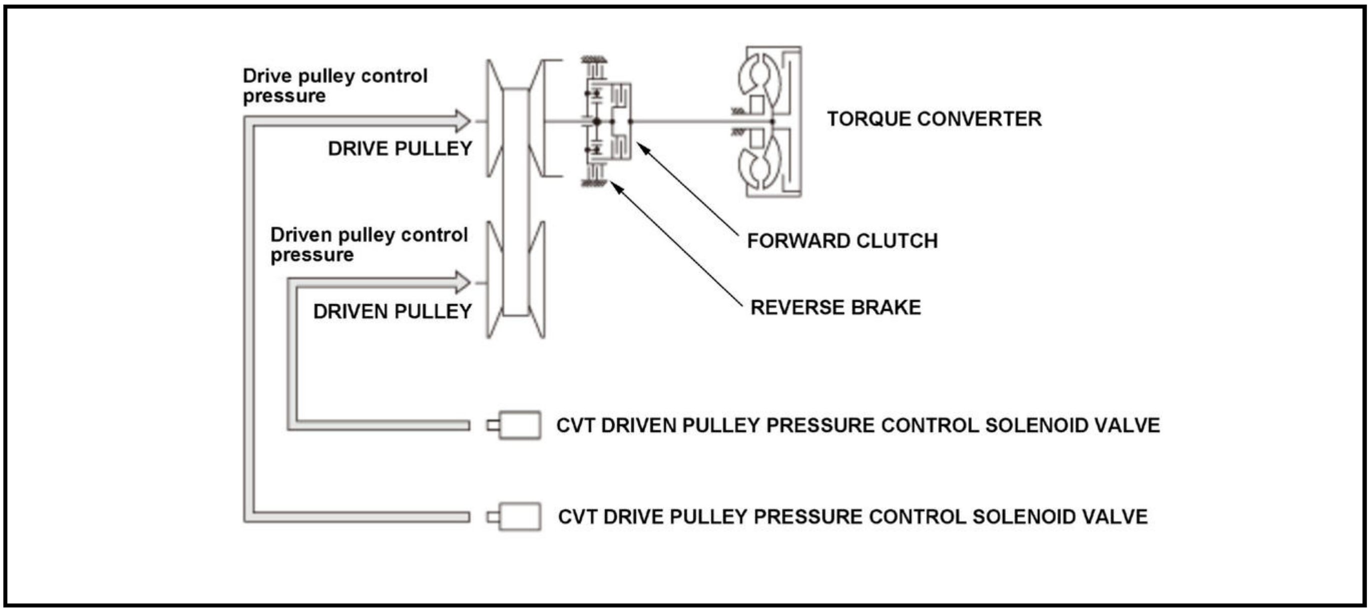
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P1898 (CVT (TCM))

DTC P1898: CVT Drive Pulley Pressure Control Valve Stuck ON or CVT Driven Pulley Pressure Control Valve Stuck OFF

General Description



Drive pulley control pressure
DRIVE PULLEY
TORQUE CONVERTER
FORWARD CLUTCH
Driven pulley control pressure
DRIVEN PULLEY
REVERSE BRAKE
CVT DRIVEN PULLEY PRESSURE CONTROL SOLENOID VALVE
CVT DRIVE PULLEY PRESSURE CONTROL SOLENOID VALVE

The CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve control hydraulic pressure. The CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve are controlled by duty cycle output. The spool in the CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve moves the valve according to the current, and produces hydraulic pressure in proportion to the current. The transmission control module (TCM) measures the current that passes through the CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve and uses feedback control to compensate for the difference between the measured current and the commanded one. To shift the transmission properly, the TCM outputs a drive/driven pulley hydraulic pressure control signal. If the pulley ratio is out of specified range from the vehicle stopped with the forward clutch engaged to the vehicle running, the TCM detects a CVT drive pulley pressure control solenoid valve stuck ON failure or a CVT driven pulley pressure control solenoid valve stuck OFF and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Accelerate with wide open throttle
3
Slow down and stop
5
Slow down and stop
Time
1
Start the engine
6
Turn vehicle to OFF (LOCK) mode

- Start the engine.
- Accelerate the vehicle in D position/mode until the speed reaches 37 mph (60 km/h).
- Slow down and stop the vehicle.
- Accelerate the vehicle with wide open throttle.
- Slow down and stop the vehicle.
- Turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 5.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on, the shift position indicator blinks, and a Confirmed DTC and the freeze data are stored.

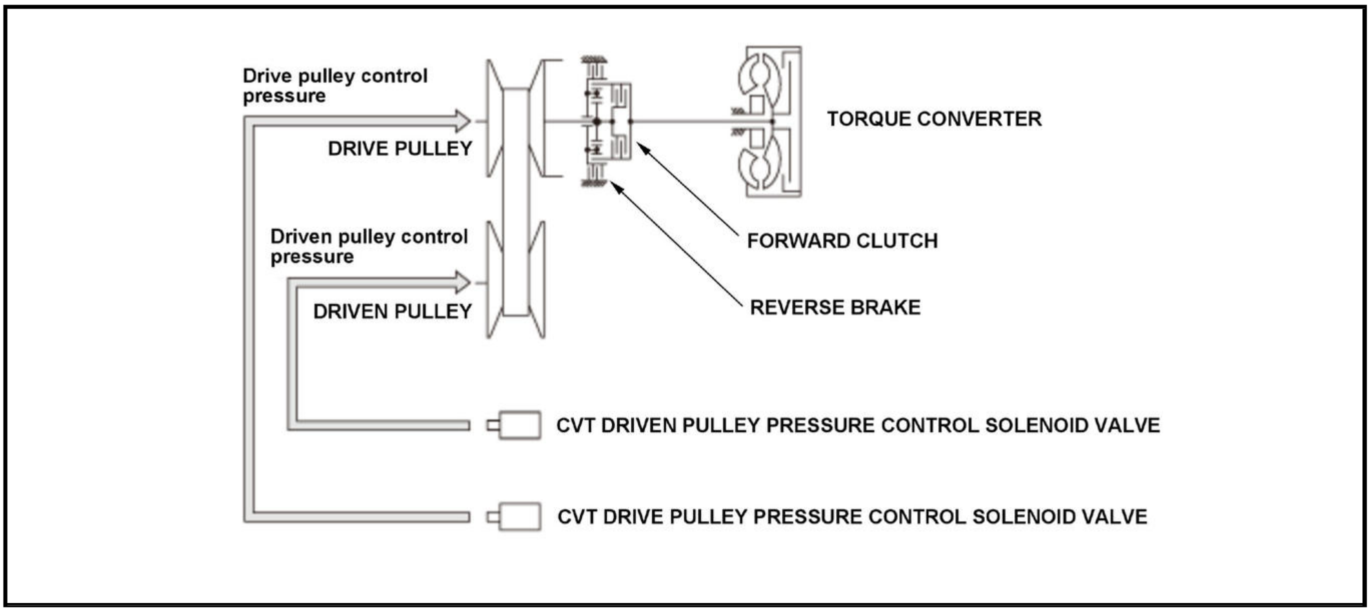
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

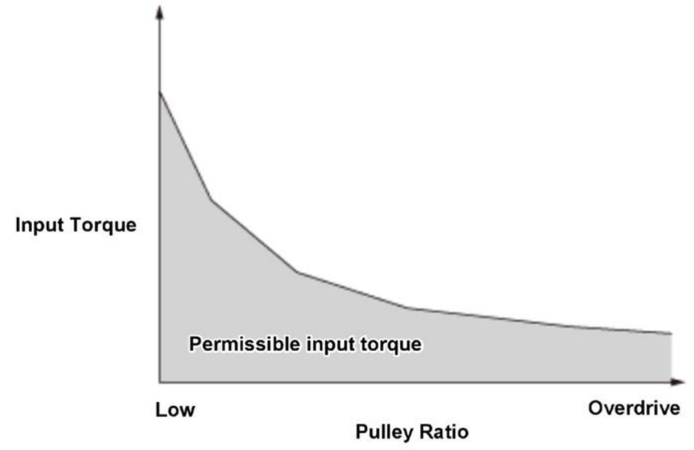
DTC P1899 (CVT (TCM))

DTC P1899: CVT Drive Pulley Pressure Control Valve Stuck OFF or CVT Driven Pulley Pressure Control Valve Stuck ON

General Description



Drive pulley control pressure
DRIVE PULLEY
Driven pulley control pressure
DRIVEN PULLEY
TORQUE CONVERTER
FORWARD CLUTCH
REVERSE BRAKE
CVT DRIVEN PULLEY PRESSURE CONTROL SOLENOID VALVE
CVT DRIVE PULLEY PRESSURE CONTROL SOLENOID VALVE



The CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve control hydraulic pressure. The CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve are controlled by duty cycle output. The spool in the CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve moves the valve according to the current, and produces hydraulic pressure in proportion to the current. The transmission control module (TCM) measures the current that passes through the CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve and uses feedback control to compensate for the difference between the measured current and the commanded one. To shift the transmission properly, the TCM outputs a drive/driven pulley hydraulic pressure control signal. If the pulley ratio is overdrive while the vehicle is stopped with the forward clutch engaged, and the estimated input torque when starting is a specified value or less and belt slippage does not occur when driving, the TCM detects a CVT drive pulley pressure control solenoid valve stuck OFF failure or a CVT driven pulley pressure control solenoid valve stuck ON and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

Symptom		Vehicle conditions	TCM detection
1		Stopped with forward clutch engaged	Pulley ratio [Pulley Ratio] is more than 0.3, or less than 0.6 for at least 2.5 seconds
2	2-A	Starting	Low input torque
	2-B	Running	Pulley ratio [Pulley Ratio] is more than 3.0

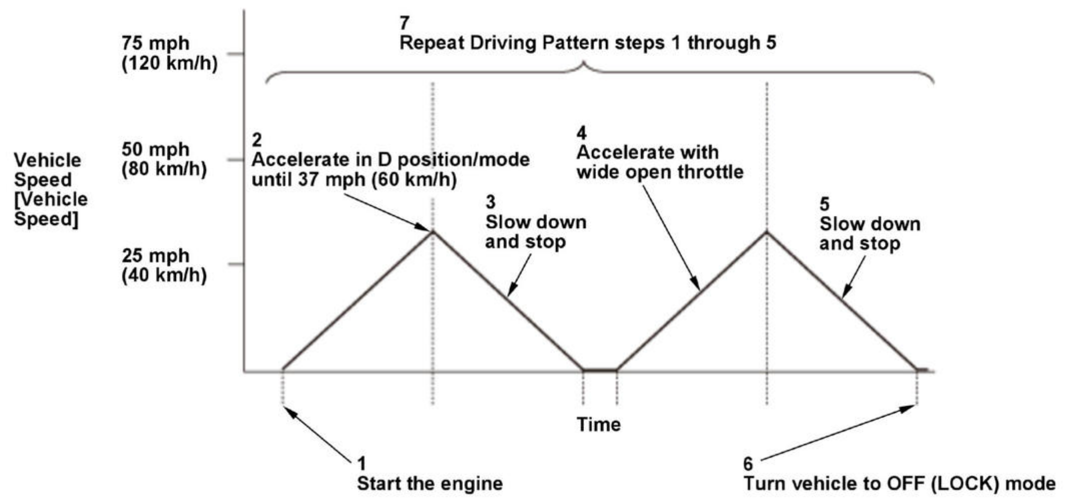
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT drive pulley pressure control solenoid valve stuck off
- CVT driven pulley pressure control solenoid valve stuck on

Confirmation Procedure

Operating Condition



- Start the engine.
- Accelerate the vehicle in D position/mode until the speed reaches 37 mph (60 km/h).
- Slow down and stop the vehicle.
- Accelerate the vehicle with wide open throttle.
- Slow down and stop the vehicle.
- Turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 5.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on, the shift position indicator blinks, and a Confirmed DTC and the freeze data are stored.

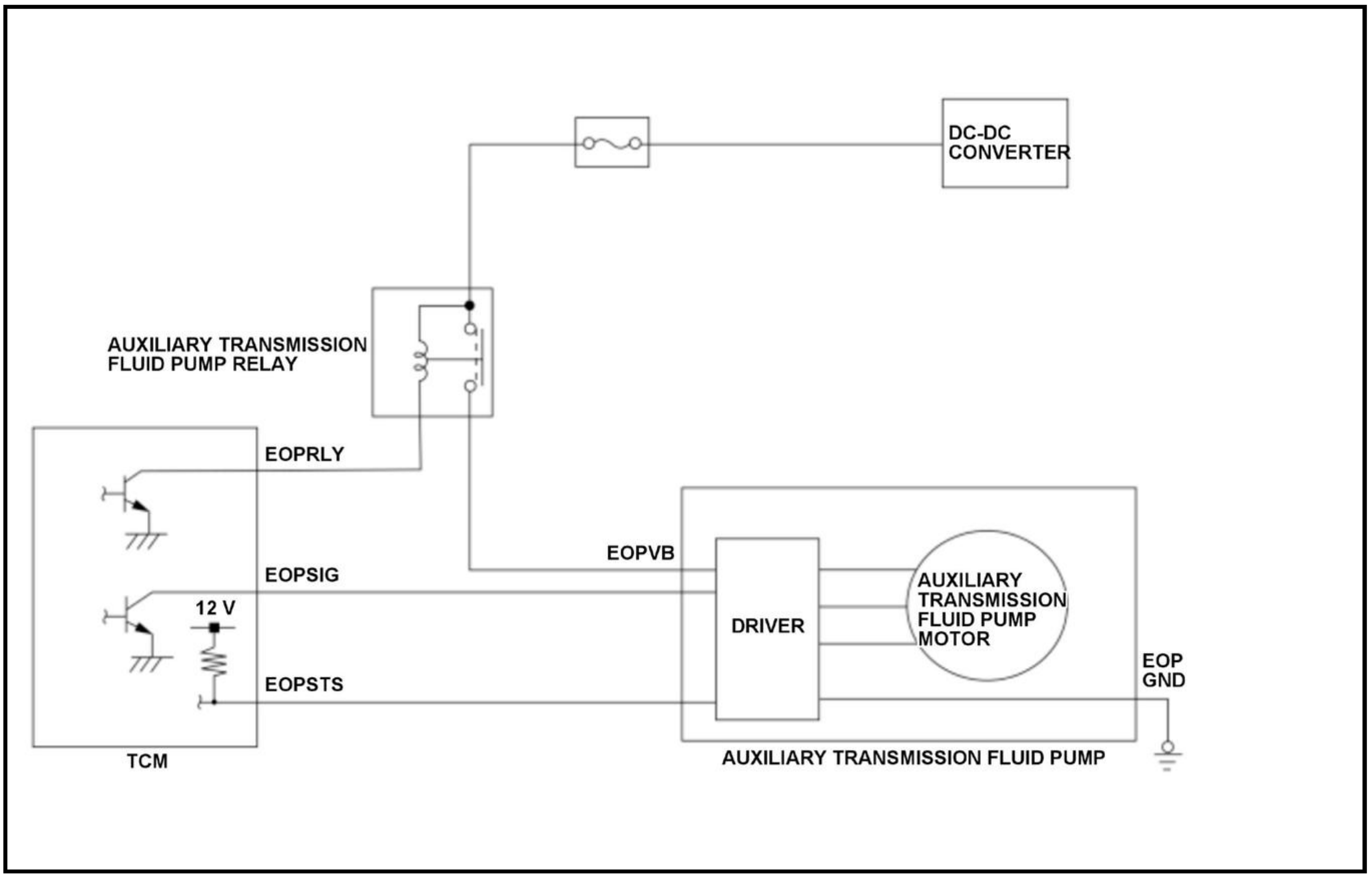
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P1900 (CVT (TCM)) (2020 2021)

DTC P1900: EOP-RELAY High Input

General Description



DC-DC CONVERTER
AUXILIARY TRANSMISSION FLUID PUMP RELAY
EOPRLY
EOPSIG
12 V
EOPSTS
TCM
EOPVB
DRIVER
AUXILIARY TRANSMISSION FLUID PUMP MOTOR
EOP GND
AUXILIARY TRANSMISSION FLUID PUMP

The auxiliary transmission fluid pump provides hydraulic pressure to control the CVT instead of the transmission fluid pump that would stop at auto idle stop. The auxiliary transmission fluid pump system consists of the three-phase brushless motor (to drive the fluid pump), the driver, and the auxiliary transmission fluid pump relay. The power source that drives the auxiliary transmission fluid pump is provided from the DC-DC converter via the auxiliary transmission fluid pump relay that is controlled by the transmission control module (TCM). The TCM and the auxiliary transmission fluid pump are connected by two communication lines (EOPSIG, EOPSTS). The TCM sends a start command (90 % duty ratio) or a stop command (5 % duty ratio) to the auxiliary transmission fluid pump by pulse width modulation (PWM) (100 Hz). In accordance to the start (or stop) command from the TCM, the auxiliary transmission fluid pump starts (or stops) the auxiliary transmission fluid pump motor. The auxiliary transmission fluid pump sends its motor speed data to the TCM using the pulse. The auxiliary transmission fluid pump motor rotates at a motor speed of 1, 000 - 5, 000 min-1 (rpm) which varies depending on transmission fluid temperature. The motor speed could be obtained from the product of 30 times pulse frequency (Hz) (ex. 3, 000 min-1 (rpm) when 100 Hz). Just after the vehicle is turned to the ON mode, the auxiliary transmission fluid pump relay is OFF and the output line EOPSTS is HIGH. And then, the auxiliary transmission fluid pump relay turns to ON and the output line EOPSTS turns to LOW. If the auxiliary transmission fluid pump motor speed is at normal speed range for certain period of time when the auxiliary transmission fluid pump relay is ON (EOPSTS: LOW) just after the vehicle is turned to the ON mode, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL off, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	10 V	-
State of the engine	During auto idle stop operation	

[ ]: HDS Parameter

Malfunction Threshold

The auxiliary transmission fluid pump motor speed is 301 - 8, 737 min-1 (rpm) for at least 5 seconds when the auxiliary transmission fluid pump relay is ON (EOPSTS: LOW) just after the vehicle is turned to the ON mode.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- TCM EOPRLY line short to ground
- Auxiliary transmission fluid pump EOPVB line short to power
- Auxiliary transmission fluid pump relay stuck on
- TCM internal failure

Confirmation Procedure

Operating Condition

- Turn the vehicle to the ON mode, and wait for at least 5 seconds.
- Start the engine and wait for at least 5 seconds in auto idle stop condition.

With the HDS

- Turn the vehicle to the ON mode, and wait for at least 5 seconds.
- Select the Auxiliary Transmission Fluid Pump Test in the Miscellaneous Test Menu, and drive the auxiliary transmission fluid pump for at least 5 seconds with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

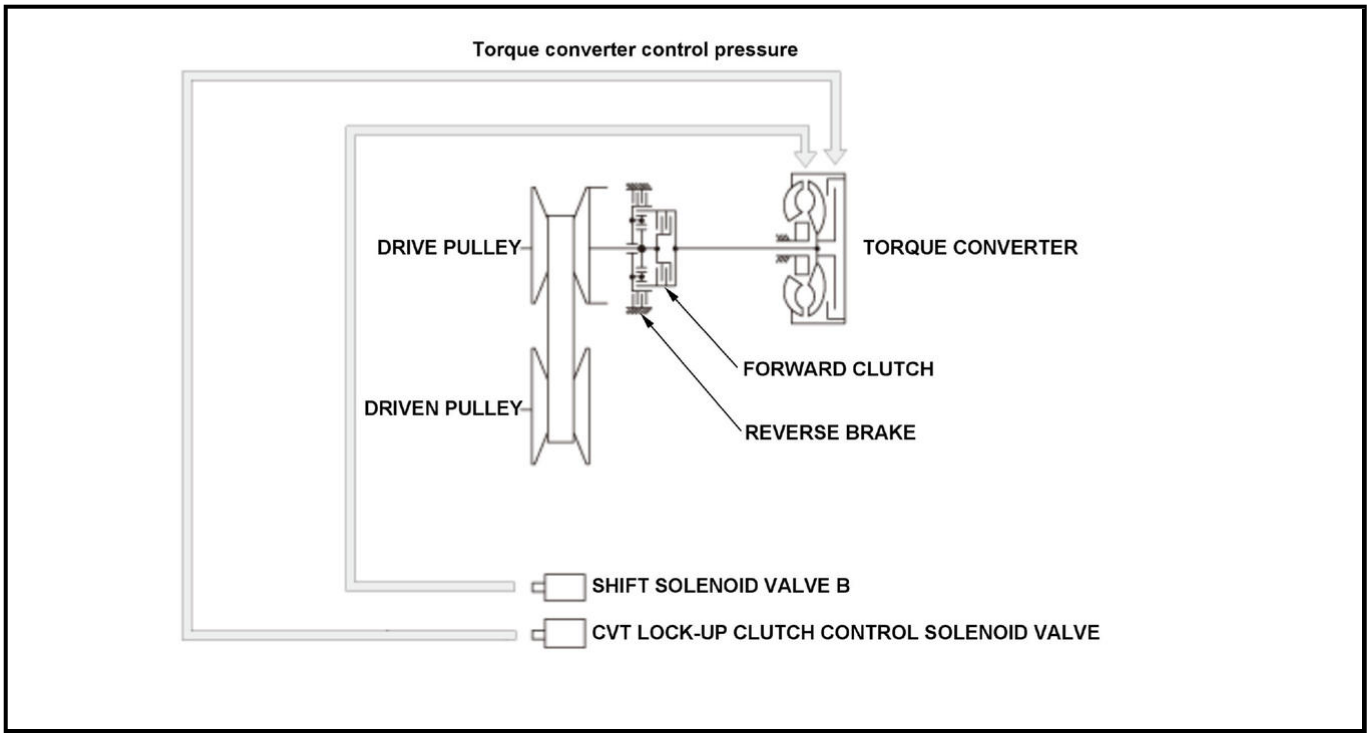
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P2715 (CVT (TCM))

DTC P2715: Pressure Control Solenoid D Stuck On

General Description



Torque converter control pressure
DRIVE PULLEY
TORQUE CONVERTER
FORWARD CLUTCH
DRIVEN PULLEY
REVERSE BRAKE
SHIFT SOLENOID VALVE B
CVT LOCK-UP CLUTCH CONTROL SOLENOID VALVE

The CVT lock-up clutch control solenoid valve controls hydraulic pressure to the torque converter clutch. The CVT lock-up clutch control solenoid valve is controlled by duty cycle output. The spool in the CVT lock-up clutch control solenoid valve moves the valve according to the current, and produces hydraulic pressure in proportion to the current. To supply proper torque converter clutch hydraulic pressure, the transmission control module (TCM) outputs a CVT lock-up clutch control solenoid valve hydraulic pressure control signal. If the torque converter clutch is judged as stuck ON, the TCM detects a CVT lock-up clutch control solenoid valve stuck ON malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	Depending on the driving conditions
DTC Type	Two drive cycles, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	500 rpm	-
Vehicle speed [Vehicle Speed]*	-	13 mph (21 km/h)
Acceleration**	-	3.2 ft/s 2 (0.98 m/s 2)

** : Symptom 2

[ ]: HDS Parameter

Malfunction Threshold

Symptom 2 occurs after Symptom 1 occurs.

- Symptom 1: Actual torque converter slip rate [ETR] is more than 99 %, or less than 130 % for at least 0.6 second when target torque converter slip rate is less than 97 %.
- Symptom 2: Actual torque converter slip rate [ETR] is more than 99 %, or less than 130 % for at least 1 second.

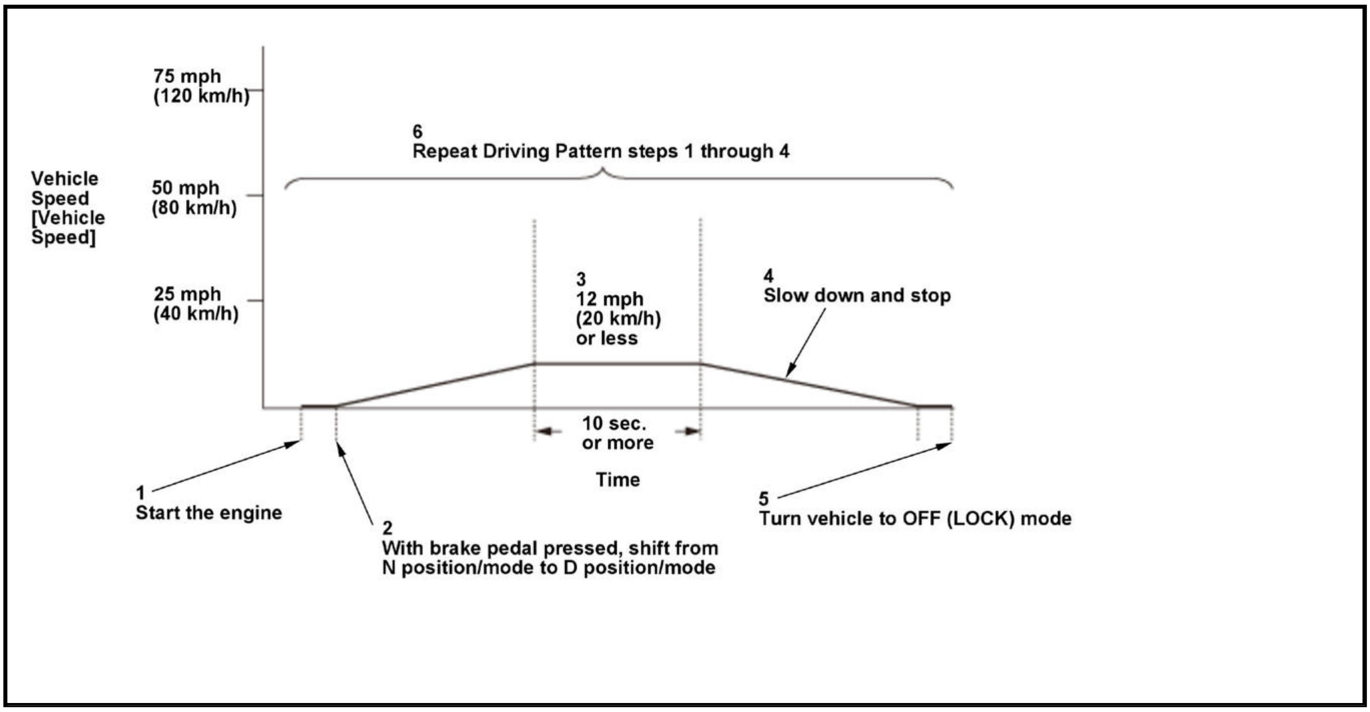
Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- CVT lock-up clutch control solenoid valve stuck on

Confirmation Procedure

Operating Condition



- Start the engine.
- With the brake pedal pressed, place the shift lever in from N position/mode to D position/mode.
- Drive the vehicle at 12 mph (20 km/h) or less for at least 10 seconds.
- Slow down and stop the vehicle.
- Turn the vehicle to the OFF (LOCK) mode.
- Repeat Driving Pattern steps 1 through 4.

- Drive the vehicle in this manner only if the traffic regulations and ambient conditions allow.

With the HDS

None.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on, the shift position indicator blinks, and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P2720 (CVT (TCM))

DTC P2720: Pressure Control Solenoid D Control Circuit Low

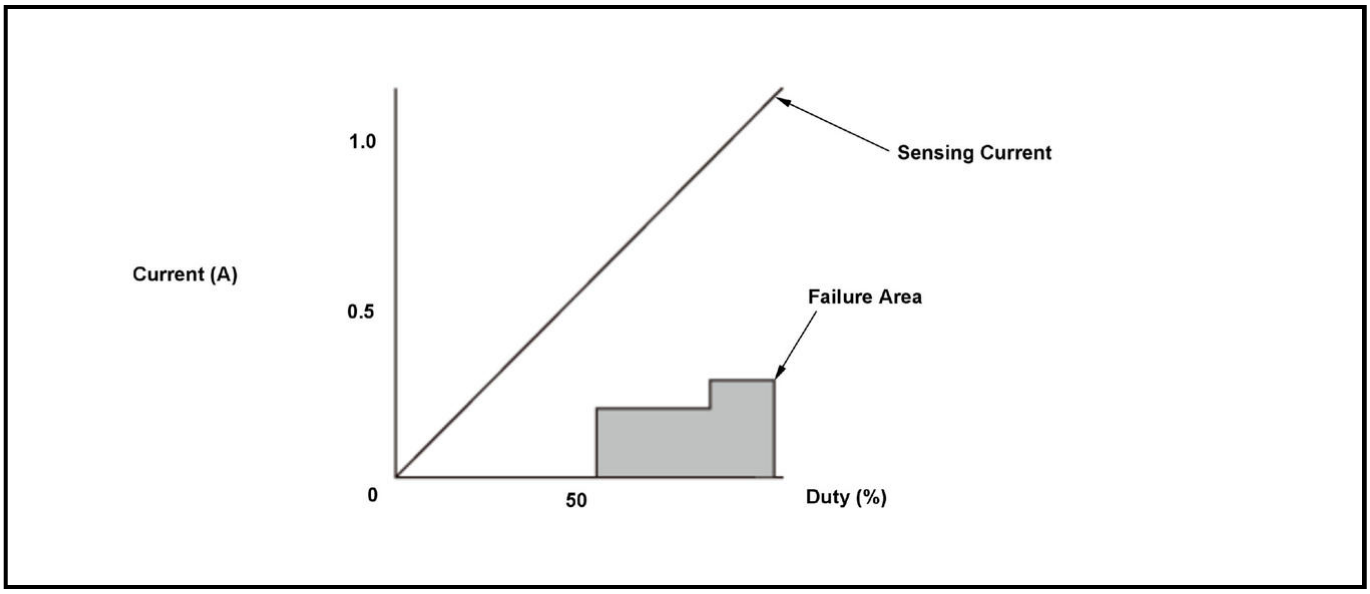
Serial communication
CURRENT DETECTION CIRCUIT
TCM
LCCLS
CVT LOCK-UP CLUTCH CONTROL SOLENOID VALVE



The CVT lock-up clutch control solenoid valve controls hydraulic pressure to the torque converter clutch. The CVT lock-up clutch control solenoid valve is controlled by duty cycle output. The spool in the CVT lock-up clutch control solenoid valve moves the valve according to the current, and produces hydraulic pressure in proportion to the current. The transmission control module (TCM) measures the current that passes through the CVT lock-up clutch control solenoid valve and uses feedback control to compensate for the difference between the measured current and the commanded one. The failure occurs by an open circuit or an intermittent open circuit. If the TCM internal driver IC detects its abnormal or the measured current is not equal to the duty cycle command, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

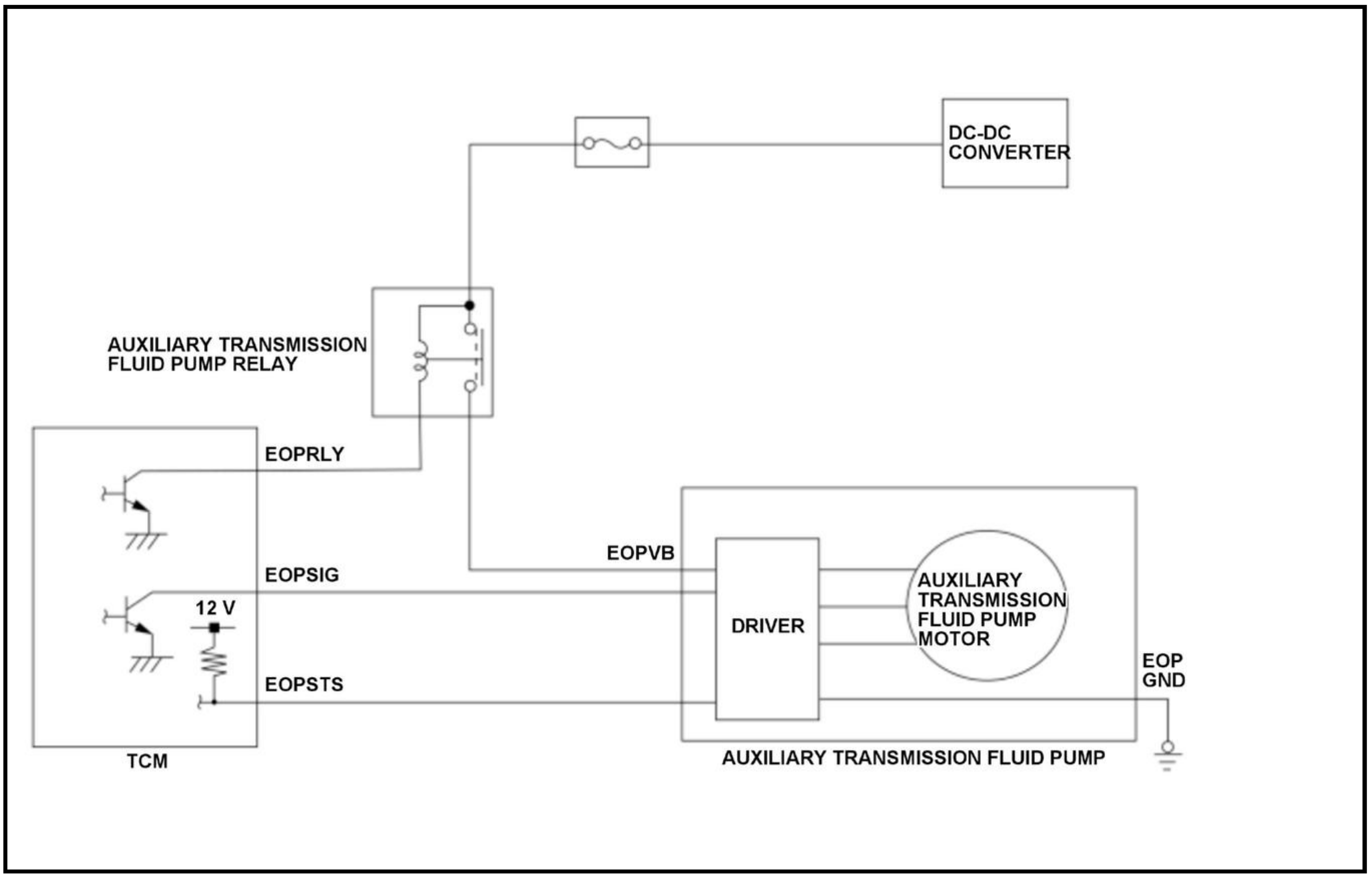
DTC P2797 (CVT (TCM)) (2020 2021)

DTC P2797: Auxiliary Transmission Fluid Pump Performance

General Description



DC-DC CONVERTER
AUXILIARY TRANSMISSION FLUID PUMP RELAY
EOPRLY
EOPSIG
12 V
EOPSTS
TCM
EOPVB
DRIVER
AUXILIARY TRANSMISSION FLUID PUMP MOTOR
EOP GND
AUXILIARY TRANSMISSION FLUID PUMP

The auxiliary transmission fluid pump provides hydraulic pressure to control the CVT instead of the transmission fluid pump that would stop at auto idle stop. The auxiliary transmission fluid pump system consists of the three-phase brushless motor (to drive the fluid pump), the driver, and the auxiliary transmission fluid pump relay. The power source that drives the auxiliary transmission fluid pump is provided from the DC-DC converter via the auxiliary transmission fluid pump relay that is controlled by the transmission control module (TCM). The TCM and the auxiliary transmission fluid pump are connected by two communication lines (EOPSIG, EOPSTS). The TCM sends a start command (90 % duty ratio) or a stop command (5 % duty ratio) to the auxiliary transmission fluid pump by pulse width modulation (PWM) (100 Hz). In accordance to the start (or stop) command from the TCM, the auxiliary transmission fluid pump starts (or stops) the auxiliary transmission fluid pump motor. The auxiliary transmission fluid pump sends its motor speed data to the TCM using the pulse. The auxiliary transmission fluid pump motor rotates at a motor speed of 1, 000 - 5, 000 min-1 (rpm) which varies depending on transmission fluid temperature. The motor speed could be obtained from the product of 30 times pulse frequency (Hz) (ex. 3, 000 min-1 (rpm) when 100 Hz). If the auxiliary transmission fluid pump motor speed is a specified speed for certain period of time when the TCM sends a start command (100 Hz, 90 % duty ratio), the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL off, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	10 V	-
State of the engine	During auto idle stop operation	

[ ]: HDS Parameter

Malfunction Threshold

The auxiliary transmission fluid pump motor speed is 8, 737 min-1 (rpm) or more for at least 5 seconds when the TCM sends a start command (100 Hz, 90 % duty ratio).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Auxiliary transmission fluid pump EOPSIG line electrical noise overlapped
- Auxiliary transmission fluid pump EOPSTS line electrical noise overlapped
- DC-DC converter power supply abnormal
- Auxiliary transmission fluid pump failure
- TCM internal circuit failure

Confirmation Procedure

Operating Condition

Start the engine and wait for at least 5 seconds in auto idle stop condition.

With the HDS

- Turn the vehicle to the ON mode.
- Select the Auxiliary Transmission Fluid Pump Test in the Miscellaneous Test Menu, and drive the auxiliary transmission fluid pump for at least 5 seconds with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P2817 (CVT (TCM))

DTC P2817: Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck Off

General Description

REVERSE BRAKE
CVT DRIVEN PULLEY PRESSURE SENSOR
SHIFT SOLENOID VALVE O/P
TCM
TRANSMISSION FLUID PUMP

Transmission fluid pump volume changes by shift solenoid valve O/P ON/OFF control

Transmission fluid pump volume	Shift Solenoid Valve O/P
High	OFF
Low	ON

The shift solenoid valve O/P controls the drain circuit close/open commanded by the transmission control module (TCM) ON/OFF commands. The transmission fluid pump volume is changed by switching the shift solenoid valve O/P ON/OFF control. The TCM commands the driver circuit to turn on the shift solenoid valve O/P. The TCM temporarily increases the driven pulley pressure up to target value. As the commanded driven pulley pressure reaches the target value, the TCM monitors the driven pulley pressure when the shift solenoid valve O/P is ON and OFF. If the driven pulley pressure does not change, the TCM detects a shift solenoid valve O/P stuck OFF malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Once per driving cycle
Sequence	None
Duration	10 seconds or less
DTC Type	Two drive cycles, MIL off, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
Engine speed [Engine Speed]	700 rpm	750 rpm

[ ]: HDS Parameter

VSA MODULATOR-CONTROL UNIT
BRAKE SYSTEM CONTROL MODULE

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (F-CAN A_H and F-CAN A_L). When the information is not sent from the powertrain control module (PCM) via the F-CAN lines and this condition continues for a specified time or when the information sent from the PCM is abnormal and this condition continues for a specified cycle, the transmission control module (TCM) detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.5 seconds or more
DTC Type	One drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	10.0 V	-

[ ]: HDS Parameter

Malfunction Threshold

One of these conditions is met:

- The TCM does not receive any signals from the PCM via F-CAN lines for at least 1.5 seconds.
- The information sent from the PCM is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCM failure (include fuse fall-outs)
- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- TCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC U0122 (CVT (TCM))

DTC U0122: Lost Communication With Vehicle Dynamics Control Module

General Description

One of these conditions is met:

- The TCM does not receive any signals from the gauge control module via F-CAN lines for at least 1.5 seconds.
- The information sent from the gauge control module is abnormal at least 20 times.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Gauge control module failure (include fuse fall-outs)
- F-CAN circuit F-CAN A_H line open
- F-CAN circuit F-CAN A_L line open
- F-CAN circuit F-CAN A_H line short to ground
- F-CAN circuit F-CAN A_L line short to ground
- F-CAN circuit F-CAN B_H line open
- F-CAN circuit F-CAN B_L line open
- F-CAN circuit F-CAN B_H line short to ground
- F-CAN circuit F-CAN B_L line short to ground
- TCM internal circuit failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

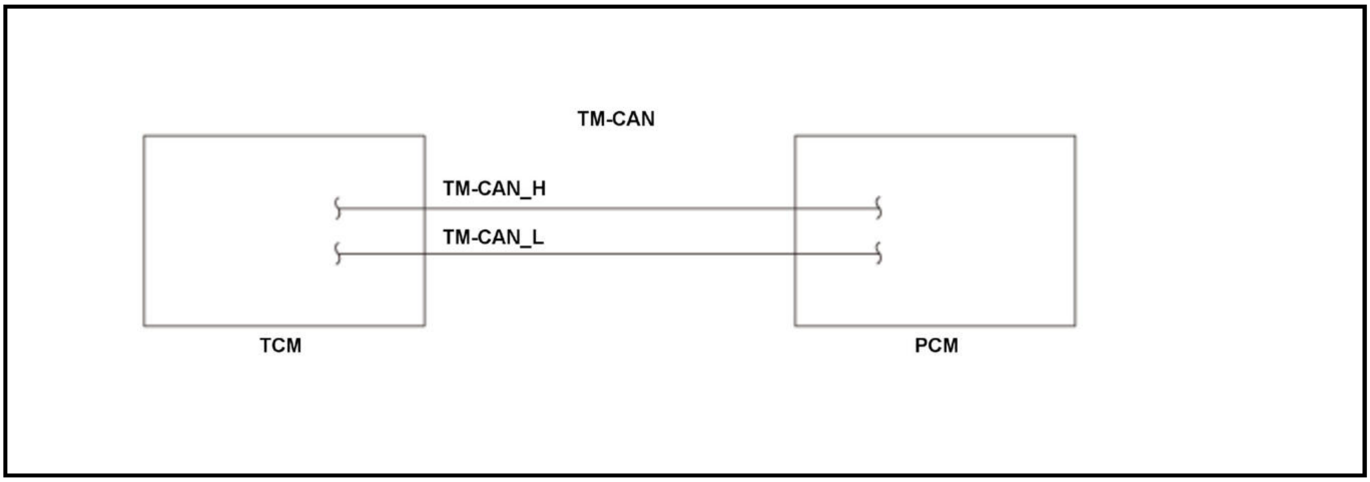
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC U0302 (CVT (TCM))

DTC U0302: PGM-FI System and A/T System Program Version Mismatch

General Description



The transmission control module (TCM) and the powertrain control module (PCM) uses communication line (TM-CAN_H and TM-CAN_L) to transmit/receive multiple signals simultaneously. When the software version in the TCM and software version sent from the PCM via the TM-CAN lines are mismatched (software version of the TCM is old compared to the PCM) for a set time, the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

Duration	1 second or more
DTC Type	One drive cycle, MIL on, Shift position indicator blinks

Enable Conditions

Condition	B
Vehicle	ON mode

Malfunction Threshold

The software version in the TCM and software version sent from the PCM via the TM-CAN lines are mismatched (software version of the TCM is old compared to the PCM) for at least 1 second.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Software version of the TCM is old compared to the PCM

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on, the shift position indicator blinks, and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the TCM memory.

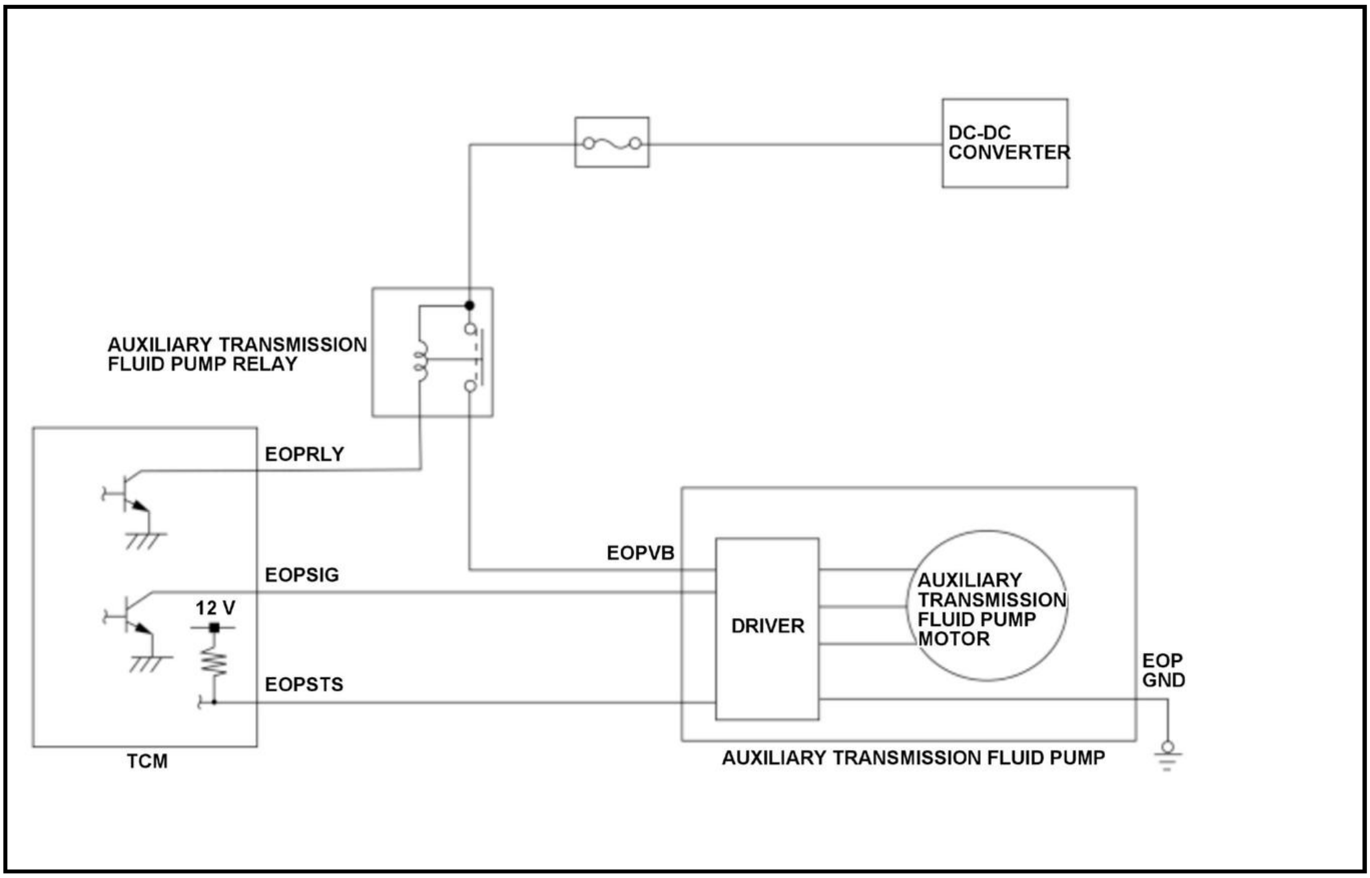
Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC U1260 (CVT (TCM)) (2020 2021)

DTC U1260: Lost Communication With Auxiliary Transmission Fluid Pump

General Description



DC-DC CONVERTER
AUXILIARY TRANSMISSION FLUID PUMP RELAY
EOPRLY
EOPSIG
12 V
EOPSTS
TCM
EOPVB
DRIVER
AUXILIARY TRANSMISSION FLUID PUMP MOTOR
EOP GND
AUXILIARY TRANSMISSION FLUID PUMP

The auxiliary transmission fluid pump provides hydraulic pressure to control the CVT instead of the transmission fluid pump that would stop at auto idle stop. The auxiliary transmission fluid pump system consists of the three-phase brushless motor (to drive the fluid pump), the driver, and the auxiliary transmission fluid pump relay. The power source that drives the auxiliary transmission fluid pump is provided from the DC-DC converter via the auxiliary transmission fluid pump relay that is controlled by the transmission control module (TCM). The TCM and the auxiliary transmission fluid pump are connected by two communication lines (EOPSIG, EOPSTS). The TCM sends a start command (90 % duty ratio) or a stop command (5 % duty ratio) to the auxiliary transmission fluid pump by pulse width modulation (PWM) (100 Hz). In accordance to the start (or stop) command from the TCM, the auxiliary transmission fluid pump starts (or stops) the auxiliary transmission fluid pump motor. The auxiliary transmission fluid pump sends its motor speed data to the TCM using the pulse. The auxiliary transmission fluid pump motor rotates at a motor speed of 1, 000 - 5, 000 min-1 (rpm) which varies depending on transmission fluid temperature. The motor speed could be obtained from the product of 30 times pulse frequency (Hz) (ex. 3, 000 min-1 (rpm) when 100 Hz). If the auxiliary transmission fluid pump motor speed is a specified speed for certain period of time when the TCM sends a start command (100 Hz, 90 % duty ratio), the TCM detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5 seconds or more
DTC Type	Two drive cycles, MIL off, Shift position indicator blinks

Enable Conditions

Condition	Minimum	Maximum
12 volt battery voltage [Battery Voltage]	10 V	-
State of the engine	During auto idle stop operation	

[ ]: HDS Parameter

Malfunction Threshold

The auxiliary transmission fluid pump motor speed is 301 min-1 (rpm) or less for at least 5 seconds when the TCM sends a start command (100 Hz, 90 % duty ratio).

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Auxiliary transmission fluid pump EOPSTS line open
- Auxiliary transmission fluid pump EOPSIG line open
- Auxiliary transmission fluid pump EOPSTS line short to ground
- Auxiliary transmission fluid pump EOPSIG line short to ground
- Auxiliary transmission fluid pump EOPSTS line electrical noise overlapped
- Auxiliary transmission fluid pump EOPSIG line electrical noise overlapped
- Auxiliary transmission fluid pump EOPGND line open
- Auxiliary transmission fluid pump EOPVB line open
- TCM EOPRLY line open
- Auxiliary transmission fluid pump relay stuck off
- DC-DC converter power supply abnormal
- Auxiliary transmission fluid pump failure
- TCM internal circuit failure

Confirmation Procedure

Operating Condition

Start the engine and wait for at least 5 seconds in auto idle stop condition.

With the HDS

- Turn the vehicle to the ON mode.
- Select the Auxiliary Transmission Fluid Pump Test in the Miscellaneous Test Menu, and drive the auxiliary transmission fluid pump for at least 5 seconds with the HDS.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the TCM memory. If the malfunction returns in the next (second) drive cycle, the shift position indicator blinks and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The shift position indicator comes off by turning the vehicle to the OFF (LOCK) mode. The Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

TROUBLESHOOTING

DTC TROUBLESHOOTING: P0501(CVT (TCM))

DTC P0501 : CVT Speed Sensor Circuit Range/Performance

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0501 CVT Speed Sensor Circuit Range/Performance	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

   -4. **Enter the VSA maintenance mode** .

   -5. Run the vehicle with the shift lever in D position/mode, and the engine speed at 1, 000 rpm or higher, then release the accelerator pedal without pressing it again, for at least 4 seconds. Slow down and stop the wheels.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0501 CVT Speed Sensor Circuit Range/Performance	B	B	B

   Is DTC P0501 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the CVT speed sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CVT speed sensor installation check

-1. Check for poor connections and loose terminals between the CVT speed sensor and the TCM, and check for proper installation of the CVT speed sensor.

Are the connection and installation OK?

YES

Connection and installation are OK. **Replace the CVT speed sensor** .

NO

Repair faulty connection or installation.

DTC TROUBLESHOOTING: P0502(CVT (TCM))

DTC P0502 : CVT Speed Sensor Circuit Open/Short

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0502 CVT Speed Sensor Circuit Open/Short	B	B	B

DTC(CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-4. **Enter the VSA maintenance mode** .

-5. Run the vehicle with the shift lever in D position/mode, and the engine speed at 1, 000 rpm or higher, then release the accelerator pedal without pressing it again, for at least 4 seconds. Slow down and stop the wheels.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0502 CVT Speed Sensor Circuit Open/Short	B	B	B

Is DTC P0502 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the CVT speed sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (VCC3 line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

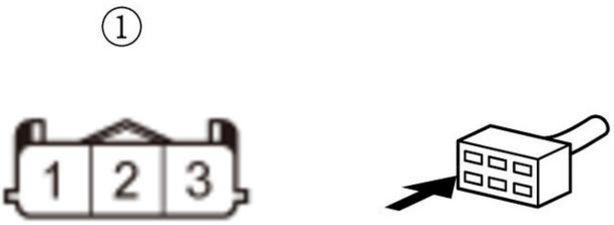
-2. Disconnect the following connector.

CVT speed sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT speed sensor 3P connector: disconnected
Test point 1	CVT speed sensor 3P connector (female terminals) No. 3 : ①
Test point 2	Body ground



Is there about 5 V?

YES

Go to step 4.

NO

Go to step 3.

3. Open wire check (VCC3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM from damage.

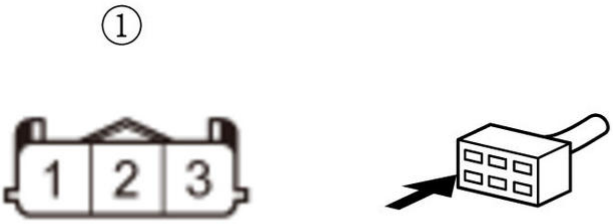
-3. Disconnect the following connector.

TCM 50P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT speed sensor 3P connector: disconnected

B	TCM 50P connector: disconnected
Test point 1	CVT speed sensor 3P connector (female terminals) No. 3 : ①
Test point 2	**TCM 50P connector No. 41**



Is there continuity?

YES

The VCC3 wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

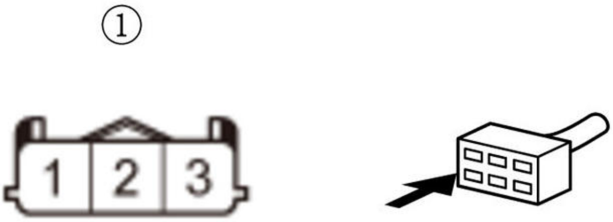
NO

Repair an open in the VCC3 wire between the CVT speed sensor and the TCM.

4. Open wire check (SG3 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT speed sensor 3P connector: disconnected
Test point 1	CVT speed sensor 3P connector (female terminals) No. 2 : ①
Test point 2	CVT speed sensor 3P connector (female terminals) No. 3 : ①



Is there about 5 V?

YES

The SG3 wire is OK. Go to step 5.

NO

Repair an open in the SG3 wire between the CVT speed sensor and the TCM.

5. Shorted wire check (VEL PWM line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

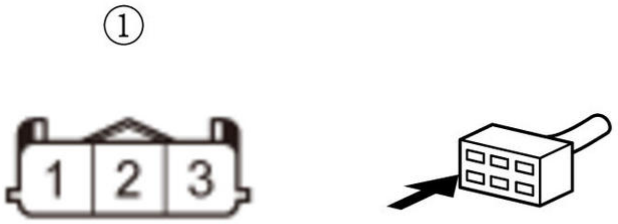
NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT speed sensor 3P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CVT speed sensor 3P connector (female terminals) No. 1 : ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the VEL PWM wire between the CVT speed sensor and the TCM.

NO

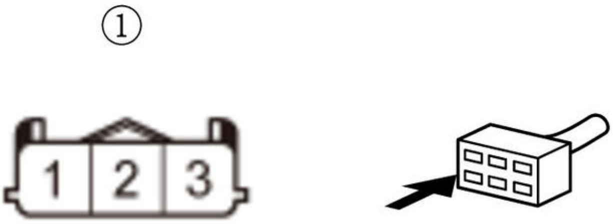
The VEL PWM wire is not shorted. Go to step 6.

6. Open wire check (VEL PWM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT speed sensor 3P connector: disconnected
B	TCM 50P connector: disconnected

Test point 1	CVT speed sensor 3P connector (female terminals) No. 1 : ①
Test point 2	TCM 50P connector No. 22



Is there continuity?

YES

The VEL-PWM wire is OK. Replace the CVT speed sensor .

NO

Repair an open in the VEL PWM wire between the CVT speed sensor and the TCM.

DTC TROUBLESHOOTING: P0600(CVT (TCM))

DTC P0600 : Serial Communication

NOTE:

- Before you troubleshoot, review the General Troubleshooting Information .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0600 Serial Communication	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0600 Serial Communication	B	B	B

Is DTC P0600 indicated?

YES

The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: P0602(CVT (TCM))

DTC P0602 : Boot Mode(Programming Error)

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This DTC is indicated when the TCM update procedure is not completed.
- Do not turn the vehicle to the OFF (LOCK) mode while updating the TCM. If you do, the TCM can be damaged.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0602 Boot Mode(Programming Error)	B	B	B

DTC(CVT)

1. Problem verification (update)

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. **Update the TCM** .

-4. Turn the vehicle to the OFF (LOCK) mode.

-5. Turn the vehicle to the ON mode.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0602 Boot Mode(Programming Error)	B	B	B

Is DTC P0602 indicated?

YES

The failure is duplicated. **Replace the TCM** .

NO

Update is complete.

DTC TROUBLESHOOTING: P062F(CVT (TCM))

DTC P062F : TCM Internal Control Module Error

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P062F TCM Internal Control Module Error	B	B	B

DTC(CVT)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Turn the vehicle to the OFF (LOCK) mode.

    -4. Turn the vehicle to the ON mode.

    -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P062F TCM Internal Control Module Error	B	B	B

    Is DTC P062F indicated?

    YES

    The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

    NO

    Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: P0641(CVT (TCM))

DTC P0641 : Sensor Reference Voltage 1 Circuit Malfunction

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0641 Sensor Reference Voltage 1 Circuit Malfunction	B	B	B

DTC(CVT)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0641 Sensor Reference Voltage 1 Circuit Malfunction	B	B	B

Is DTC P0641 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the TCM and the following parts. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

- CVT drive pulley speed sensor
- CVT driven pulley pressure sensor

2. Determine possible failure area (VCC lines, others)

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Disconnect the following connector.

CVT drive pulley speed sensor 3P connector
CVT driven pulley pressure sensor 3P connector

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0641 Sensor Reference Voltage 1 Circuit Malfunction	B	B	B

Is DTC P0641 indicated?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted part check:

Check for Pending or Confirmed DTCs with the HDS while reconnecting these parts, one at a time:

- CVT drive pulley speed sensor

- CVT driven pulley pressure sensor

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0641 Sensor Reference Voltage 1 Circuit Malfunction	B	B	B

Is DTC P0641 indicated?

YES

Replace the part that caused the DTC when it was reconnected.

NO

Check for poor connections and loose terminals at the TCM and the following parts, then go to step 1.

- CVT drive pulley speed sensor
- CVT driven pulley pressure sensor

4. Shorted wire check (VCC lines to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Check for continuity between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	CVT drive pulley speed sensor 3P connector: disconnected
B	CVT driven pulley pressure sensor 3P connector: disconnected
B	TCM 50P connector: disconnected

Connector	Terminal
TCM 50P connector	No. 17
	No. 18

Is there continuity?

YES

Repair a short to ground in the VCC wire between the TCM and each part that was disconnected in step 2.

NO

Go to step 5.

5. Shorted wire check (VCC lines to power)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between these test points and body ground individually.

Test condition	Vehicle ON mode
B	CVT drive pulley speed sensor 3P connector: disconnected
B	CVT driven pulley pressure sensor 3P connector: disconnected
B	TCM 50P connector: disconnected

Connector	Terminal
TCM 50P connector	No. 17
	No. 18

Is there battery voltage?

YES

Repair a short to power in the VCC wire between the TCM and each part that was disconnected in step 2.

NO

The VCC wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

DTC TROUBLESHOOTING: P0651(CVT (TCM))

DTC P0651 : Sensor Reference Voltage 2 Circuit Malfunc

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0651 Sensor Reference Voltage 2 Circuit Malfunc	B	B	B

DTC(CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0651 Sensor Reference Voltage 2 Circuit Malfunc	B	B	B

Is DTC P0651 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the TCM and the following parts. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

- CVT speed sensor
- Torque converter turbine speed sensor

2. Determine possible failure area (VCC lines, others)

-1. Clear the DTC with the HDS.

-2. Turn the vehicle to the OFF (LOCK) mode.

-3. Disconnect the following connectors.

CVT speed sensor 3P connector
Torque converter turbine speed sensor 3P connector

-4. Turn the vehicle to the ON mode.

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0651 Sensor Reference Voltage 2 Circuit Malfunc	B	B	B

Is DTC P0651 indicated?

YES

Go to step 4.

NO

Go to step 3.

3. Shorted part check:

Check for Pending or Confirmed DTCs with the HDS while reconnecting these parts, one at a time:

- CVT speed sensor
- Torque converter turbine speed sensor

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0651 Sensor Reference Voltage 2 Circuit Malfunc	B	B	B

Is DTC P0651 indicated?

YES

Replace the part that caused the DTC when it was reconnected.

NO

Check for poor connections and loose terminals at the TCM and the following parts, then go to step 1.

- CVT speed sensor
- Torque converter turbine speed sensor

4. Shorted wire check (VCC lines to ground)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Check for continuity between these test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	CVT speed sensor 3P connector: disconnected
B	Torque converter turbine speed sensor 3P connector: disconnected
B	TCM 50P connector: disconnected

Connector	Terminal
TCM 50P connector	No. 21
	No. 41

Is there continuity?

YES

Repair a short to ground in the VCC wire between the TCM and each part that was disconnected in step 2.

NO

Go to step 5.

5. Shorted wire check (VCC lines to power)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between these test points and body ground individually.

Test condition	Vehicle ON mode
	CVT speed sensor 3P connector: disconnected
	Torque converter turbine speed sensor 3P connector: disconnected
	TCM 50P connector: disconnected

Connector	Terminal
TCM 50P connector	No. 21
	No. 41

Is there battery voltage?

YES

Repair a short to power in the VCC wire between the TCM and each part that was disconnected in step 2.

NO

The VCC wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

DTC TROUBLESHOOTING: P06A8(CVT (TCM))

DTC P06A8 : Internal VCC Power Malfunction

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P06A8 Internal VCC Power Malfunction	B	B	B

DTC(CVT)

1. Problem verification

    -1. Turn the vehicle to the ON mode.

    -2. Clear the DTC with the HDS.

    -3. Turn the vehicle to the OFF (LOCK) mode.

    -4. Turn the vehicle to the ON mode.

    -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P06A8 Internal VCC Power Malfunction	B	B	B

    Is DTC P06A8 indicated?

    YES

    The failure is duplicated. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

    NO

    Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals at the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: P0705(CVT (TCM))

DTC P0705 : Transmission Range Switch Multiple Shift Position Input

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0705 Transmission Range Switch Multiple Shift Position Input	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Compare the transmission range switch signal inputs with the HDS to the following table, in each shift lever position/mode.

Signal	Threshold						Current conditions	
	P	R	N	D	S	L	Values	Unit
A/T P Switch	ON	OFF	OFF	OFF	OFF	OFF	B	B
A/T R Switch	OFF	ON	OFF	OFF	OFF	OFF	B	B
A/T N Switch	OFF	OFF	ON	OFF	OFF	OFF	B	B

Signal	Threshold						Current conditions	
	P	R	N	D	S	L	Values	Unit
A/T D Switch	OFF	OFF	OFF	ON	OFF	OFF	B	B
A/T S Switch	OFF	OFF	OFF	OFF	ON	OFF	B	B
A/T L Switch	OFF	OFF	OFF	OFF	OFF	ON	B	B
ATP-FWD	OFF	OFF	OFF	ON	ON	ON	B	B
ATP-RVS	OFF	ON	OFF	OFF	OFF	OFF	B	B

   Do the transmission range switch signals match?

   YES

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission range switch and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

   NO

   The failure is duplicated. Go to step 2.

2. Transmission range switch signal check

   -1. Compare the transmission range switch signal inputs with the HDS to the following table, in each shift lever position/mode.

Signal	Threshold						Current conditions	
	P	R	N	D	S	L	Values	Unit
A/T P Switch	ON	OFF	OFF	OFF	OFF	OFF	B	B
A/T R Switch	OFF	ON	OFF	OFF	OFF	OFF	B	B
A/T N Switch	OFF	OFF	ON	OFF	OFF	OFF	B	B
A/T D Switch	OFF	OFF	OFF	ON	OFF	OFF	B	B
A/T S Switch	OFF	OFF	OFF	OFF	ON	OFF	B	B
A/T L Switch	OFF	OFF	OFF	OFF	OFF	ON	B	B
Forward Switch	OFF	OFF	OFF	ON	ON	ON	B	B
Reverse Switch(ATPRVS)	OFF	ON	OFF	OFF	OFF	OFF	B	B

Are any transmission range switch signals ON in all shift lever positions/modes?

YES

Record the abnormal circuit, then go to step 4.

NO

Record the abnormal circuit, then go to step 3.

3. Transmission range switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

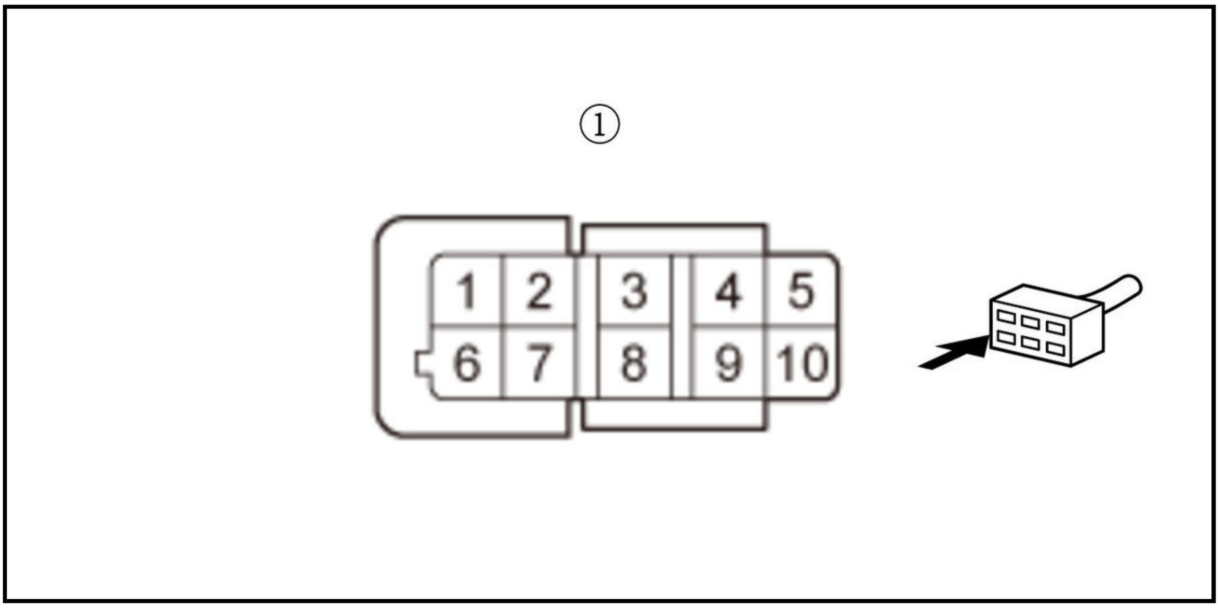
-2. Disconnect the following connector.

Transmission range switch 10P connector

-3. Connect the transmission range switch connector terminal that incorrectly indicates ON in step 2 to ground with a jumper wire.

Signal	**Transmission range switch 10P connector (female terminals) : ①**
	Terminal number
A/T P Switch	5
A/T R Switch	4
A/T N Switch	9
A/T D Switch	3

Signal	**Transmission range switch 10P connector (female terminals) : ①**
	Terminal number
A/T S Switch	8
A/T L Switch	2
Forward Switch	6
Reverse Switch(ATPRVS)	10



-4. Turn the vehicle to the ON mode.

-5. Compare the transmission range switch signal inputs with the HDS to the following table.

Signal	Current conditions	
	Values	Unit
A/T P Switch	B	B
A/T R Switch	B	B
A/T N Switch	B	B
A/T D Switch	B	B
A/T S Switch	B	B
A/T L Switch	B	B
Forward Switch	B	B
Reverse Switch(ATPRVS)	B	B

Do multiple transmission range switch signals indicate ON?

YES

The transmission range switch is OK. Repair a short in the wires between the corresponding transmission range switch connector terminal and the TCM. Refer to the following table.

B	ATPP	ATPR	ATPN	ATPD	ATPS	ATPL	ATP-FWD	ATP-RVS
TCM	48	47	46	37	36	35	44	43
Transmission range switch	5	4	9	3	8	2	6	10

NO

Replace the transmission range switch .

4. Transmission range switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Transmission range switch 10P connector

-3. Turn the vehicle to the ON mode.

-4. Check the transmission range switch signal input that remained ON with the HDS to the following table.

Signal	Current conditions	
	Values	Unit
A/T P Switch	B	B
A/T R Switch	B	B
A/T N Switch	B	B
A/T D Switch	B	B
A/T S Switch	B	B
A/T L Switch	B	B
Forward Switch	B	B
Reverse Switch(ATPRVS)	B	B

Do any transmission range switch signals remain ON?

YES

The transmission range switch is OK. Go to step 5.

NO

Replace the transmission range switch .

5. Shorted wire check (corresponding line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

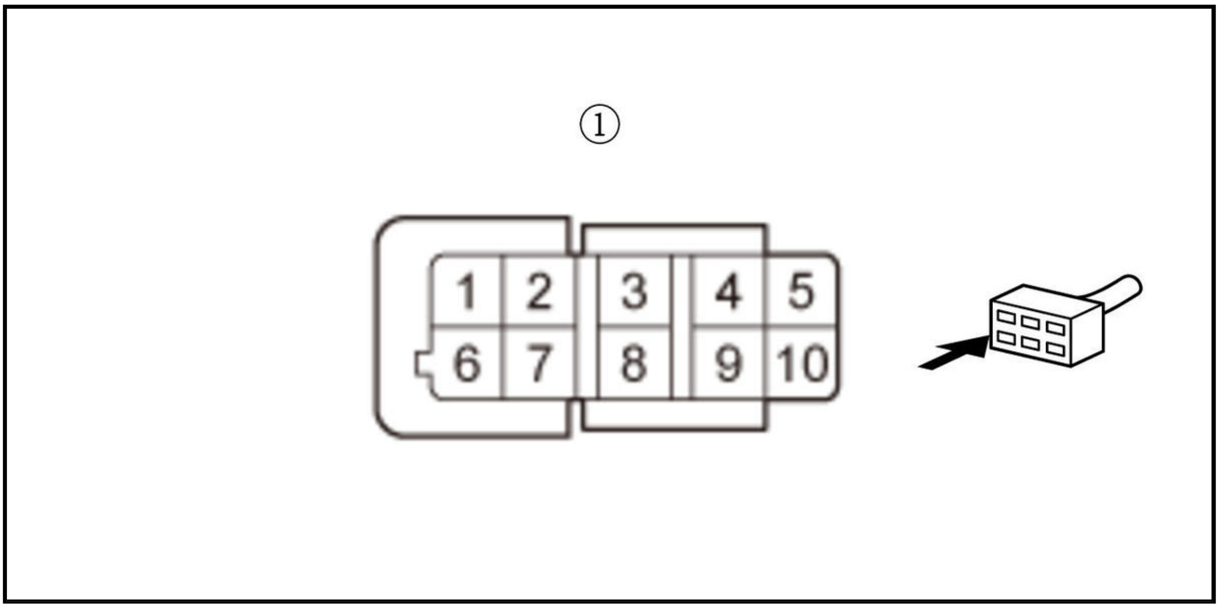
NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Check for continuity between the connector terminal on the circuit that remained ON in step 4 and ground; refer to the following table.

Signal	**Transmission range switch 10P connector (female terminals) : ①**
	Terminal number
A/T P Switch	5
A/T R Switch	4
A/T N Switch	9
A/T D Switch	3
A/T S Switch	8
A/T L Switch	2
Forward Switch	6
Reverse Switch(ATPRVS)	10



Does the circuit that indicated ON have continuity to ground?

YES

Repair a short to ground in the wire between the corresponding transmission range switch connector terminal, the shift position indicator, and the TCM.

NO

The wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

DTC TROUBLESHOOTING: P0706(CVT (TCM))

DTC P0706 : Transmission Range Switch Open

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0706 Transmission Range Switch Open	B	B	B

DTC(CVT)

1. Problem verification

-1. **Make sure the shift cable is properly adjusted** .

-2. Turn the vehicle to the ON mode.

-3. Compare the transmission range switch signal inputs with the HDS to the following table, in each shift lever position/mode.

Signal	Threshold						Current conditions	
	P	R	N	D	S	L	Values	Unit
A/T P Switch	ON	OFF	OFF	OFF	OFF	OFF	B	B
A/T R Switch	OFF	ON	OFF	OFF	OFF	OFF	B	B
A/T N Switch	OFF	OFF	ON	OFF	OFF	OFF	B	B

Signal	Threshold						Current conditions	
	P	R	N	D	S	L	Values	Unit
A/T D Switch	OFF	OFF	OFF	ON	OFF	OFF	B	B
A/T S Switch	OFF	OFF	OFF	OFF	ON	OFF	B	B
A/T L Switch	OFF	OFF	OFF	OFF	OFF	ON	B	B
ATP-FWD	OFF	OFF	OFF	ON	ON	ON	B	B
ATP-RVS	OFF	ON	OFF	OFF	OFF	OFF	B	B

Are the transmission range switch signals OK?

YES

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission range switch and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

The failure is duplicated. Go to step 2.

2. Transmission range switch signal check

-1. Compare the transmission range switch signal inputs with the HDS to the following table, in each shift lever position/mode.

Signal	**Threshold**						**Current conditions**	
	P	**R**	**N**	**D**	**S**	**L**	**Values**	**Unit**
A/T P Switch	ON	OFF	OFF	OFF	OFF	OFF	B	B
A/T R Switch	OFF	ON	OFF	OFF	OFF	OFF	B	B
A/T N Switch	OFF	OFF	ON	OFF	OFF	OFF	B	B
A/T D Switch	OFF	OFF	OFF	ON	OFF	OFF	B	B
A/T S Switch	OFF	OFF	OFF	OFF	ON	OFF	B	B
A/T L Switch	OFF	OFF	OFF	OFF	OFF	ON	B	B
ATP-FWD	OFF	OFF	OFF	ON	ON	ON	B	B
ATP-RVS	OFF	ON	OFF	OFF	OFF	OFF	B	B

Do all transmission range switch signals remain OFF?

YES

Go to step 5.

NO

Records the abnormal circuit, then go to step 3.

3. Transmission range switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

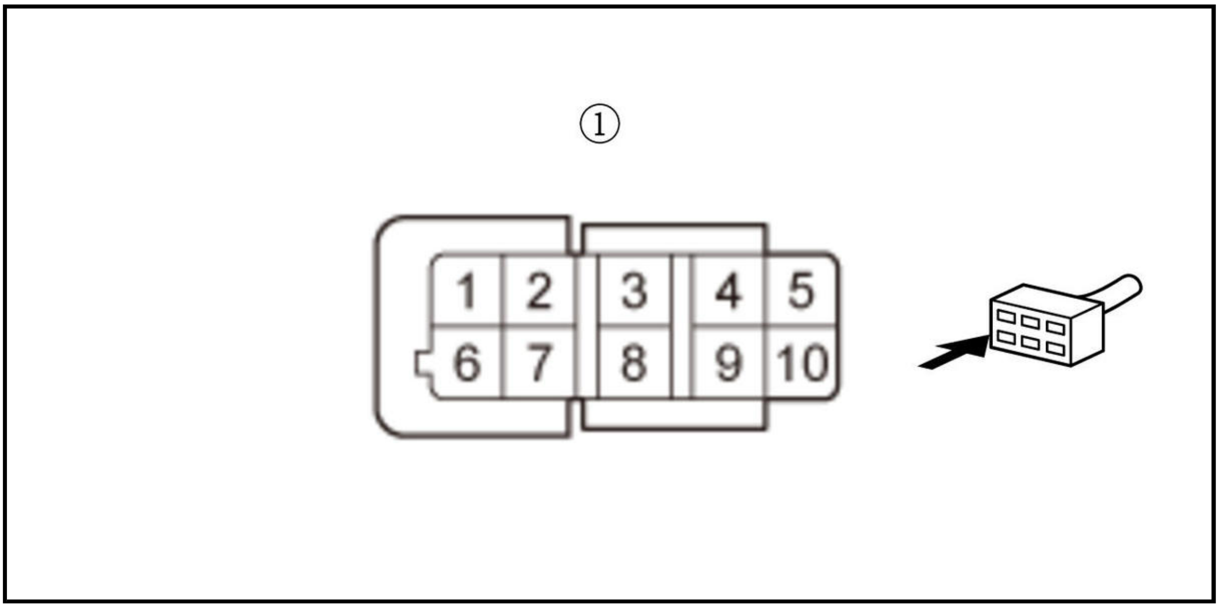
Transmission range switch 10P connector

-3. Connect the transmission range switch connector terminal that did not indicate ON in step 2 to ground with a jumper wire; refer to the following table.

Signal	**Transmission range switch 10P connector (female terminals) : ①**
	Terminal number
A/T P Switch	5
A/T R Switch	4
A/T N Switch	9
A/T D Switch	3
A/T S Switch	8

Signal	**Transmission range switch 10P connector (female terminals) : ①**
	Terminal number
A/T L Switch	2
Forward Switch	6

Signal	Transmission range switch 10P connector (female terminals) : ①
	Terminal number
Reverse Switch(ATPRVS)	10



-4. Turn the vehicle to the ON mode.

-5. Check the transmission range switch signal that did not indicate ON with the HDS.

Does the transmission range switch signal indicate ON?

YES

Replace the transmission range switch .

NO

The transmission range switch is OK. Go to step 4.

4. Open wire check (corresponding line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

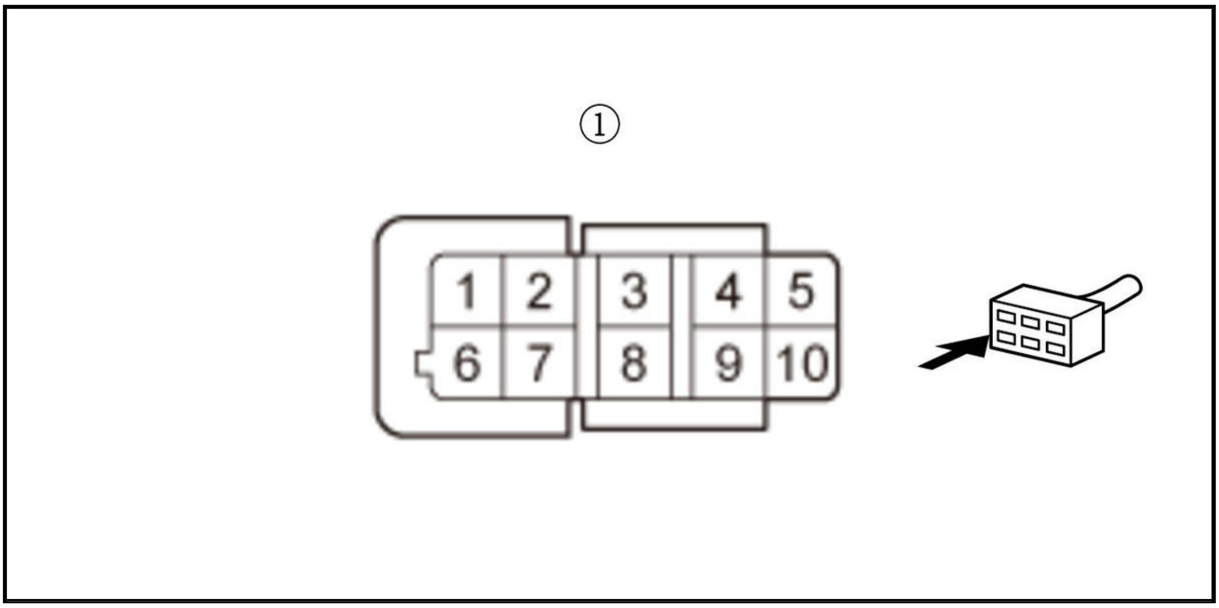
NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Check for continuity between the transmission range switch connector terminal and the TCM terminal of the input which indicated OFF. Refer to the following table.

B	ATPP	ATPR	ATPN	ATPD	ATPS	ATPL	ATP-FWD	ATP-RVS
TCM	48	47	46	37	36	35	44	43
Transmission range switch	5	4	9	3	8	2	6	10



Is there continuity?

YES

The wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Repair an open in the wire between the corresponding transmission range switch connector terminal and the TCM.

5. Open wire check (PG1 line)

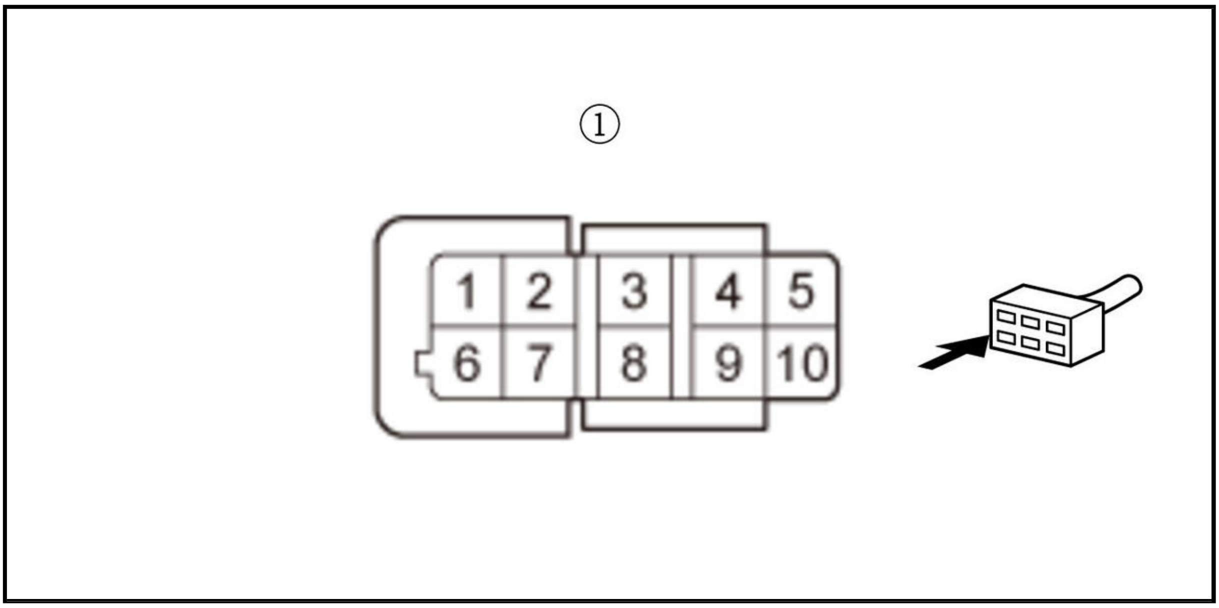
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Transmission range switch 10P connector

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmission range switch 10P connector: disconnected
Test point 1	Transmission range switch 10P connector (female terminals) No. 1 : ①
Test point 2	Body ground



Is there continuity?

YES

The PG1 wire is OK, replace the transmission range switch .

NO

Repair an open in the PG1 wire between the transmission range switch and ground (G151), or repair poor ground (G151).

DTC TROUBLESHOOTING: P0710(CVT (TCM)) (2018 2019 2020 2021)

DTC P0710 : CVT Fluid Temperature Sensor (Out of Range)

NOTE:

- Before you troubleshoot, review the General Troubleshooting Information .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0710 CVT Fluid Temperature Sensor (Out of Range)	B	B	B

DTC(CVT)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for other Pending or Confirmed DTCs indicated along with DTC P0710 with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0712 CVT Fluid Temperature Sensor (Short)	B	B	B
P0713 CVT Fluid Temperature Sensor (Open)	B	B	B

   Are there other DTCs indicated at the same time?

   YES

Go to the indicated DTC's troubleshooting .

NO

Go to step 2.

2. Problem verification

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temp Sensor (V)	0.05-0.09	V	B	B
	4.83-4.92	V	B	B

Do the current condition(s) match the threshold?

YES (0.05-0.09 V)

Go to step 3.

YES (4.83-4.92 V)

Go to step 5.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission fluid temperature sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/onboard snapshot.

3. Transmission fluid temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Solenoid wire harness A 8P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temp Sensor (V)	Less than 0.09	V	B	B

Do the current condition(s) match the threshold?

YES

The transmission fluid temperature sensor is OK. Go to step 4.

NO

Faulty transmission fluid temperature sensor. Replace solenoid wire harness A .

4. Shorted wire check (TATF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

TCM 50P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 33**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the TATF wire between solenoid wire harness A and the TCM.

NO

The TATF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good TCM** , then recheck. If this DTC goes away and the TCM was substituted, **replace the original TCM** .

5. Determine possible failure area (TATF line, others)

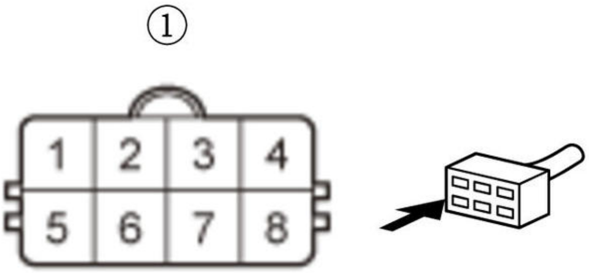
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Solenoid wire harness A 8P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Solenoid wire harness A 8P connector (female terminals) No. 7: ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temp Sensor (V)	Less than 0.07	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 6.

NO

Go to step 7.

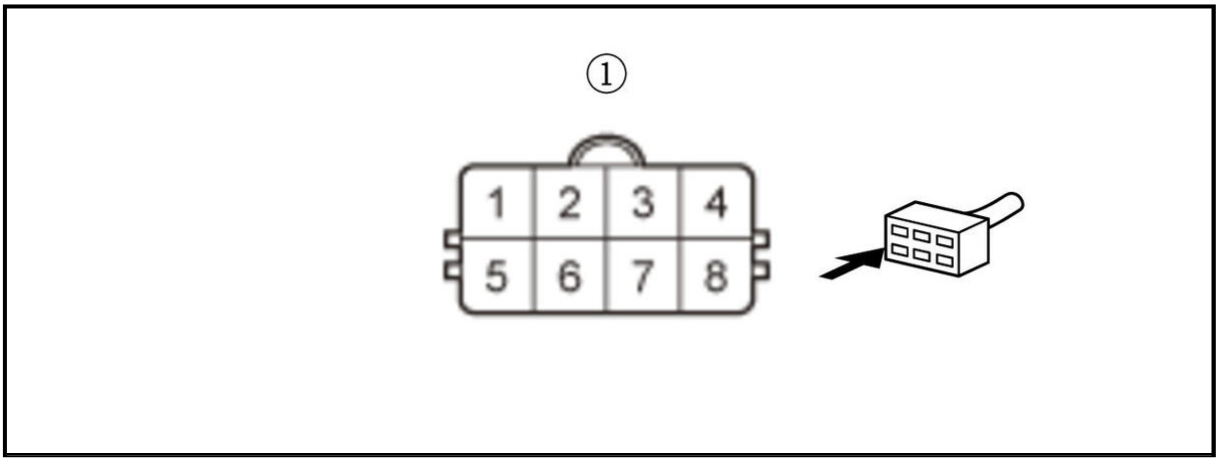
6. Transmission fluid temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Solenoid wire harness A 8P connector (female terminals) No. 6: ①
Terminal B	Solenoid wire harness A 8P connector (female terminals) No. 7: ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temp Sensor (V)	Less than 0.07	V	B	B

Do the current condition(s) match the threshold?

YES

Faulty transmission fluid temperature sensor. **Replace solenoid wire harness A** .

NO

The transmission fluid temperature sensor is OK. Repair an open in the SG5 wire between solenoid wire harness A and the TCM.

7. Open wire check (TATF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

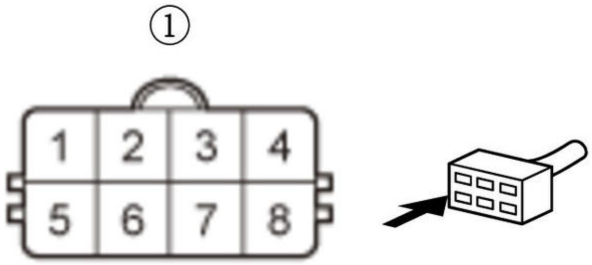
-3. Disconnect the following connector.

TCM 50P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	TCM 50P connector: disconnected

Test point 1	Solenoid wire harness A 8P connector (female terminals) No. 7: ①
Test point 2	**TCM 50P connector No. 33**



Is there continuity?

YES

The TATF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **substitute a known-good TCM** , then recheck. If this DTC goes away and the TCM was substituted, **replace the original TCM** .

NO

Repair an open in the TATF wire between solenoid wire harness A and the TCM.

DTC TROUBLESHOOTING: P0711(CVT (TCM))

DTC P0711 : CVT Fluid Temperature Sensor (Range/Performance)

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0711 CVT Fluid Temperature Sensor (Range/Performance)	B	B	B

DTC(CVT)

1. Current transmission fluid temperature check

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temperature	-10 or less	deg.C	B	B
	14 or less	deg.F		

   Do the current condition(s) match the threshold?

   YES

   Go to step 2.

   NO

   Go to step 3.

2. Transmission fluid temperature sensor check (after warm up)

   -1. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on twice).

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temperature	-10 or less	deg.C	B	B
	14 or less	deg.F		

   Do the current condition(s) match the threshold?

   14 deg.F (-10 deg.C) or below

   Faulty transmission fluid temperature sensor. **Replace solenoid wire harness A** .

   Abnormal temperature rise

   If there is an abnormal temperature rise in temperature of the transmission fluid temperature sensor, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

   14 deg.F (-10 deg.C) or higher

   The transmission fluid temperature sensor is OK. Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission fluid temperature sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Problem verification

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temperature	110 or more	deg.C	B	B
	230 or more	deg.F		

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 4.

NO

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

4. Transmission fluid temperature sensor check (after cool down)

-1. Let the engine cool until the Engine Coolant Temperature reads 122 deg.F (50 deg.C) or below with the HDS.

Signal	Current conditions	
	Values	Unit
Engine Coolant Temperature	B	B

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temperature	110 or more	deg.C	B	B
	230 or more	deg.F		

Do the current condition(s) match the threshold?

230 deg.F (110 deg.C) or higher

Faulty transmission fluid temperature sensor. **Replace solenoid wire harness A** .

Abnormal temperature decrease

If there is an abnormal temperature decrease in temperature of the transmission fluid temperature sensor, check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

230 deg.F (110 deg.C) or below

The transmission fluid temperature sensor is OK. Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission fluid temperature sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: P0712(CVT (TCM))

DTC P0712 : CVT Fluid Temperature Sensor (Short)

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0712 CVT Fluid Temperature Sensor (Short)	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temp Sensor (V)	Less than 0.07	V	B	B

   Do the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission fluid temperature sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/onboard snapshot.

2. Transmission fluid temperature sensor check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Solenoid wire harness A 8P connector

   -3. Turn the vehicle to the ON mode.

   -4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temp Sensor (V)	Less than 0.07	V	B	B

   Do the current condition(s) match the threshold?

   YES

   The transmission fluid temperature sensor is OK. Go to step 3.

   NO

   Faulty transmission fluid temperature sensor. **Replace solenoid wire harness A** .

3. Shorted wire check (TATF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 33**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the TATF wire between solenoid wire harness A and the TCM.

NO

The TATF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

DTC TROUBLESHOOTING: P0713(CVT (TCM))

DTC P0713 : CVT Fluid Temperature Sensor (Open)

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0713 CVT Fluid Temperature Sensor (Open)	B	B	B

DTC(CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temp Sensor (V)	More than 4.93	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission fluid temperature sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/onboard snapshot.

2. Determine possible failure area (TATF line, others)

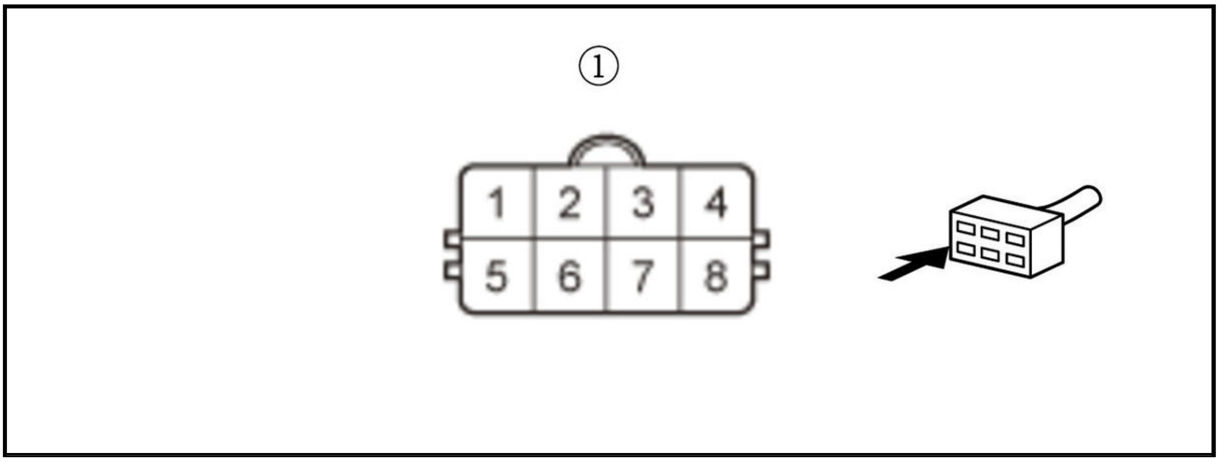
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Solenoid wire harness A 8P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Solenoid wire harness A 8P connector (female terminals) No. 7 : ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
CVTF Temp Sensor (V)	Less than 0.07	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Go to step 4.

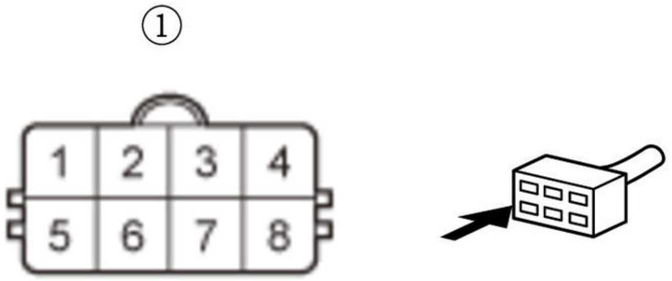
3. Transmission fluid temperature sensor check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	Solenoid wire harness A 8P connector (female terminals) No. 6 : ①
Terminal B	Solenoid wire harness A 8P connector (female terminals) No. 7 : ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
CVTF Temp Sensor (V)	Less than 0.07	V	B	B

Do the current condition(s) match the threshold?

YES

Faulty transmission fluid temperature sensor. **Replace solenoid wire harness A** .

NO

The transmission fluid temperature sensor is OK. Repair an open in the SG5 wire between solenoid wire harness A and the TCM.

4. Open wire check (TATF line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

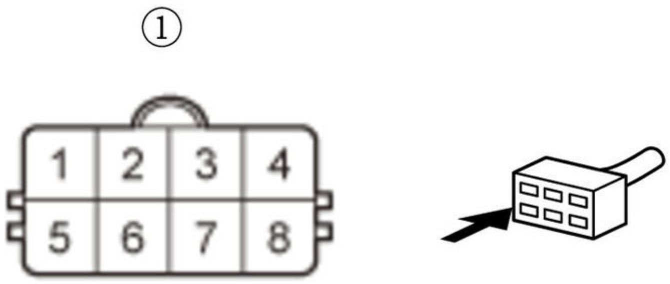
NOTE: This step must be done to protect the TCM from damage.

-4. Disconnect the following connector.

TCM 50P connector

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Solenoid wire harness A 8P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	Solenoid wire harness A 8P connector (female terminals) No. 7 : ①
Test point 2	**TCM 50P connector No. 33**



Is there continuity?

YES

The TATF wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Repair an open in the TATF wire between solenoid wire harness A and the TCM.

DTC TROUBLESHOOTING: P0714(CVT (TCM))

DTC P0714 : CVT Fluid Temperature Sensor (Intermittent Failure)

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0714 CVT Fluid Temperature Sensor (Intermittent Failure)	B	B	B

DTC(CVT)

1. Current transmission fluid temperature check

-1. Turn the vehicle to the ON mode.

-2. Check the parameter(s) below with the HDS.

CVT System

Signal	Current conditions	
	Values	Unit
CVTF Temperature	B	B

PGM-FI System

Signal	Current conditions	
	Values	Unit
ECT Sensor 2	B	B

Are the CVTF Temperature and ECT SENSOR 2 equal to the ambient air temperature?

YES

Go to step 3.

NO

Record the values of the CVTF Temperature, then go to step 2.

2. Transmission fluid temperature difference check

-1. Turn the vehicle to the OFF (LOCK) mode, and wait for at least 30 minutes.

-2. Turn the vehicle to the ON mode.

-3. Compare the current CVTF Temperature to the CVTF Temperature recorded in step 1

Signal	Current conditions	
	Values	Unit
CVTF Temperature	B	B

Did the CVTF Temperature change?

YES

Leave the engine off for at least 6 hours, then go to step 3.

NO

Faulty transmission fluid temperature sensor. **Replace solenoid wire harness A** .

3. Transmission fluid temperature sensor check

-1. Compare the values of the CVTF Temperature and ECT SENSOR 2 in the Data List with the HDS.

CVT System

Signal	Current conditions	
	Values	Unit
CVTF Temperature	B	B

PGM-FI System

Signal	Current conditions	
	Values	Unit
ECT Sensor 2	B	B

Is the value of the CVTF Temperature higher than the value of ECT SENSOR 2 by 58 deg.F (32 deg.C), or is the value of the CVTF Temperature lower than the value of ECT SENSOR 2 by 43 deg.F (24 deg.C)?

YES

Faulty transmission fluid temperature sensor. **Replace solenoid wire harness A** .

NO

The transmission fluid temperature sensor is OK. Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission fluid temperature sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/onboard snapshot.

DTC TROUBLESHOOTING: P0716(CVT (TCM))

DTC P0716 : CVT Input Shaft (Drive Pulley) Speed Sensor A Circuit Range/Performance / Input/Turbine Speed Sensor A Circuit Range/Performance

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0716 CVT Input Shaft (Drive Pulley) Speed Sensor A Circuit Range/Performance / Input/Turbine Speed Sensor A Circuit Range/Performance	B	B	B

DTC(CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-4. **Enter the VSA maintenance mode** .

-5. Run the vehicle at speeds over 19 mph (30 km/h) for at least 30 seconds. Slow down, and stop the wheels.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0716 CVT Input Shaft (Drive Pulley) Speed Sensor A Circuit Range/Performance / Input/Turbine Speed Sensor A Circuit Range/Performance	B	B	B

Is DTC P0716 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the torque converter turbine speed sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/onboard snapshot.

2. Torque converter turbine speed sensor check

   -1. Rotate the front wheels with the shift lever in D position/mode, and compare the Torque Converter Turbine Speed and the Input Shaft (Drive Pulley) Speed rpm in the Data List with the HDS.

Signal	Current conditions	
	Values	**Unit**
Torque Converter Turbine Speed	B	B
Input Shaft(Drive Pulley) Speed rpm	B	B

Are the speeds about the same?

YES

The torque converter turbine speed sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Replace the torque converter turbine speed sensor .

DTC TROUBLESHOOTING: P0717(CVT (TCM))

DTC P0717 : CVT Input Shaft (Drive Pulley) Speed Sensor A Circuit No Signal / Input/Turbine Speed Sensor A Circuit No Signal

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0717 CVT Input Shaft (Drive Pulley) Speed Sensor A Circuit No Signal / Input/Turbine Speed Sensor A Circuit No Signal	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

   -4. **Enter the VSA maintenance mode** .

-5. Run the vehicle at speeds over 19 mph (30 km/h) for at least 30 seconds. Slow down, and stop the wheels.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0717 CVT Input Shaft (Drive Pulley) Speed Sensor A Circuit No Signal / Input/Turbine Speed Sensor A Circuit No Signal	B	B	B

Is DTC P0717 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the torque converter turbine speed sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/onboard snapshot.

2. Determine possible failure area (NT line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

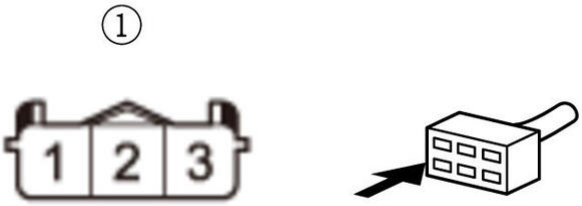
-2. Disconnect the following connector.

Torque converter turbine speed sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Torque converter turbine speed sensor 3P connector: disconnected
Test point 1	Torque converter turbine speed sensor 3P connector (female terminals) No. 2 : ①
Test point 2	Body ground



Is there about 5 V?

YES

Go to step 3.

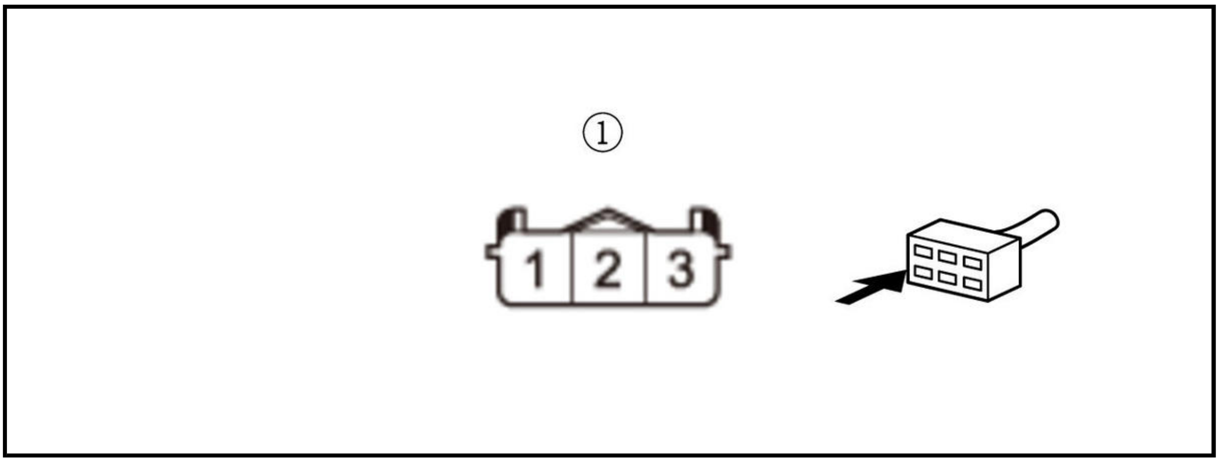
NO

Go to step 5.

3. Open wire check (VCC2 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Torque converter turbine speed sensor 3P connector: disconnected
Test point 1	Torque converter turbine speed sensor 3P connector (female terminals) No. 3 : ①
Test point 2	Body ground



Is there about 5 V?

YES

The VCC2 wire is OK. Go to step 4.

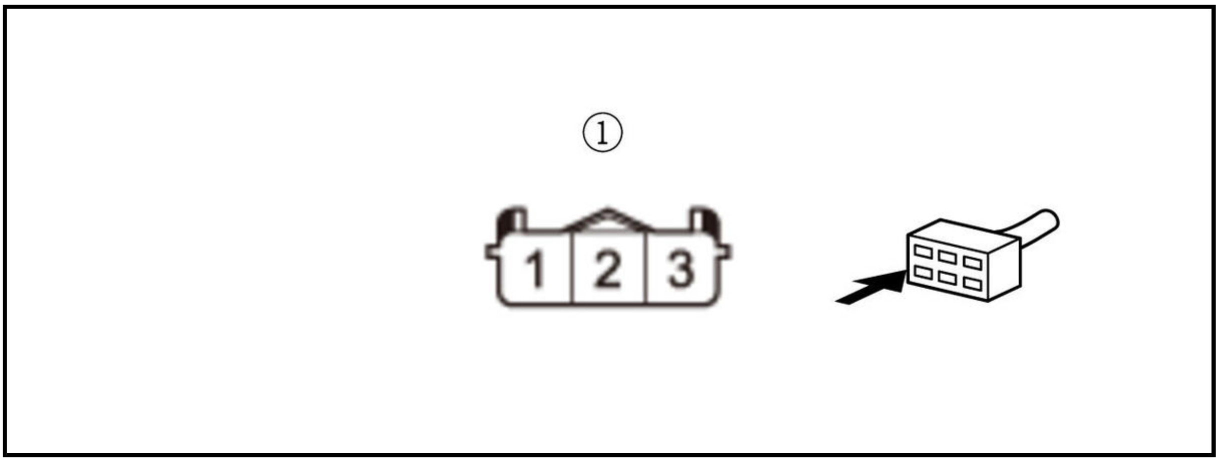
NO

Repair an open in the VCC2 wire between the torque converter turbine speed sensor and the TCM.

4. Torque converter turbine speed sensor check

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Torque converter turbine speed sensor 3P connector: disconnected
Test point 1	Torque converter turbine speed sensor 3P connector (female terminals) No. 1 : ①
Test point 2	Torque converter turbine speed sensor 3P connector (female terminals) No. 3 : ①



Is there about 5 V?

YES

Replace the torque converter turbine speed sensor .

NO

The torque converter turbine speed sensor is OK. Repair an open in the SG2 wire between the torque converter turbine speed sensor and the TCM.

5. Shorted wire check (NT line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM from damage.

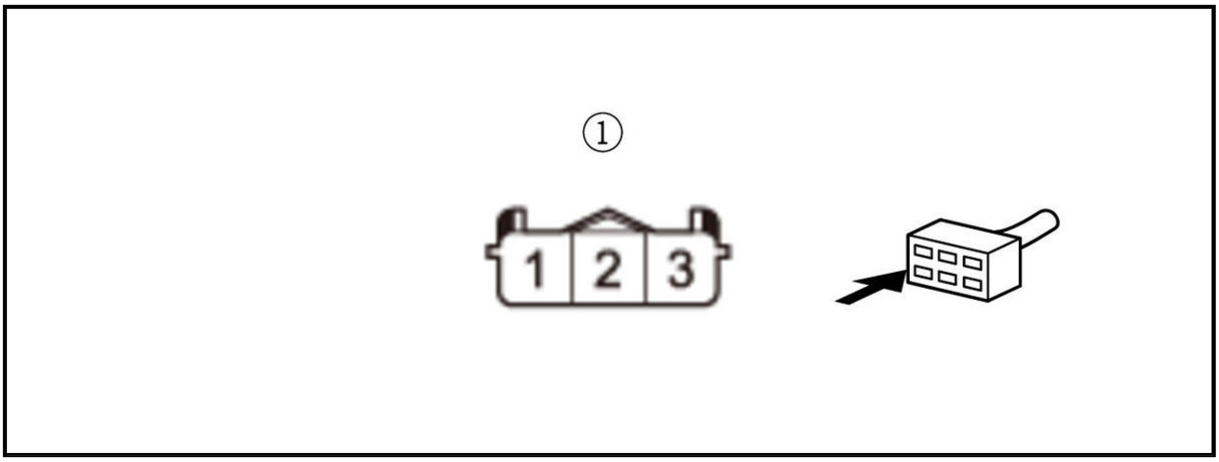
-3. Disconnect the following connector.

TCM 50P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque converter turbine speed sensor 3P connector: disconnected
B	TCM 50P connector: disconnected

Test point 1	Torque converter turbine speed sensor 3P connector (female terminals) No. 2 : ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the NT wire between the torque converter turbine speed sensor and the TCM.

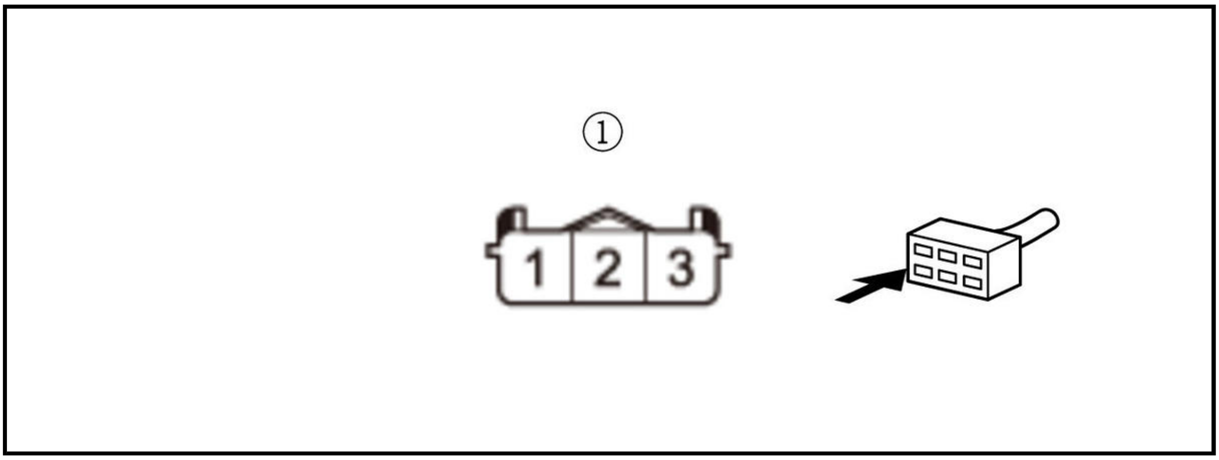
NO

The NT wire is not shorted. Go to step 6.

6. Open wire check (NT line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Torque converter turbine speed sensor 3P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	Torque converter turbine speed sensor 3P connector (female terminals) No. 2 : ①
Test point 2	**TCM 50P connector No. 49**



Is there continuity?

YES

The NT wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Repair an open in the NT wire between the torque converter turbine speed sensor and the TCM.

DTC TROUBLESHOOTING: P0741(CVT (TCM))

DTC P0741 : Torque Converter Clutch Circuit Performance or Stuck OFF

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0741 Torque Converter Clutch Circuit Performance or Stuck OFF	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on twice).

   -4. Test-drive the vehicle at speeds about 37 mph (60 km/h) on a flat road for at least 1 minute. Slow down and stop the wheels.

   -5. Repeat step 1

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0741 Torque Converter Clutch Circuit Performance or Stuck OFF	B	B	B

   Is DTC P0741 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shift solenoid valve B check

   -1. **Do the shift solenoid valve B test** .

   Does shift solenoid valve B work properly?

   YES

   Shift solenoid valve B is OK. Go to step 3.

   NO

   Faulty shift solenoid valve B. **Replace the valve body assembly** .

3. CVT lock-up clutch control solenoid valve check

   -1. **Do the CVT lock-up clutch control solenoid valve test** .

Does the CVT lock-up clutch control solenoid valve work properly?

YES

The CVT lock-up clutch control solenoid valve is OK. **Replace the transmission, or the torque converter** .

NO

Faulty CVT lock-up clutch control solenoid valve. **Replace the valve body assembly** .

DTC TROUBLESHOOTING: P0746(CVT (TCM))

DTC P0746 : CVT Drive Pulley Pressure Control Solenoid Valve Stuck OFF

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0746 CVT Drive Pulley Pressure Control Solenoid Valve Stuck OFF	B	B	B

DTC(CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Test-drive the vehicle in D position/mode until the vehicle speed reaches 37 mph (60 km/h). Slow down and stop the vehicle, then accelerate from a stop at full throttle in D position/mode until the vehicle speed reaches 37 mph (60 km/h).

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0746 CVT Drive Pulley Pressure Control Solenoid Valve Stuck OFF	B	B	B

Is DTC P0746 indicated?

YES

The failure is duplicated. Faulty CVT drive pulley pressure control solenoid valve. **Replace the valve body assembly** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: P0777(CVT (TCM))

DTC P0777 : CVT Driven Pulley Pressure Control Solenoid Valve Stuck ON

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0777 CVT Driven Pulley Pressure Control Solenoid Valve Stuck ON	B	B	B

DTC(CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Test-drive the vehicle in D position/mode until the vehicle speed reaches 37 mph (60 km/h). Slow down and stop the vehicle, then accelerate from a stop at full throttle in D position/mode until the vehicle speed reaches 37 mph (60 km/h).

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0777 CVT Driven Pulley Pressure Control Solenoid Valve Stuck ON	B	B	B

Is DTC P0777 indicated?

YES

The failure is duplicated. Faulty CVT driven pulley pressure control solenoid valve. **Replace the valve body assembly** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: P0780(CVT (TCM))

DTC P0780 : Shift Error

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is stored whenever DTCs P1898 and P1899 are detected.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0780 Shift Error	B	B	B

DTC(CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Test-drive the vehicle in D position/mode until the vehicle speed reaches 37 mph (60 km/h). Slow down and stop the vehicle, then accelerate from a stop at full throttle in D position/mode until the vehicle speed reaches 37 mph (60 km/h).

-5. Check for other Pending or Confirmed DTCs indicated along with DTC P0780 with the HDS.

NOTE: P0780 means there is one or more CVT DTCs regarding the shift control system.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0780 Shift Error	B	B	B
P1898 CVT Drive Pulley Pressure Control Valve Stuck ON or CVT Driven Pulley Pressure Control Valve Stuck OFF	B	B	B
P1899 CVT Drive Pulley Pressure Control Valve Stuck OFF or CVT Driven Pulley Pressure Control Valve Stuck ON	B	B	B

Are there other DTCs?

1. **YES**

   The failure is duplicated. Go to the indicated DTC's troubleshooting.

   - P1898
   - P1899

   NO

   There are no DTCs along with DTC P0780. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or replace the original TCM .

DTC TROUBLESHOOTING: P0792(CVT (TCM))

DTC P0792 : Intermediate Shaft Speed Sensor A Circuit Range/Performance

NOTE:

- Before you troubleshoot, review the General Troubleshooting Information .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0792 Intermediate Shaft Speed Sensor A Circuit Range/Performance	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

   -4. Enter the VSA maintenance mode .

-5. Run the vehicle with the shift lever in D position/mode, and keep the vehicle at speeds over 19 mph (30 km/h) for at least 30 seconds. Slow down and stop the wheels.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0792 Intermediate Shaft Speed Sensor A Circuit Range/Performance	B	B	B

Is DTC P0792 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the CVT drive pulley speed sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. CVT drive pulley speed sensor check

-1. Rotate the front wheels with the shift lever in D position/mode, and compare the Input Shaft (Drive Pulley) Speed rpm and the Torque Converter Turbine Speed in the Data List with the HDS.

Signal	Current conditions	
	Values	Unit
Input Shaft(Drive Pulley) Speed rpm	B	B
Torque Converter Turbine Speed	B	B

Are the speeds about the same?

YES

The CVT drive pulley speed sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Replace the CVT drive pulley speed sensor .

DTC TROUBLESHOOTING: P0793(CVT (TCM))

DTC P0793 : Intermediate Shaft Speed Sensor A Circuit No Signal

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0793 Intermediate Shaft Speed Sensor A Circuit No Signal	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

   -4. **Enter the VSA maintenance mode** .

   -5. Run the vehicle with the shift lever in D position/mode, and keep the vehicle at speeds over 19 mph (30 km/h) for at least 30 seconds. Slow down and stop the wheels.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0793 Intermediate Shaft Speed Sensor A Circuit No Signal	B	B	B

   Is DTC P0793 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the CVT drive pulley speed sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (NDR PWM line, others)

   -1. Turn the vehicle to the OFF (LOCK) mode.

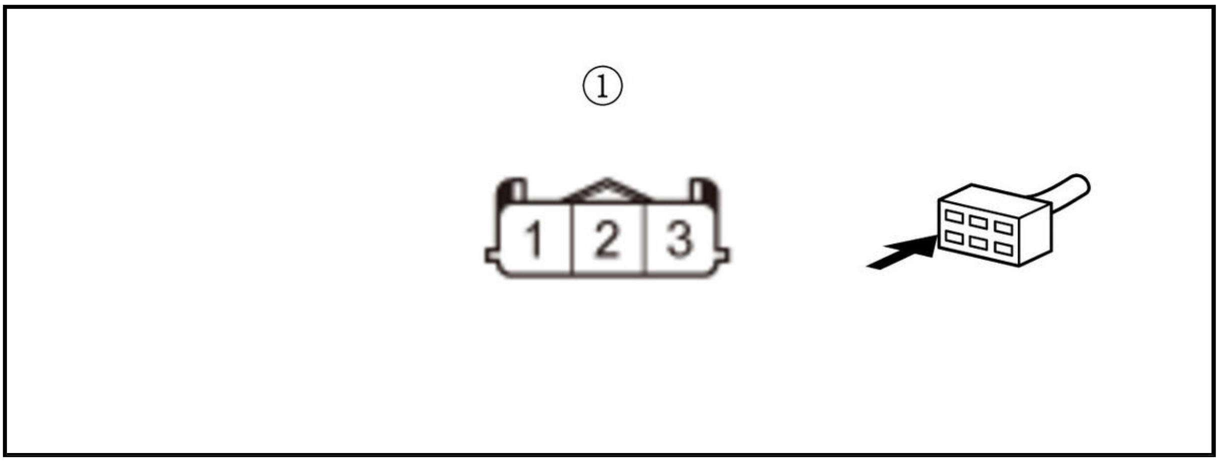
   -2. Disconnect the following connector.

CVT drive pulley speed sensor 3P connector

   -3. Turn the vehicle to the ON mode.

   -4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT drive pulley speed sensor 3P connector: disconnected
Test point 1	CVT drive pulley speed sensor 3P connector (female terminals) No. 1 : ①
Test point 2	Body ground



Is there about 5 V?

YES

Go to step 3.

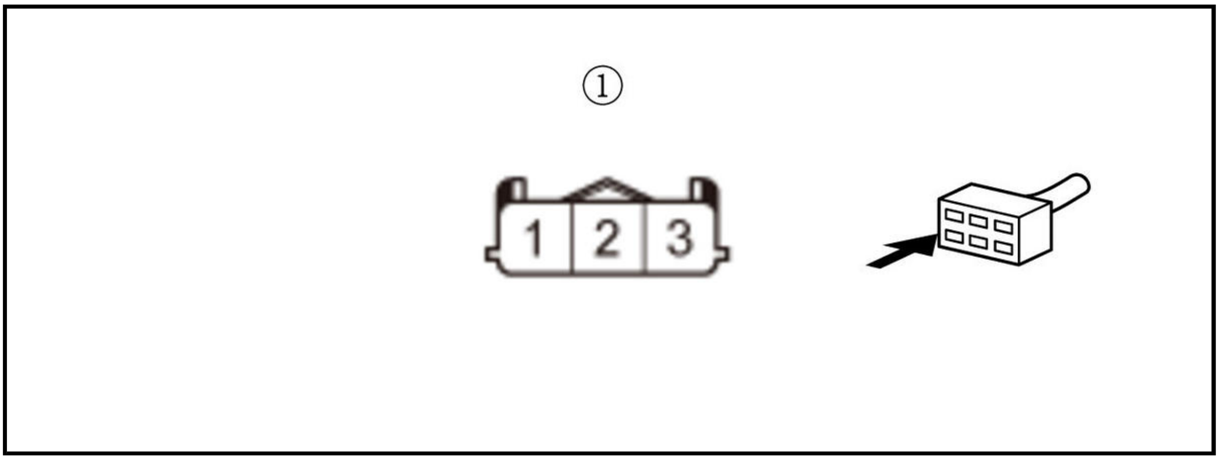
NO

Go to step 5.

3. Open wire check (VCC1 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT drive pulley speed sensor 3P connector: disconnected
Test point 1	CVT drive pulley speed sensor 3P connector (female terminals) No. 3 : ①
Test point 2	Body ground



Is there about 5 V?

YES

The VCC1 wire is OK. Go to step 4.

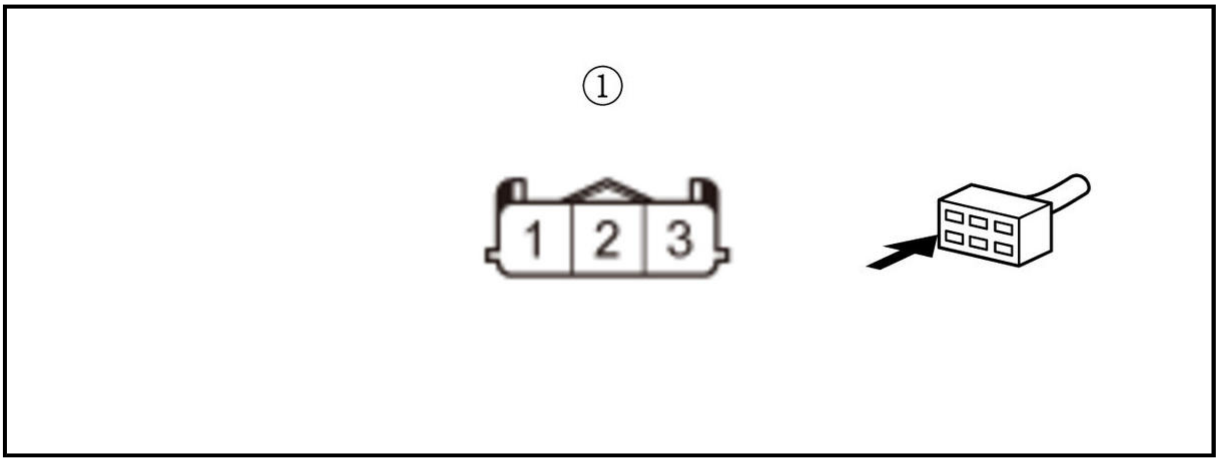
NO

Repair an open in the VCC1 wire between the CVT drive pulley speed sensor and the TCM.

4. CVT drive pulley speed sensor check

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT drive pulley speed sensor 3P connector: disconnected
Test point 1	CVT drive pulley speed sensor 3P connector (female terminals) No. 2 : ①
Test point 2	CVT drive pulley speed sensor 3P connector (female terminals) No. 3 : ①



Is there about 5 V?

YES

Replace the CVT drive pulley speed sensor .

NO

The CVT drive pulley speed sensor is OK. Repair an open in the SG1 wire between the CVT drive pulley speed sensor and the TCM.

5. Shorted wire check (NDR PWM line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

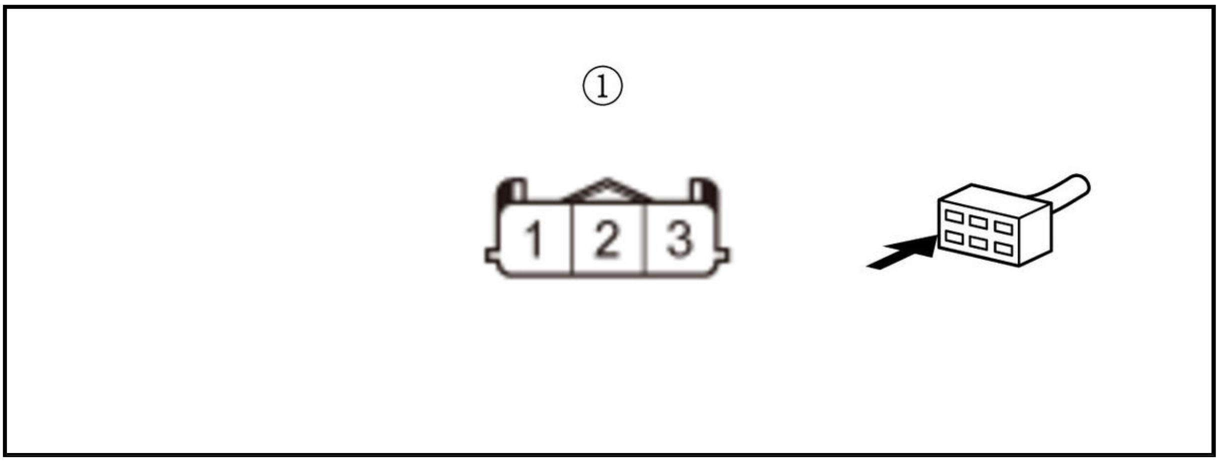
NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT drive pulley speed sensor 3P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CVT drive pulley speed sensor 3P connector (female terminals) No. 1 : ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the NDR PWM wire between the CVT drive pulley speed sensor and the TCM.

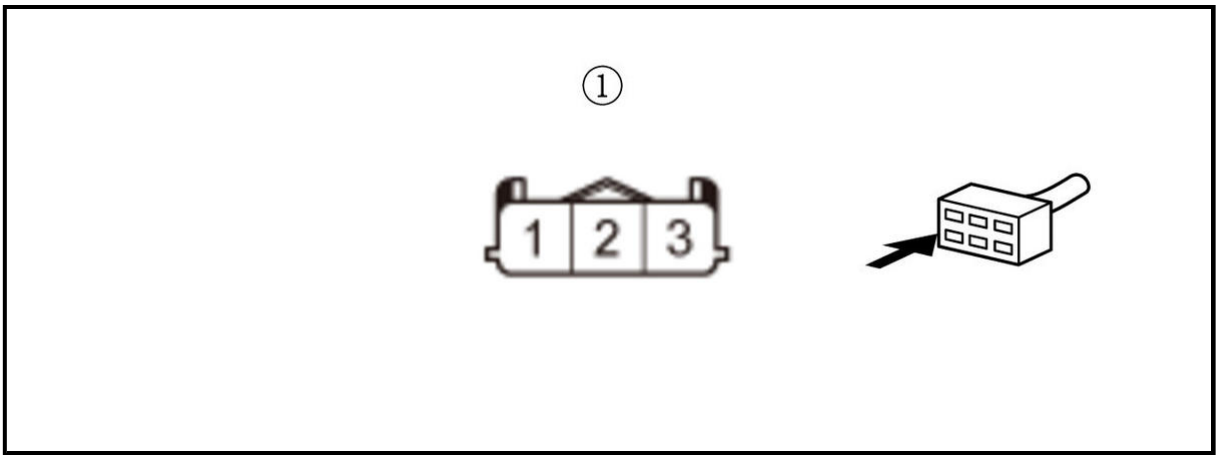
NO

The NDR PWM wire is not shorted. Go to step 6.

6. Open wire check (NDR PWM line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT drive pulley speed sensor 3P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CVT drive pulley speed sensor 3P connector (female terminals) No. 1 : ①
Test point 2	**TCM 50P connector No. 28**



Is there continuity?

YES

The NDR PWM wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Repair an open in the NDR PWM wire between the CVT drive pulley speed sensor and the TCM.

DTC TROUBLESHOOTING: P0796(CVT (TCM))

DTC P0796 : Pressure Control Solenoid Valve C Performance or Stuck OFF

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0796 Pressure Control Solenoid Valve C Performance or Stuck OFF	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine in P position/mode. Shift the transmission to N position/mode, then to D position/mode while pressing the brake pedal, and wait for at least 30 seconds.

   -4. Turn the vehicle to the OFF (LOCK) mode. Repeat the shift lever operational mode in step 1-3 again.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0796 Pressure Control Solenoid Valve C Performance or Stuck OFF	B	B	B

Is DTC P0796 indicated?

YES

The failure is duplicated. Faulty CVT clutch pressure control solenoid valve. **Replace the valve body assembly** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: P0797(CVT (TCM))

DTC P0797 : Pressure Control Solenoid Valve C Stuck ON

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0797 Pressure Control Solenoid Valve C Stuck ON	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

-3. Start the engine.

-4. With the brake pedal pressed, do the following operational mode of the shift lever five times:

-1. Shift the transmission to N position/mode, then to D position/mode, and wait for at least 2 second.

-2. Shift the transmission to N position/mode, and wait for at least 2 seconds.

-3. Shift the transmission to D position/mode, and wait for at least 1 second.

-5. Turn the vehicle to the OFF (LOCK) mode. Repeat the shift lever operational mode in step 1-4 five times.

-6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0797 Pressure Control Solenoid Valve C Stuck ON	B	B	B

Is DTC P0797 indicated?

YES

The failure is duplicated. Faulty CVT clutch pressure control solenoid valve. **Replace the valve body assembly** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: P0842(CVT (TCM))

DTC P0842 : Transmission Fluid Pressure Sensor/Switch A Circuit Low

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0842 Transmission Fluid Pressure Sensor/Switch A Circuit Low	B	B	B

DTC(CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Driven Pulley Pressure Sensor(V)	Less than 0.21	V	B	B

Do the current condition(s) match the threshold?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the CVT driven pulley pressure sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/onboard snapshot.

2. Determine possible failure area (PDN line, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

CVT driven pulley pressure sensor 3P connector

-3. Turn the vehicle to the ON mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
Driven Pulley Pressure Sensor(V)	Less than 0.21	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Go to step 4.

3. Shorted wire check (PDN line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

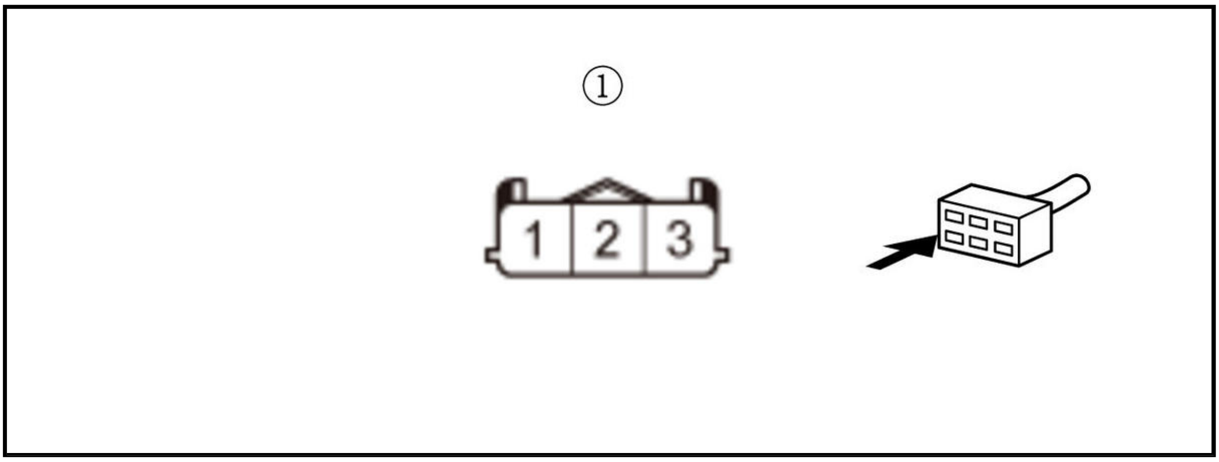
NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT driven pulley pressure sensor 3P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CVT driven pulley pressure sensor 3P connector (female terminals) No. 2 : ①
Test point 2	Body ground



Is there continuity?

YES

Repair a short to ground in the PDN wire between the CVT driven pulley pressure sensor and the TCM.

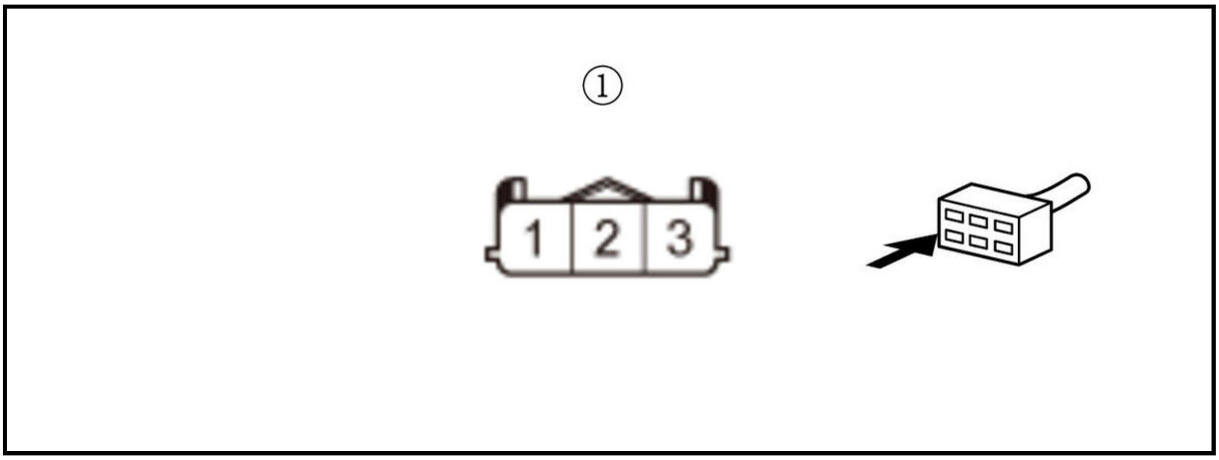
NO

The PDN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

4. Open wire check (VCC4 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT driven pulley pressure sensor 3P connector: disconnected
Test point 1	CVT driven pulley pressure sensor 3P connector (female terminals) No. 3 : ①
Test point 2	Body ground



Is there about 5 V?

YES

The VCC4 wire is OK. **Replace the CVT driven pulley pressure sensor** .

NO

Repair an open in the VCC4 wire between the CVT driven pulley pressure sensor and the TCM.

DTC TROUBLESHOOTING: P0843(CVT (TCM))

DTC P0843 : Transmission Fluid Pressure Sensor/Switch A Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0843 Transmission Fluid Pressure Sensor/Switch A Circuit High	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Driven Pulley Pressure Sensor(V)	More than 4.84	V	B	B

   Do the current condition(s) match the threshold?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the CVT driven pulley pressure sensor and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/onboard snapshot.

2. Determine possible failure area (PDN line, others)

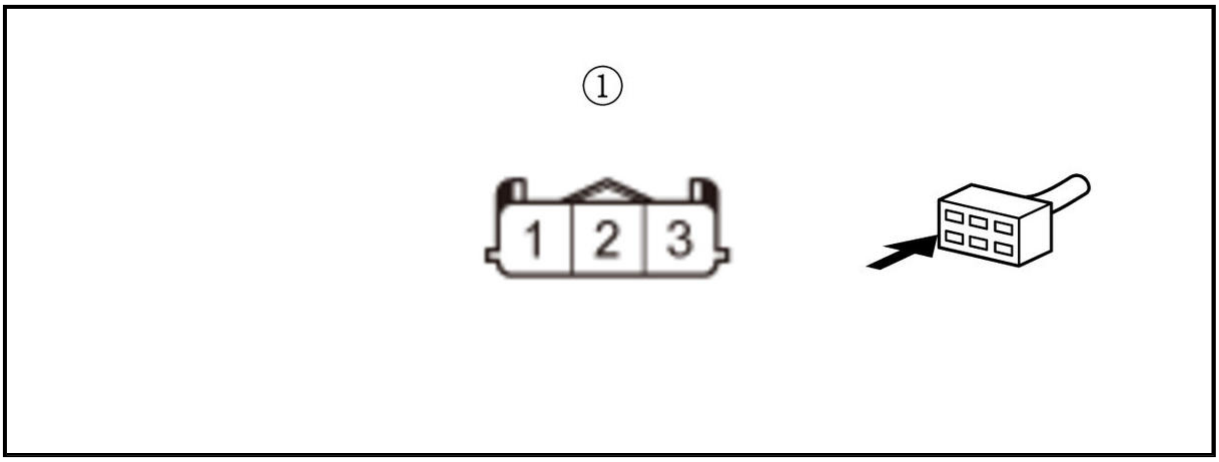
   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

CVT driven pulley pressure sensor 3P connector

   -3. Connect terminals A and B with a jumper wire.

Terminal A	CVT driven pulley pressure sensor 3P connector (female terminals) No. 1 : ①
Terminal B	CVT driven pulley pressure sensor 3P connector (female terminals) No. 2 : ①



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Driven Pulley Pressure Sensor(V)	More than 4.84	V	B	B

Do the current condition(s) match the threshold?

YES

Go to step 3.

NO

Go to step 4.

3. Open wire check (PDN line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

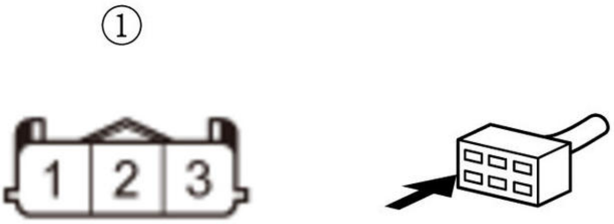
NOTE: This step must be done to protect the TCM from damage.

-4. Disconnect the following connector.

TCM 50P connector

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT driven pulley pressure sensor 3P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CVT driven pulley pressure sensor 3P connector (female terminals) No. 2 : ①
Test point 2	**TCM 50P connector No. 31**



Is there continuity?

YES

The PDN wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Repair an open in the PDN wire between the CVT driven pulley pressure sensor and the TCM.

4. CVT driven pulley pressure sensor check

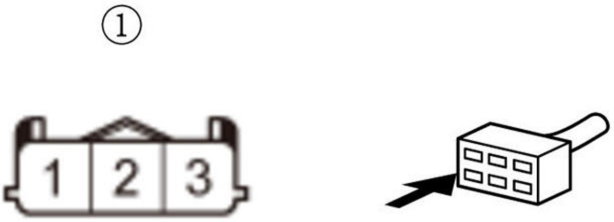
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT driven pulley pressure sensor 3P connector: disconnected
Test point 1	CVT driven pulley pressure sensor 3P connector (female terminals) No. 1 : ①
Test point 2	CVT driven pulley pressure sensor 3P connector (female terminals) No. 3 : ①



Is there about 5 V?

YES

Replace the CVT driven pulley pressure sensor .

NO

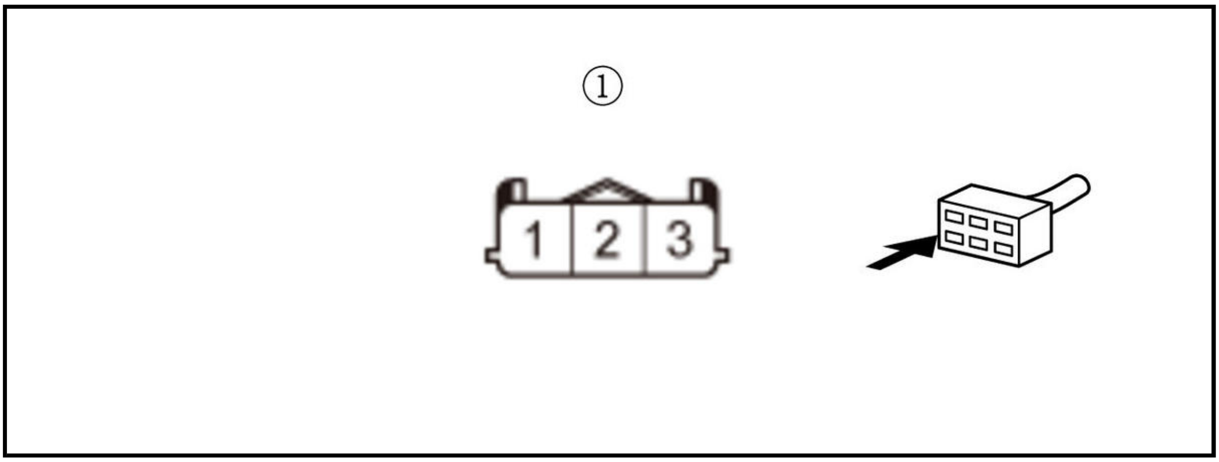
The CVT driven pulley pressure sensor is OK. Go to step 5.

5. Open wire check (VCC4 line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	CVT driven pulley pressure sensor 3P connector: disconnected

Test point 1	CVT driven pulley pressure sensor 3P connector (female terminals) No. 3 : ①
Test point 2	Body ground



Is there about 5 V?

YES

Repair an open in the SG4 wire between the CVT driven pulley pressure sensor and the TCM.

NO

Repair an open in the VCC4 wire between the CVT driven pulley pressure sensor and the TCM.

DTC TROUBLESHOOTING: P0962, P0963(CVT (TCM))

DTC P0962 : CVT Drive Pulley Pressure Control Valve Circuit Low

DTC P0963 : CVT Drive Pulley Pressure Control Valve Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0962 CVT Drive Pulley Pressure Control Valve Circuit Low	B	B	B
P0963 CVT Drive Pulley Pressure Control Valve Circuit High	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and wait for at least 1 second.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0962 CVT Drive Pulley Pressure Control Valve Circuit Low	B	B	B
P0963 CVT Drive Pulley Pressure Control Valve Circuit High	B	B	B

   Is DTC P0962 or P0963 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the CVT drive pulley pressure control solenoid valve and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (TCM, short in DRLS line, open in DRLS/DRC+ line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   NOTE: This step must be done to protect the TCM from damage.

   -3. Disconnect the following connector.

TCM 50P connector

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 15**
Test point 2	Body ground

   Is there 5.0-6.3 Ω?

   5.0-6.3 Ω

   Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

   Less than 5.0 Ω

Go to step 3.

More than 6.3 Ω

Go to step 4.

3. Shorted wire check (DRLS line)

-1. Disconnect the following connector.

CVT drive pulley pressure control solenoid valve 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT drive pulley pressure control solenoid valve 2P connector: disconnected
B	TCM 50P connector: disconnected

Test point 1	**TCM 50P connector No. 15**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the DRLS wire between the CVT drive pulley pressure control solenoid valve and the TCM.

NO

The DRLS wire is OK. Faulty CVT drive pulley pressure control solenoid valve. **Replace the valve body assembly** .

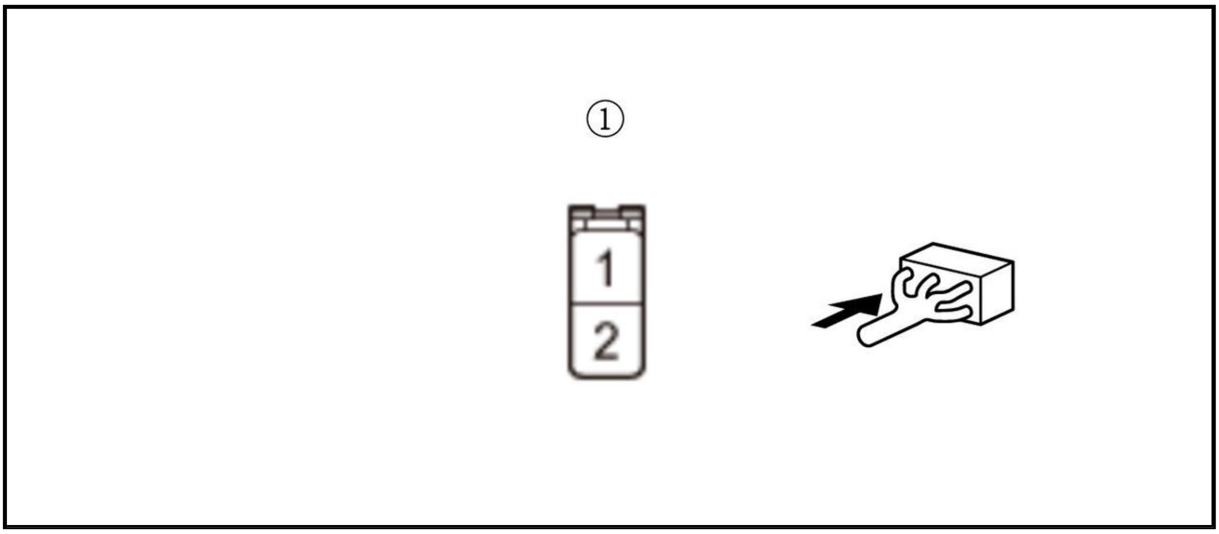
4. Open wire check (DRLS/DRC+ line)

-1. Disconnect the following connector.

CVT drive pulley pressure control solenoid valve 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT drive pulley pressure control solenoid valve 2P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CVT drive pulley pressure control solenoid valve 2P connector (female terminals) No. 2 : ①
Test point 2	**TCM 50P connector No. 15**



Is there continuity?

YES

The DRLS/DRC+ wire is OK. Go to step 5.

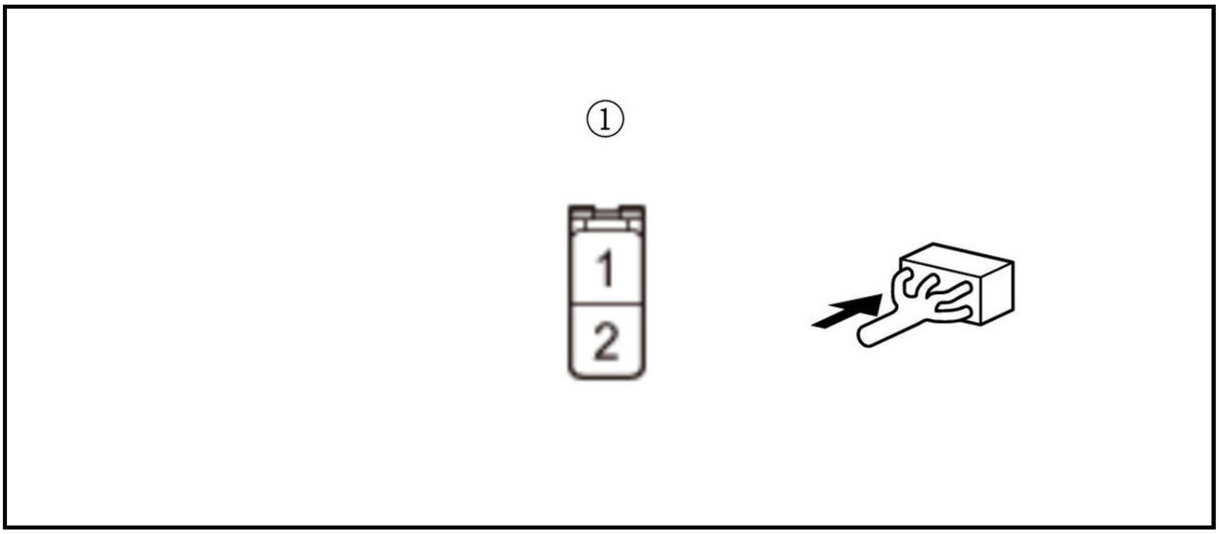
NO

Repair an open in the DRLS/DRC+ wire between the CVT drive pulley pressure control solenoid valve and the TCM.

5. Open wire check (DRC- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT drive pulley pressure control solenoid valve 2P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CVT drive pulley pressure control solenoid valve 2P connector No. 1 : ①
Test point 2	Body ground



Is there continuity?

YES

The DRC- wire is OK. Faulty CVT drive pulley pressure control solenoid valve. **Replace the valve body assembly** .

NO

Repair an open in the DRC- wire between the CVT drive pulley pressure control solenoid valve and ground (G161), or repair poor ground (G161).

DTC TROUBLESHOOTING: P0966, P0967(CVT (TCM))

DTC P0966 : CVT Driven Pulley Pressure Control Valve Circuit Low

DTC P0967 : CVT Driven Pulley Pressure Control Valve Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0966 CVT Driven Pulley Pressure Control Valve Circuit Low	B	B	B
P0967 CVT Driven Pulley Pressure Control Valve Circuit High	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and wait for at least 1 second.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0966 CVT Driven Pulley Pressure Control Valve Circuit Low	B	B	B
P0967 CVT Driven Pulley Pressure Control Valve Circuit High	B	B	B

   Is DTC P0966 or P0967 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the CVT driven pulley pressure control solenoid valve and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (TCM, short in DNLS line, open in DNLS/DNC+ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 14**
Test point 2	Body ground

Is there 5.0-6.3 Ω?

5.0-6.3 Ω

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

Less than 5.0 Ω

Go to step 3.

More than 6.3 Ω

Go to step 4.

3. Shorted wire check (DNLS line)

-1. Disconnect the following connector.

CVT driven pulley pressure control solenoid valve 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT driven pulley pressure control solenoid valve 2P connector: disconnected
B	TCM 50P connector: disconnected

Test point 1	**TCM 50P connector No. 14**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the DNLS wire between the CVT driven pulley pressure control solenoid valve and the TCM.

NO

The DNLS wire is OK. Faulty CVT driven pulley pressure control solenoid valve. **Replace the valve body assembly** .

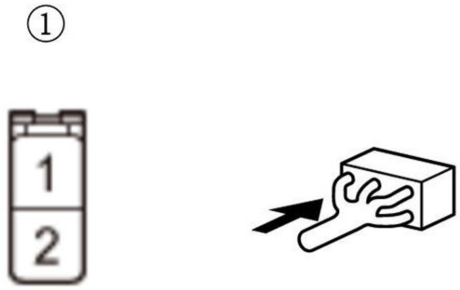
4. Open wire check (DNLS/DNC+ line)

-1. Disconnect the following connector.

CVT driven pulley pressure control solenoid valve 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT driven pulley pressure control solenoid valve 2P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CVT driven pulley pressure control solenoid valve 2P connector (female terminals) No. 2 : ①
Test point 2	**TCM 50P connector No. 14**



Is there continuity?

YES

The DNLS/DNC+ wire is OK. Go to step 5.

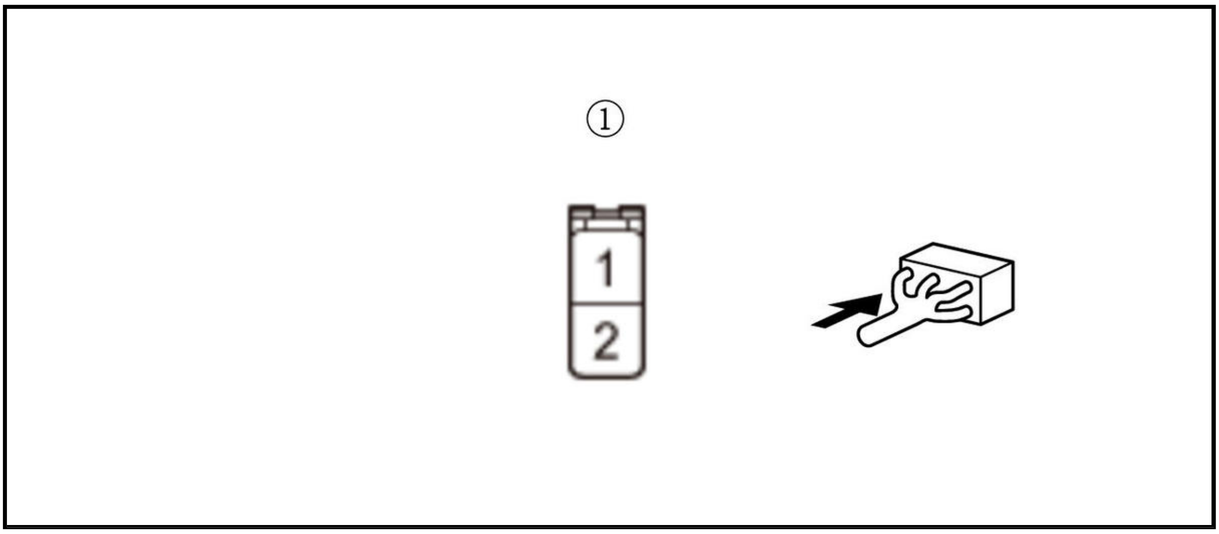
NO

Repair an open in the DNLS/DNC+ wire between the CVT driven pulley pressure control solenoid valve and the TCM.

5. Open wire check (DNC- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT driven pulley pressure control solenoid valve 2P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CVT driven pulley pressure control solenoid valve 2P connector (female terminals) No. 1 : ①
Test point 2	Body ground



Is there continuity?

YES

The DNC- wire is OK. Faulty CVT driven pulley pressure control solenoid valve. **Replace the valve body assembly** .

NO

Repair an open in the DNC- wire between the CVT driven pulley pressure control solenoid valve and ground (G161), or repair poor ground (G161).

DTC TROUBLESHOOTING: P0970, P0971(CVT (TCM))

DTC P0970 : Pressure Control Solenoid C Control Circuit Low

DTC P0971 : Pressure Control Solenoid C Control Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0970 Pressure Control Solenoid C Control Circuit Low	B	B	B
P0971 Pressure Control Solenoid C Control Circuit High	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and wait for at least 1 second.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0970 Pressure Control Solenoid C Control Circuit Low	B	B	B
P0971 Pressure Control Solenoid C Control Circuit High	B	B	B

Is DTC P0970 or P0971 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the CVT clutch pressure control solenoid valve and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (TCM, short in CPCLS line, open in CPCLS/CPC+ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 13**
Test point 2	Body ground

Is there 4.7-5.9 Ω?

4.7-5.9 Ω

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

Less than 4.7 Ω

Go to step 3.

More than 5.9 Ω

Go to step 4.

3. Shorted wire check (CPCLS line)

-1. Disconnect the following connector.

CVT clutch pressure control solenoid valve 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT clutch pressure control solenoid valve 2P connector: disconnected
B	TCM 50P connector: disconnected

Test point 1	**TCM 50P connector No. 13**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the CPCLS wire between the CVT clutch pressure control solenoid valve and the TCM.

NO

The CPCLS wire is OK. Faulty CVT clutch pressure control solenoid valve. **Replace the valve body assembly** .

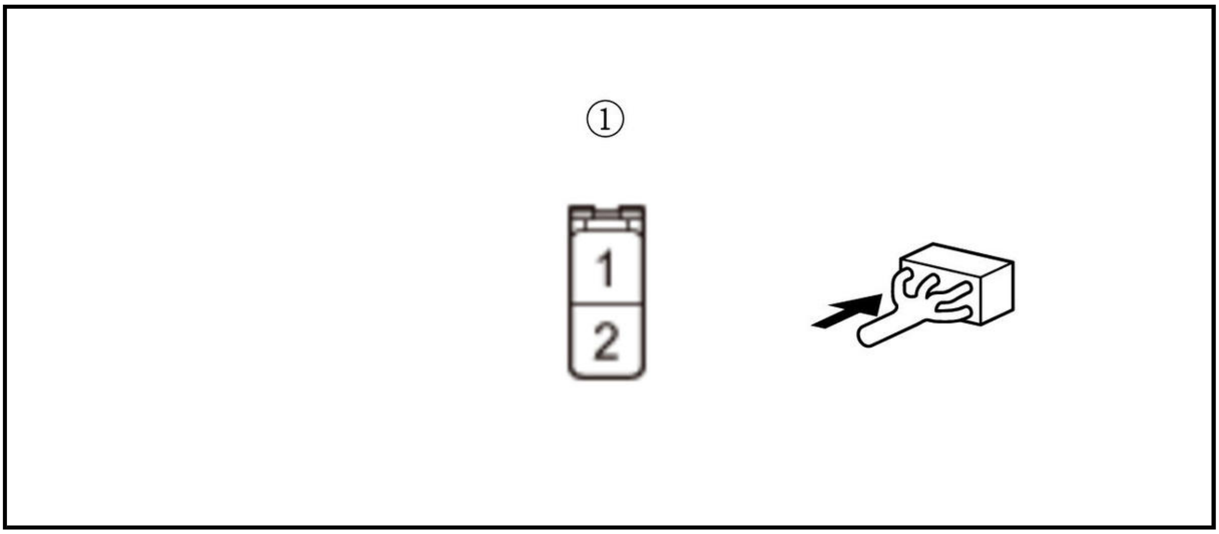
4. Open wire check (CPCLS/CPC+ line)

-1. Disconnect the following connector.

CVT clutch pressure control solenoid valve 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT clutch pressure control solenoid valve 2P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CVT clutch pressure control solenoid valve 2P connector (female terminals) No. 2 : ①
Test point 2	**TCM 50P connector No. 13**



Is there continuity?

YES

The CPCLS/CPC+ wire is OK. Go to step 5.

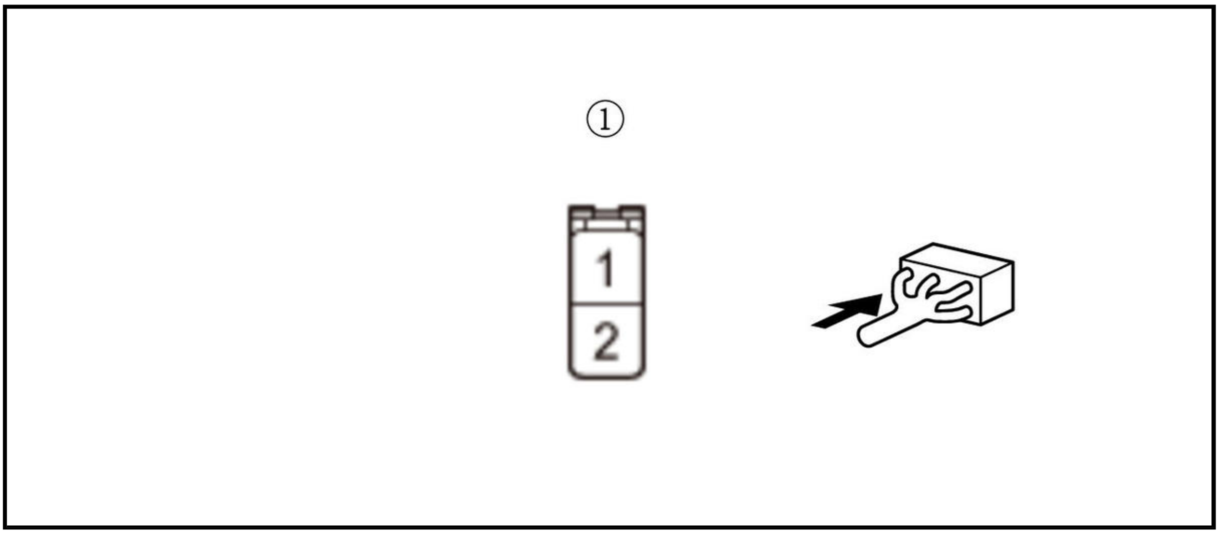
NO

Repair an open in the CPCLS/CPC+ wire between the CVT clutch pressure control solenoid valve and the TCM.

5. Open wire check (CPC- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT clutch pressure control solenoid valve 2P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CVT clutch pressure control solenoid valve 2P connector (female terminals) No. 1 : ①
Test point 2	Body ground



Is there continuity?

YES

The CPC- wire is OK. Faulty CVT clutch pressure control solenoid valve. **Replace the valve body assembly** .

NO

Repair an open in the CPC- wire between the CVT clutch pressure control solenoid valve and ground (G162), or repair poor ground (G162).

DTC TROUBLESHOOTING: P0976, P0977(CVT (TCM))

DTC P0976 : Shift Solenoid Valve B Circuit Low

DTC P0977 : Shift Solenoid Valve B Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0976 Shift Solenoid Valve B Circuit Low	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0977 Shift Solenoid Valve B Circuit High	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Test-drive under following conditions:

DTC	Test-drive condition
P0976	• Start the engine, and warm it up to normal operating temperature (the radiator fan comes on twice). • Test-drive the vehicle in D position/mode on a flat road at speeds about 37 mph (60 km/h) for at least 10 seconds.
P0977	• Shift the transmission to P position/mode. • Start the engine, and wait for at least 10 seconds.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0976 Shift Solenoid Valve B Circuit Low	B	B	B
P0977 Shift Solenoid Valve B Circuit High	B	B	B

   Is DTC P0976 or P0977 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between shift solenoid valve B and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (TCM, short in SOL B line, open in SOL B/SHB+ line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

TCM 50P connector

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 7**
Test point 2	Body ground

   Is there 10.6-13.5 Ω?

10.6-13.5 Ω

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

Less than 10.6 Ω

Go to step 3.

More than 13.5 Ω

Go to step 4.

3. Shorted wire check (SOL B line)

-1. Disconnect the following connector.

Shift solenoid valve B 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shift solenoid valve B 2P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 7**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the SOL B wire between shift solenoid valve B and the TCM.

NO

The SOL B wire is OK. Faulty shift solenoid valve B. **Replace the valve body assembly** .

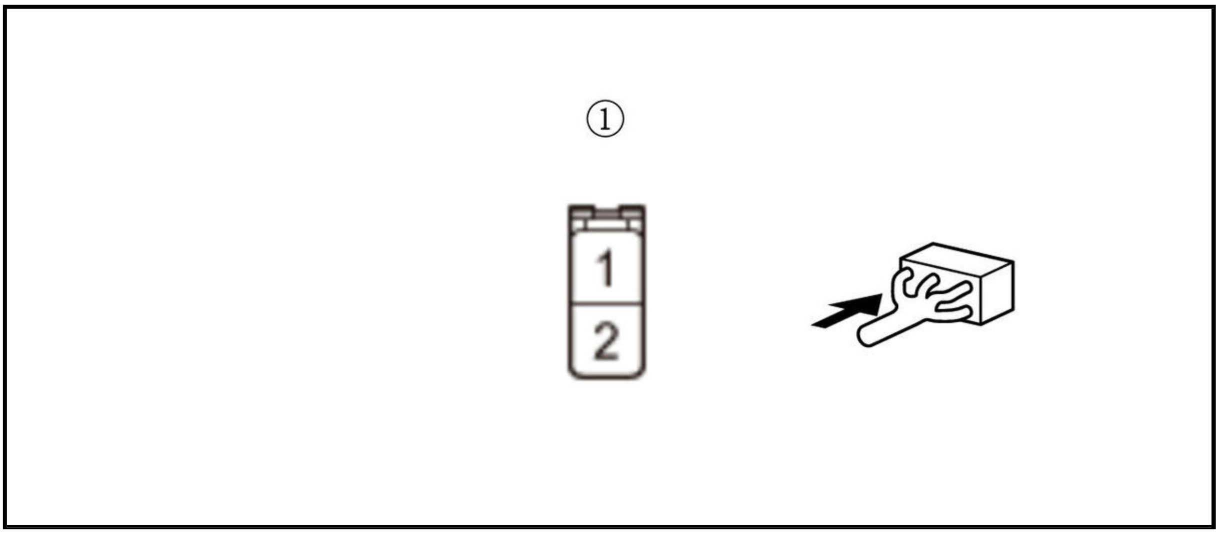
4. Open wire check (SOL B/SHB+ line)

-1. Disconnect the following connector.

Shift solenoid valve B 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Shift solenoid valve B 2P connector: disconnected
	TCM 50P connector: disconnected
Test point 1	Shift solenoid valve B 2P connector (female terminals) No. 1 : ①
Test point 2	**TCM 50P connector No. 7**



Is there continuity?

YES

The SOL B/SHB+ wire is OK. Faulty shift solenoid valve B. **Replace the valve body assembly** .

NO

Repair an open in the SOL B/SHB+ wire between shift solenoid valve B and the TCM.

DTC TROUBLESHOOTING: P1717(CVT (TCM))

DTC P1717 : Transmission Range Switch ATP RVS Switch (Open or Short)

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1717 Transmission Range Switch ATP RVS Switch (Open or Short)	B	B	B

DTC(CVT)

1. Problem verification

-1. **Make sure the shift cable is properly adjusted** .

-2. Turn the vehicle to the ON mode.

-3. Shift the transmission to R position/mode.

-4. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
A/T R Switch	ON	B	B	B
Reverse Switch(ATPRVS)	ON	B	B	B

Do the current condition(s) match the threshold?

YES

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the transmission range switch and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

The failure is duplicated. Go to step 2.

2. Transmission range switch check

-1. **Do the transmission range switch test** .

Is the transmission range switch OK?

YES

The transmission range switch is OK. Go to step 3.

NO

Check for proper transmission range switch installation, then recheck. If the transmission range switch installation is OK, **replace the transmission range switch** .

3. Open wire check (ATP-RVS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

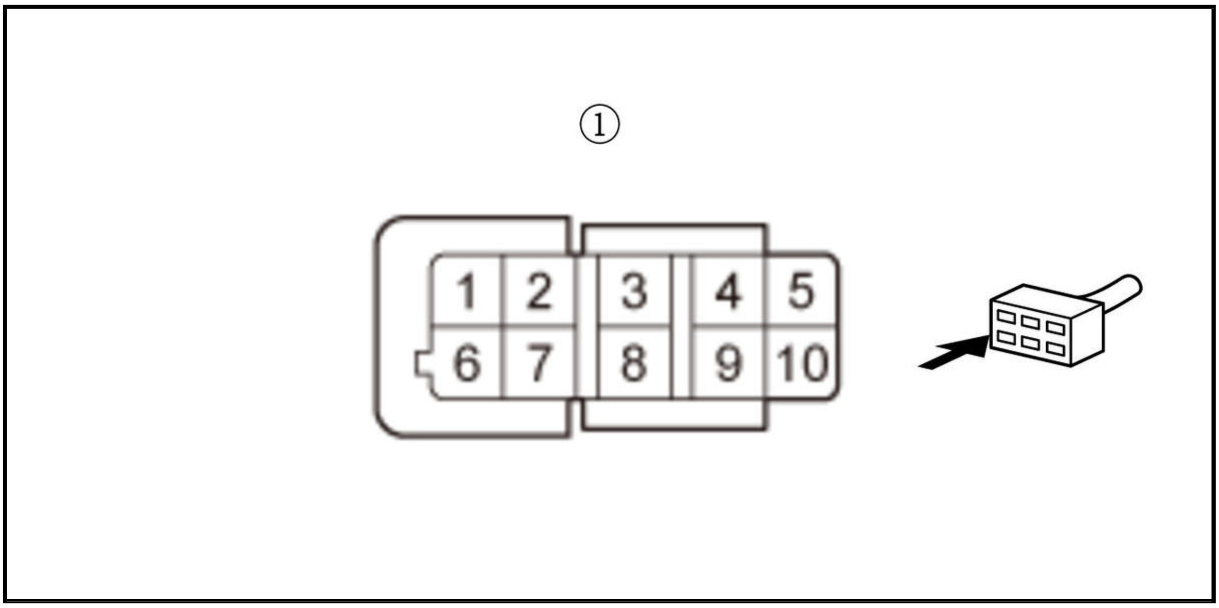
-2. Disconnect the following connector.

Transmission range switch 10P connector

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Transmission range switch 10P connector: disconnected
Test point 1	Transmission range switch 10P connector (female terminals) No. 10 : ①
Test point 2	Body ground



Is there about 5 V?

YES

The ATP-RVS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Repair an open in the ATP-RVS wire between the transmission range switch and the TCM.

DTC TROUBLESHOOTING: P1840(CVT (TCM))

DTC P1840 : CVT Speed Sensor Circuit Forward Rotation Range/Performance

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1840 CVT Speed Sensor Circuit Forward Rotation Range/Performance	B	B	B

DTC(CVT)

1. CVT speed sensor check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-4. **Enter the VSA maintenance mode** .

-5. Test-drive the vehicle in D position/mode at speeds over 19 mph (30 km/h) for at least 5 seconds.

-6. Check the parameter(s) below with the HDS while running the vehicle in D position/mode.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Direction of Secondary-shaft Rotation	Forward	B	B	B

Do the current condition(s) match the threshold?

YES

The CVT speed sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Replace the CVT speed sensor .

DTC TROUBLESHOOTING: P1841(CVT (TCM))

DTC P1841 : CVT Speed Sensor Circuit Reverse Rotation Range/Performance

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1841 CVT Speed Sensor Circuit Reverse Rotation Range/Performance	B	B	B

DTC(CVT)

1. CVT speed sensor check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

   -4. **Enter the VSA maintenance mode** .

   -5. Test-drive the vehicle in R position/mode at speeds over 19 mph (30 km/h) for at least 5 seconds.

   -6. Check the parameter(s) below with the HDS while running the vehicle in R position/mode.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Direction of Secondary-shaft Rotation	Reverse	B	B	B

Do the current condition(s) match the threshold?

YES

The CVT speed sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Replace the CVT speed sensor .

DTC TROUBLESHOOTING: P1844(CVT (TCM))

DTC P1844 : CVT Input Shaft Speed Sensor Circuit Forward Rotation Range/Performance

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1844 CVT Input Shaft Speed Sensor Circuit Forward Rotation Range/Performance	B	B	B

DTC(CVT)

1. CVT drive pulley speed sensor check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

   -4. **Enter the VSA maintenance mode** .

   -5. Test-drive the vehicle in D position/mode at speeds over 19 mph (30 km/h) for at least 5 seconds.

   -6. Check the parameter(s) below with the HDS while running the vehicle in D position/mode.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Direction of Drive Pulley Rotation	Forward	B	B	B

Do the current condition(s) match the threshold?

YES

The CVT drive pulley speed sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Replace the CVT drive pulley speed sensor .

DTC TROUBLESHOOTING: P1845(CVT (TCM))

DTC P1845 : CVT Input Shaft Speed Sensor Circuit Reverse Rotation Range/Performance

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1845 CVT Input Shaft Speed Sensor Circuit Reverse Rotation Range/Performance	B	B	B

DTC(CVT)

1. CVT drive pulley speed sensor check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

-3. Raise the vehicle on a lift. Make sure it is securely supported, and allow all four wheels to rotate freely.

-4. **Enter the VSA maintenance mode** .

-5. Test-drive the vehicle in R position/mode at speeds over 19 mph (30 km/h) for at least 5 seconds.

-6. Check the parameter(s) below with the HDS while running the vehicle in R position/mode.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Direction of Drive Pulley Rotation	Reverse	B	B	B

Do the current condition(s) match the threshold?

YES

The CVT drive pulley speed sensor is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Replace the CVT drive pulley speed sensor .

DTC TROUBLESHOOTING: P1855(CVT (TCM)) (2020 2021)

DTC P1855 : Inclination Sensor Circuit Range/Performance

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1855 Inclination Sensor Circuit Range/Performance	B	B	B

DTC (CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

Clear DTC (CVT)

-3. Test-drive the vehicle until the OBD status of DTC P1855 changes.

-4. Monitor the OBD STATUS for DTC P1855 in the DTCs MENU with the HDS.

DTC Description	OBD STATUS
P1855 Inclination Sensor Circuit Range/Performance	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. **Replace the SRS unit** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the SRS unit and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot. If the HDS indicates NOT COMPLETED, go to step 1-1 and recheck.

DTC TROUBLESHOOTING: P1890(CVT (TCM))

DTC P1890 : CVT Speed Control System

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1890 CVT Speed Control System	B	B	B

DTC(CVT)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1890 CVT Speed Control System	B	B	B

   Is there any DTC(s) other than DTC P1890?

   YES

   Go to the indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. Problem verification

   -1. Clear the DTC with the HDS.

   -2. Start the engine.

   -3. Test-drive the vehicle in D position/mode, accelerate slowly until the vehicle speed reaches 37 mph (60 km/h) on a flat road, then keep the vehicle at speeds about 37 mph (60 km/h) for at least 60 seconds.

   -4. Monitor the OBD STATUS for P1890 in the DTCs MENU with the HDS.

DTC Description	OBD Status
P1890 CVT Speed Control System	B

   Does the HDS indicate FAILED?

   YES

   The failure is duplicated. **Replace the transmission** .

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. If the HDS indicates NOT COMPLETED, test-drive again. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: P1898(CVT (TCM))

DTC P1898 : CVT Drive Pulley Pressure Control Valve Stuck ON or CVT Driven Pulley Pressure Control Valve Stuck OFF

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1898 CVT Drive Pulley Pressure Control Valve Stuck ON or CVT Driven Pulley Pressure Control Valve Stuck OFF	B	B	B

DTC(CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Start the engine.

-4. Test-drive the vehicle in D position/mode until the vehicle speed reaches 37 mph (60 km/h). Slow down and stop the vehicle, then accelerate from a stop at full throttle in D position/mode until the vehicle speed reaches 37 mph (60 km/h).

-5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0780 Shift Error	B	B	B
P1898 CVT Drive Pulley Pressure Control Valve Stuck ON or CVT Driven Pulley Pressure Control Valve Stuck OFF	B	B	B

Are DTC P1898 and P0780 indicated?

YES

The failure is duplicated. Faulty CVT drive pulley pressure control solenoid valve and/or CVT driven pulley pressure control solenoid valve. **Replace the valve body assembly** .

NO

Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: P1899(CVT (TCM))

DTC P1899 : CVT Drive Pulley Pressure Control Valve Stuck OFF or CVT Driven Pulley Pressure Control Valve Stuck ON

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1899 CVT Drive Pulley Pressure Control Valve Stuck OFF or CVT Driven Pulley Pressure Control Valve Stuck ON	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine.

   -4. Test-drive the vehicle in D position/mode until the vehicle speed reaches 37 mph (60 km/h). Slow down and stop the vehicle, then accelerate from a stop at full throttle in D position/mode until the vehicle speed reaches 37 mph (60 km/h).

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P0780 Shift Error	B	B	B
P1899 CVT Drive Pulley Pressure Control Valve Stuck OFF or CVT Driven Pulley Pressure Control Valve Stuck ON	B	B	B

   Are DTC P1899 and P0780 indicated?

   YES

   The failure is duplicated. Faulty CVT drive pulley pressure control solenoid valve and/or CVT driven pulley pressure control solenoid valve. **Replace the valve body assembly** .

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: P1900(CVT (TCM)) (2020 2021)

DTC P1900 : EOP-RELAY High Input

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P1900 EOP-RELAY High Input	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Turn the vehicle to the ON mode, and wait for at least 5 seconds.

-5. Select the Electrical Oil Pump Activation in the Function Test Menu, and drive the auxiliary transmission fluid pump for at least 5 seconds with the HDS.

-6. Monitor the OBD STATUS for P1900 in the DTCs MENU with the HDS.

DTC Description	OBD Status
P1900 EOP-RELAY High Input	B

Does the HDS indicate FAILED?

YES

The failure is duplicated. Go to step 2.

NO

If the HDS indicates PASSED, intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the auxiliary transmission fluid pump relay, the auxiliary transmission fluid pump, and the TCM. If the HDS indicates NOT COMPLETED, go to step 1-3 and recheck.

2. Relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Remove the auxiliary transmission fluid pump relay** .

-3. **Test the auxiliary transmission fluid pump relay** .

Is the relay OK?

YES

The auxiliary transmission fluid pump relay is OK. Go to step 3.

NO

Replace the auxiliary transmission fluid pump relay.

3. Shorted wire check (EOPRLY line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Auxiliary transmission fluid pump relay 4P socket: disconnected
B	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 27**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

The EOPRLY wire is OK. Go to step 4.

NO

Repair a short to ground in the EOPRLY wire between the auxiliary transmission fluid pump relay and the TCM.

4. Shorted wire check (EOPVB line to power)

-1. Disconnect the following connector.

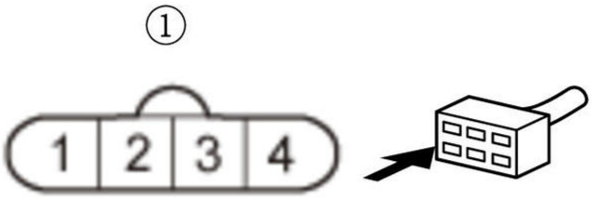
Auxiliary transmission fluid pump 4P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Auxiliary transmission fluid pump relay 4P socket: disconnected
B	Auxiliary transmission fluid pump 4P connector: disconnected
B	TCM 50P connector: disconnected

Test point 1	Auxiliary transmission fluid pump 4P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

Repair a short to power in the EOPVB wire between the auxiliary transmission fluid pump relay and the auxiliary transmission fluid pump.

NO

The EOPVB wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

DTC TROUBLESHOOTING: P2715(CVT (TCM))

DTC P2715 : Pressure Control Solenoid D Stuck On

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2715 Pressure Control Solenoid D Stuck On	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine. With the brake pedal pressed, shift the transmission to N position/mode, then shift to D position/mode, and wait for at least 1 second. Release the brake pedal, and test-drive the vehicle in D position/mode at speeds 12 mph (20 km/h) or below for at least 10 seconds.

   -4. Turn the vehicle to the OFF (LOCK) mode. Repeat the test-drive in step 1-3 again.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2715 Pressure Control Solenoid D Stuck On	B	B	B

   Is DTC P2715 indicated?

   YES

   The failure is duplicated. Faulty CVT lock-up clutch control solenoid valve. **Replace the valve body assembly** .

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: P2720, P2721(CVT (TCM))

DTC P2720 : Pressure Control Solenoid D Control Circuit Low

DTC P2721 : Pressure Control Solenoid D Control Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2720 Pressure Control Solenoid D Control Circuit Low	B	B	B
P2721 Pressure Control Solenoid D Control Circuit High	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine, and wait for at least 1 second.

   -4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2720 Pressure Control Solenoid D Control Circuit Low	B	B	B
P2721 Pressure Control Solenoid D Control Circuit High	B	B	B

   Is DTC P2720 or P2721 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the CVT lock-up clutch control solenoid valve and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (TCM, short in LCCLS line, open in LCCLS/LCC+ line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   NOTE: This step must be done to protect the TCM from damage.

   -3. Disconnect the following connector.

TCM 50P connector

   -4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 16**
Test point 2	Body ground

   Is there 5.0-6.3 Ω?

5.0-6.3 Ω

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

Less than 5.0 Ω

Go to step 3.

More than 6.3 Ω

Go to step 4.

3. Shorted wire check (LCCLS line)

-1. Disconnect the following connector.

CVT lock-up clutch control solenoid valve 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT lock-up clutch control solenoid valve 2P connector: disconnected
B	TCM 50P connector: disconnected

Test point 1	**TCM 50P connector No. 16**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the LCCLS wire between the CVT lock-up clutch control solenoid valve and the TCM.

NO

The LCCLS wire is OK. Faulty CVT lock-up clutch control solenoid valve. **Replace the valve body assembly** .

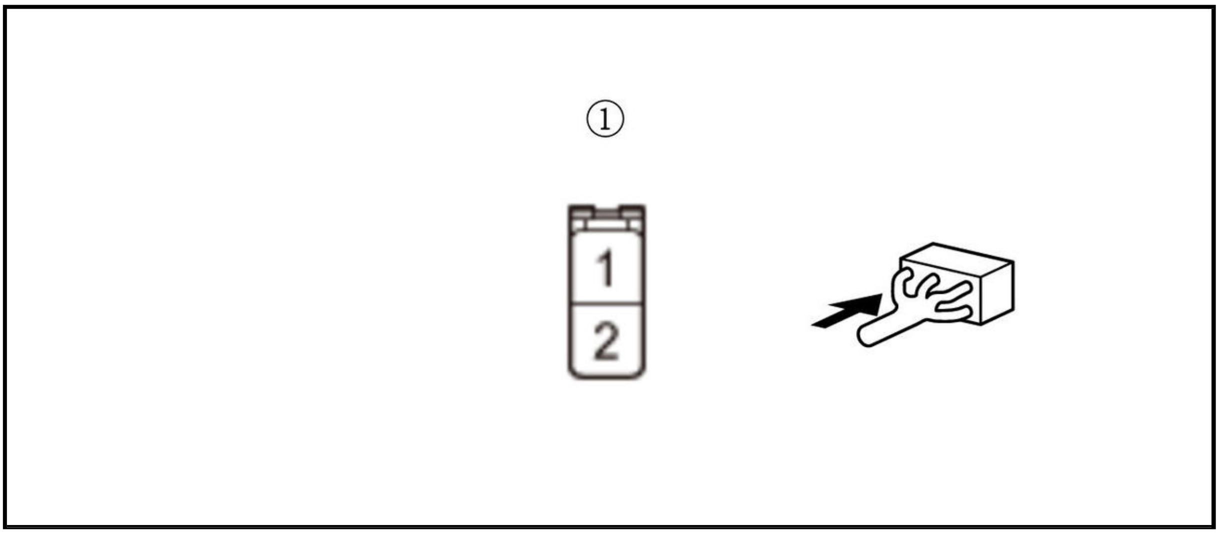
4. Open wire check (LCCLS/LCC+ line)

-1. Disconnect the following connector.

CVT lock-up clutch control solenoid valve 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT lock-up clutch control solenoid valve 2P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CVT lock-up clutch control solenoid valve 2P connector (female terminals) No. 2 : ①
Test point 2	**TCM 50P connector No. 16**



Is there continuity?

YES

The LCCLS/LCC+ wire is OK. Go to step 5.

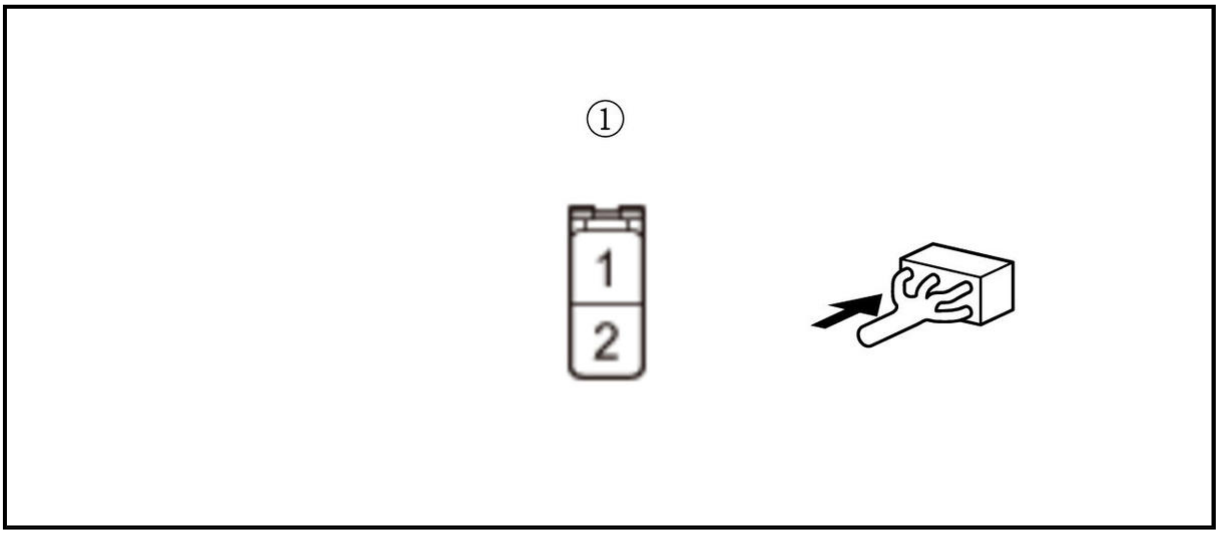
NO

Repair an open in the LCCLS/LCC+ wire between the CVT lock-up clutch control solenoid valve and the TCM.

5. Open wire check (LCC- line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CVT lock-up clutch control solenoid valve 2P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CVT lock-up clutch control solenoid valve 2P connector (female terminals) No. 1 : ①
Test point 2	Body ground



Is there continuity?

YES

The LCC- wire is OK. Faulty CVT lock-up clutch control solenoid valve. **Replace the valve body assembly** .

NO

Repair an open in the LCC- wire between the CVT lock-up clutch control solenoid valve and ground (G162), or repair poor ground (G162).

DTC TROUBLESHOOTING: P2797(CVT (TCM)) (2020 2021)

DTC P2797 : Auxiliary Transmission Fluid Pump Performance

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2797 Auxiliary Transmission Fluid Pump Performance	B	B	B

DTC(CVT)

1. Determine possible failure area (PGM-FI system, others)

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs in the PGM-FI system with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0A94 Voltage Stabilizer Malfunction	B	B

   Is DTC P0A94 indicated?

   YES

   Go to the troubleshooting for DTC P0A94 in the PGM-FI system .

   NO

   Go to step 2.

2. Problem verification

   -1. Select the Electrical Oil Pump Activation in the Function Test Menu, and drive the auxiliary transmission fluid pump for at least 5 seconds with the HDS.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2797 Auxiliary Transmission Fluid Pump Performance	B	B	B

   Is DTC P2797 indicated?

   YES

   The failure is duplicated. **Replace the auxiliary transmission fluid pump** .

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the auxiliary transmission fluid pump and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC TROUBLESHOOTING: P2817(CVT (TCM))

DTC P2817 : Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck Off

NOTE: Before you troubleshoot, **review the General Troubleshooting Information** .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2817 Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck Off	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine. With the brake pedal pressed, shift the transmission to N position/mode, then shift to D position/mode, and wait for at least 1 second. Release the brake pedal, and test-drive the vehicle in D position/mode until the vehicle speed reaches 12 mph (20 km/h). Slow down to a stop, and keep stopping for at least 10 seconds.

   -4. Turn the vehicle to the OFF (LOCK) mode. Repeat the test-drive in step 1-3 again.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2817 Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck Off	B	B	B

   Is DTC P2817 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shift Solenoid Valve O/P operation check

   -1. Select the Shift Solenoid Valve O/P Test in the Miscellaneous Test Menu, and check that the shift solenoid valve O/P operates with the HDS.

   Does the shift solenoid valve O/P work properly?

   YES

   The shift solenoid valve O/P is OK. **Replace the transmission fluid pump** .

NO

Replace the shift solenoid valve O/P .

DTC TROUBLESHOOTING: P2818(CVT (TCM))

DTC P2818 : Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck On

NOTE: Before you troubleshoot, review the General Troubleshooting Information .

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2818 Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck On	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Start the engine. With the brake pedal pressed, shift the transmission to N position/mode, then shift to D position/mode, and wait for at least 1 second. Release the brake pedal, and test-drive the vehicle in D position/mode until the vehicle speed reaches 25 mph (40 km/h). Slow down to a stop, and keep stopping for at least 10 seconds.

   -4. Turn the vehicle to the OFF (LOCK) mode. Repeat the test-drive in step 1-3 again.

   -5. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P2818 Shift Solenoid Valve O/P (Pressure Control Solenoid H) Stuck On	B	B	B

   Is DTC P2818 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shift Solenoid Valve O/P operation check

   -1. Select the Shift Solenoid Valve O/P Test in the Miscellaneous Test Menu, and check that the shift solenoid valve O/P operates with the HDS.

   Does the shift solenoid valve O/P work properly?

   YES

   The shift solenoid valve O/P is OK. Replace the transmission fluid pump .

   NO

Replace the shift solenoid valve O/P .

DTC TROUBLESHOOTING: P281D, P281E(CVT (TCM))

DTC P281D : Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit Low

DTC P281E : Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit High

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P281D Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit Low	B	B	B
P281E Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit High	B	B	B

DTC(CVT)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Test-drive under following conditions:

DTC	Test-drive condition
P281D	• Start the engine. • Shift the transmission to D position/mode while pressing the brake pedal, and wait for at least 30 seconds.
P281E	• Start the engine. • Shift the transmission to D position/mode while pressing the brake pedal, and wait for at least 30 seconds. • Shift the transmission to P position/mode. • Turn the vehicle to the OFF (LOCK) mode. • Start the engine, and wait for at least 1 second.

-4. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
P281D Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit Low	B	B	B
P281E Shift Solenoid Valve O/P (Pressure Control Solenoid H) Control Circuit High	B	B	B

Is DTC P281D or P281E indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the shift solenoid valve O/P and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (TCM, short in SOL C line, open in SOL C/SHC+ line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 6**
Test point 2	Body ground

Is there 10.6-13.5 Ω?

10.6-13.5 Ω

Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

Less than 10.6 Ω

Go to step 3.

More than 13.5 Ω

Go to step 4.

3. Shorted wire check (SOL C line)

-1. Disconnect the following connector.

Shift solenoid valve O/P 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Shift solenoid valve O/P 2P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 6**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the SOL C wire between the shift solenoid valve O/P and the TCM.

NO

The SOL C wire is OK. **Replace the shift solenoid valve O/P** .

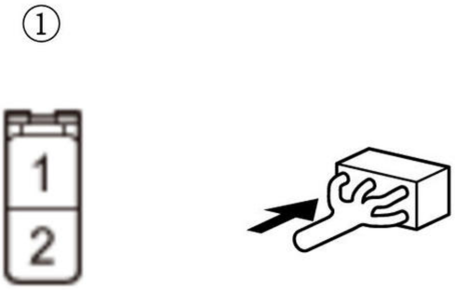
4. Open wire check (SOL C/SHC+ line)

-1. Disconnect the following connector.

Shift solenoid valve O/P 2P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Shift solenoid valve O/P 2P connector: disconnected TCM 50P connector: disconnected
Test point 1	Shift solenoid valve O/P 2P connector (female terminals) No. 1 : ①
Test point 2	**TCM 50P connector No. 6**



Is there continuity?

YES

The SOL C/SHC+ wire is OK. **Replace the shift solenoid valve O/P** .

NO

Repair an open in the SOL C/SHC+ wire between the shift solenoid valve O/P and the TCM.

DTC TROUBLESHOOTING: U0029(CVT (TCM))

DTC U0029 : F-CAN Malfunction (F-CAN Bus OFF)

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0029 F-CAN Malfunction (F-CAN Bus OFF)	B	B	B

DTC(CVT)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to the indicated DTC's troubleshooting in the CAN gateway system .

NO

Intermittent failure, the system is OK at this time.

DTC TROUBLESHOOTING: U0038(CVT (TCM))

DTC U0038 : TM-CAN Malfunction (TCM-PCM)

NOTE:

- Before you troubleshoot, review the General Troubleshooting Information .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 TM-CAN Malfunction (TCM-PCM)	B	B	B

DTC(CVT)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode.

   -4. Turn the vehicle to the ON mode.

   -5. Check for Pending or Confirmed DTCs in the PGM-FI system with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0038 TM-CAN Malfunction (TCM-PCM)	B	B	B

Is DTC U0038 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the PCM and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (TM-CAN_H line and TM-CAN_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM and the PCM from damage.

-3. Disconnect the following connectors.

TCM 50P connector
PCM connector A (50P)

-4. Check for continuity between test points 1 and 2.

TM-CAN_H line

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	**TCM 50P connector No. 4**
Test point 2	**PCM connector A (50P) No. 21**

TM-CAN_L line

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	**TCM 50P connector No. 12**
Test point 2	**PCM connector A (50P) No. 20**

Are there continuity?

YES

The TM-CAN_H wire and/or TM-CAN_L wire are not open. Go to step 3.

NO

Repair an open in the TM-CAN_H wire and/or TM-CAN_L wire between the PCM and the TCM.

3. Shorted wire check (TM-CAN_H line and TM-CAN_L line)

-1. Check for continuity between test points 1 and 2.

TM-CAN_H line

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	**TCM 50P connector No. 4**

Test point 2	Body ground

TM-CAN_L line

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	**TCM 50P connector No. 12**

Test point 2	Body ground

Are there continuity?

YES

Repair a short to ground in the TM-CAN_H wire and/or TM-CAN_L wire between the PCM and the TCM.

NO

The TM-CAN_H wire and/or TM-CAN_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

DTC TROUBLESHOOTING: U0100, U0122, U0129, U0151, U0155(CVT (TCM))

DTC U0100 : F-CAN Malfunction (TCM - FI Control Module)

DTC U0122 : Lost Communication With Vehicle Dynamics Control Module

DTC U0129 : Lost Communication With Brake System Control Module

DTC U0151 : Lost Communication With SRS Unit

DTC U0155 : Lost Communication With Gauge Control Module

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.
- Refer to the DTC shown on the display, then inspect the connectors and terminals based on the instructions.
- According to the detected DTC(s), check for the power circuit and the ground circuit of the control unit which cannot communicate with the TCM.
- Before disconnecting the SRS unit connector, **do the 12 volt battery terminal disconnection procedure** , and wait for at least 3 minutes.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0100 F-CAN Malfunction (TCM - FI Control Module)	B	B	B
U0122 Lost Communication With Vehicle Dynamics Control Module	B	B	B
U0129 Lost Communication With Brake System Control Module	B	B	B
U0151 Lost Communication With SRS Unit	B	B	B

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0155 Lost Communication With Gauge Control Module	B	B	B

DTC(CVT)

1. CAN gateway system DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

   DTC (CAN gateway)

   Is any DTC indicated?

   YES

   Go to the troubleshooting for CAN gateway system DTC(s) .

   NO

   Go to step 2.

2. F-CAN circuit communication check (Receiving control unit)

   -1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

   F-CAN Bus Connected Unit Check

   Does the TCM detect the CAN gateway Bus channels A?

   Bus A is Not Available

   Go to step 3.

   Bus A is Available

   Go to step 4.

3. Open wire check (F-CAN A_H line, F-CAN A_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Jump the SCS line with the HDS, and wait more than 1 minute.

   NOTE: This step must be done to protect the TCM from damage.

   -3. Disconnect the following connectors.

CAN gateway 12P connector (12P connector type)
CAN gateway 16P connector (16P connector type)
TCM 50P connector

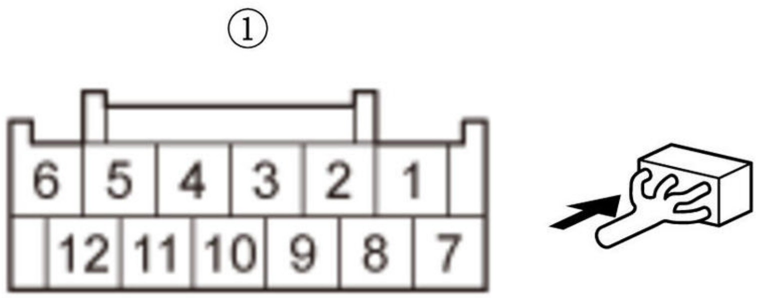
   -4. Check for continuity between test points 1 and 2.

F-CAN A_H line (12P connector type)

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CAN gateway 12P connector (female terminals) No. 3: ①
Test point 2	**TCM 50P connector No. 3**

F-CAN A_L line (12P connector type)

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CAN gateway 12P connector (female terminals) No. 9: ①
Test point 2	**TCM 50P connector No. 11**

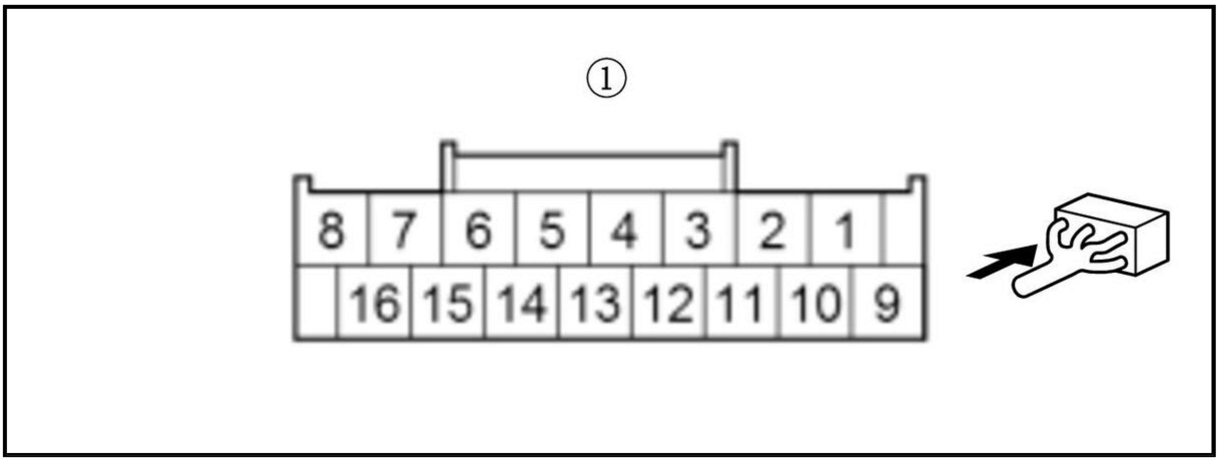


F-CAN A_H line (16P connector type)

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 3: ①
Test point 2	**TCM 50P connector No. 3**

F-CAN A_L line (16P connector type)

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 16P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	CAN gateway 16P connector (female terminals) No. 11: ①
Test point 2	**TCM 50P connector No. 11**



Is there continuity?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the TCM and the CAN gateway.

4. F-CAN circuit communication check (Transmitting control unit)

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

According to the detected DTC on the following table, make sure that the transmitting control unit detects the CAN gateway Bus channel(s) normally.

DTC	Transmitting control unit	Detected CAN geteway Bus channel(s) at normal
U0100	PCM	A, B
U0122	VSA modulator-control unit	A, B
U0129	Electric brake booster	A, B
U0151	SRS unit	B
U0155	Gauge control module	A

Is it detected normally?

Detected normal

Intermittent failure, the system is OK at this time. Check for poor connections or loose terminals at the transmitting control unit and the CAN gateway.

U0100: PCM is Not Available for Bus A

Go to step 5.

U0100: PCM is Not Available for Bus B

Go to step 6.

U0122: VSA modulator-control unit is Not Available for Bus A

Go to step 5.

U0122: VSA modulator-control unit is Not Available for Bus B

Go to step 6.

U0129: Electric brake booster is Not Available for Bus A

Go to step 5.

U0129: Electric brake booster is Not Available for Bus B

Go to step 6.

U0151: SRS unit is Not Available for Bus B

Go to step 6.

U0155: Gauge control module is Not Available for Bus A

Go to step 5.

5. Open wire check (F-CAN A_H line, F-CAN A_L line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

   -3. U0129: Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

   NOTE: Do not open and close the driver's door.

   -4. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 12P connector (12P connector type)CAN gateway 16P connector (16P connector type)
U0100	PCM connector A (50P)
U0122	VSA modulator-control unit 46P connector
U0129	Electric brake booster 26P connector
U0155	Gauge control module connector A (32P)

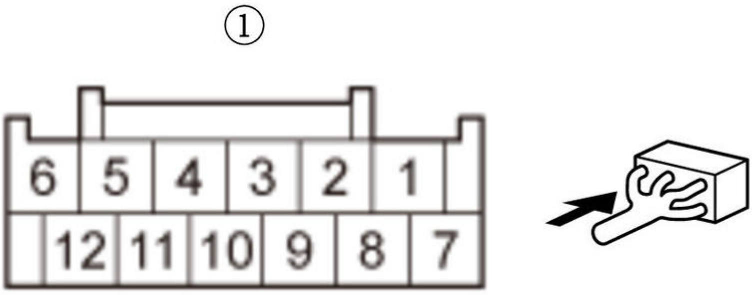
   -5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector (12P connector type): disconnected
B	CAN gateway 16P connector (16P connector type): disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

12P connector type

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN A_H	CAN gateway 12P connector (female	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 9		No. 36

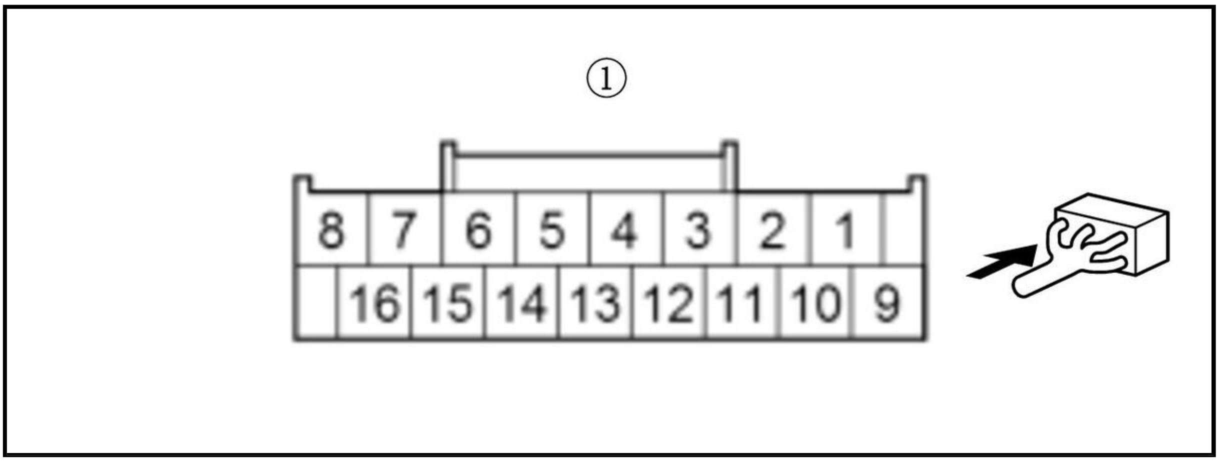
DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0122	F-CAN A_H	CAN gateway 12P connector (female terminals): ① terminals): ①	No. 3	VSA modulator-control unit 46P connector	No. 40
	F-CAN A_L		No. 9		No. 28
U0129	F-CAN A_H	CAN gateway 12P connector (female terminals): ①	No. 3	Electric brake booster 26P connector	No. 26
	F-CAN A_L		No. 9		No. 18
U0155	F-CAN A_H	CAN gateway 12P connector (female terminals): ①	No. 3	Gauge control module connector A (32P)	No. A19
	F-CAN A_L		No. 9		No. A20



16P connector type

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0100	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	PCM connector A (50P)	No. 37
	F-CAN A_L		No. 11		No. 36
U0122	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	VSA modulator-control unit 46P connector	No. 40
	F-CAN A_L		No. 11		No. 28
U0129	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	Electric brake booster 26P connector	No. 26
	F-CAN A_L		No. 11		No. 18

DTC	Circuit name	Test point 1 (Receiving control unit)		Test point 2 (Transmitting control unit)	
		Connector	Terminal	Connector	Terminal
U0155	F-CAN A_H	CAN gateway 16P connector (female terminals): ①	No. 3	Gauge control module connector A (32P)	No. A19
	F-CAN A_L		No. 11		No. A20



Is there continuity?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting.According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	Check for poor connections or loose terminals at the CAN gateway and the PCM. **Replace the original PCM** .
U0122	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .
U0129	Check for poor connections or loose terminals at the CAN gateway and the electric brake booster. **Replace the electric brake booster** .
U0155	Check for poor connections or loose terminals at the CAN gateway and the gauge control module. **Replace the original gauge control module** .

NO

Repair an open in the F-CAN A_H wire or the F-CAN A_L wire between the transmitting control unit and the CAN gateway.

6. Open wire check (F-CAN B_H line, F-CAN B_L line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. U0100: Jump the SCS line with the HDS, and wait more than 1 minute.

-3. U0129: Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

NOTE: Do not open and close the driver's door.

-4. According to the detected DTC on the following table, disconnect the transmitting control unit connector(s).

DTC	Connector
-	CAN gateway 12P connector (12P connector type)CAN gateway 16P connector (16P connector type)
U0100	PCM connector A (50P)
U0129	Electric brake booster 26P connector
U0122	VSA modulator-control unit 46P connector
U0151	SRS Unit Connector A (39P) Type

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	CAN gateway 12P connector (12P connector type): disconnected
B	CAN gateway 16P connector (16P connector type): disconnected
B	Transmitting control unit connector(s) for indicated DTCs: disconnected

12P connector type

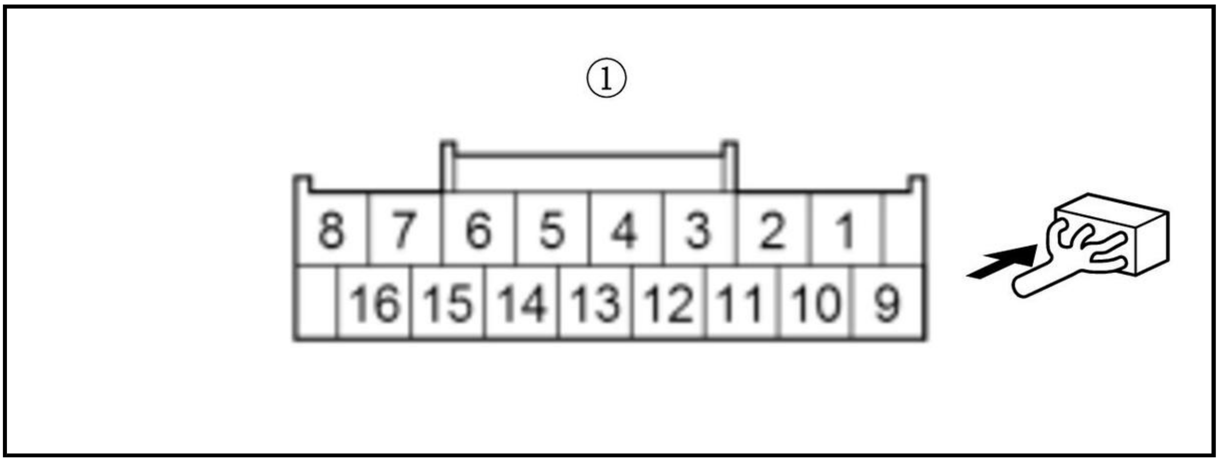
	F-CAN B_L		No. 14		No. 35



Is there continuity?

YES

The F-CAN B_H wire and the F-CAN B_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting.According to the detected DTC on the following table, substitute or replace the correspond control unit.

DTC	Operation for transmitting control unit
U0100	Check for poor connections or loose terminals at the CAN gateway and the PCM. **Replace the original PCM** .
U0122	Check for poor connections or loose terminals at the CAN gateway and the VSA modulator-control unit. **Replace the VSA modulator-control unit** .
U0129	Check for poor connections or loose terminals at the CAN gateway and the electric brake booster. **Replace the electric brake booster** .
U0151	Check for poor connections or loose terminals at the CAN gateway and the SRS unit. **Replace the SRS unit** .

NO

Repair an open in the F-CAN B_H wire or the F-CAN B_L wire between the transmitting control unit and the CAN gateway.

DTC TROUBLESHOOTING: U0302(CVT (TCM))

DTC U0302 : PGM-FI System and A/T System Program Version Mismatch

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This DTC is indicated when the TCM update procedure is not completed.
- Do not turn the vehicle to the OFF (LOCK) mode while updating the TCM. If you do, the TCM can be damaged.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0302 PGM-FI System and A/T System Program Version Mismatch	B	B	B

DTC(CVT)

1. Problem verification (update)

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. **Update the TCM** .

   -4. Turn the vehicle to the OFF (LOCK) mode.

   -5. Turn the vehicle to the ON mode.

   -6. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U0302 PGM-FI System and A/T System Program Version Mismatch	B	B	B

   Is DTC U0302 indicated?

   YES

   The failure is duplicated. **Replace the TCM** .

   NO

   Update is complete.

DTC TROUBLESHOOTING: U1260(CVT (TCM)) (2020 2021)

DTC U1260 : Lost Communication With Auxiliary Transmission Fluid Pump

NOTE:

- Before you troubleshoot, **review the General Troubleshooting Information** .
- This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U1260 Lost Communication With Auxiliary Transmission Fluid Pump	B	B	B

DTC(CVT)

1. Determine possible failure area (PGM-FI system, others)

   -1. Turn the vehicle to the ON mode.

   -2. Check for Pending or Confirmed DTCs in the PGM-FI system with the HDS.

DTC Description	Confirmed DTC	Pending DTC
P0A94 Voltage Stabilizer Malfunction	B	B

Is DTC P0A94 indicated?

YES

Go to the troubleshooting for DTC P0A94 in the PGM-FI system .

NO

Go to step 2.

2. Problem verification

   -1. Select the Electrical Oil Pump Activation in the Function Test Menu, and drive the auxiliary transmission fluid pump for at least 5 seconds with the HDS.

   -2. Check for Pending or Confirmed DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
U1260 Lost Communication With Auxiliary Transmission Fluid Pump	B	B	B

   Is DTC U1260 indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Intermittent failure, the system is OK at this time. Check for poor connections and loose terminals between the auxiliary transmission fluid pump and the TCM. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Determine possible failure area (power circuit, others)

   -1. Clear the DTC with the HDS.

   -2. Turn the vehicle to the OFF (LOCK) mode.

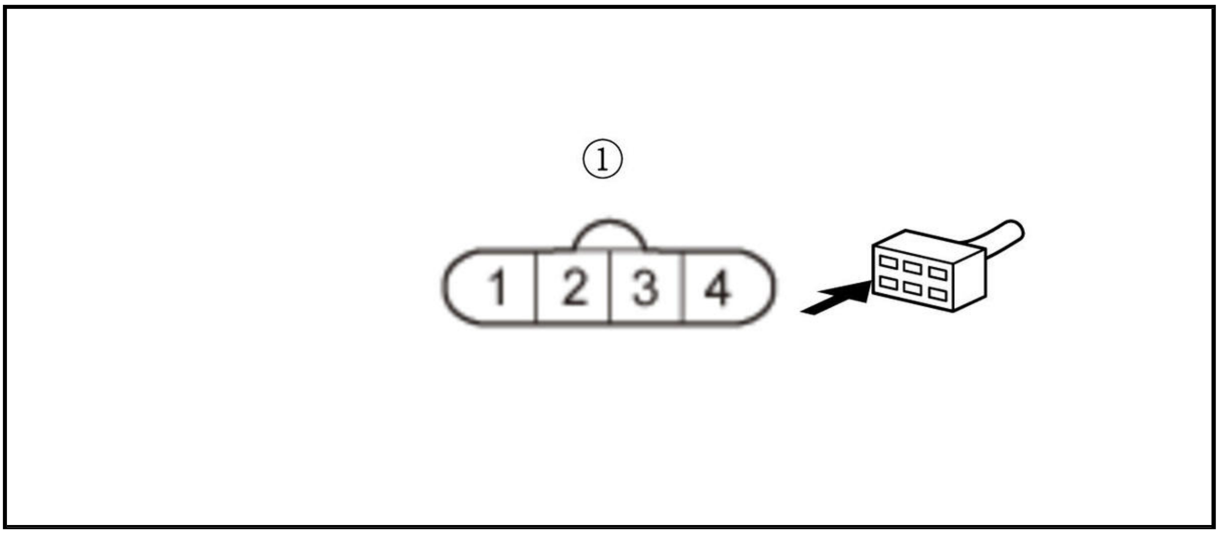
   -3. Disconnect the following connector.

Auxiliary transmission fluid pump 4P connector

   -4. Turn the vehicle to the ON mode.

   -5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Auxiliary transmission fluid pump 4P connector: disconnected
Test point 1	Auxiliary transmission fluid pump 4P connector (female terminals) No. 1: ①
Test point 2	Auxiliary transmission fluid pump 4P connector (female terminals) No. 4: ①



Is there battery voltage?

YES

Go to step 4.

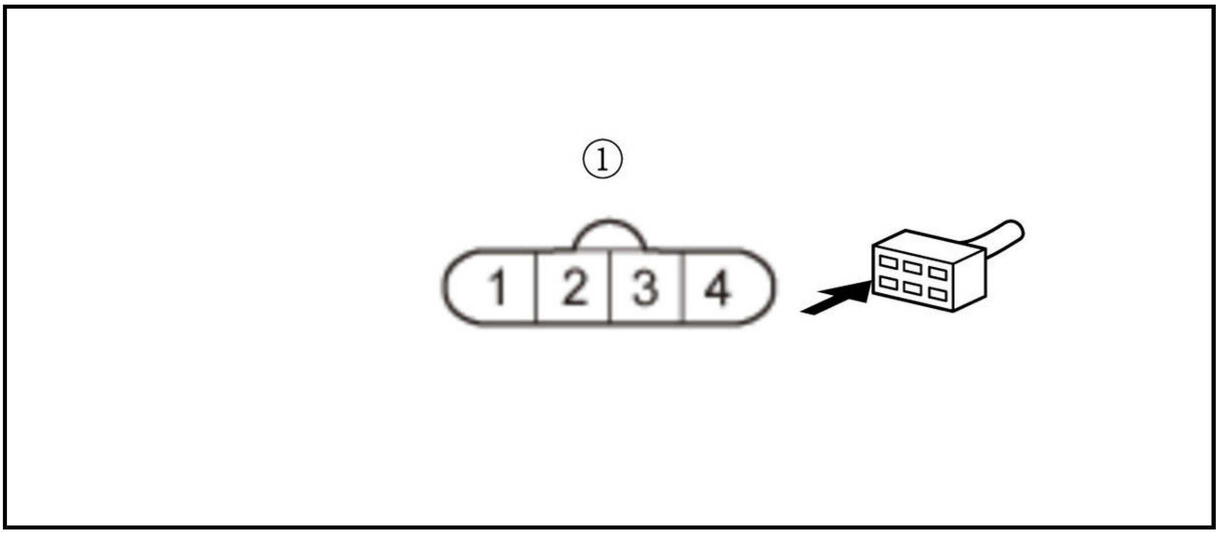
NO

Go to step 10.

4. Determine possible failure area (EOPSTS line, others)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Auxiliary transmission fluid pump 4P connector: disconnected
Test point 1	Auxiliary transmission fluid pump 4P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 5.

NO

Go to step 8.

5. Open wire check (EOPSIG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM from damage.

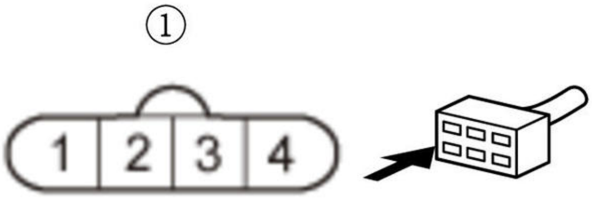
-3. Disconnect the following connector.

TCM 50P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Auxiliary transmission fluid pump 4P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	Auxiliary transmission fluid pump 4P connector (female terminals) No. 3: ①
Test point 2	**TCM 50P connector No. 40**



Is there 1.0 Ω or less?

YES

The EOPSIG wire is not open. Go to step 6.

NO

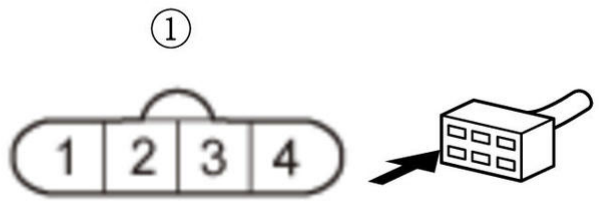
Repair an open in the EOPSIG wire between the auxiliary transmission fluid pump and the TCM.

6. Shorted wire check (EOPSIG line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Auxiliary transmission fluid pump 4P connector: disconnected
B	TCM 50P connector: disconnected

Test point 1	Auxiliary transmission fluid pump 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Repair a short to ground in the EOPSIG wire between the auxiliary transmission fluid pump and the TCM.

NO

The EOPSIG wire is OK. Go to step 7.

7. Auxiliary transmission fluid pump check

-1. Reconnect all connectors.

-2. **Test the auxiliary transmission fluid pump** .

Is the auxiliary transmission fluid pump OK?

YES

The auxiliary transmission fluid pump is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, **replace the original TCM** .

NO

Replace the auxiliary transmission fluid pump .

8. Shorted wire check (EOPSTS line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

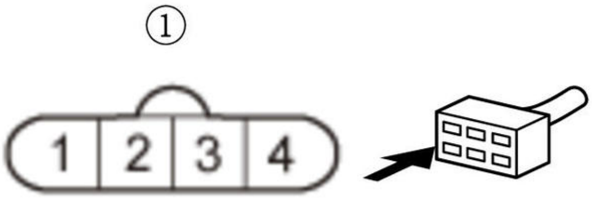
NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Auxiliary transmission fluid pump 4P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	Auxiliary transmission fluid pump 4P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The EOPSTS wire is not shorted. Go to step 9.

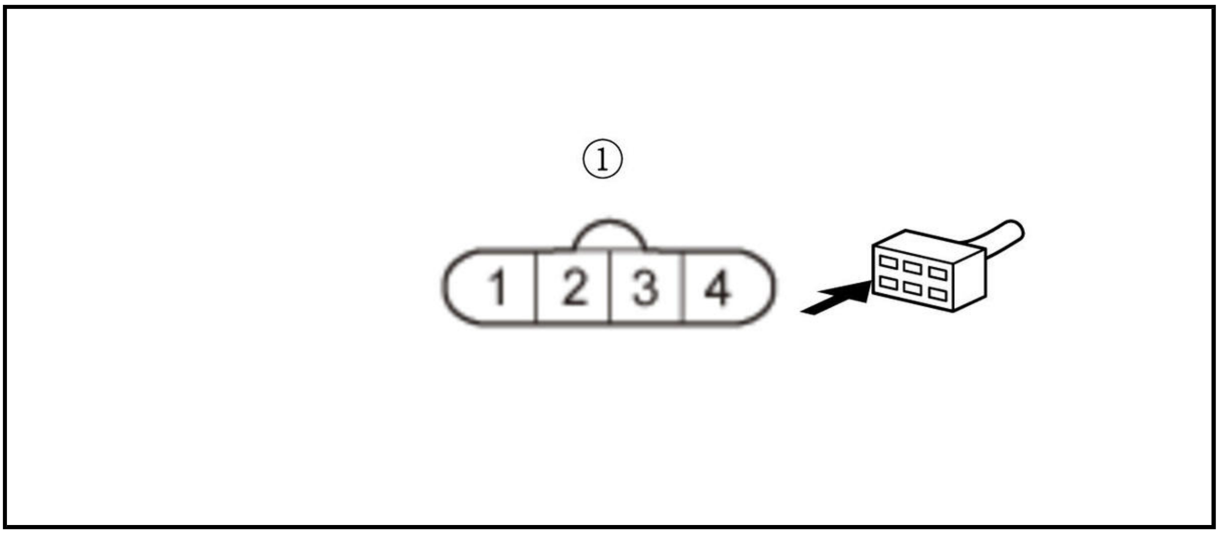
NO

Repair a short to ground in the EOPSTS wire between the auxiliary transmission fluid pump and the TCM.

9. Open wire check (EOPSTS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Auxiliary transmission fluid pump 4P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	Auxiliary transmission fluid pump 4P connector (female terminals) No. 2: ①
Test point 2	**TCM 50P connector No. 50**



Is there 1.0 Ω or less?

YES

The EOPSTS wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, **replace the original TCM** .

NO

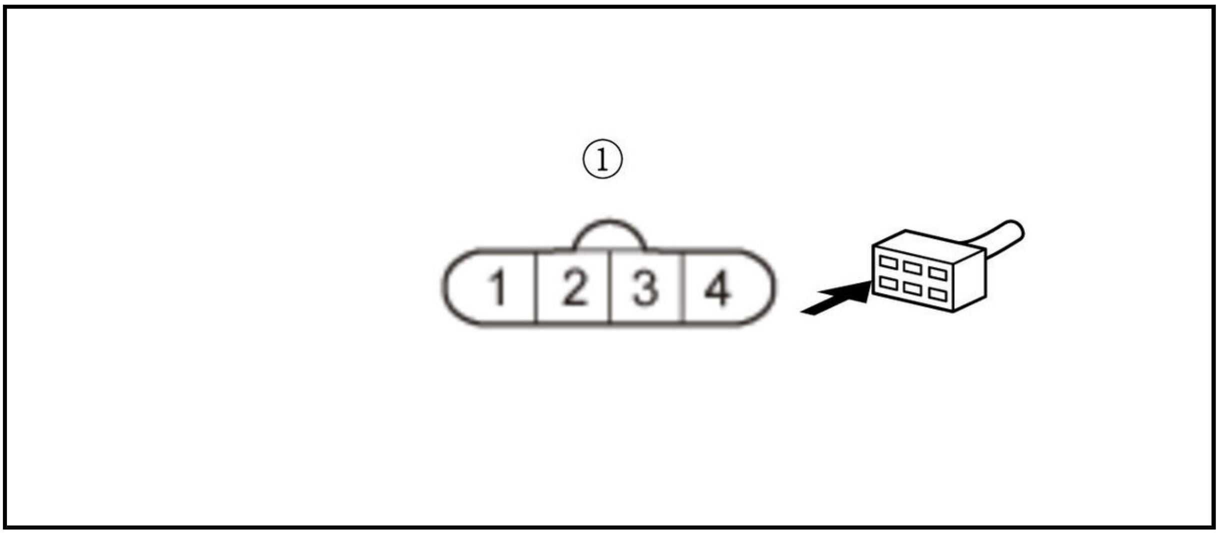
Repair an open in the EOPSTS wire between the auxiliary transmission fluid pump and the TCM.

10. Open wire check (EOPGND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Auxiliary transmission fluid pump 4P connector: disconnected
Test point 1	Auxiliary transmission fluid pump 4P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The EOPGND wire is OK. Go to step 11.

NO

Repair an open in the EOPGND wire between the auxiliary transmission fluid pump and ground (G151), or repair poor ground (G151).

11. Fuse check

-1. Check the following fuse.

Fuse	**No. F3**

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 12.

NO

Replace the No. F3 (7.5A) fuse, and recheck. If the fuse blows again, repair a short to ground in the No. F3 (7.5A) fuse circuit.

12. Relay check

-1. **Remove the auxiliary transmission fluid pump relay** .

-2. **Test the auxiliary transmission fluid pump relay** .

Is the relay OK?

YES

The auxiliary transmission fluid pump relay is OK. Go to step 13.

NO

Replace the auxiliary transmission fluid pump relay.

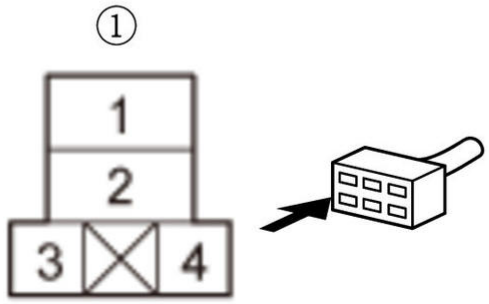
13. Open wire check (+B EOP line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between the following test points and body ground individually.

Test condition	Vehicle ON mode
B	Auxiliary transmission fluid pump relay 4P socket: disconnected
B	Auxiliary transmission fluid pump 4P connector: disconnected

Connector	**Terminal**
Auxiliary transmission fluid pump relay 4P socket (female terminals): ①	No. 2
	No. 4



Is there battery voltage?

YES

The +B EOP wire is OK. Go to step 14.

NO

Repair an open in the +B EOP wire between the auxiliary transmission fluid pump relay and the DC-DC converter.

14. Open wire check (EOPRLY/EOP RLY CL- line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

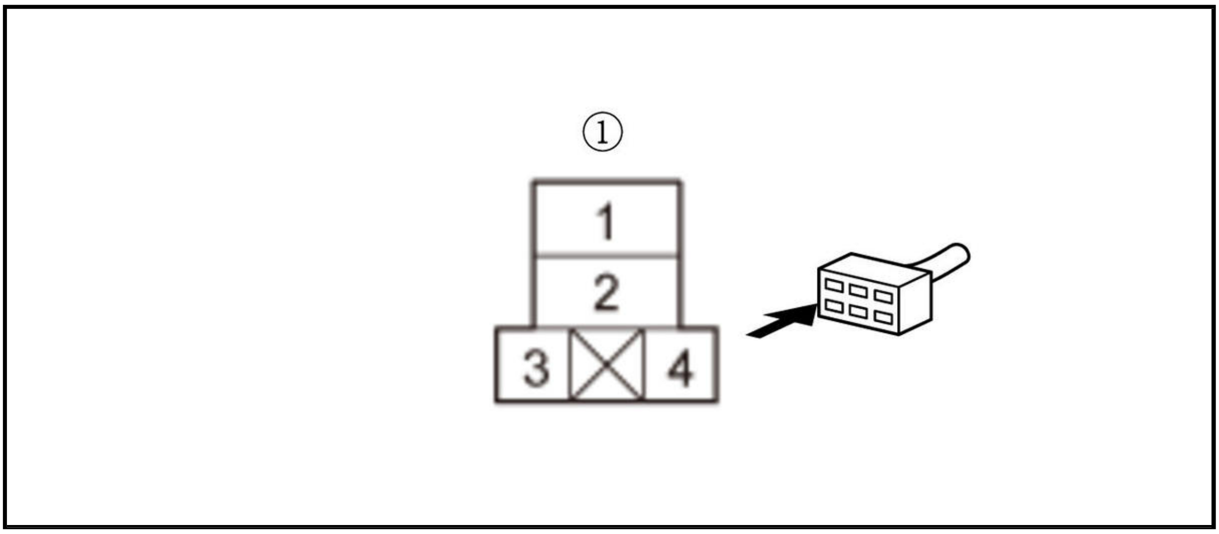
NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Auxiliary transmission fluid pump relay 4P socket: disconnected
B	Auxiliary transmission fluid pump 4P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	Auxiliary transmission fluid pump relay 4P socket (female terminals) No. 3: ①
Test point 2	**TCM 50P connector No. 27**



Is there 1.0 Ω or less?

YES

The EOPRLY/EOP RLY CL- wire is OK. Go to step 15.

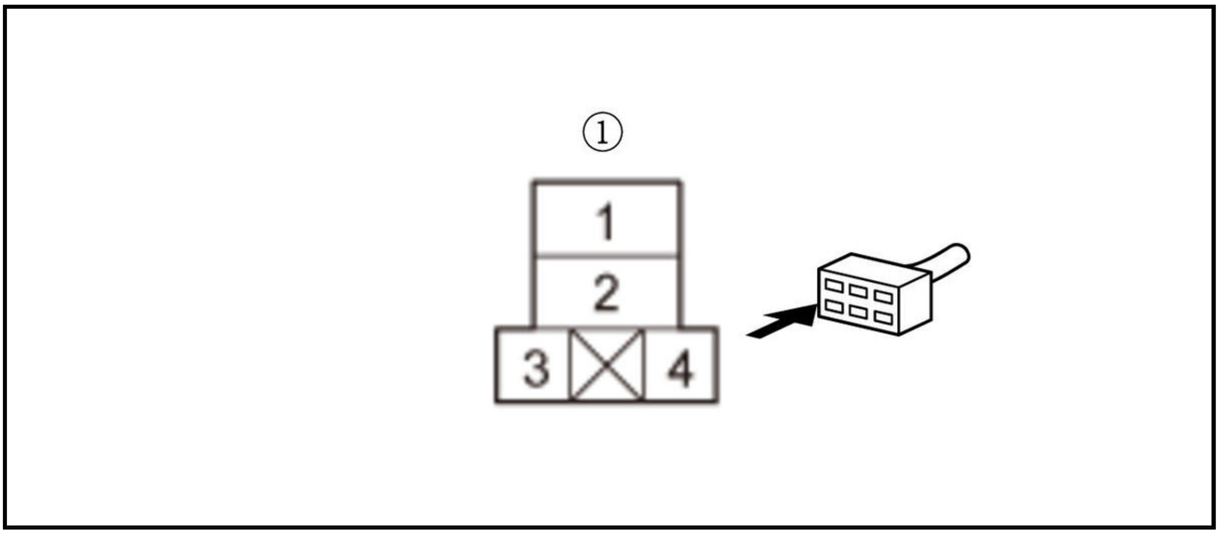
NO

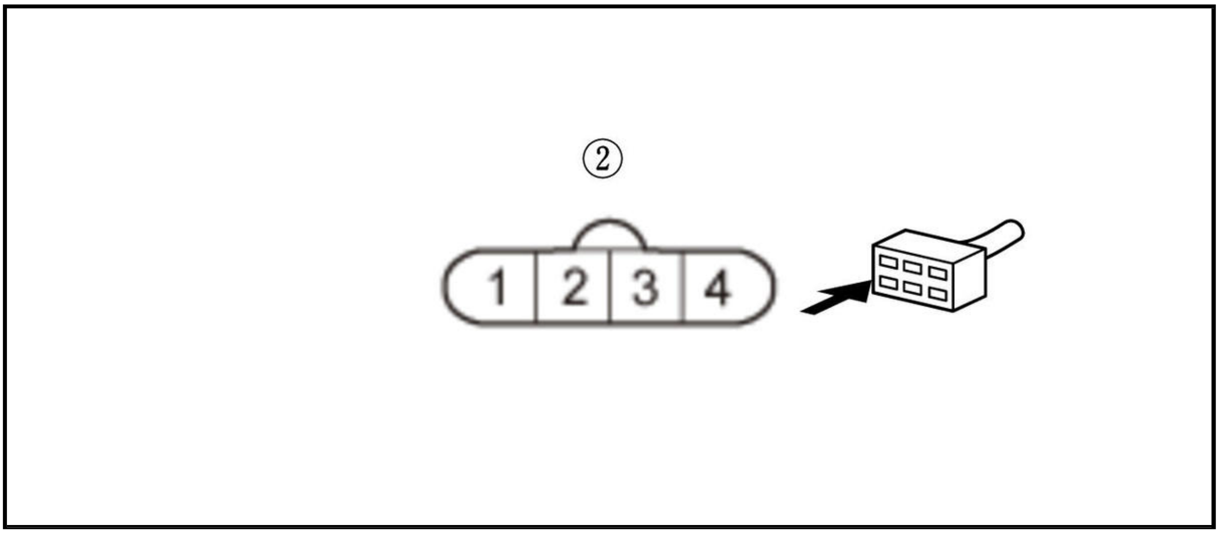
Repair an open in the EOPRLY/EOP RLY CL- wire between the auxiliary transmission fluid pump relay and TCM.

15. Open wire check (EOPVB/EOP RLY OUT line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Auxiliary transmission fluid pump relay 4P socket: disconnected
B	Auxiliary transmission fluid pump 4P connector: disconnected
B	TCM 50P connector: disconnected
Test point 1	Auxiliary transmission fluid pump relay 4P socket (female terminals) No. 1: ①
Test point 2	Auxiliary transmission fluid pump 4P connector (female terminals) No. 4: ②





Is there 1.0 Ω or less?

YES

The EOPVB/EOP RLY OUT wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, **replace the original TCM** .

NO

Repair an open in the EOPVB/EOP RLY OUT wire between the auxiliary transmission fluid pump relay and the auxiliary transmission fluid pump.

DISASSEMBLY AND REASSEMBLY

COUNTERSHAFT DISASSEMBLY AND REASSEMBLY

Special Tools Required

Image	Description/Tool Number
	Driver Handle, 40 mm I.D. 07746-0030100
	Bearing Driver Attachment, 30 mm I.D. 07746-0030300

Disassembly

NOTE:

- The bearing and the bearing outer race should be replaced as a set.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

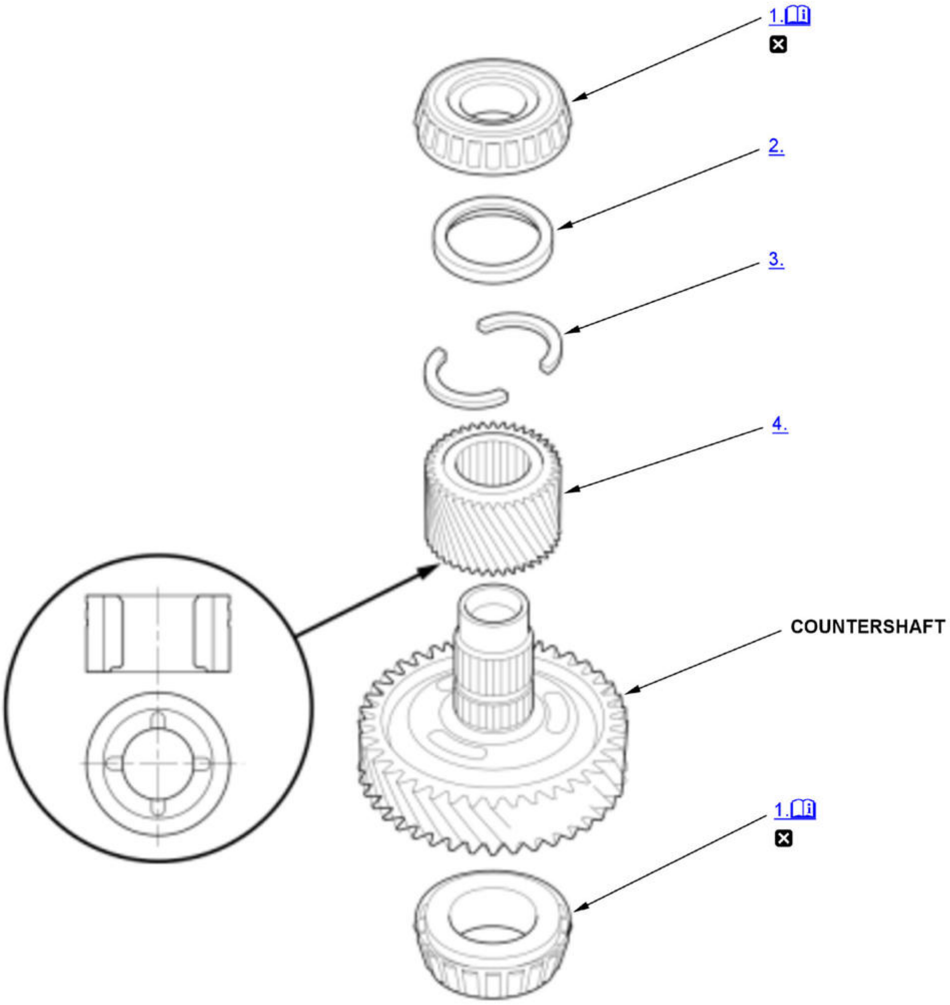


Fig. 1: Exploded View Of Countershaft Disassembly Components
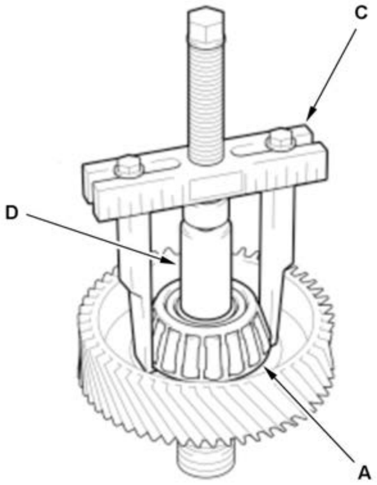
Courtesy of HONDA, U.S.A., INC.

☒	Replace

1. Countershaft Bearing - Remove

Flywheel Housing Side  **Transmission Housing Side**	1. Remove the countershaft tapered roller bearings (A) using the commercially available bearing separator (B), a commercially available bearing puller (C), and a commercially available spacer (D).



2. Cotter Retainer - Remove
3. Cotter - Remove
4. Final Drive Gear - Remove

Reassembly

NOTE:

- The bearing and the bearing outer race should be replaced as a set.
- **Inspect the countershaft bearing thrust clearance** whenever the bearing is replaced.
- Apply a light coat of clean ATF on all parts before installation.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

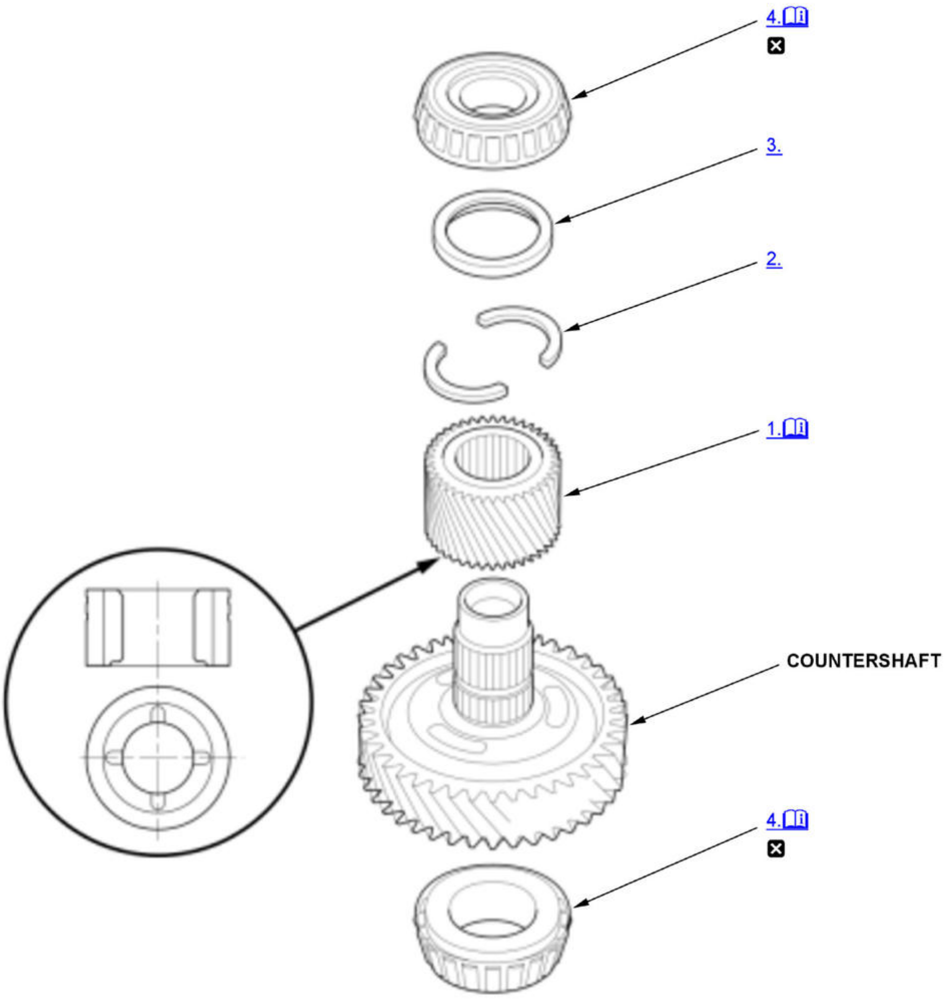


Fig. 2: Exploded View Of Countershaft Reassembly Components
Courtesy of HONDA, U.S.A., INC.

☒	Replace

1. Final Drive Gear - Install

   NOTE: Make sure the final drive gear is installed in the correct direction.

2. Cotter - Install
3. Cotter Retainer - Install
4. Countershaft Bearing - Install

	**Flywheel Housing Side** 1. Install the countershaft bearing (A) until it bottoms using the 40 mm I.D. driver handle and a press.

	**Transmission Housing Side** 2. Install the countershaft bearing (A) until it bottoms using the 40 mm I.D. driver handle, the 30 mm I.D. bearing driver attachment, and a press.

DIFFERENTIAL DISASSEMBLY AND REASSEMBLY

Special Tools Required

Image	Description/Tool Number
	Installer Attachment, 45 x 55 mm 07MAD-PR90100

Disassembly

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

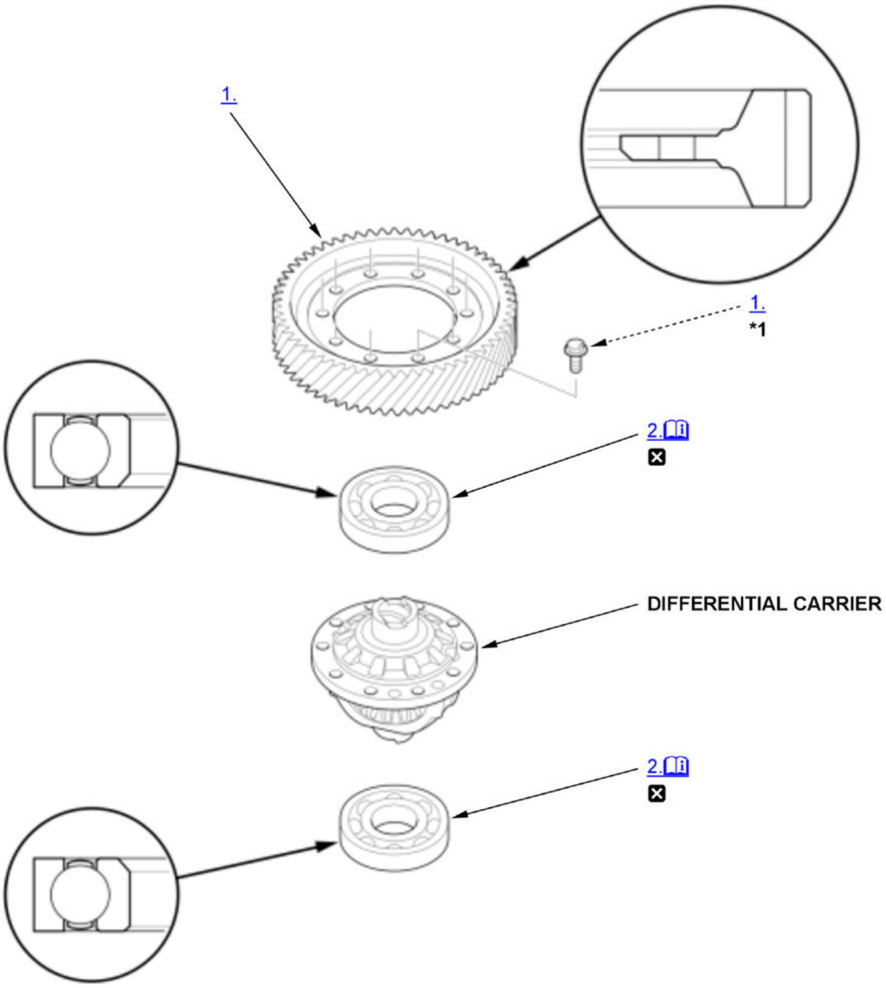

Fig. 3: Exploded View Of Differential Disassembly Components
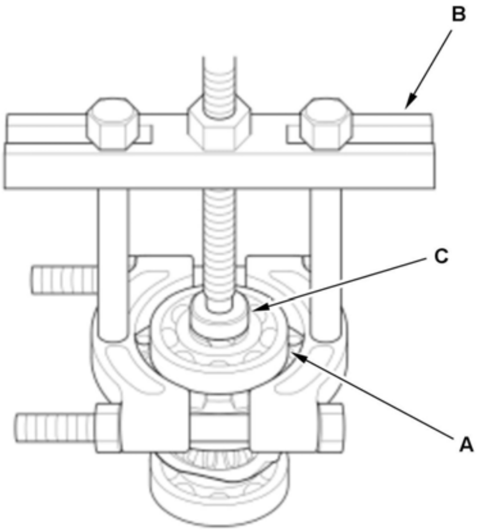
Courtesy of HONDA, U.S.A., INC.

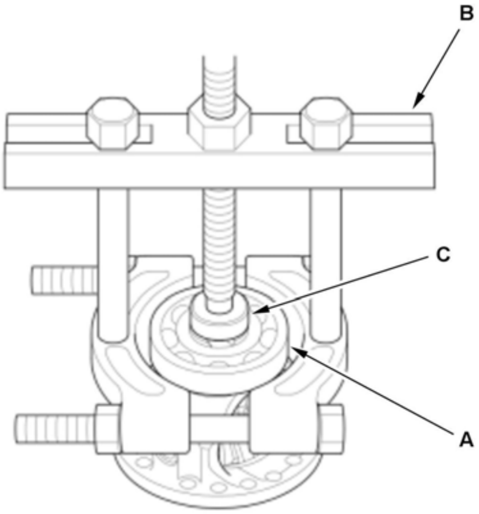
☒	Replace
*1	Left-hand threads

1. Final Driven Gear - Remove
2. Differential Carrier Bearing - Remove

B **Flywheel Housing Side**	1. Remove the differential carrier bearings (A) using a commercially available bearing puller (B) and a commercially available spacer (C).



Transmission Housing Side



Reassembly

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

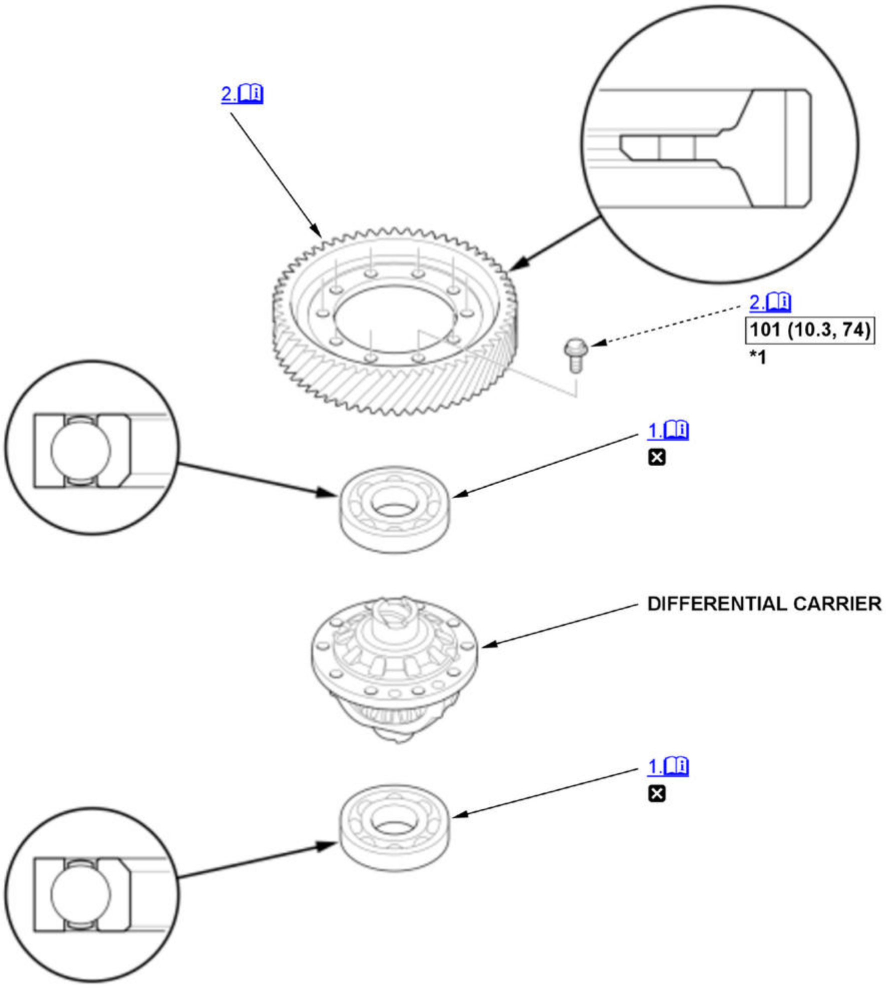


Fig. 4: Exploded View Of Differential Reassembly Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace
*1	Left-hand threads

1. Differential Carrier Bearing - Install

B **Flywheel Housing Side**	1. Install the differential carrier bearings (A) until it bottoms using the 45 x 55 mm installer attachment and a press. **NOTE:** Make sure the differential carrier bearing is installed in the correct direction.

 **Transmission Housing Side**  	

2. Final Driven Gear - Install

NOTE:

- Make sure the final driven gear is installed in the correct direction.
- Tighten the bolts to the specified torque in a crisscross pattern in at least two steps.

TRANSFER ASSEMBLY DISASSEMBLY AND REASSEMBLY

Special Tools Required

Image	Description/Tool Number
	Driver, 32.5 mm 070AD-SAA0101

Image	Description/Tool Number
	Driver Handle, 15 x 135L 07749-0010000
	Oil Seal Driver Attachment, 58 mm 07JAD-PH80101
	Holder, Companion 07PAB-0020000

Disassembly

☒	Replace

1. Transfer Hypoid Drive Gear/Shaft Assembly - Remove
2. Locknut - Remove

	1. Using a chisel, cut the lock tab (A) of the locknut (B). **NOTE:** Be careful not to damage the shaft.

	2. Secure the transfer hypoid drive gear/shaft assembly (A) in a bench vise (B) with hex wrench (C). 3. Remove the locknut.

3. Transfer Driven Gear and Washer - Remove

	1. Remove the transfer driven gear (A) and the washer (B) using a puller (C).

4. Stud Bolt - Remove
5. Locknut - Remove

	1. Using a chisel, cut the lock tab (A) of the locknut (B). **NOTE:** Be careful not to damage the shaft.

	2. Secure the transfer housing (A) in a bench vise (B). **NOTE:** To prevent damaging, always use wood blocks (C) or equivalent materials between the transfer housing and the bench vise. 3. Set the companion holder on the companion flange, then loosen the locknut. 4. Remove the companion holder. 5. Remove the locknut.

6. Conical Spring Washer - Remove
7. Back-Up Ring - Remove
8. Companion Flange - Remove
9. Transfer Hypoid Driven Gear - Remove
10. Thrust Washer - Remove
11. Transfer Spacer - Remove
12. Transfer Oil Seal - Remove

Reassembly

NOTE:

- Apply a light coat of clean ATF on all O-rings and moving parts before reassembly.
- Be careful not to damage the O-rings.

Fig. 6: Exploded View Of Transfer Assembly Reassembly Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Transfer Oil Seal - Install

	1. Install the transfer oil seal (A) to a depth (B) of 4.5-5.5 mm (0.177-0.217 in) below the transfer housing surface (C) using the 15 x 135L driver handle and the 58 mm oil seal driver attachment. **NOTE:** Apply a light coat of clean ATF to the oil seal surface of the press-fit part before installation.

2. Transfer Spacer - Install

   NOTE: Make sure the transfer spacer is installed in the correct direction.

3. Thrust Washer - Install
4. Transfer Hypoid Driven Gear - Install
5. Companion Flange - Install
6. Back-Up Ring - Install
7. Conical Spring Washer - Install

   NOTE: Make sure the conical spring washer is installed in the correct direction.

8. Locknut - Install

	1. Secure the transfer housing (A) in a bench vise (B). **NOTE:** To prevent damaging, always use wood blocks (C) or equivalent materials between the transfer housing and the bench vise. 2. Loosely install the locknut. 3. Rotate the companion flange several turns to seat the tapered roller bearings. 4. Set the companion holder on the companion flange. 5. Tighten the locknut while measuring the starting torque of the transfer hypoid driven gear tapered roller bearing so the starting torque is within the specified torque. Tighten the locknut to the lower torque specification, then check the starting torque. If the starting torque is low, increase the torque on the locknut until the starting torque is acceptable. **NOTE:** • If the starting torque exceeds the specified torque, replace the transfer spacer and reassemble the parts. Do not adjust the torque with the locknut loose. • If the tightening torque exceeds the specified torque and the starting torque is below the specified torque, replace the transfer spacer and reassemble the parts.

	6. Remove the companion holder.

Starting Torque:
0.98-1.39 N.m (10.0-14.2 kgf.cm, 8.7-12.3 lbf.in)

	7. Stake the locknut to a depth (A) of at least 0.7 mm (0.028 in) using a 3.0-3.5 mm (0.118-0.138 in) punch (B). **NOTE:** Be careful not to crack the locknut when staking.

9. Stud Bolt - Install
10. Transfer Driven Gear - Install

	1. Install the transfer driven gear (A) using the 32.5 mm driver and a press. **NOTE:** Make sure the transfer driven gear is installed in the correct direction.

11. Washer - Install

	1. Install the washer (A) using the 32.5 mm driver and a press. **NOTE:** Make sure the washer is installed in the correct direction.

12. Locknut - Install

	1. Secure the transfer hypoid drive gear/shaft assembly (A) in a bench vise (B) with hex wrench (C). 2. Install the locknut.

	3. Stake the locknut to a depth (A) of at least 0.7 mm (0.028 in) using a 3.0-3.5 mm (0.118-0.138 in) punch (B). **NOTE:** Be careful not to crack the locknut when staking.

	4. Secure the transfer hypoid drive gear/shaft assembly (A) in a bench vise (B). **NOTE:** To prevent damaging, always use wood blocks (C) or equivalent materials between the transfer hypoid drive gear/shaft assembly and the bench vise. 5. Rotate the transfer driven gear (D) several turns to seat the tapered roller bearings. 6. Measure the starting torque of the transfer hypoid drive gear tapered roller bearing using the torque wrench (E) and a socket (F). 7. If the starting torque is out of the specification, replace the transfer hypoid drive gear/shaft assembly.

Starting Torque:
1.63-5.23 N.m (16.6-53.4 kgf.cm, 14.4-46.3 lbf.in)

13. Transfer Hypoid Gear Tooth Contact Pattern - Check
14. Transfer Hypoid Drive Gear/Shaft Assembly - Install
15. Total Starting Torque - Check
16. Transfer Gear Backlash - Check

TRANSMISSION (E-CVT) DISASSEMBLY AND REASSEMBLY

Special Tools Required

Image	Description/Tool Number
	Oil Seal Driver C 070AD-TZ3A300
	Slide Hammer 07936-371020A
	Bearing Driver Attachment, 42 x 47 mm 07746-0010300

☒	Replace

1. Transmission Fluid Pressure Sensor - Remove

   NOTE: Be careful not to damage the plastic part.

2. Shift Solenoid Valve A - Remove
3. Shift Solenoid Valve B - Remove
4. ATF Inlet Line - Remove
5. ATF Outlet Line - Remove
6. Filler Plug - Remove
7. Sealing Bolt - Remove
8. Breather Cap - Remove
9. Filler Cap - Remove
10. Transmission Hanger A - Remove
11. Transmission Hanger B - Remove
12. Park Pawl Actuator - Remove

13. Park Position Sensor - Remove
14. Flywheel Housing - Remove
15. Intermediate Shaft Oil Seal - Remove
16. Input Shaft Oil Seal - Remove
17. 10 x 46.5 mm Pipe - Remove
18. 8 x 44.1 mm Pipe - Remove
19. 10.8 x 35 mm Pipe - Remove
20. Shim - Remove
21. Generator Shaft - Remove
22. Shim - Remove
23. Input Shaft - Remove
24. Over Drive Clutch - Remove
25. Cotter Retainer A - Remove

	1. Remove cotter retainer A by compressing the snap ring (B).

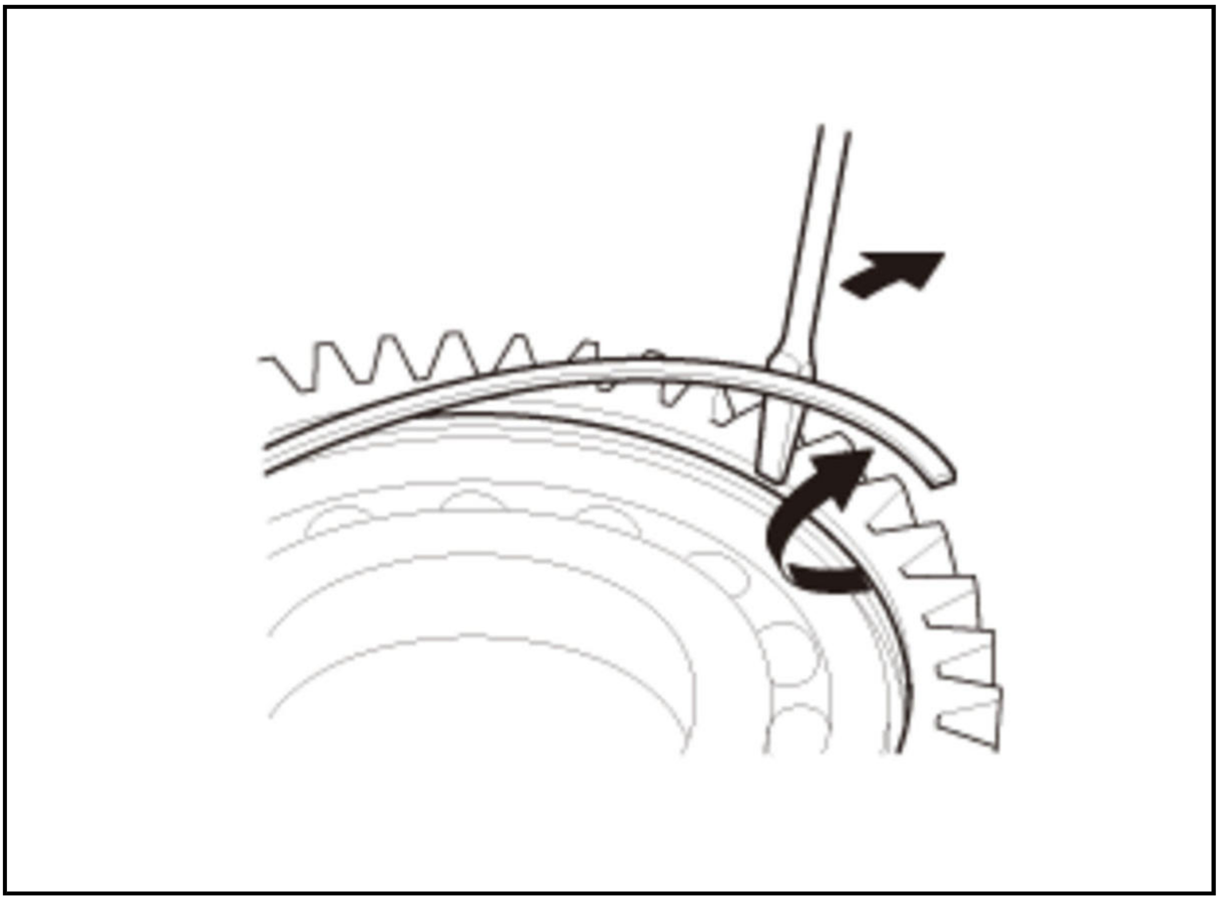
26. Snap Ring - Remove
27. Cotter - Remove
28. Parking Gear - Remove
29. Countershaft and Differential - Remove

	1. Remove the spacer (A). 2. Remove the countershaft (B) and the differential (C) together. 3. Remove the spacer (D).

30. Countershaft Bearing Outer Race (Transmission Housing Side) - Remove

	1. Remove the countershaft bearing outer race using the 45-75 mm adjustable bearing puller and a commercially available 3/8"-16 slide hammer (A).

31. Shim - Remove
32. Over Drive Gear - Remove
33. Over Drive Gear Bearing (Over Drive Clutch Side) - Remove
34. Internal Snap Ring - Remove



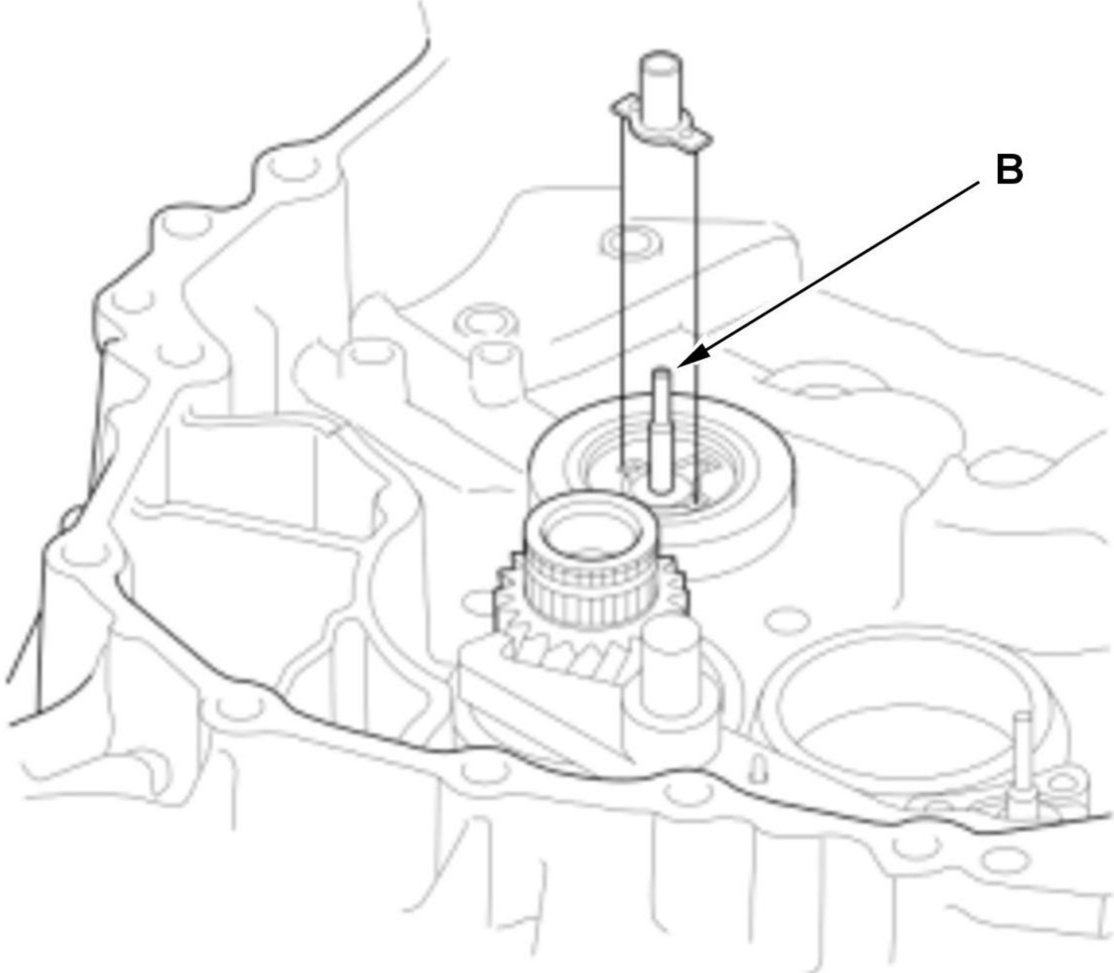
35. Over Drive Gear Bearing (Transmission Housing Side) - Remove

	1. Remove the over drive gear bearing (A) (transmission housing side) using a commercially available 3.0 mm pin driver (B). **NOTE:** Lightly tap the pin driver in a crisscross pattern to prevent the bearing from binding.

36. Internal Snap Ring - Remove

 	1. Remove the internal snap ring (A) by compressing it using commercially available snap ring pliers (B).

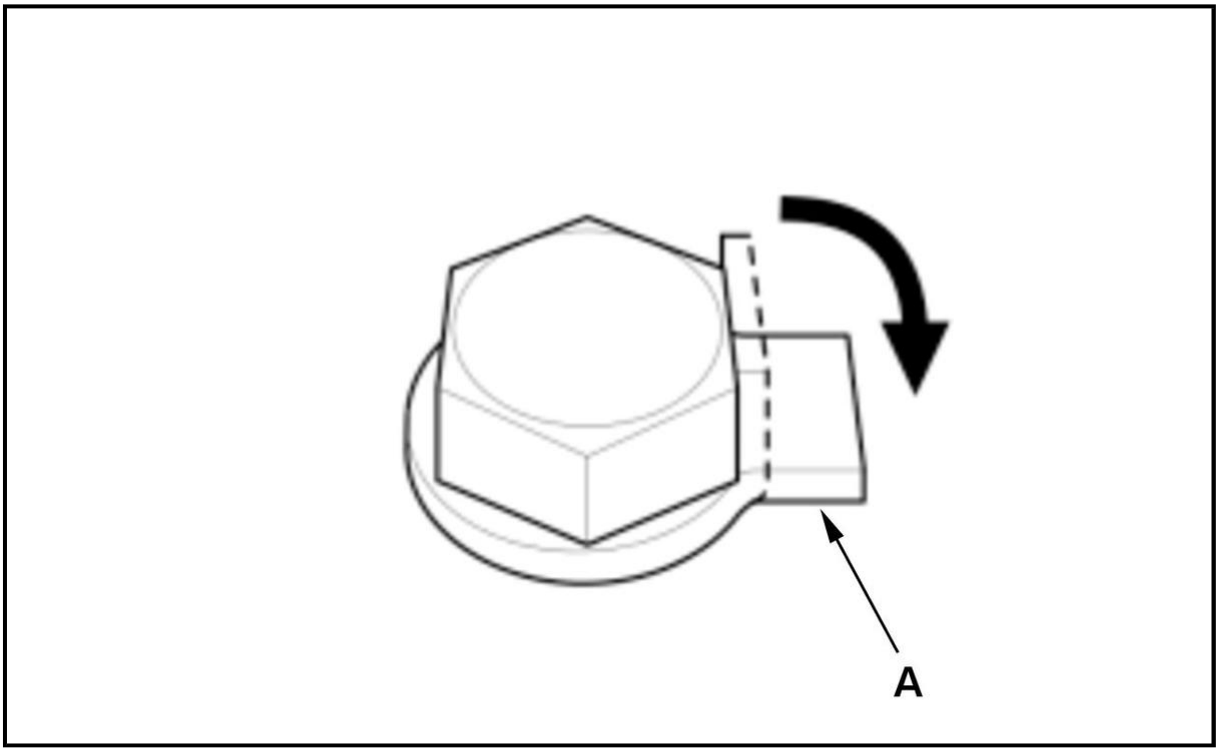
37. Feed Pipe Flange - Remove
38. Feed Pipe A - Remove



NOTE: Replace the transmission (e-CVT), if feed pipe B replacement is required.

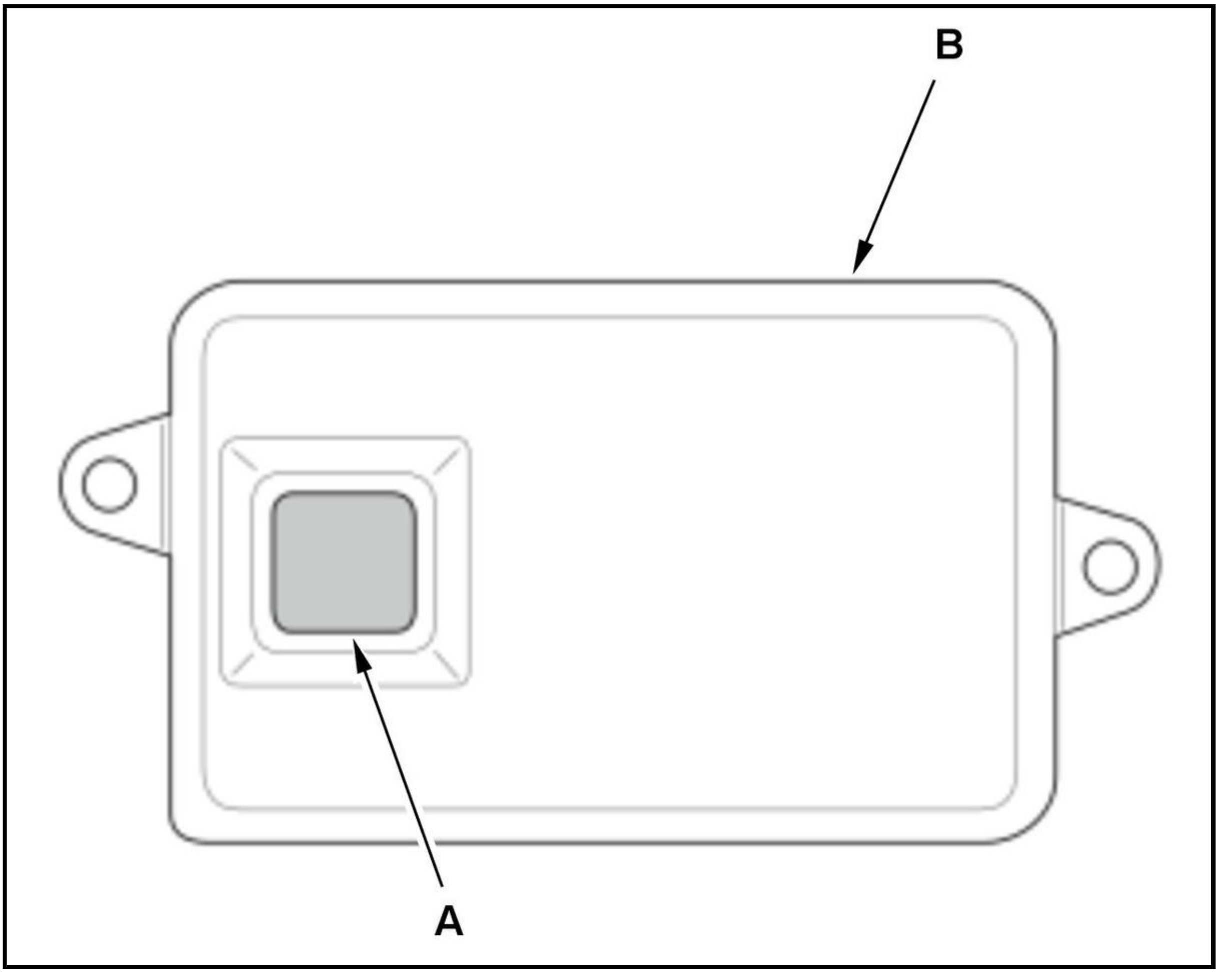
39. Parking Brake Pawl - Remove
40. Parking Pawl Spring - Remove
41. Parking Shaft - Remove

42. Parking Brake Rod Holder - Remove



NOTE: Pry down the lock tab (A) of the lock washer.

43. ATF Magnet - Remove and Clean
44. Driveshaft Oil Seal - Remove
45. ATF Strainer - Remove

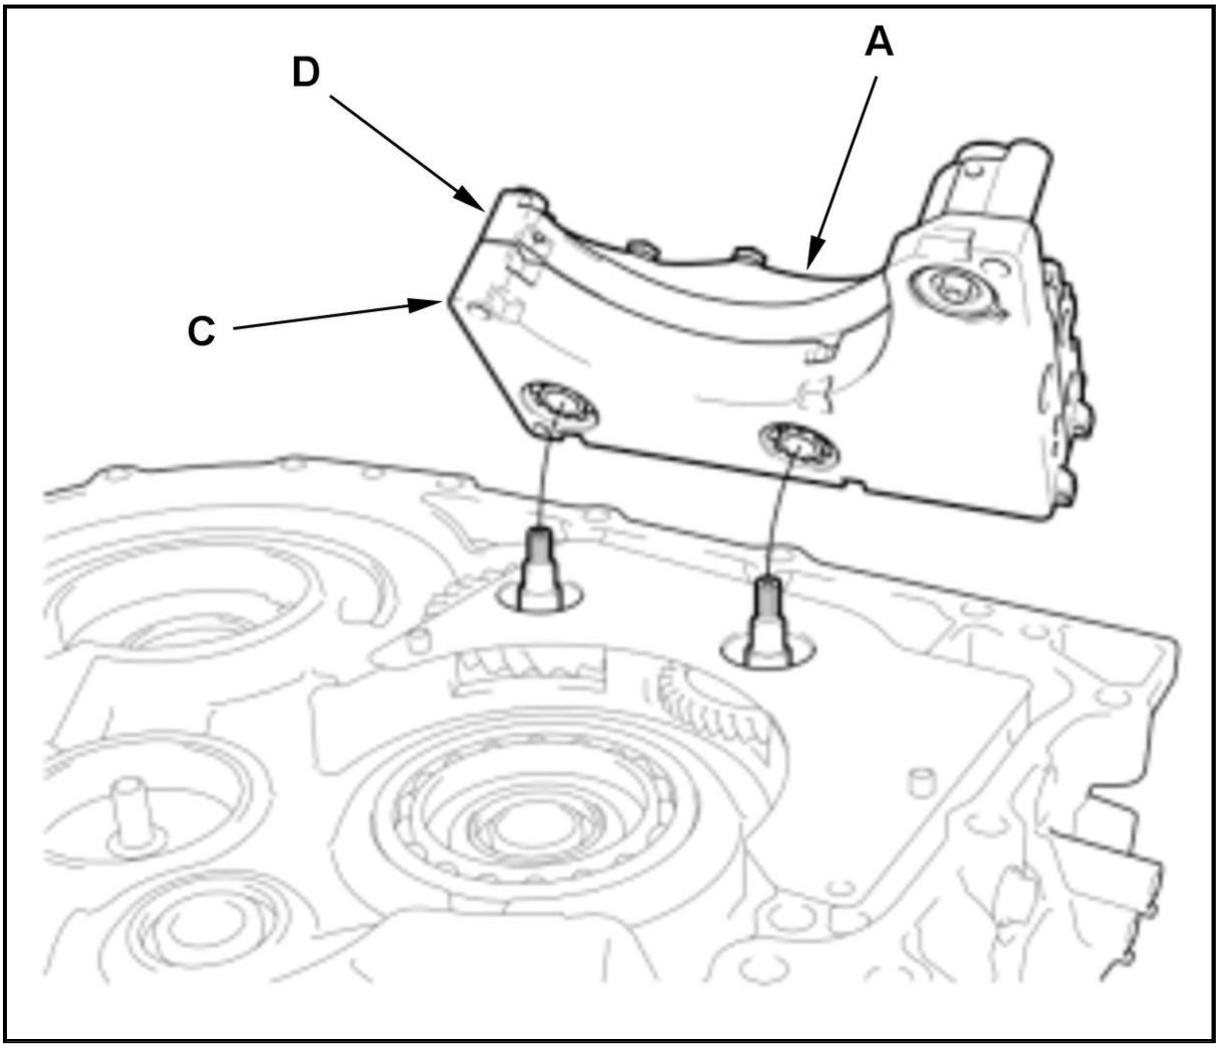


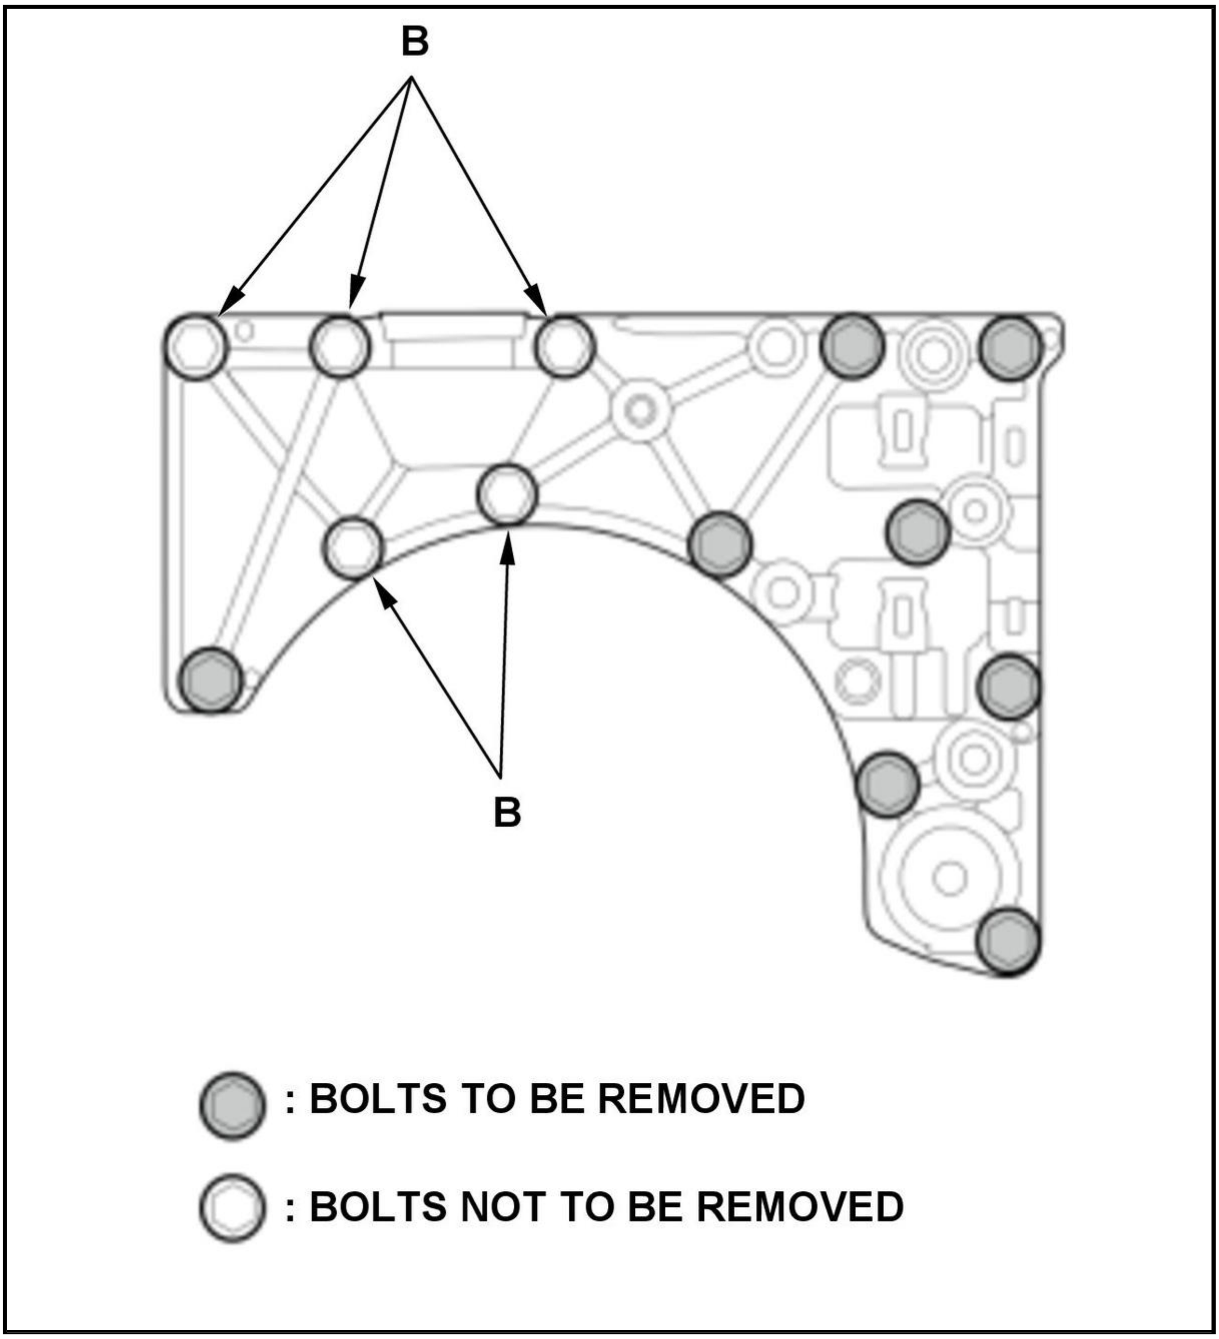
ATF Strainer Check

1. Clean the inlet opening (A) of the ATF strainer (B) thoroughly with compressed air, then check that it is in good condition and that the inlet opening is not clogged.

2. Check the ATF strainer for clogs, debris, or damage. If the strainer is clogged or damaged, replace it.

46. Valve Body Assembly - Remove





B
B
: BOLTS TO BE REMOVED
: BOLTS NOT TO BE REMOVED

NOTE:

- Do not disassemble the valve body assembly (A). If any problem occurs, replace the assembly.
- Remove the appropriate bolts as shown.
- Do not remove the mounting bolts (B). These bolts secure the regulator valve body (C) and the shift valve body (D).

47. Separator Plate - Remove
48. ATF Pump Drive Shaft A - Remove
49. ATF Pump Drive Shaft B - Remove
50. ATF Pump Drive Shaft A Bearing - Remove

 07936-371020A 07936-166010A A	1. Remove the ATF pump drive shaft A bearing (A) using the 12 mm bearing remover shaft set and the slide hammer.

51. ATF Pump Drive Shaft B Bearing - Remove

 077936-371020A 07936-166010A A	1. Remove the ATF pump drive shaft B bearing (A) using the 12 mm bearing remover shaft set and the slide hammer.

52. Baffle Plate - Remove

53. Shim - Remove

	1. Using a commercially available snap ring pliers (B), remove the shim (A) by compressing it.

54. Generator Shaft Bearing - Remove

	1. Remove the generator shaft bearing (A) using the 20 mm bearing remover shaft set, the remover handle, and the slide hammer.

55. Countershaft Bearing Outer Race (Flywheel Housing Side) - Remove

	1. Remove the countershaft bearing outer race (A) by heating the flywheel housing (B) using a heat gun (C). **NOTE:** - Be careful not to burn yourself by the hot part. - Do not heat the flywheel housing more than 212B°F (100B°C).

56. Oil Guide Plate C - Remove

57. Input Shaft Bearing - Remove

	1. Remove the input shaft bearing (A) by heating the flywheel housing (B) using a heat gun (C). **NOTE:** • Be careful not to burn yourself by the hot part. • Do not heat the flywheel housing more than 212B°F (100B°C).

58. Drain Plug - Remove

59. Sealing Bolt - Remove

Reassembly

NOTE:

- Keep all foreign particles out of the transmission (e-CVT).
- Clean all removing parts before reassembly.
- Apply a light coat of clean ATF on all O-rings and moving parts before reassembly.
- Be careful not to damage the O-rings.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Sealing Bolt - Install
2. Drain Plug - Install
3. Input Shaft Bearing - Install

 07749-0010000 07ZAD-PNA0100 or 07ZAD-PNAA100 A	1. Install the input shaft bearing (A) until it bottoms using the 15 x 135L driver handle and the 96 mm oil seal driver attachment.

4. Oil Guide Plate C - Install

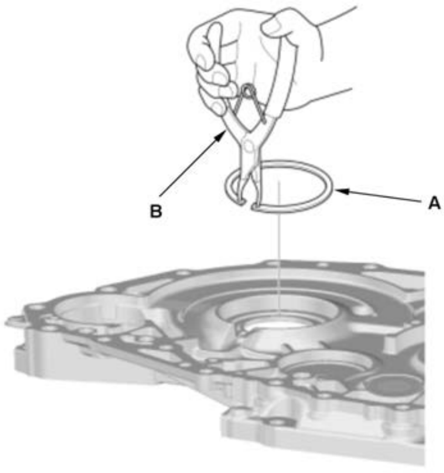
5. Countershaft Bearing Outer Race (Flywheel Housing Side) - Install

 070AD-TZ30300 A	1. Install the countershaft bearing outer race (A) until it bottoms using oil seal driver C.

6. Generator Shaft Bearing - Install

 07749-0010000 A 07746-0010300	1. Install the generator shaft bearing (A) until it bottoms using the 15 x 135L driver handle and the 42 x 47 mm bearing driver attachment.

7. Shim - Install

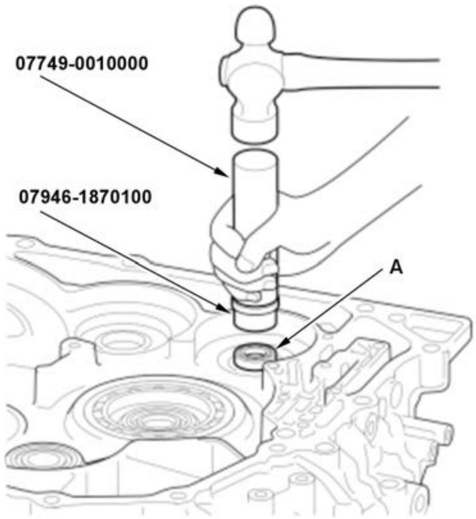


1. Using a commercially available snap ring pliers (B), install the shim (A) by compressing it.

NOTE:

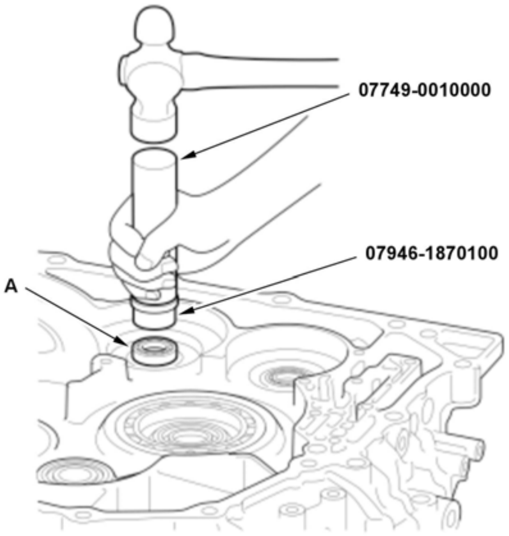
- Be careful not to deform the snap ring by opening/closing it excessively.
- Make sure the snap ring is firmly installed in the groove. If it is not, remove the snap ring and check for dirt or debris in the groove.

8. Baffle Plate - Install
9. ATF Pump Drive Shaft A Bearing - Install



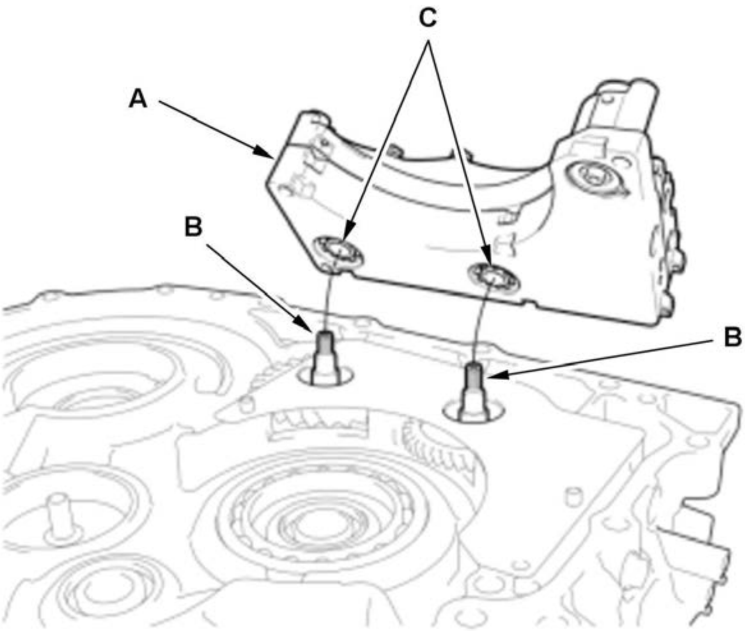
1. Install the ATF pump drive shaft A bearing (A) until it bottoms using the 15 x 135L driver handle and the 28 x 30 mm bearing driver attachment.

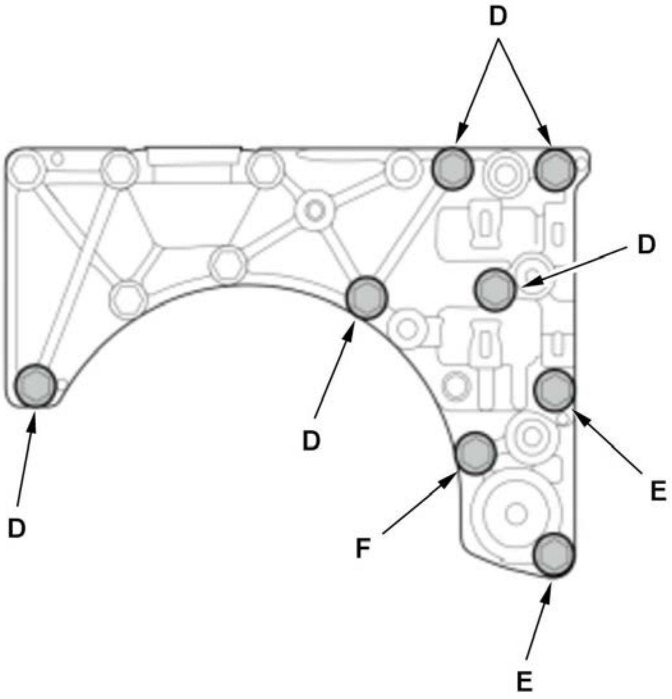
10. ATF Pump Drive Shaft B Bearing - Install



1. Install the ATF pump drive shaft B bearing (A) until it bottoms using the 15 x 135L driver handle and the 28 x 30 mm bearing driver attachment.

11. ATF Pump Drive Shaft A - Install
12. ATF Pump Drive Shaft B - Install
13. Separator Plate - Install
14. Valve Body Assembly - Install





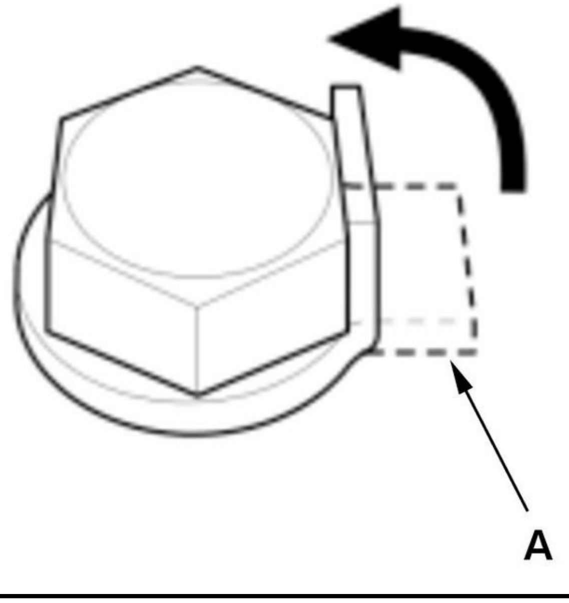
1. Install the valve body assembly (A) by aligning the ATF pump drive shafts (B) and the bearings (C).

Bolt	Length
D	70 mm (2.76 in)
E	60 mm (2.36 in)
F	30 mm (1.18 in)

15. ATF Strainer - Install
16. Drive Shaft Oil Seal - Install

	1. Install the drive shaft oil seal (A) flush with the transmission housing using the 15 x 135L driver handle and the oil seal driver attachment. **NOTE:** Apply a light coat of clean ATF to the oil seal surface of the press-fit part and the lip part before installation.

17. ATF Magnet - Install
18. Parking Brake Rod Holder - Install



NOTE: Pry up the lock tab (A) of the lock washer.

19. Parking Shaft, Parking Pawl Spring, and Parking Brake Pawl - Install

	1. Install the parking shaft (A), the parking pawl spring (B), and the parking brake pawl (C) as shown.

20. Feed Pipe A - Install

	1. Install feed pipe A by aligning the fingers (B) with the grooves (C).

21. Feed Pipe Flange - Install

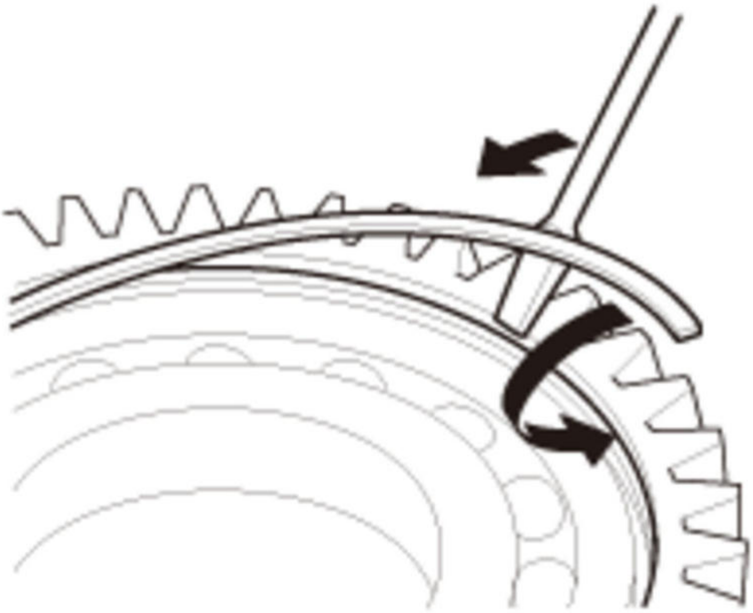
22. Internal Snap Ring - Install

	1. Using a commercially available snap ring pliers (A), install the internal snap ring (B) by compressing it. **NOTE:** • Be careful not to deform the snap ring by opening/closing it excessively. • Make sure the snap ring is firmly installed in the groove.

23. Over Drive Gear Bearing (Transmission Housing Side) - Install

	1. Install the over drive gear bearing (A) until it bottoms using the 15 x 135L driver handle and the 110 x 140 mm driver attachment. **NOTE:** Make sure the over drive gear bearing is installed in the correct direction.

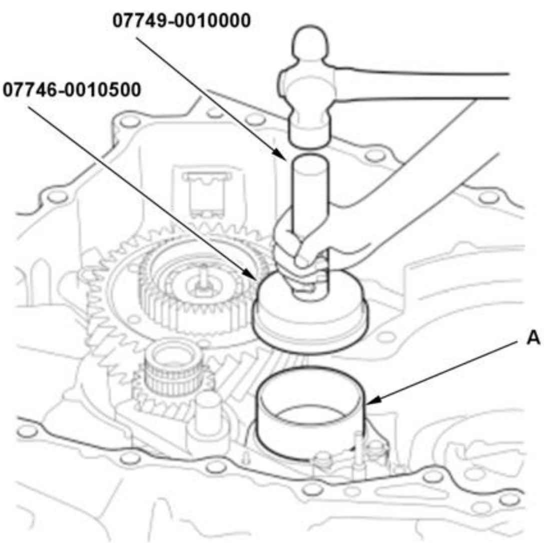
24. Internal Snap Ring - Install



NOTE:

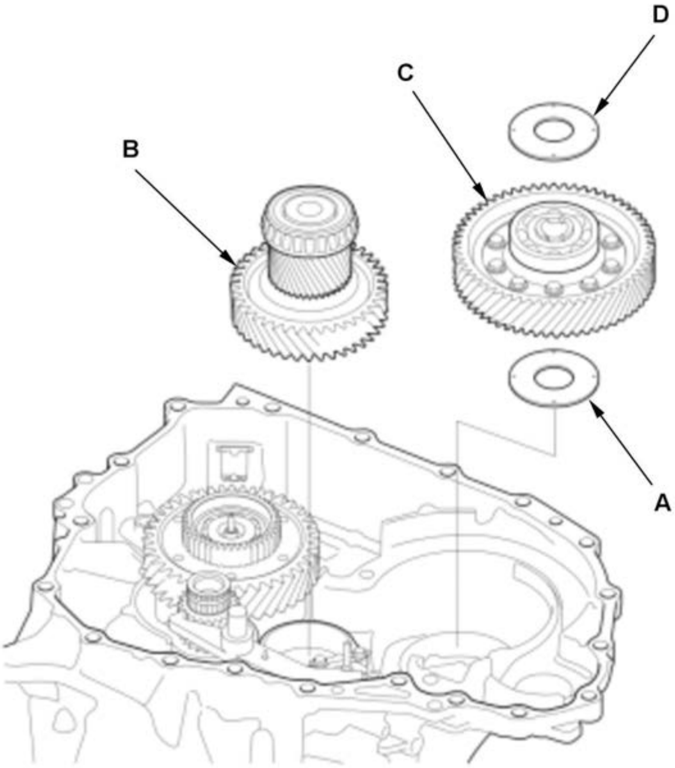
- Be careful not to deform the snap ring by opening/closing it excessively.
- Make sure the snap ring is firmly installed in the groove.

25. Over Drive Gear Bearing (Over Drive Clutch Side) - Install
26. Over Drive Gear - Install
27. Shim - Install
28. Countershaft Bearing Outer Race (Transmission Housing Side) - Install



1. Install the countershaft bearing outer race (A) using the 15 x 135L driver handle and the 62 x 68 mm bearing driver attachment.

29. Countershaft and Differential - Install



1. Install the spacer (A).

2. Join the countershaft (B) and the differential (C) together, then install them.

3. Install the spacer (D).

30. Parking Gear - Install

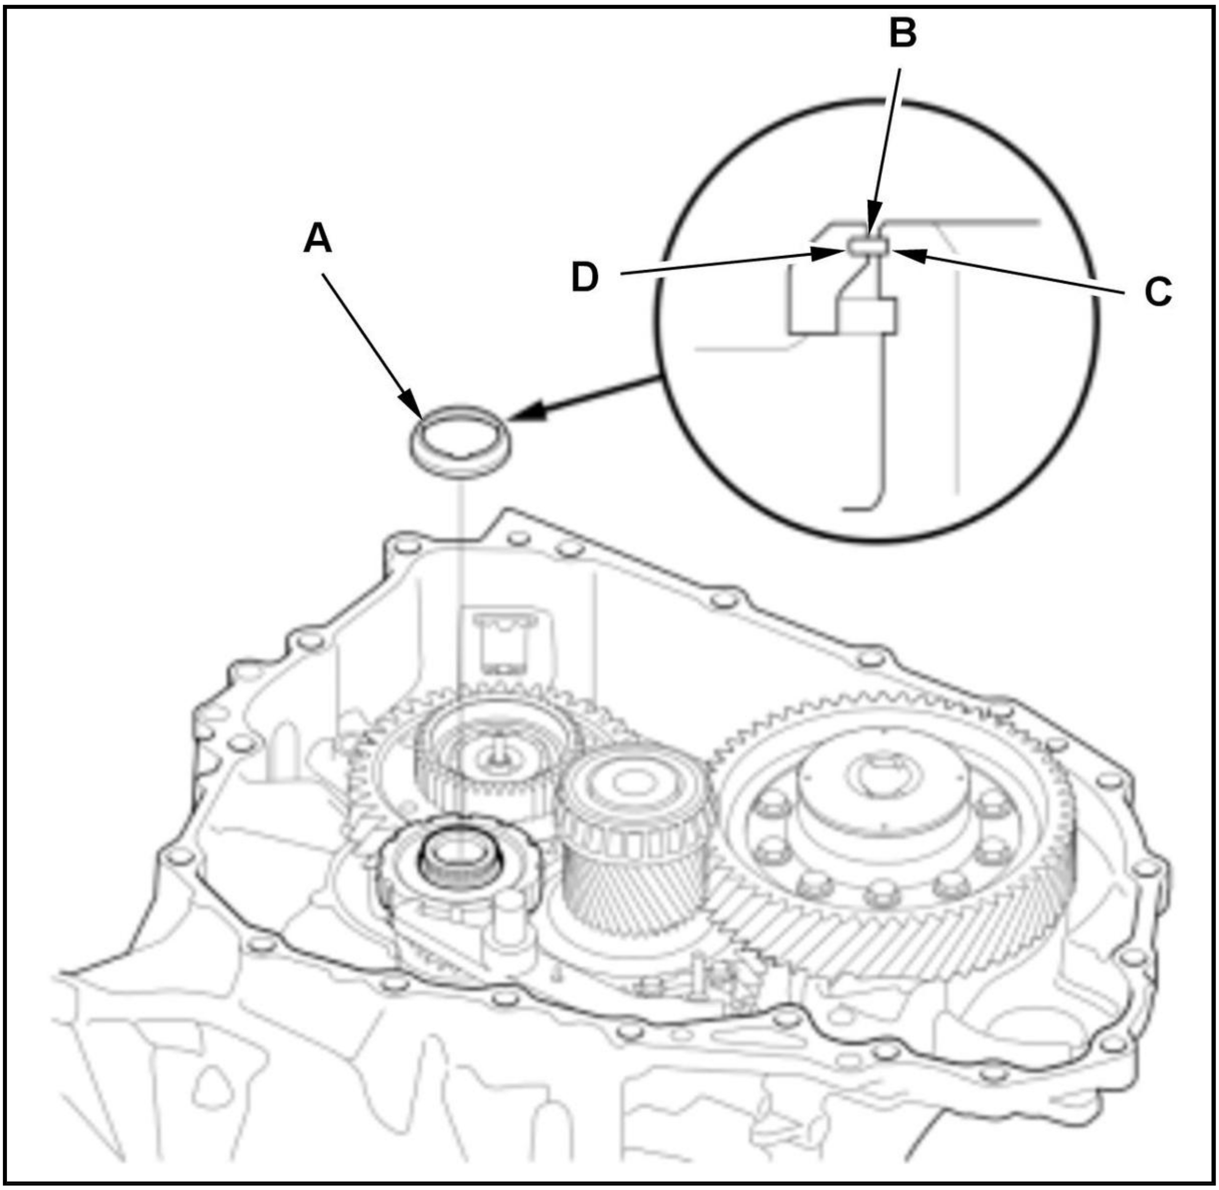
NOTE: Make sure the parking gear is installed in the correct direction.

31. Cotter - Install
32. Snap Ring - Install

NOTE:

- Be careful not to deform the snap ring by opening/closing it excessively.
- Make sure the snap ring is firmly installed in the groove.

33. Cotter Retainer A - Install



NOTE: The snap ring (B) locks cotter retainer A by engaging the shaft groove (C) with the retainer groove (D). Make sure the snap ring is firmly installed in each groove.

34. Over Drive Clutch - Install

	1. Install the over drive clutch (A) by aligning the over drive clutch discs (B) with the over drive gear splines (C).

35. Input Shaft - Install

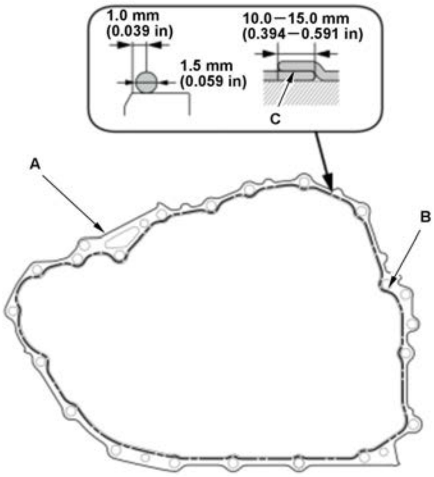
36. Shim - Install
37. Generator Shaft - Install
38. Shim - Install
39. 10.8 x 35 mm Pipe - Install
40. 8 x 44.1 mm Pipe - Install
41. 10 x 46.5 mm Pipe - Install
42. Input Shaft Oil Seal - Install

	1. Install the input shaft oil seal (A) flush with the flywheel housing using the 15 x 135L driver handle and the 42 x 47 mm bearing driver attachment. **NOTE:** Apply a light coat of clean ATF to the oil seal surface of the press-fit part and the lip part before installation.

43. Intermediate Shaft Oil Seal - Install

	1. Install the intermediate shaft oil seal (A) flush with the flywheel housing using the 15 x 135L driver handle and the 64 x 72 mm oil seal driver attachment. **NOTE:** Apply a light coat of clean ATF to the oil seal surface of the press-fit part and the lip part before installation.

44. Flywheel Housing - Install

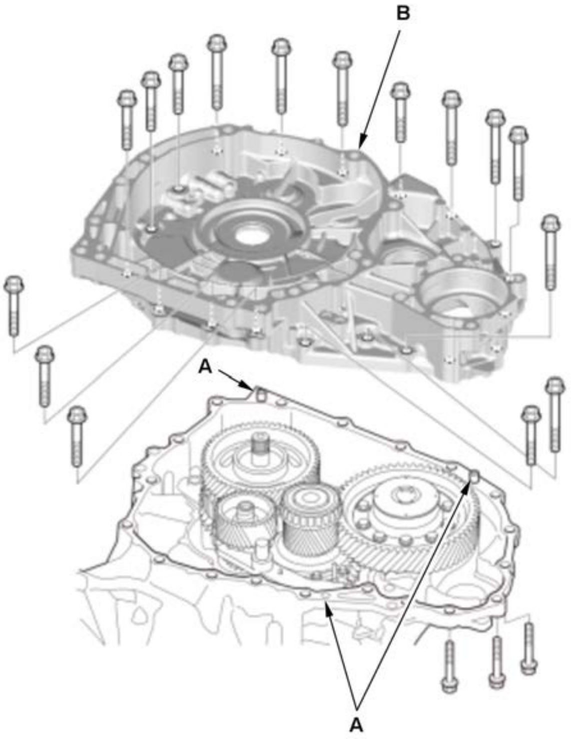


1. Remove all of the old liquid gasket, dirt, and oil from the sealing surface of the transmission housing, the flywheel housing, the bolt holes, and the bolts.

2. Apply liquid gasket (Honda Genuine Liquid Gasket 5460H) to the transmission housing (A).

NOTE:

- Apply a 1.5 mm (0.059 in) diameter bead of liquid gasket along the broken line (B) which is 1.0 mm (0.039 in) from the chamfered surface of the transmission housing inner side.
- Apply the liquid gasket all around as shown. When the bead is broken or arriving at the end point, overlap 10.0-15.0 mm (0.394-0.591 in) (C) the liquid gasket.
- Do not apply any liquid gasket to the bolt holes.
- The flywheel housing must be installed within 4 minutes. If too much time has passed after applying the liquid gasket, remove the old liquid gasket and residue, then reapply new liquid gasket.
- Do not touch the applied liquid gasket face.



3. Install the dowel pins (A).

4. Place the flywheel housing (B).

5. Install the flywheel housing mounting bolts, then tighten the bolts in at least two steps in a crisscross pattern.

NOTE:

- Wait at least 1 hour before filling the transmission (e-CVT) with the recommended fluid.
- Do not run the engine for at least 3 hours after installing the parts.

45. Park Position Sensor - Install
46. Park Pawl Actuator - Install
47. Transmission Hanger A - Install
48. Transmission Hanger B - Install
49. Filler Cap - Install

NOTE: Turn the lever toward the front of the vehicle, and install it.

50. Breather Cap - Install

    NOTE: Be sure to install the suction hole of the breather cap to the front of the vehicle.

51. Sealing Bolt - Install
52. Filler Plug - Install
53. ATF Outlet Line - Install
54. ATF Inlet Line - Install
55. Shift Solenoid Valve A - Install
56. Shift Solenoid Valve B - Install
57. Transmission Fluid Pressure Sensor - Install

    NOTE: Be careful not to damage the plastic part.

REMOVAL AND INSTALLATION

ATF COOLER REMOVAL AND INSTALLATION

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

☐	Torque: N.m (kgf.m, lbf.ft)

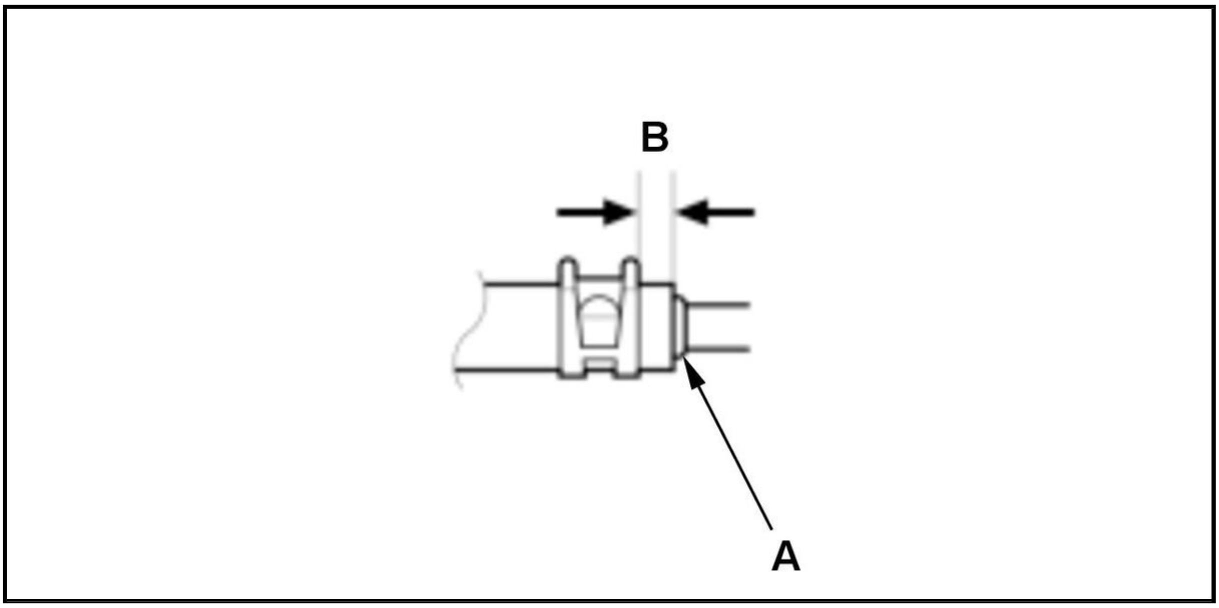
1. **Vehicle - Lift**
2. **Engine Undercover - Remove**
3. **ATF - Drain**
4. **Left Front Wheel - Remove**
5. **Left Front Inner Fender - Remove**
6. ATF Hose - Disconnect (Transmission Side)



Note for installation

- Connect the hoses until the hose end contacts the bulge (A).
- Secure the hoses with the clamps at 6.0-8.0 mm (0.236-0.315 in) (B) from the hose ends, and make sure they do not interfere with the surrounding parts.

7. ATF Cooler Assembly - Remove
8. Intake Cover Mount Rubber - Remove
9. ATF Cooler Assembly - Disassembly (If Necessary)
10. **Front Bumper - Remove**
11. ATF Cooler Guide - Remove
12. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

13. **ATF - Refill**

PARK PAWL ACTUATOR DRIVER UNIT REMOVAL AND INSTALLATION

Removal and Installation

SRS components are located in this area. Review **the SRS component locations** and **the precautions and procedures** before doing repair or service.

NOTE:

- If you only remove the park pawl actuator driver unit, skip the Procedure After Replacing Park Pawl Actuator Driver Unit.
- If you replace or substitute the park pawl actuator driver unit, you must do all procedures below.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

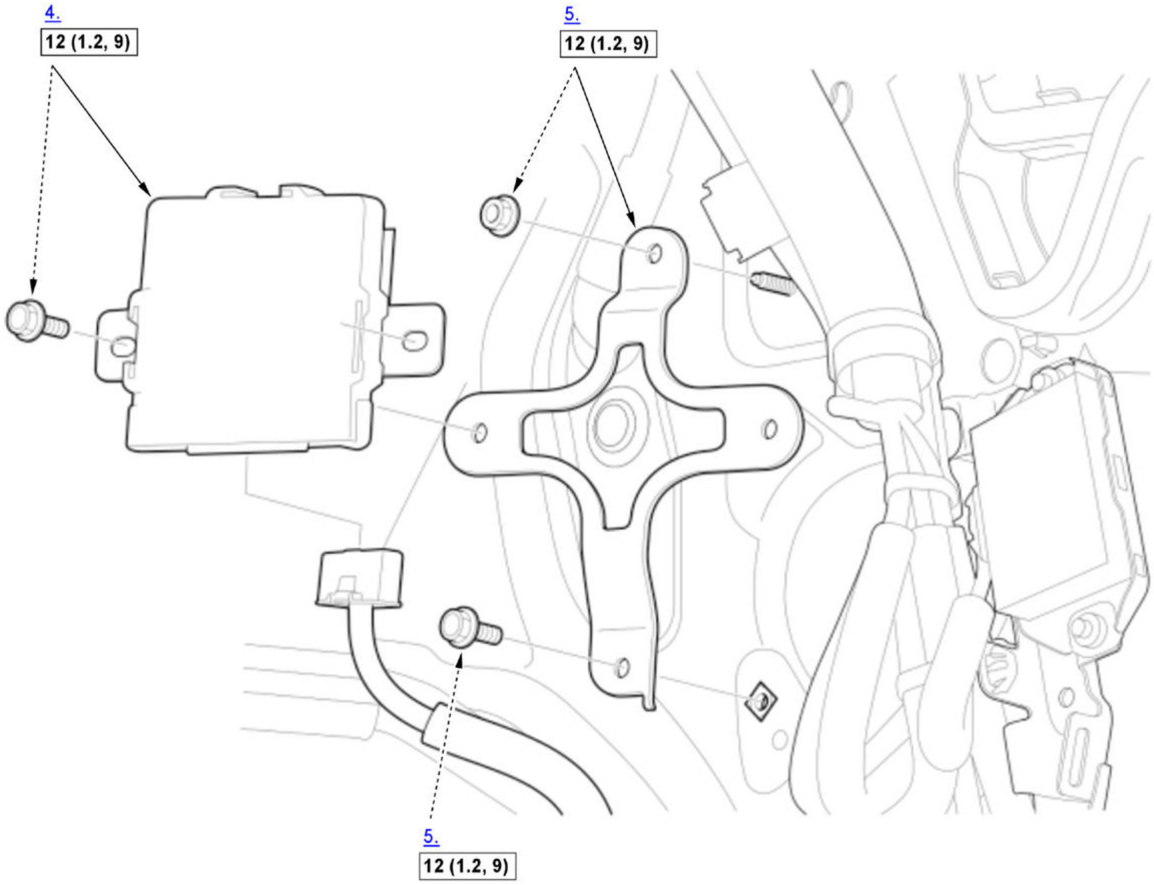


Fig. 17: Exploded View Of Park Pawl Actuator Driver Unit Components With Torque Specifications

☐	Torque: N.m (kgf.m, lbf.ft)

1. 12 Volt Battery Terminal - Disconnect
2. Passenger's Dashboard Undercover - Remove
3. Kick Panel (Passenger's Side) - Remove
4. Park Pawl Actuator Driver Unit - Remove
5. Park Pawl Actuator Driver Unit Bracket - Remove
6. All Removed Parts - Install

    1. Install the parts in the reverse order of removal.

    Procedure After Replacing Park Pawl Actuator Driver Unit

7. Keyless Access System - Register
8. Park Pawl Actuator Driver Unit - Update

PARK PAWL ACTUATOR REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- Keep all foreign particles out of the transmission (e-CVT).
- Apply a light coat of clean ATF on the O-ring before installation.
- Check the connector for corrosion, dirt, or oil, and clean if necessary.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

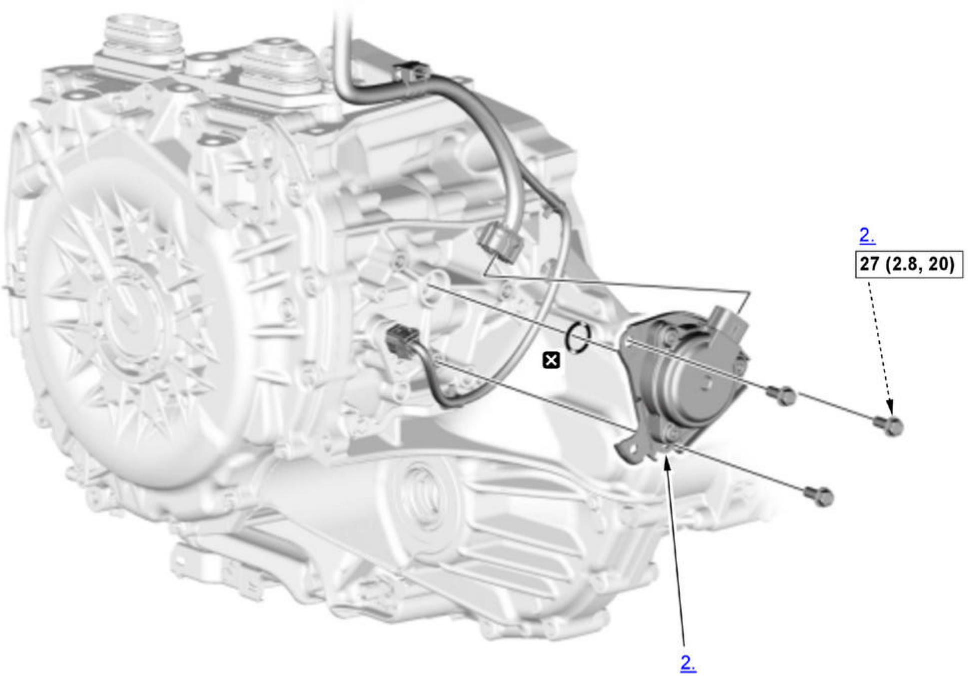

Fig. 18: Exploded View Of Park Pawl Actuator Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Vehicle - Lift
2. Park Pawl Actuator - Remove
3. All Removed Parts - Install
    1. Install the parts in the reverse order of removal.

PARK POSITION SENSOR REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- Keep all foreign particles out of the transmission (e-CVT).
- Apply a light coat of clean ATF on the O-ring before installation.
- Check the connector for corrosion, dirt, or oil, and clean if necessary.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

Removal

WARNING: **The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.**

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain service precautions before doing repairs or service .

NOTE:

- Use fender covers to avoid damaging painted surfaces.
- Special tool engine support hanger AAR-T-1256-J00 must be used with the side engine mount installed.
- Keep all foreign particles out of the transmission (e-CVT).

1. **Vehicle - Lift Set**
2. **DTC (Electric Powertrain System) - Check**

   1. Check for DTCs in the Electric Powertrain system with the HDS. If any DTCs are indicated, record them first, then go to the next step.

3. **Neutral Position Holding Mode - Enter**

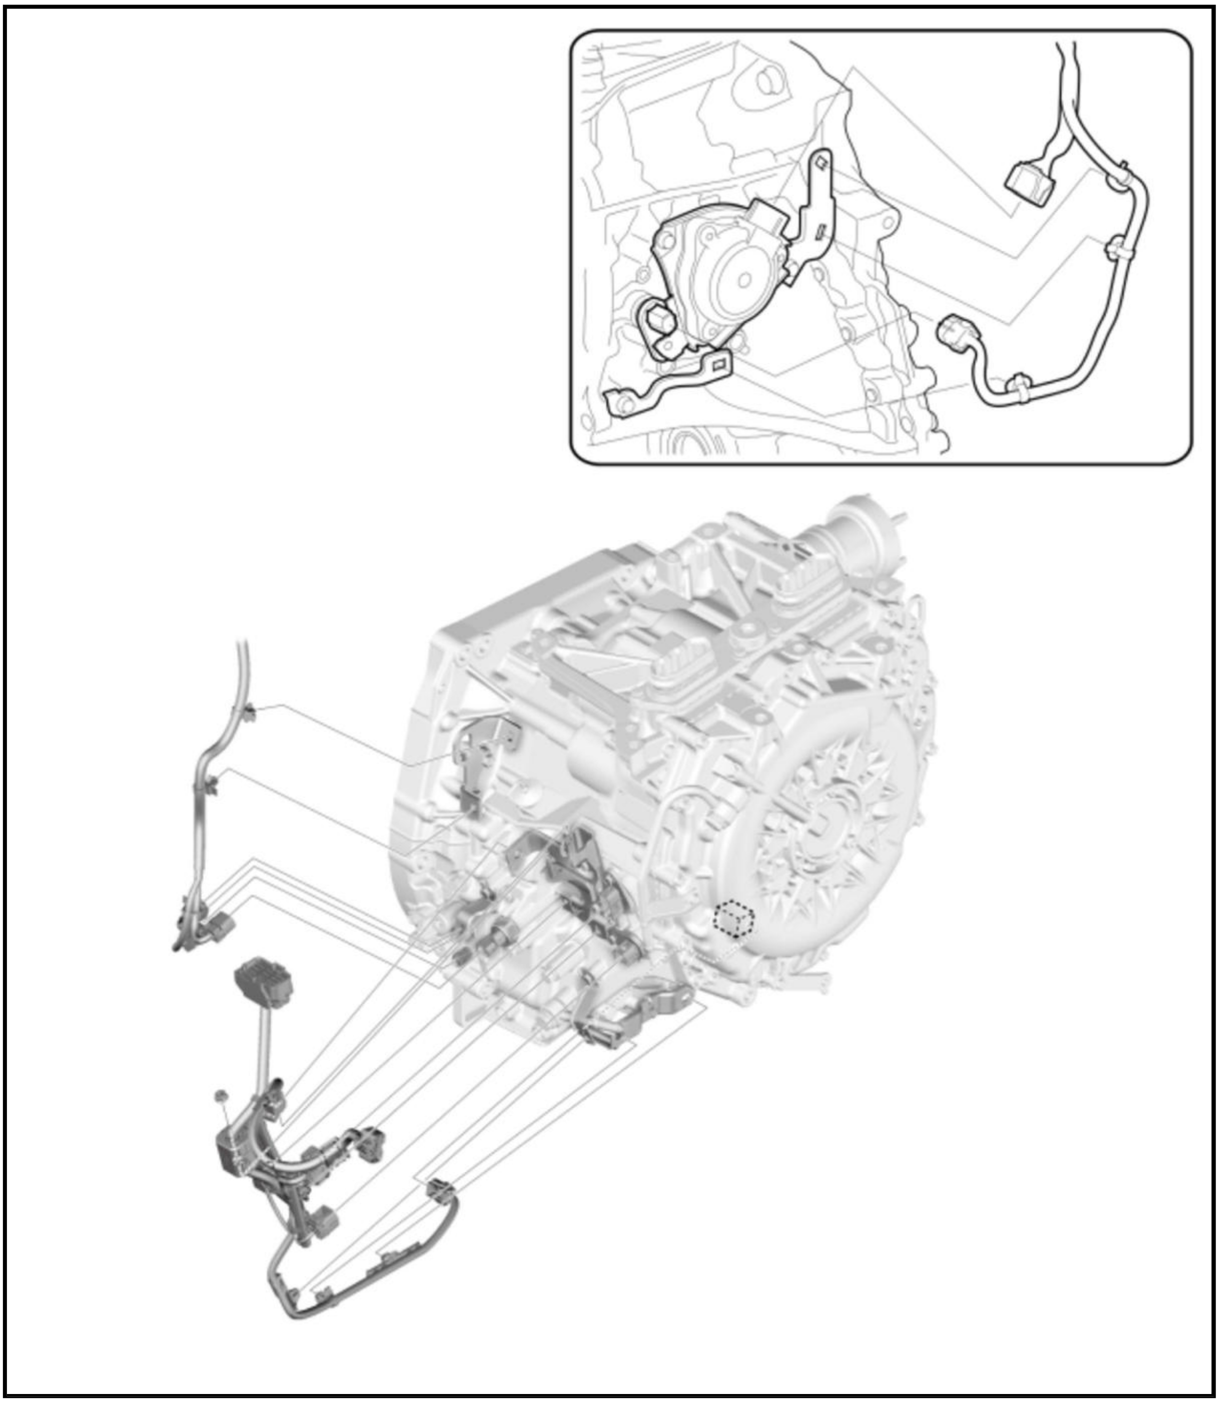
   NOTE: Even if the negative terminal of the 12 volt battery is disconnected after the neutral position holding mode is actuated, the vehicle continues to keep the N position.

4. **12 Volt Battery Terminal - Disconnect**
5. **Service Plug - Turn Off**

NOTE: Do not connect the 12 volt battery terminal to keep the N position.

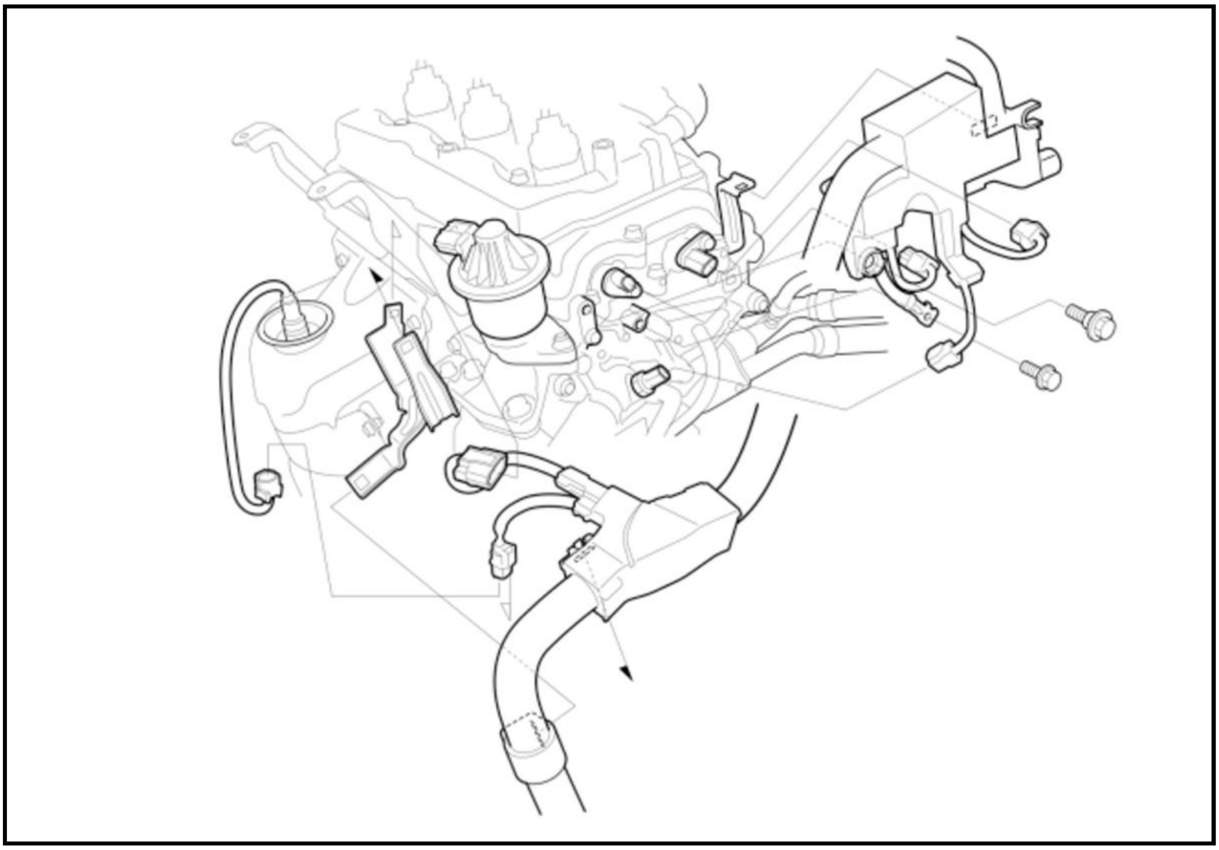
6. **Hood - Wide Open**
7. **12 Volt Battery - Remove**
8. **12 Volt Battery Base - Remove**
9. **Front Bulkhead Cover - Remove**
10. **Windshield Wiper Arm - Remove**
11. **Center Cowl Cover - Remove**
12. **Engine Undercover - Remove**
13. **PCU Coolant - Drain**
14. **PCU - Remove**
15. **Steering Joint - Disconnect**
16. Engine Wire Harness - Remove

NOTE: Swing the engine wire harness out of the way.



17. Harness Cover - Remove

NOTE: Swing the engine wire harness out of the way.



18. **CMP Sensor A - Remove**
19. Engine Support Hanger - Install

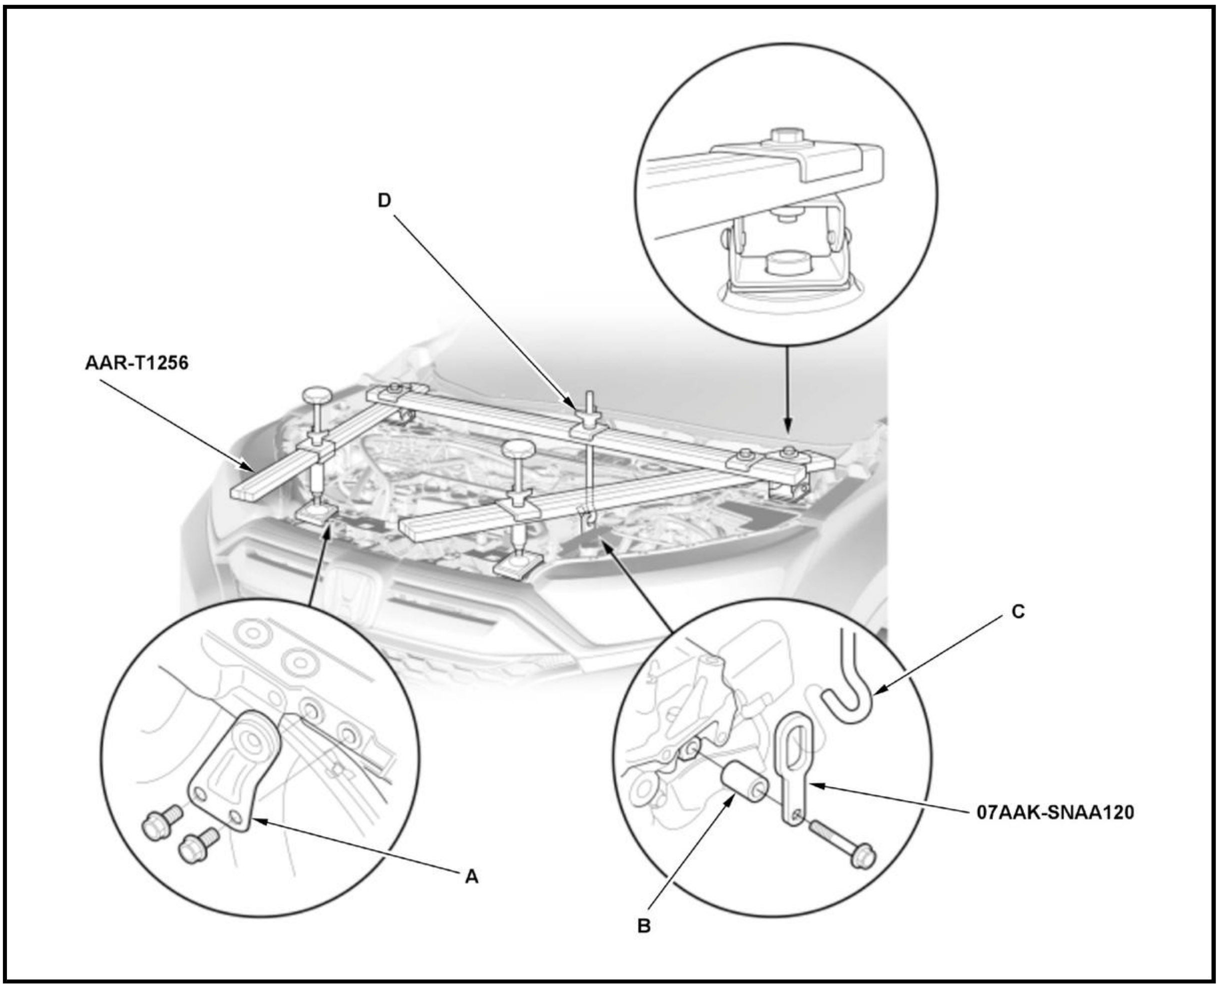
NOTE:

- Be careful when working around the windshield.
- Be careful not to damage the hood opener cable when installing the engine support hanger at the front bulkhead.

1. Remove the front damper caps.

2. **Remove the radiator cap base** .

3. Remove the hood open stay bracket (A).



4. Install the sub hanger stay with a commercially available spacer (B).

NOTE: Make sure the sub hanger stay does not interfere with the surrounding parts.

5. Install the engine support hanger onto the vehicle as shown.

6. Attach the hook (C) to the slotted hole in the sub hanger stay.

7. Tighten the wing nut (D) by hand, lift and support the engine/transmission (e-CVT).

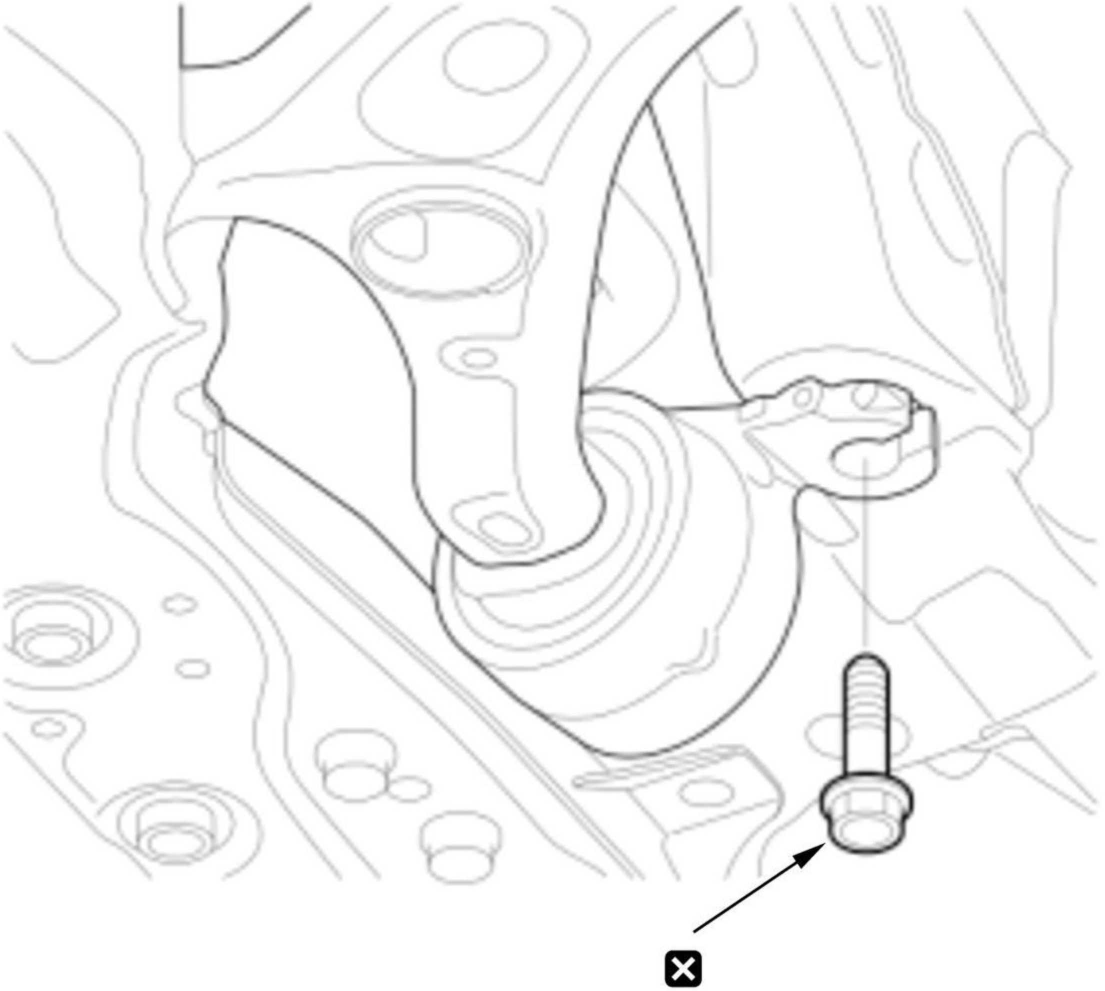
20. **Transmission Mount - Remove**
21. Upper Transmission (e-CVT) Mounting Bolt - Remove

    NOTE: Refer to the Exploded View as needed during this procedure.

22. Vehicle - Lift Up
23. **Front Wheel - Remove (Both Sides)**
24. **ATF - Drain**
25. **Exhaust Pipe A - Remove**
26. Drive Plate - Disconnect

	1. Remove the flywheel cover (A). 2. Remove eight flywheel bolts (B) while rotating the crankshaft pulley.

27. **Connectors (EPS Motor/Control Unit) - Disconnect**
28. **Lower Torque Rod Mounting Bolt - Remove**
29. **Lower Arm - Disconnect (Both Sides)**
30. Lower Arm Mounting Bolt - Remove (Both Sides)



31. **Tie-Rod End Ball Joint - Disconnect (Both Sides)**
32. **Front Stabilizer Link Ball Joint - Disconnect (Both Sides)**
33. Front Subframe - Support

	1. Set the subframe adapter (VSB02C000016) on a transmission jack (A), line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts. 2. Attach the subframe adapter to the front subframe (B).

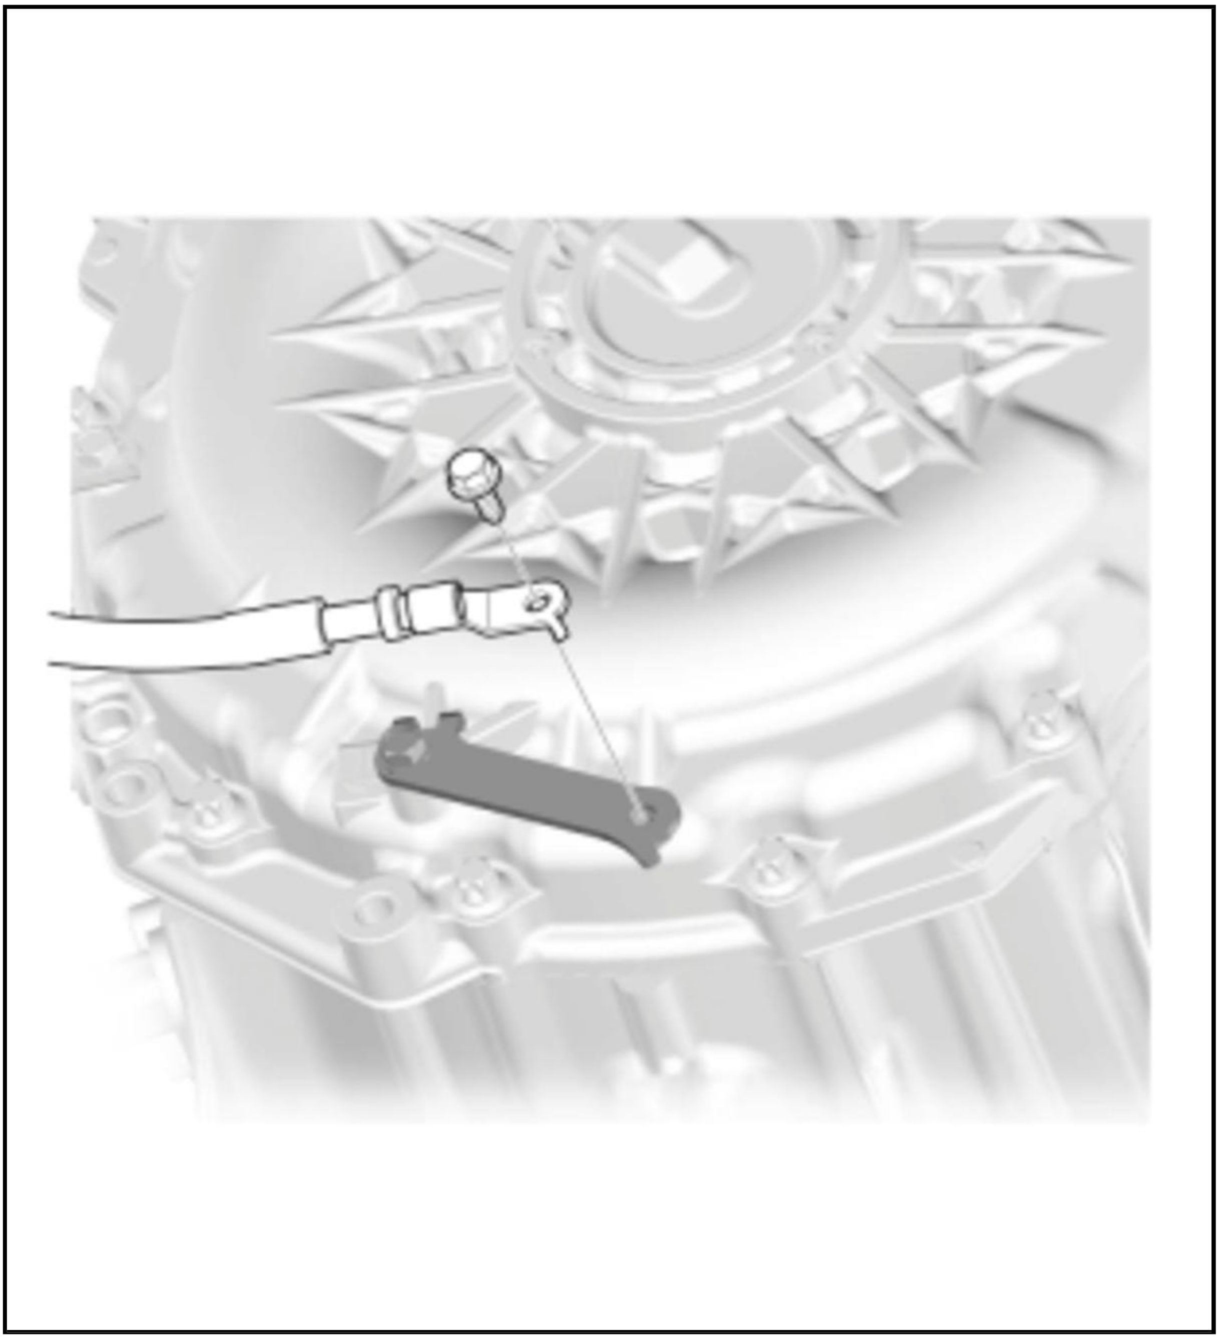
34. **Front Subframe - Remove**
35. Transmission - Support

1. Support the transmission with the transmission jack.

36. **Driveshaft Inboard Joint - Disconnect (Both Sides)**

NOTE: Secure the driveshaft to the body with a nylon strap on both sides.

37. **Intermediate Shaft - Remove**
38. **Propeller Shaft - Remove**
39. Ground Cable - Disconnect



40. **ATF Hose (Transmission Side) - Disconnect**

    NOTE: Turn the ends of the ATF hoses up to prevent ATF from flowing out, then plug the hoses and the lines.

41. **Radiator Inlet Pipe A - Remove**

    NOTE: Remove the necessary part(s).

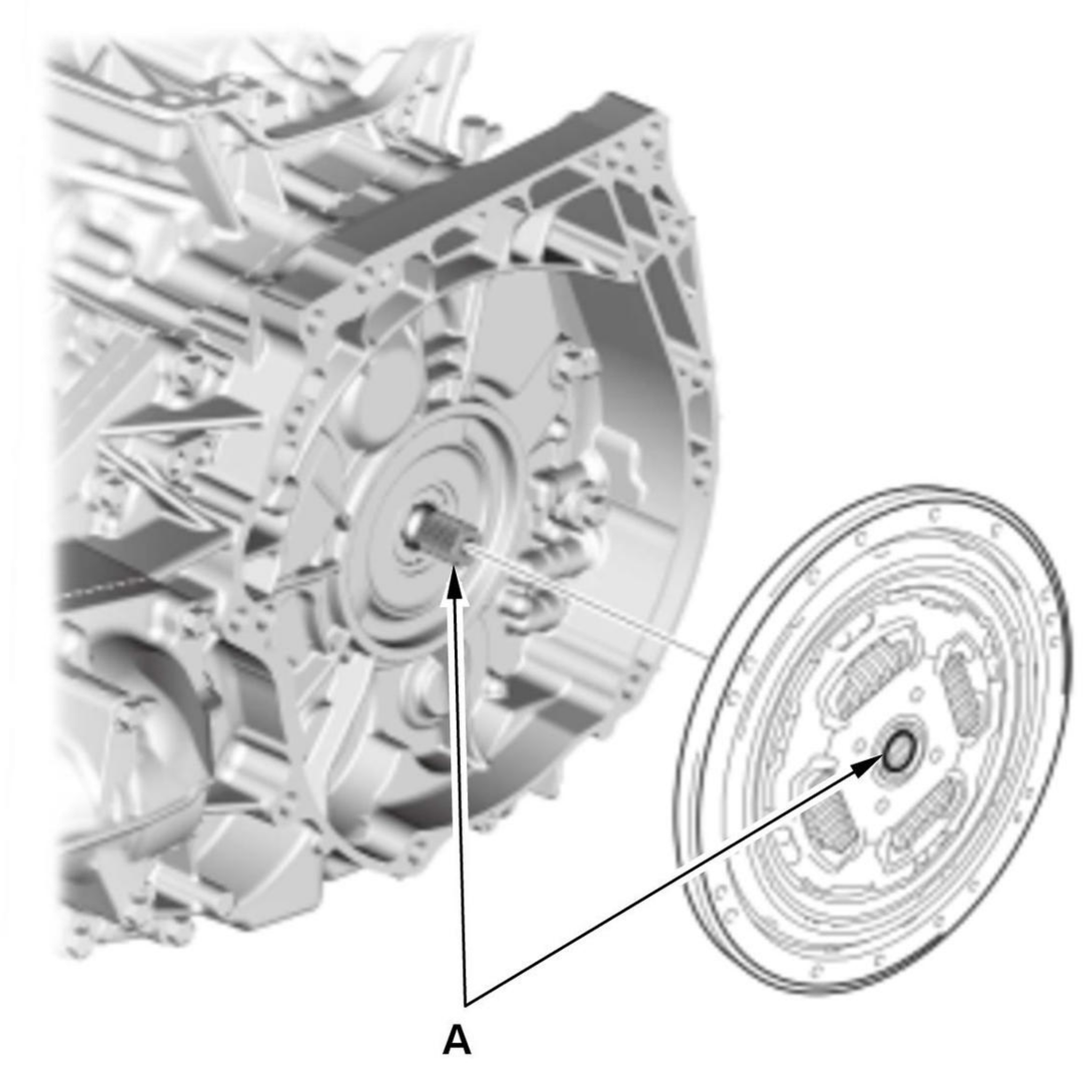
42. Lower Transmission (e-CVT) Mounting Bolt - Remove

    NOTE: Refer to the Exploded View as needed during this procedure.

43. Transmission (e-CVT) - Remove

 	1. Check once again that the transmission (e-CVT) (A) is free of hoses and electrical wiring. 2. Hold the transmission (e-CVT) on the transmission jack. 3. Lower the transmission (e-CVT) by loosening the wing nut of the engine support hanger, and tilt the engine just enough for the transmission (e-CVT) to clear its end from the side frame. 4. Slide the transmission (e-CVT) away from the engine, then remove the transmission (e-CVT) from the vehicle. 5. Lower the transmission (e-CVT) carefully. **NOTE:** Be careful not to drop the flywheel.

44. Flywheel - Remove

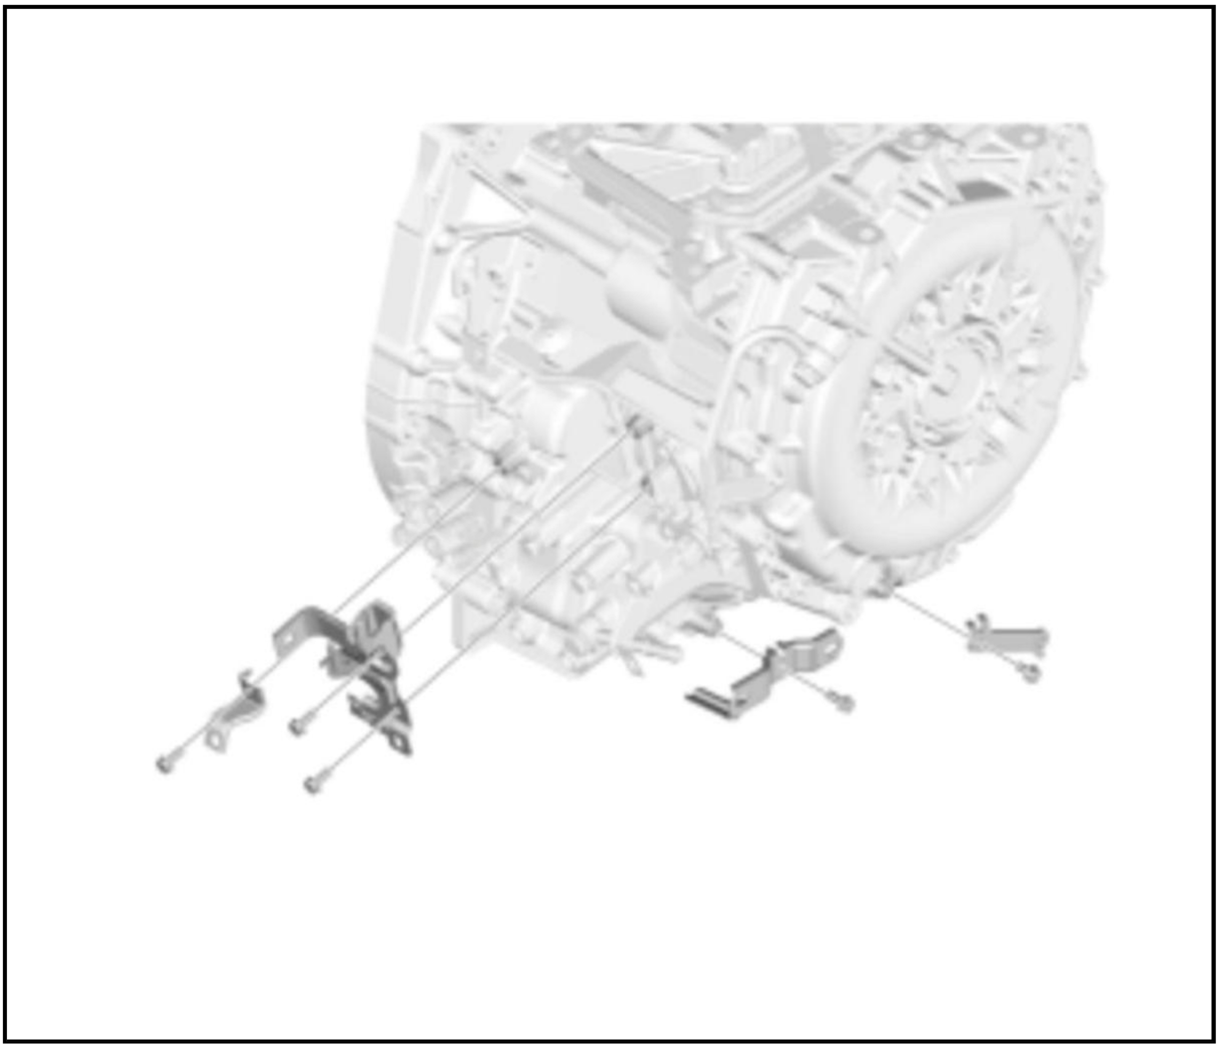


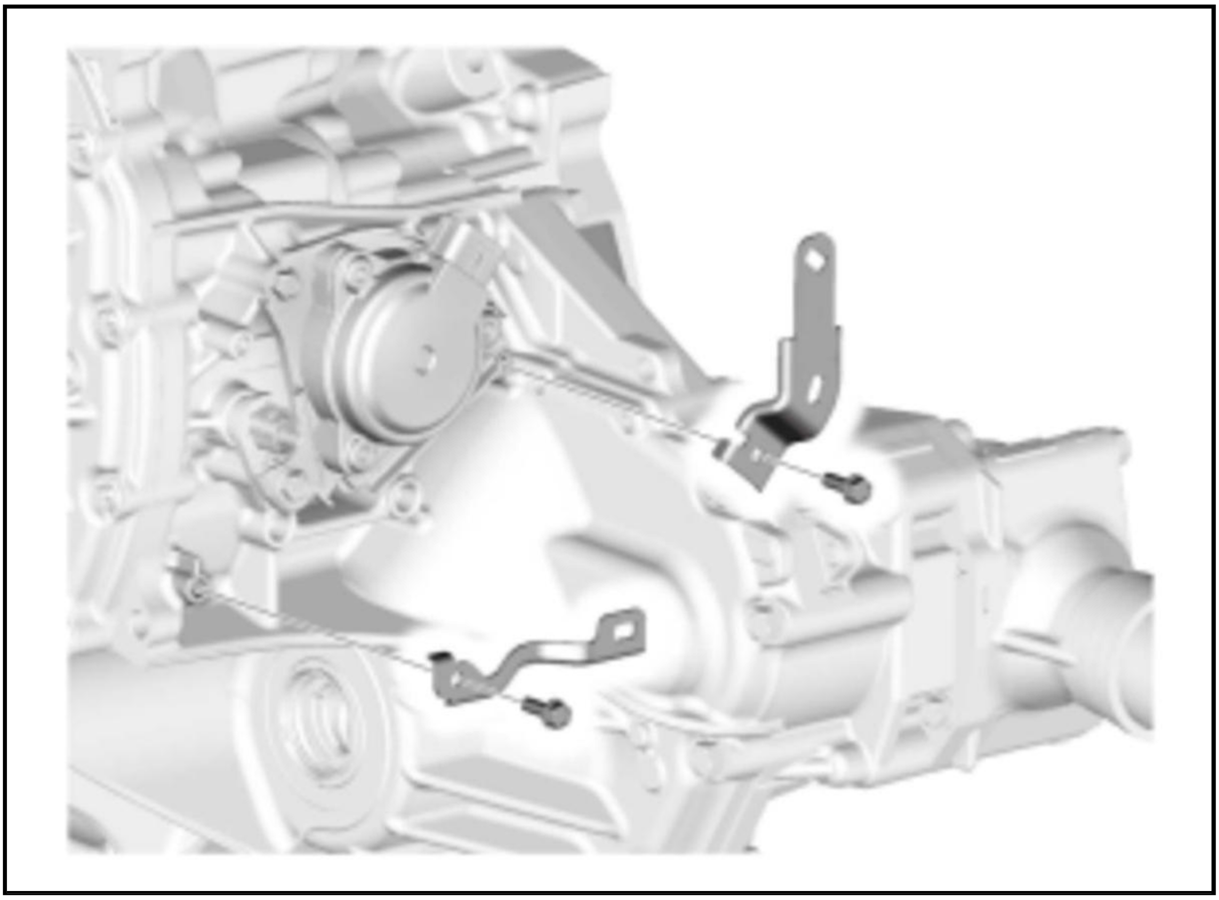
NOTE: Do not wipe off the special grease applied to the spline (A).

45. Dowel Pin - Remove

NOTE: Refer to the Exploded View as needed during this procedure.

46. Bracket - Remove (If Necessary)





47. Drive Plate - Inspect

1. Inspect the drive plate, and replace it if it is damaged.

48. Transfer Assembly - Remove (If Necessary)

Installation

WARNING: **The power cables carry high voltage when the electric powertrain system is energized. To avoid serious injury from electrical shock, do not turn on the system with the power cables disconnected.**

The electric powertrain components are located in this area. The electric powertrain is a high-voltage system. You must be familiar with the electric powertrain system before working on or around it. Make sure you have read the electric powertrain service precautions before doing repairs or service .

NOTE:

- How to read the torque specifications .
- Use fender covers to avoid damaging painted surfaces.
- Special tool engine support hanger AAR-T-1256-J00 must be used with the side engine mount installed.
- Keep all foreign particles out of the transmission (e-CVT).

1. Transfer Assembly - Install (If Necessary)
2. Bracket - Install

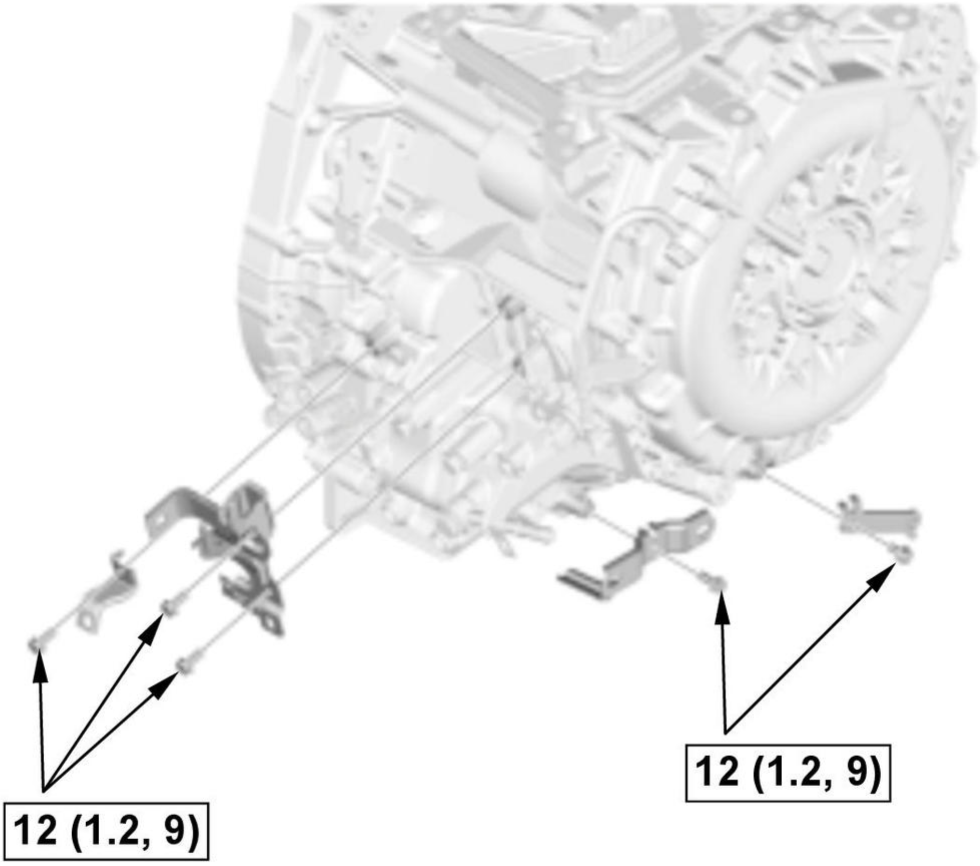


Fig. 21: Bracket Components With Torque Specifications (1 Of 2)
Courtesy of HONDA, U.S.A., INC.

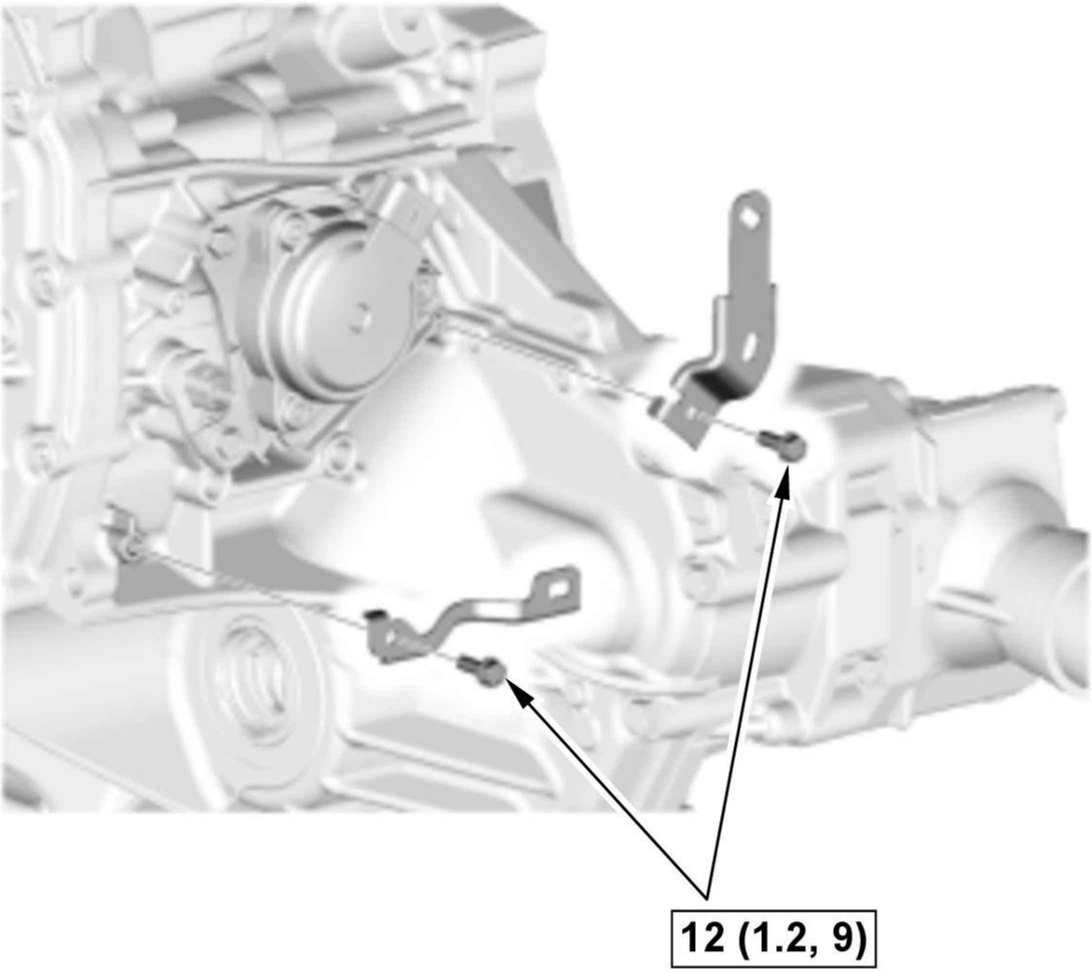

Fig. 22: Bracket Components With Torque Specifications (2 Of 2)
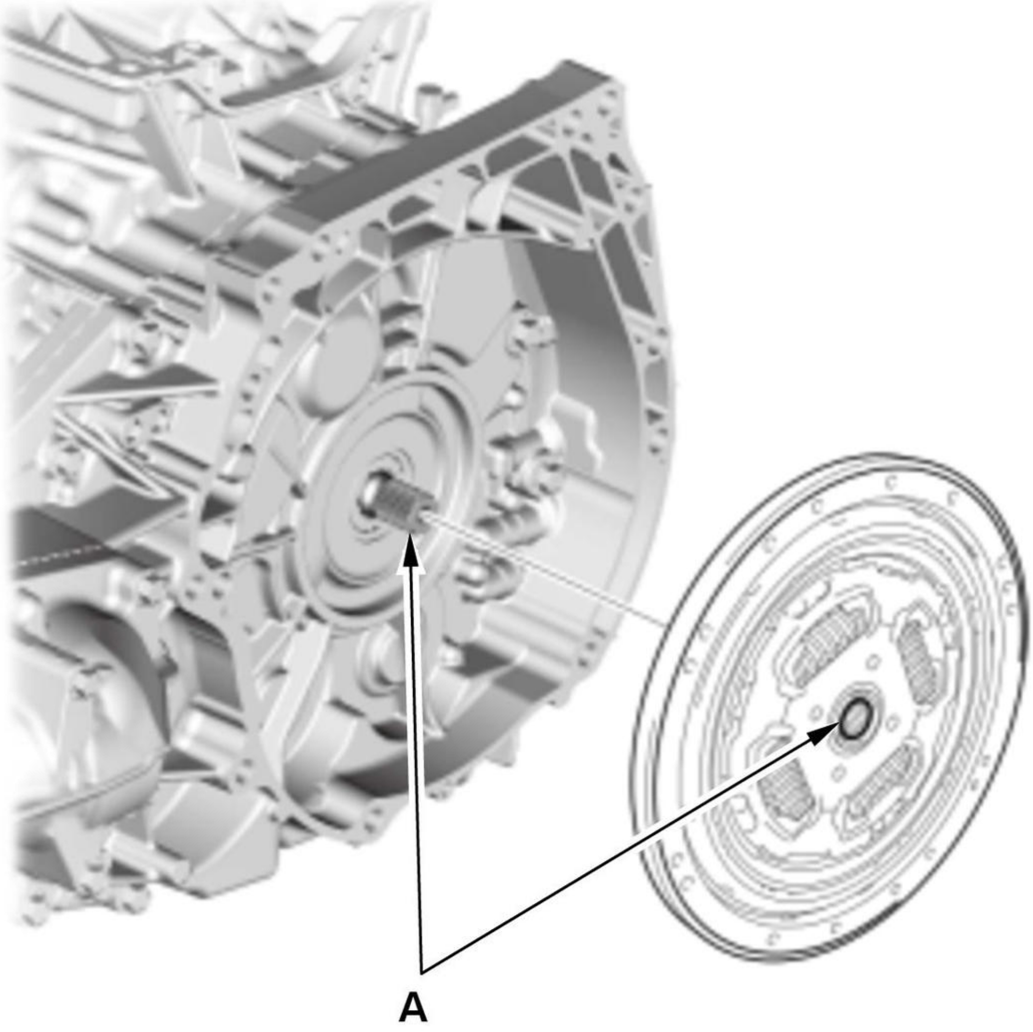
Courtesy of HONDA, U.S.A., INC.

3. Dowel Pin - Install

   NOTE: Refer to the Exploded View as needed during this procedure.

4. Flywheel - Install



NOTE: Do not wipe off the special grease applied to the spline (A).

5. Transmission (e-CVT) - Install

	1. Place the transmission (e-CVT) (A) on a transmission jack, then raise it to the engine level. **NOTE:** Be careful not to drop the flywheel. 2. Attach the transmission (e-CVT) to the engine.

6. Lower Transmission (e-CVT) Mounting Bolt - Install

NOTE: Refer to the Exploded View as needed during this procedure.

7. Radiator Inlet Pipe A - Install
8. ATF Hose (Transmission Side) - Connect
9. Ground Cable - Connect

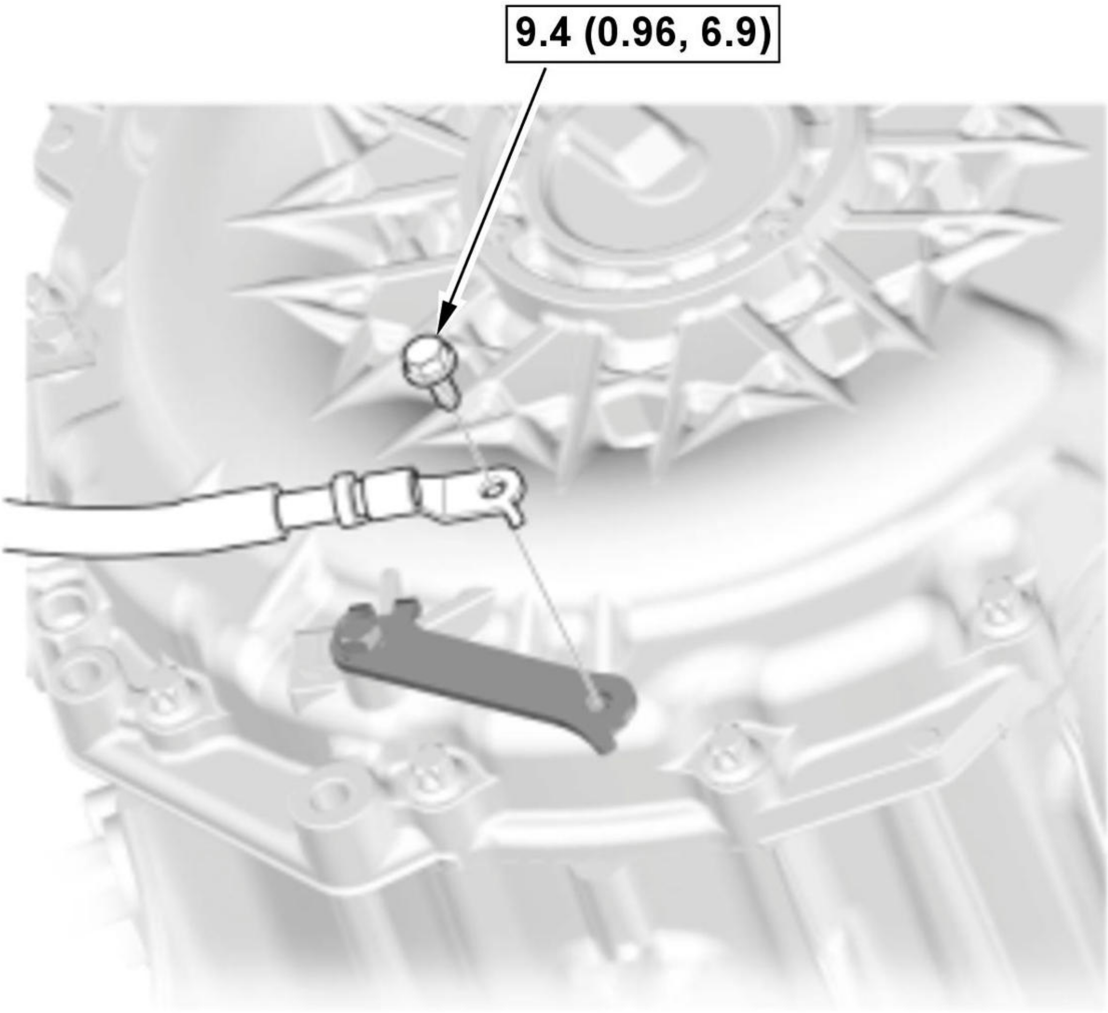


Fig. 23: Ground Cable Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

10. Propeller Shaft - Install
11. Intermediate Shaft - Install
12. Driveshaft Inboard Joint - Connect (Both Sides)
13. Front Subframe - Support

	1. Support the front subframe (A) with a transmission jack (B).

14. Front Subframe - Install
15. Front Stabilizer Link Ball Joint - Connect (Both Sides)
16. Tie-Rod End Ball Joint - Connect (Both Sides)
17. Lower Arm Mounting Bolt - Install (Both Sides)

	1. Install both sides of the front lower arm mounting bolt to the body .

18. Lower Arm - Connect (Both Sides)
19. Lower Torque Rod Mounting Bolt - Loosely Install
20. Connectors (EPS Motor/Control Unit) - Connect
21. Drive Plate - Connect

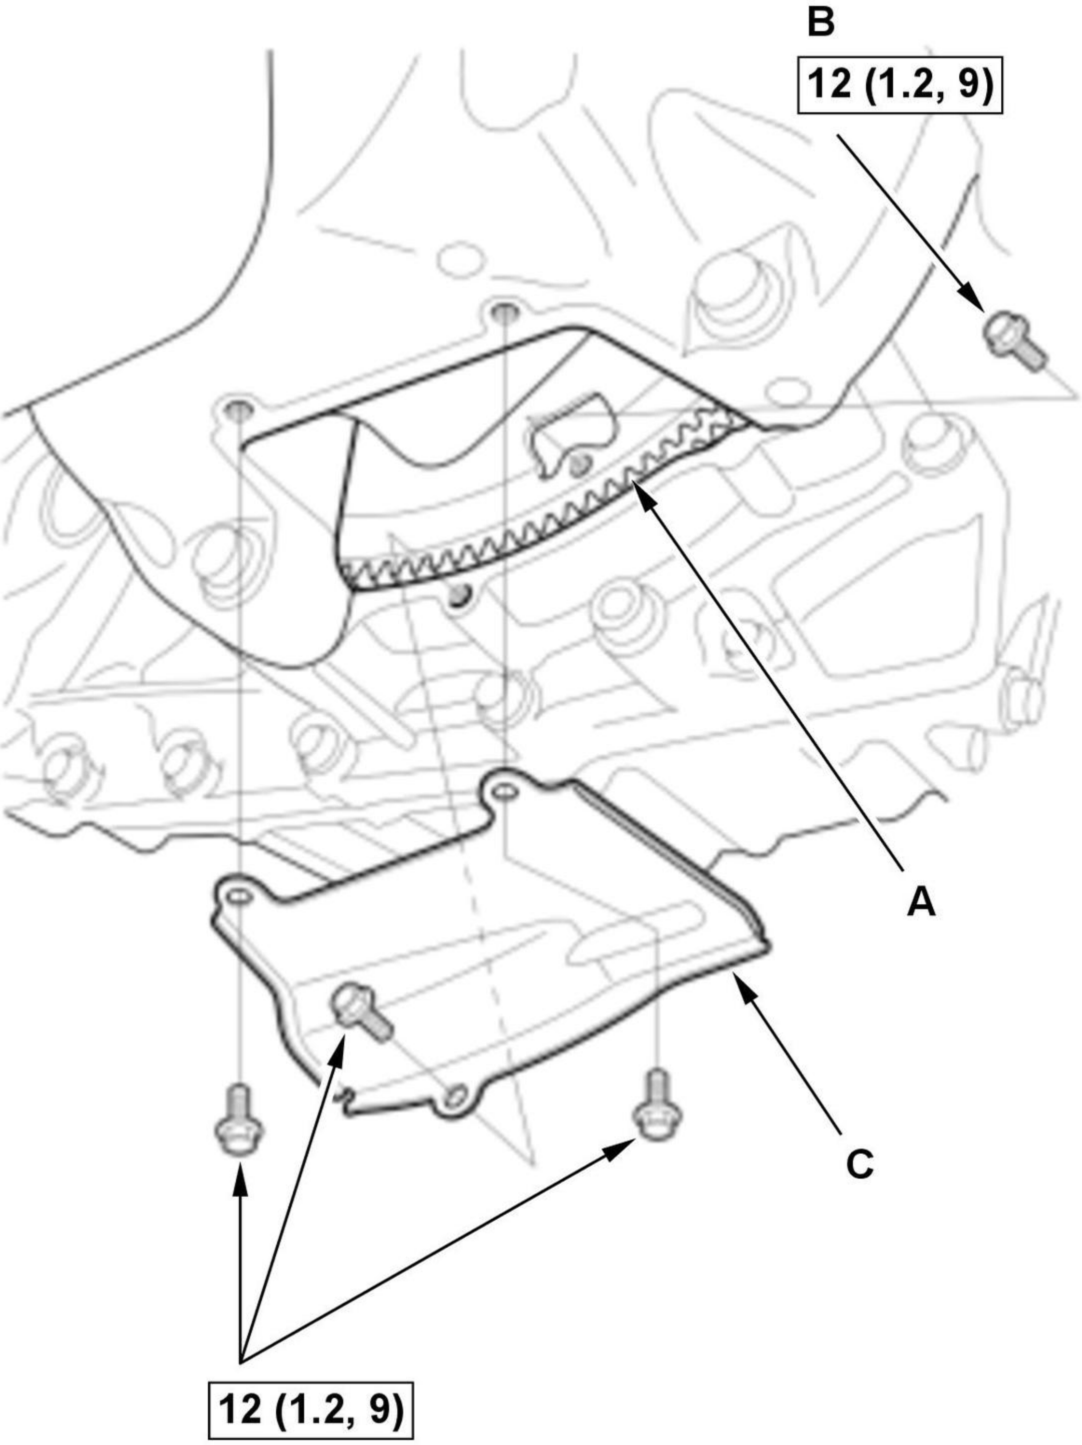

Fig. 24: Drive Plate Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Attach the drive plate (A) to the flywheel with eight flywheel bolts (B).

NOTE: There are eight flywheel bolts.

2. Rotate the crankshaft pulley as necessary to tighten the bolt to half of the specified torque, then to the final torque, in a crisscross pattern.

3. Check that the crankshaft rotates freely.

4. Install the torque converter cover (C).

22. **Exhaust Pipe A - Install**

23. Vehicle - Lower
24. Upper Transmission (e-CVT) Mounting Bolt - Install

NOTE: Refer to the Exploded View as needed during this procedure.

25. **Transmission Mount - Loosely Install**
26. Engine Support Hanger - Remove

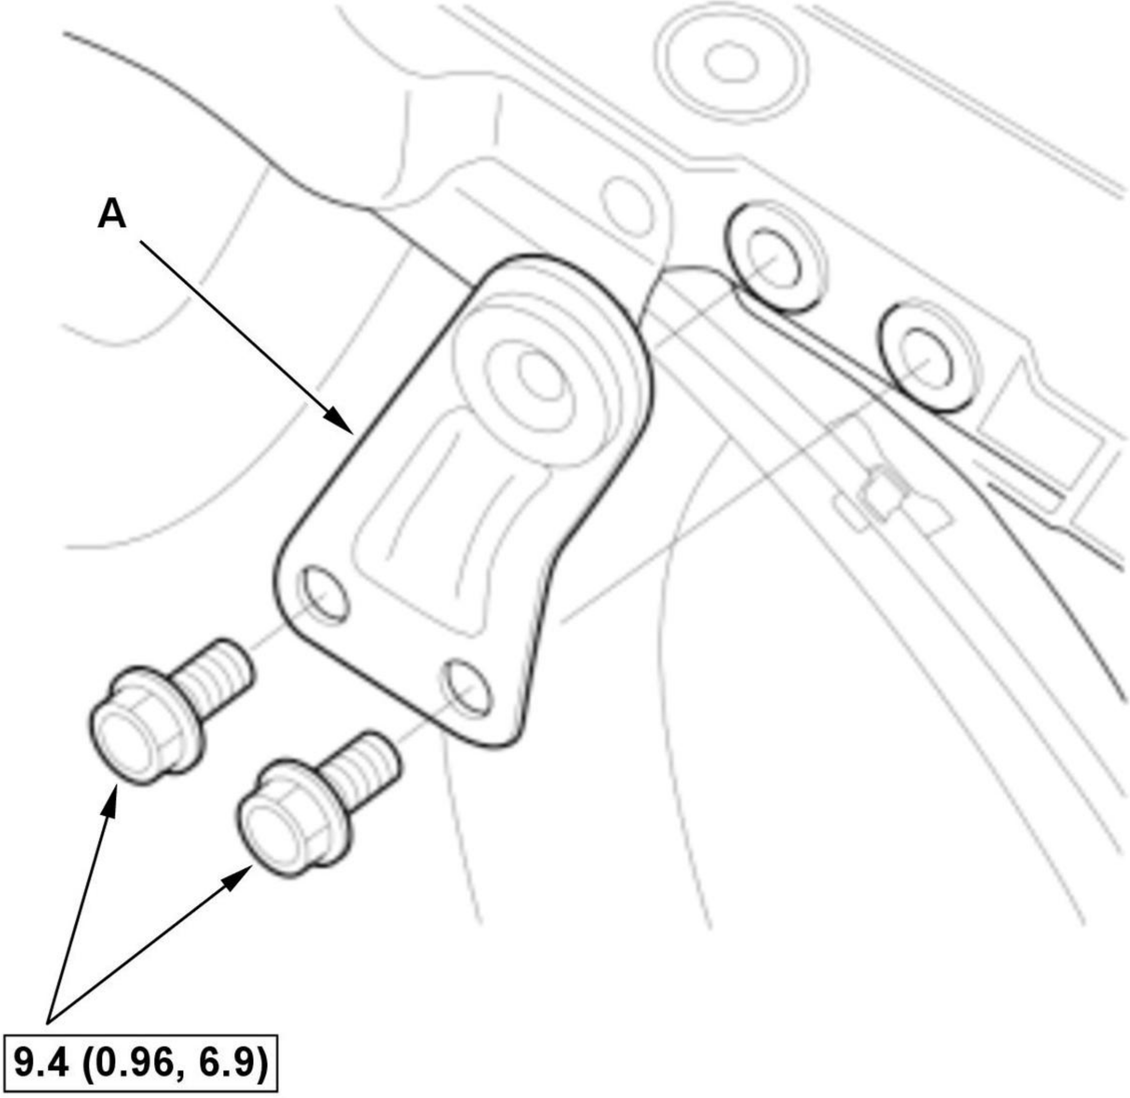

Fig. 25: Hood Open Stay Bracket Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the engine support hanger and the sub hanger stay.

2. Install the hood open stay bracket (A).

3. **Install the radiator cap base** .

4. Install the front damper caps.

27. **Engine/Transmission Mount/Torque Rod - Tightening Procedure**
28. **CMP Sensor A - Install**
29. Harness Cover - Install

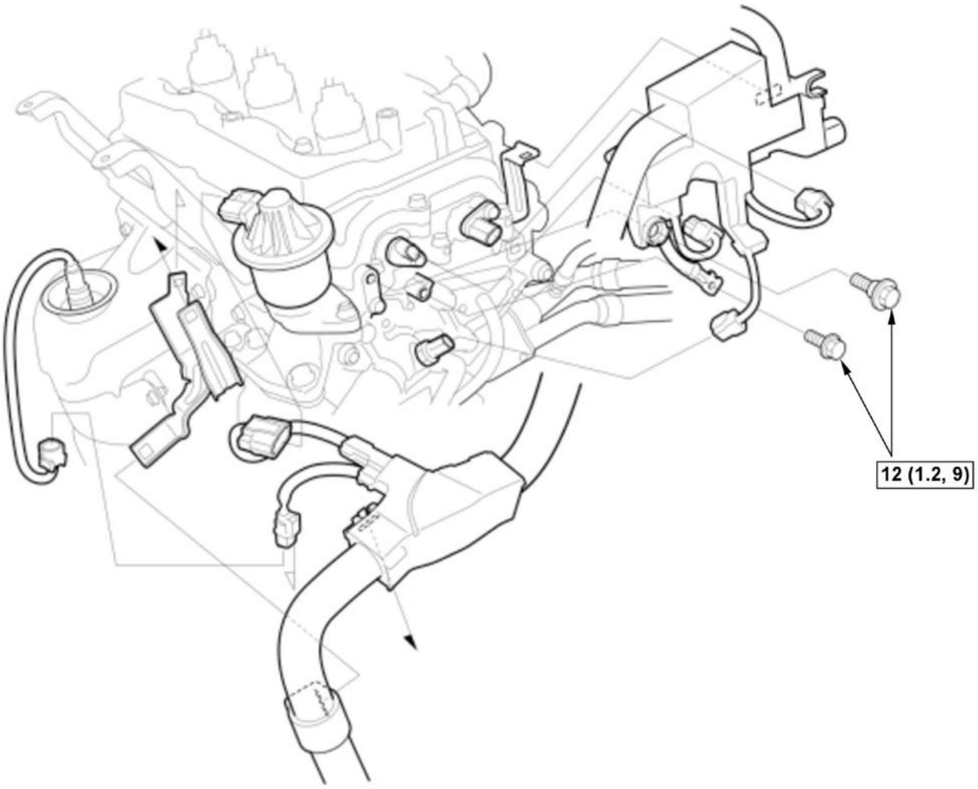

Fig. 26: Harness Cover Bolts With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

30. Engine Wire Harness - Install

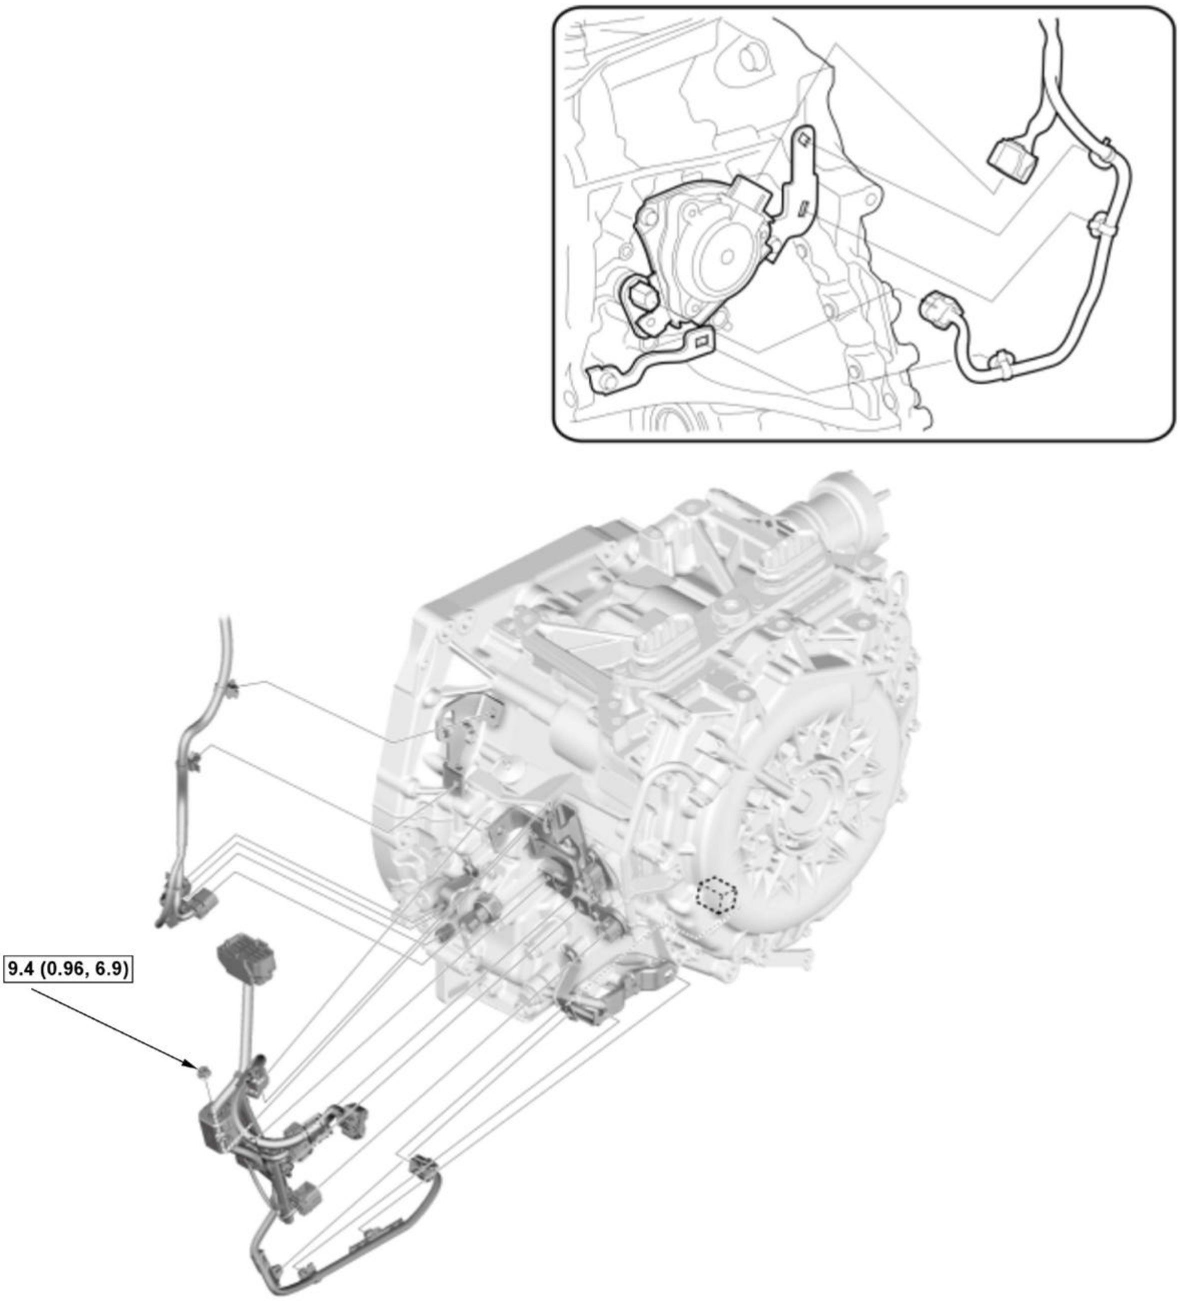

Fig. 27: Engine Wire Harness Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

31. Steering Joint - Connect
32. PCU - Install
33. Center Cowl Cover - Install
34. Windshield Wiper Arm - Install
35. Front Bulkhead Cover - Install
36. Service Plug - Turn On
37. 12 Volt Battery Base - Install
38. 12 Volt Battery - Install
39. PCU Coolant - Refill
40. ATF - Refill
41. Engine Undercover - Install
42. Front Wheel - Install (Both Sides)
43. Wheel Alignment - Check

44. VSA Sensor Neutral Position - Memorize
45. Motor Rotor Position - Calibrate
46. Vehicle - Test-Drive

    NOTE: Before test drive, turn the vehicle to the ON mode and shift the transmission to each shift position/mode, and wait for at least 1 seconds to each position/mode. Make sure to be able to select each shift position.

TRANSMISSION FLUID PRESSURE SENSOR REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- Keep all foreign particles out of the transmission (e-CVT).
- Check the connector for corrosion, dirt, or oil, and clean if necessary.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

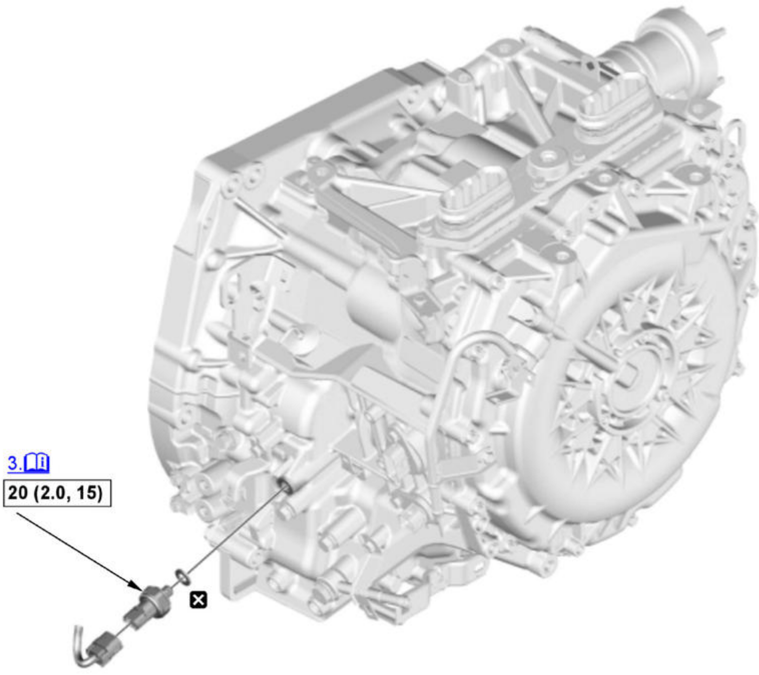

Fig. 28: Transmission Fluid Pressure Sensor Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Vehicle - Lift
2. Engine Undercover - Remove
3. Transmission Fluid Pressure Sensor - Remove

    NOTE: Be careful not to damage the plastic part.

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

5. ATF Level - Check

REMOVAL, INSTALLATION & TEST

SHIFT SOLENOID VALVE REMOVAL, INSTALLATION, AND TEST

Removal and Installation

NOTE:

- Keep all foreign particles out of the transmission (e-CVT).
- Apply a light coat of clean ATF on all O-rings before installation.
- Check the connector for corrosion, dirt, or oil, and clean if necessary.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

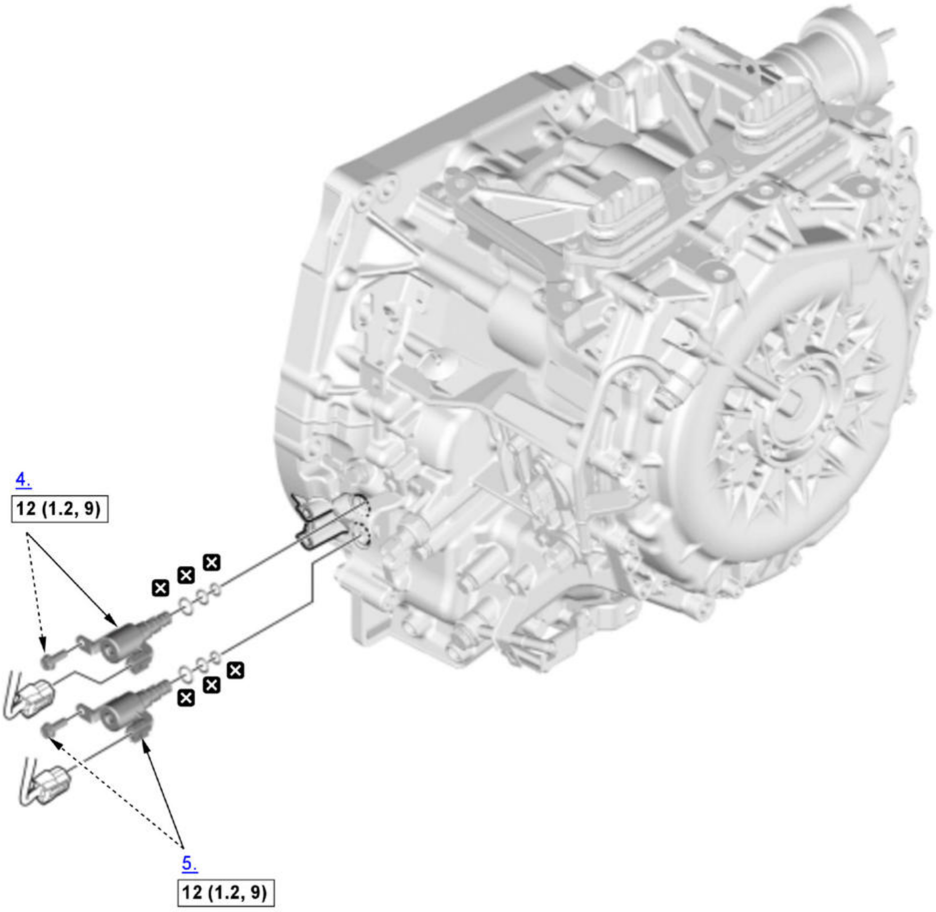

Fig. 29: Exploded View Of Shift Solenoid Valve Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)

✖	Replace

1. **Vehicle - Lift**
2. **Engine Undercover - Remove**
3. **ATF - Drain**
4. Shift Solenoid Valve A - Remove
5. Shift Solenoid Valve B - Remove
6. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

7. **ATF - Refill**

Test

NOTE: Check the connector for corrosion, dirt, or oil, and clean if necessary.

1. **Vehicle - Lift**
2. **HDS - Connect**
3. Shift Solenoid Valve - HDS Function Test

   1. From the system selection menu, select AT, Function Test and then Shift Solenoid Test.

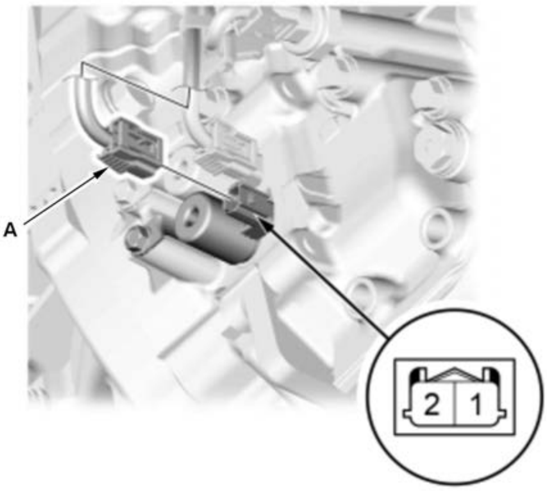
   2. Select Shift Solenoid Valve A or B, follow the screen prompts and check that the shift solenoid valve operates with the HDS. A clicking sound should be heard.

      - Select Shift Solenoid Valve C, D and E are not supported on this vehicle.
      - If a clicking sound is heard, the solenoid valve is OK. The test is complete, disconnect the HDS.
      - If no clicking sound is heard, go to the next step, and check the shift solenoid valve resistance.

4. **Engine Undercover - Remove**
5. Shift Solenoid Valve - Resistance Check

Shift Solenoid Valve A  **Shift Solenoid Valve B**	1. Disconnect the connector (A). 2. Measure the resistance of the shift solenoid valve between connector (male terminals) terminals No. 1 and No. 2. - If the resistance is out of the specifications (change for all occurrences), replace the appropriate shift solenoid valve. - If the resistance is within the specifications (change for all occurrences), go to the next step, and check the shift solenoid valve operation.



Standard:	**13.8-17.1 Ω**

6. Shift Solenoid Valve - Operation Check

Shift Solenoid Valve A  **Shift Solenoid Valve B**  	1. Connect a jumper wire from the positive 12 volt battery terminal to connector (male terminals) terminal No. 1, and connect another jumper wire from the negative 12 volt battery terminal to connector (male terminals) terminal No. 2. • If a clicking sound is heard, go to the next step. • If no clicking sound is heard, replace the appropriate shift solenoid valve.

Shift Solenoid Valve A  **Shift Solenoid Valve B**  	2. Remove the appropriate shift solenoid valve. 3. Connect a tube (A) to the shift solenoid valve. 4. Connect a jumper wire from the positive 12 volt battery terminal to connector (male terminals) terminal No. 1, and connect another jumper wire from the negative 12 volt battery terminal to connector (male terminals) terminal No. 2. Blow the air into the tube. • If the air goes out of the port (B), go to the next step. • If the air does not go out of the port, replace the appropriate shift solenoid valve. 5. Disconnect the jumper wires. Blow the air into the tube. • If the air goes out of the port, replace the appropriate shift solenoid valve. • If the air does not go out of the port, repair the wire between the shift solenoid valve and the PCM.

7. All Removed Parts - Install

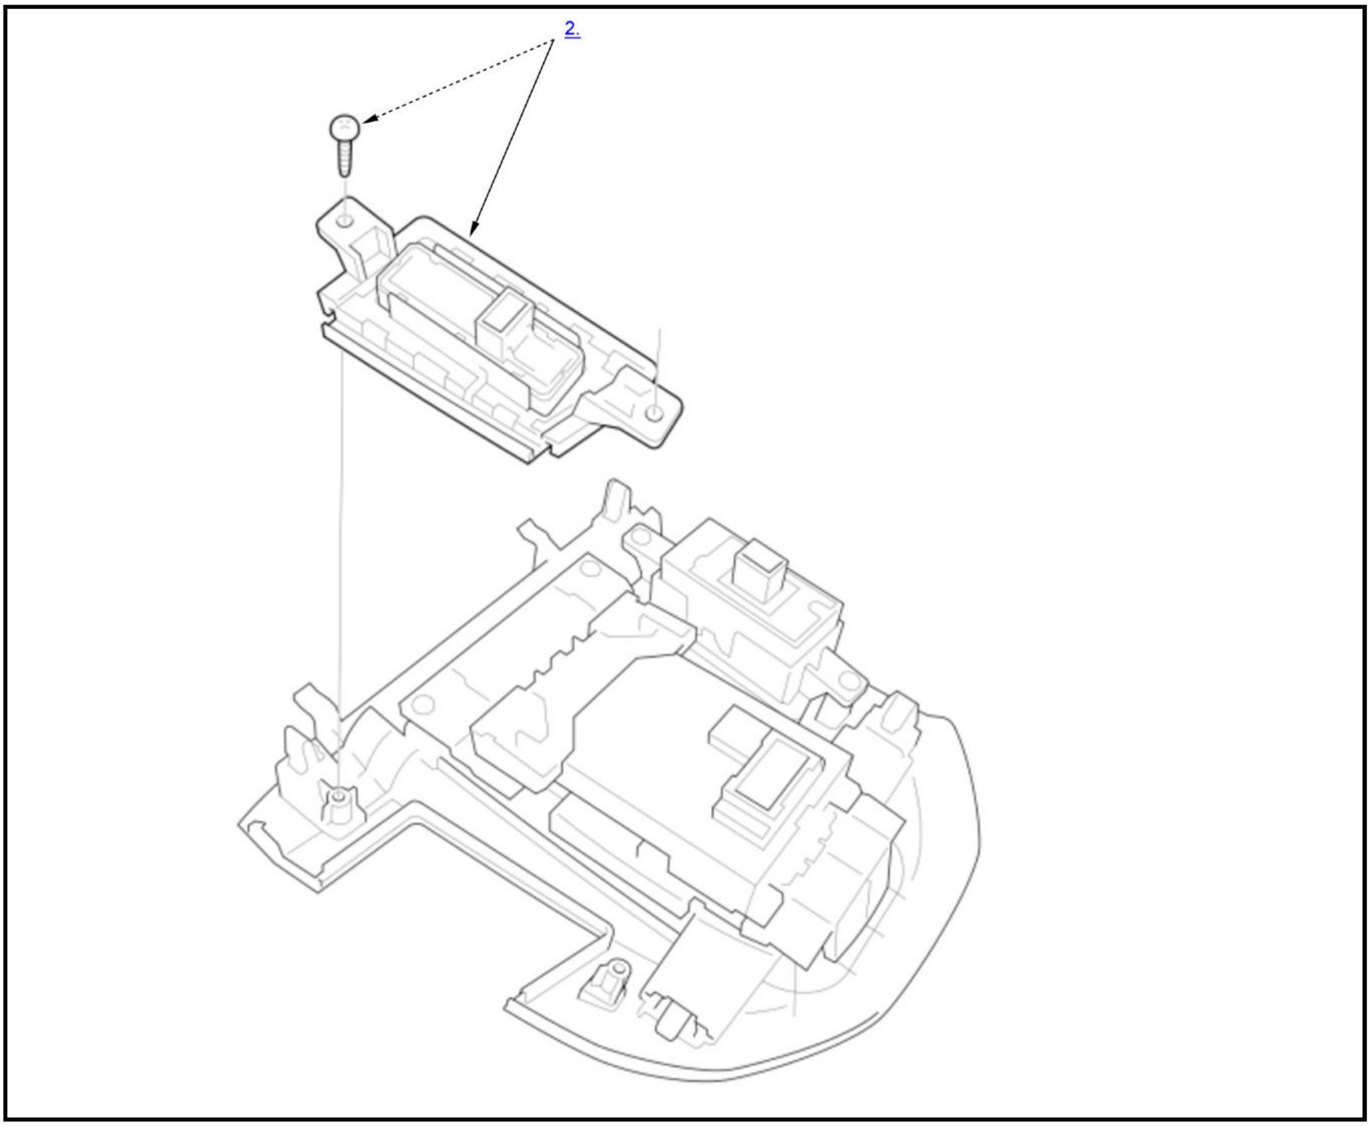
1. Install the parts in the reverse order of removal.

SPORT MODE SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

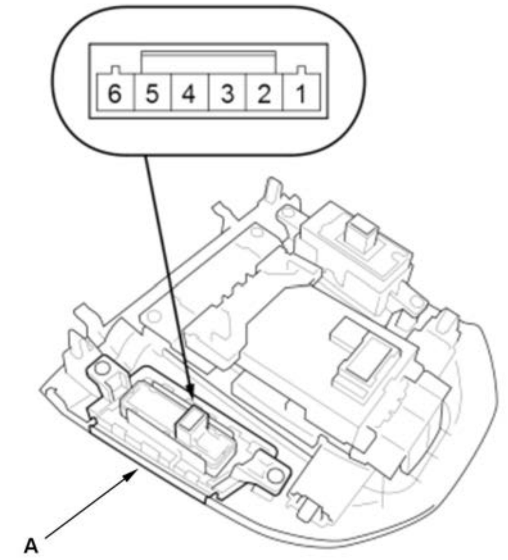


1. **Escutcheon Panel - Remove**
2. Sport Mode Switch - Remove
3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Test

1. **Escutcheon Panel - Remove**
2. Sport Mode Switch - Test



Terminal Position/Illumination	1	4	5		6
Pressed	○	○			
Switch lights			⊕	▷|—⋀⋀⋀	⊖

○—○ = Continuity check
⊕—⊖ = Voltage for LED

1. Test the sport mode switch (A) according to the table.

NOTE:

- When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.
- Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

2. If the result is not as specified, replace the sport mode switch.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

ENGINE VIBRATES UNDER ALL DRIVING CONDITIONS

Probable cause(s)

- Generator motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate
    - 3-phase wires
- Generator motor defective; faulty installations:
-
    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals
- Engine output low
- Clutch defective
- Clearance between clutch end-plate and top disc incorrect

NOTE:

- Check the engine control system.
- Inspect the generator shaft for wear and damage.
- Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, replace the clutch.
- **Replace the transmission (e-CVT)** .

EXCESSIVE SHOCK WHEN CHANGING FROM EV DRIVE MODE TO HYBRID DRIVE MODE

Probable cause(s)

- Generator motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate
    - 3-phase wires
- Generator motor defective; faulty installations:
-

    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals
- Generator motor stator temperature high
- Generator motor position sensor not learned
- Flywheel defective
- Input shaft worn or damaged
- Generator shaft worn or damaged
- Torque limiter defective

NOTE:

- Check the flywheel for wear and damage, if the flywheel is worn or damaged, replace the flywheel.
- Inspect the input shaft for wear and damage.
- Inspect the generator shaft for wear and damage.
- **Replace the transmission (e-CVT)** .

EXCESSIVE SHOCK WHEN CHANGING FROM ENGINE DRIVE MODE TO HYBRID DRIVE MODE

Probable cause(s)

- Traction motor position sensor defective
- Traction motor position sensor line failure
- Transmission fluid temperature sensor defective
- Traction motor sensor harness failure
- Traction motor position sensor failed to install
- Generator motor position sensor defective
- Generator motor position sensor line failure
- Generator motor position sensor failed to install
- Low ATF level
- ATF pump worn or binding
- Main regulator valve stuck or spring worn
- Foreign material in separator plate orifice
- Cooler relief valve defective
- ATF strainer clogged
- Clutch defective
- Clearance between clutch end-plate and top disc incorrect

NOTE:

- Check the ATF level. If the level is below the lower level, check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines.
- Check the motor position sensor harness for poor connections, loose terminals, wear, and damage.
- Check the ATF pump drive gears for wear and damage.
- Inspect the motor shaft for wear and damage.
- Inspect the generator shaft for wear and damage.
- Inspect the input shaft for wear and damage.

- **Replace the valve body assembly** .
- Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice.
- Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris.
- Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, replace the clutch.
- **Replace the transmission (e-CVT)** .

EXCESSIVE SHOCK WHEN CHANGING FROM HYBRID DRIVE MODE TO EV DRIVE MODE

Probable cause(s)

- Flywheel defective
- Input shaft worn or damaged
- Generator shaft worn or damaged
- Torque limiter defective

NOTE:

- Check the flywheel for wear and damage, if the flywheel is worn or damaged, replace the flywheel.
- Inspect the input shaft for wear and damage.
- Inspect the generator shaft for wear and damage.
- **Replace the transmission (e-CVT)** .

EXCESSIVE SHOCK WHEN CHANGING FROM HYBRID DRIVE MODE TO ENGINE DRIVE MODE

Probable cause(s)

- Traction motor position sensor defective
- Traction motor position sensor line failure
- Transmission fluid temperature sensor defective
- Traction motor sensor harness failure
- Traction motor position sensor failed to install
- Generator motor position sensor defective
- Generator motor position sensor line failure
- Generator motor position sensor failed to install
- Shift solenoid valve A defective
- Shift solenoid valve B defective
- Transmission fluid pressure sensor defective
- Engine output low
- Low ATF level
- ATF pump worn or binding
- Main regulator valve stuck or spring worn
- Foreign material in separator plate orifice
- Shift valve A defective
- Shift valve B defective
- Input shaft worn or damaged
- Over drive gears worn or damaged

- Clutch defective
- Clearance between clutch end-plate and top disc incorrect
- Torque limiter defective

NOTE:

- Check the engine control system.
- Inspect the shift solenoid valve function with the HDS. Check for a seized shift solenoid valve, and inspect the O-rings.
- Check the motor position sensor harness for poor connections, loose terminals, wear, and damage.
- Check the ATF level. If the level is below the lower level, check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines.
- Check the ATF pump drive gears for wear and damage.
- **Replace the valve body assembly** .
- Inspect the input shaft for wear and damage.
- Check the over drive gears for wear and damage.
- Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice.
- Inspect the motor shaft for wear and damage.
- Inspect the generator shaft for wear and damage.
- Inspect the countershaft for wear and damage.
- Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, replace the clutch.
- Check the transmission fluid pressure sensor.
- **Replace the transmission (e-CVT)** .

HDS DOES NOT COMMUNICATE WITH THE PCM

Probable cause(s)

- DLC circuit error
- PCM defective

NOTE:

Troubleshooting the DLC circuit .

NOISE FROM TRANSMISSION (E-CVT) IN EV DRIVE MODE

Probable cause(s)

- Traction motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate
    - Sensor harness
    - 3-phase wires
- Traction motor defective; faulty installations:

-
    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals
- Foreign material in traction motor
- Countershaft worn or damaged
- Motor shaft worn or damaged
- Final gears worn or damaged
- Clutch defective
- Clearance between clutch end-plate and top disc incorrect
- Thrust washer seized, worn, or damaged
- Input shaft bearing, countershaft bearing, generator shaft bearing, motor shaft bearing, or differential carrier bearing defective

NOTE:

- Check the motor position sensor harness for poor connections, loose terminals, wear, and damage.
- Inspect the countershaft for wear and damage.
- Inspect the motor shaft for wear and damage.
- Check the final gears for wear and damage.
- Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, replace the clutch.
- Check the thrust washers for seizure, wear and damage.
- Check the bearings for the input shaft, the countershaft, the generator shaft, the motor shaft, and the differential carrier.
- **Replace the transmission (e-CVT)** .

NOISE FROM TRANSMISSION (E-CVT) IN ENGINE DRIVE MODE

Probable cause(s)

- Traction motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate
    - Sensor harness
    - 3-phase wires
- Traction motor defective; faulty installations:
-
    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals
- Foreign material in traction motor

- Generator motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate
    - 3-phase wires
- Generator motor defective; faulty installations:
-
    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals
- Flywheel defective
- Low ATF level
- ATF pump worn or binding
- ATF strainer clogged
- Input shaft worn or damaged
- Countershaft worn or damaged
- Motor shaft worn or damaged
- Final gears worn or damaged
- Over drive gears worn or damaged
- Clutch defective
- Thrust washer seized, worn, or damaged
- Input shaft bearing, countershaft bearing, generator shaft bearing, motor shaft bearing, or differential carrier bearing defective

NOTE:

- Check the flywheel for wear and damage, if the flywheel is worn or damaged, replace the flywheel.
- Check the ATF level. If the level is below the lower level, check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines.
- Check the motor position sensor harness for poor connections, loose terminals, wear, and damage.
- Check the ATF pump drive gears for wear and damage.
- Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris.
- **Replace the valve body assembly** .
- Inspect the input shaft for wear and damage.
- Inspect the countershaft for wear and damage.
- Inspect the motor shaft for wear and damage.
- Inspect the generator shaft for wear and damage.
- Check the final gears for wear and damage.
- Check the over drive gears for wear and damage.
- Check the thrust washers for seizure, wear and damage.
- Check the bearings for the input shaft, the countershaft, the generator shaft, the motor shaft, and the differential carrier.

- Replace the transmission (e-CVT) .

NOISE FROM TRANSMISSION (E-CVT) IN HYBRID DRIVE MODE

Probable cause(s)

- Traction motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate
    - Sensor harness
    - 3-phase wires
- Traction motor defective; faulty installations:
-
    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals
- Foreign material in traction motor
- Generator motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate
    - 3-phase wires
- Generator motor defective; faulty installations:
-
    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals
- Flywheel defective
- Low ATF level
- ATF pump worn or binding
- ATF strainer clogged
- Input shaft worn or damaged
- Countershaft worn or damaged
- Generator shaft worn or damaged
- Motor shaft worn or damaged
- Final gears worn or damaged
- Clutch defective
- Clearance between clutch end-plate and top disc incorrect

- Torque limiter defective
- Thrust washer seized, worn, or damaged
- Input shaft bearing, countershaft bearing, generator shaft bearing, motor shaft bearing, or differential carrier bearing defective

NOTE:

- Check the flywheel for wear and damage, if the flywheel is worn or damaged, replace the flywheel.
- Check the ATF level. If the level is below the lower level, check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines.
- Check the motor position sensor harness for poor connections, loose terminals, wear, and damage.
- Check the ATF pump drive gears for wear and damage.
- Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris.
- **Replace the valve body assembly** .
- Inspect the input shaft for wear and damage.
- Inspect the countershaft for wear and damage.
- Inspect the generator shaft for wear and damage.
- Inspect the motor shaft for wear and damage.
- Check the final gears for wear and damage.
- Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, replace the clutch.
- Check the thrust washers for seizure, wear and damage.
- Check the bearings for the input shaft, the countershaft, the generator shaft, the motor shaft, and the differential carrier.
- **Replace the transmission (e-CVT)** .

NOISE FROM TRANSMISSION (E-CVT) WHILE RECHARGING WHEN VEHICLE STOPPED

Probable cause(s)

- Foreign material in traction motor
- Generator motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate
    - 3-phase wires
- Generator motor defective; faulty installations:
-
    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals
- Flywheel defective
- Low ATF level
- ATF pump worn or binding

- ATF strainer clogged
- Input shaft worn or damaged
- Generator shaft worn or damaged
- Torque limiter defective

NOTE:

- Check the flywheel for wear and damage, if the flywheel is worn or damaged, replace the flywheel.
- Check the ATF level. If the level is below the lower level, check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines.
- Check the ATF pump drive gears for wear and damage.
- Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris.
- **Replace the valve body assembly** .
- Inspect the input shaft for wear and damage.
- Inspect the generator shaft for wear and damage.
- **Replace the transmission (e-CVT)** .

POOR ACCELERATION

Probable cause(s)

- Traction motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate
    - Transmission fluid temperature sensor
    - Sensor harness
    - 3-phase wires
- Traction motor defective; faulty installations:
-
    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals
- Traction motor stator temperature high
- Traction motor rotor temperature high
- Traction motor position sensor not learned
- Generator motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate

    - 3-phase wires
- Generator motor defective; faulty installations:
-
    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals
- Generator motor stator temperature high
- Generator motor position sensor not learned
- Engine output low
- Low ATF level
- ATF pump worn or binding
- Main regulator valve stuck or spring worn
- Foreign material in separator plate orifice
- Cooler relief valve defective
- ATF strainer clogged
- ATF cooler clogged

NOTE:

- Check the engine control system.
- Check the ATF level. If the level is below the lower level, check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines.
- Inspect the motor shaft for wear and damage.
- Inspect the generator shaft for wear and damage.
- Check the ATF pump drive gears for wear and damage.
- **Replace the valve body assembly** .
- Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice.
- Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris.
- Check the ATF cooler.
- **Replace the transmission (e-CVT)** .

SHIFT POSITION INDICATOR DOES NOT INDICATE AT ALL

Probable cause(s)

- Gauge control module defective
- SBW shifter control module defective
- PCM defective

NOTE:

- **Check the F-CAN communication line by using the gauge control module self-diagnostic function** .
- **Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function** .

SPEEDOMETER AND ODOMETER DOES NOT OPERATE

Probable cause(s)

- Traction motor position sensor defective
- Traction motor position sensor line failure
- Traction motor sensor harness failure
- Traction motor position sensor failed to install

NOTE:

- Inspect the motor shaft for wear and damage.
- Check the motor position sensor harness for poor connections, loose terminals, wear, and damage.
- **Replace the transmission (e-CVT)** .

THE PADDLE SHIFTERS DO NOT OPERATE EVEN THOUGH THE PADDLE SHIFTER IS OPERATED IN D POSITION/MODE

Probable cause(s)

- A problem in the paddle shifter circuit
- Paddle shifter defective
- PCM defective

NOTE:

- **Troubleshoot the paddle shifter circuit** .
- **Test the paddle shifter** .

TRANSMISSION DOES NOT SHIFT INTO P POSITION/MODE OR SHIFT OUT OF P POSITION/MODE

Probable cause(s)

- Park pawl actuator defective
- Park pawl actuator driver unit defective
- Park position sensor defective
- SBW shifter control module defective
- Park mechanism defective

NOTE:

- Check the park position sensor.
- Inspect the park mechanism and the park pawl actuator.
- Check SBW shifter control module.

VEHICLE DOES NOT ACCELERATE ABOVE CERTAIN SPEED

Probable cause(s)

- Traction motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate

  - Transmission fluid temperature sensor
  - Sensor harness
  - 3-phase wires
- Traction motor defective; faulty installations:
-
  - Stator
  - Position sensor
  - Terminals
  - 3-phase wire terminals
- Traction motor stator temperature high
- Traction motor rotor temperature high
- Traction motor position sensor not learned
- Generator motor defective: worn or damaged:
-
  - Stator
  - Rotor
  - Position sensor
  - Position sensor line
  - Terminal plate
  - 3-phase wires
- Generator motor defective; faulty installations:
-
  - Stator
  - Position sensor
  - Terminals
  - 3-phase wire terminals
- Generator motor stator temperature high
- Generator motor position sensor not learned
- Engine output low
- Low ATF level
- ATF pump worn or binding
- Main regulator valve stuck or spring worn
- Foreign material in separator plate orifice
- Cooler relief valve defective
- ATF strainer clogged
- ATF cooler clogged

NOTE:

- Check the engine control system.
- Check the motor position sensor harness for poor connections, loose terminals, wear, and damage.
- Check the ATF level. If the level is below the lower level, check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines.
- Check the ATF pump drive gears for wear and damage.
- **Replace the valve body assembly** .
- Inspect the motor shaft for wear and damage.

- Inspect the generator shaft for wear and damage.
- Check for a clogged orifice in the separator plate. If the orifice is clogged, remove it and clean the separator plate orifice.
- Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris.
- Check the ATF cooler.
- **Replace the transmission (e-CVT)** .

VEHICLE DOES NOT MOVE IN D POSITION/MODE

Probable cause(s)

- Traction motor position sensor defective
- Traction motor position sensor line failure
- Traction motor sensor harness failure
- Park pawl actuator defective
- Park pawl actuator driver unit defective
- Park position sensor defective
- SBW shifter control module defective

NOTE:

- Inspect the motor shaft for wear and damage.
- Check the motor position sensor harness for poor connections, loose terminals, wear, and damage.
- Check the park position sensor.
- Inspect the park mechanism and the park pawl actuator.
- Check the SBW shifter control module.
- **Replace the transmission (e-CVT)** .

VEHICLE DOES NOT MOVE IN R POSITION/MODE

Probable cause(s)

- Traction motor position sensor defective
- Traction motor position sensor line failure
- Traction motor sensor harness failure
- Park pawl actuator defective
- Park pawl actuator driver unit defective
- Park position sensor defective
- SBW shifter control module defective

NOTE:

- Inspect the motor shaft for wear and damage.
- Check the motor position sensor harness for poor connections, loose terminals, wear, or damage.
- Check the park position sensor.
- Inspect the park mechanism and the park pawl actuator.
- Check the SBW shifter control module.
- **Replace the transmission (e-CVT)** .

VEHICLE DOES NOT RECHARGE FROM GENERATOR MOTOR

Probable cause(s)

- Foreign material in traction motor
- Foreign material in PCU 3-phase connectors
- Generator motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate
    - 3-phase wires
- Generator motor defective; faulty installations:
-
    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals

- Countershaft worn or damaged
- Motor shaft worn or damaged
- Thrust washer seized, worn, or damaged
- Input shaft bearing, countershaft bearing, generator shaft bearing, motor shaft bearing, or differential carrier bearing defective
- Park mechanism defective

NOTE:

- Inspect the generator shaft for wear and damage.
- Inspect the countershaft for wear and damage.
- Inspect the motor shaft for wear and damage.
- Check the thrust washers for seizure, wear and damage.
- Check the bearings for the input shaft, the countershaft, the generator shaft, the motor shaft, and the differential carrier.
- Inspect the park mechanism and the park pawl actuator.
- **Replace the transmission (e-CVT)** .

VEHICLE DOES NOT RECHARGE FROM MOTOR REGENERATIVE SYSTEM

Probable cause(s)

- Traction motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate
    - Sensor harness

    - 3-phase wires
- Traction motor defective; faulty installations:
-
    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals
- Foreign material in traction motor
- Foreign material in PCU 3-phase connectors
- Countershaft worn or damaged
- Motor shaft worn or damaged
- Final gears worn or damaged
- Thrust washer seized, worn, or damaged
- Input shaft bearing, countershaft bearing, generator shaft bearing, motor shaft bearing, or differential carrier bearing defective

NOTE:

- Check the motor position sensor harness for poor connections, loose terminals, wear, and damage.
- Inspect the countershaft for wear and damage.
- Inspect the motor shaft for wear and damage.
- Check the final gears for wear and damage.
- Check the thrust washers for seizure, wear and damage.
- Check the bearings for the input shaft, the countershaft, the generator shaft, the motor shaft, and the differential carrier.
- **Replace the transmission (e-CVT)** .

VEHICLE DOES NOT TURN TO THE READY TO DRIVE MODE

Probable cause(s)

- Park pawl actuator defective
- Park pawl actuator driver unit defective
- Park position sensor defective
- SBW shifter control module defective

NOTE:

- Check the park position sensor.
- Inspect the park mechanism and the park pawl actuator.
- Check the SBW shifter control module.

VEHICLE IN READY TO DRIVE MODE, BUT VEHICLE DOES NOT MOVE IN ANY GEAR

Probable cause(s)

- Traction motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor

    - Position sensor line
    - Terminal plate
    - Sensor harness
    - 3-phase wires
- Traction motor defective; faulty installations:
-
    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals
- Foreign material in traction motor
- Foreign material in PCU 3-phase connectors
- Generator motor defective: worn or damaged:
-
    - Stator
    - Rotor
    - Position sensor
    - Position sensor line
    - Terminal plate
    - 3-phase wires
- Generator motor defective; faulty installations:
-
    - Stator
    - Position sensor
    - Terminals
    - 3-phase wire terminals
- Generator motor position sensor not learned
- Park pawl actuator defective
- Park pawl actuator driver unit defective
- Park position sensor defective
- SBW shifter control module defective
- Transmission assembly and drive plate installation defective
- Countershaft worn or damaged
- Motor shaft worn or damaged
- Final gears worn or damaged
- Thrust washer seized, worn, or damaged
- Input shaft bearing, countershaft bearing, generator shaft bearing, motor shaft bearing, or differential carrier bearing defective
- ATF cooler clogged
- Axle disengaged

NOTE:

- Check for an incorrectly installed transmission, and check the drive plate for wear and damage. Replace the drive plate if it is worn or damaged.
- Inspect the countershaft for wear and damage.
- Inspect the motor shaft for wear and damage.

- Inspect the generator shaft for wear and damage.
- Inspect the final gears for wear and damage.
- Check the thrust washer for seizure, wear, and damage.
- Check the bearings for the input shaft, the countershaft, the generator shaft, the motor shaft, and the differential carrier.
- Check the ATF cooler.
- Check the axles.
- Check the park position sensor.
- Inspect the park mechanism and the park pawl actuator.
- Check the SBW shifter control module.
- **Replace the transmission (e-CVT)** .

VEHICLE MOVES IN N POSITION/MODE

Probable cause(s)

- Excessive ATF
- Relief valve defective
- Clutch defective
- Clearance between clutch end-plate and top disc incorrect

NOTE:

- Check the ATF level. If the level is above the upper level, drain the ATF if it is over-filled.
- **Replace the valve body assembly** .
- Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, replace the clutch.

VIBRATION IN ALL SHIFT POSITIONS/MODES

Probable cause(s)

- Transmission assembly and drive plate installation defective
- Flywheel defective

NOTE:

- Check for an incorrectly installed transmission, and check the drive plate for wear and damage. Replace the drive plate if it is worn or damaged.
- Check the flywheel for wear and damage, if the flywheel is worn or damaged, replace the flywheel.

WITH THE VEHICLE IN THE ON MODE, THE SHIFT POSITION INDICATOR DISPLAYS AN IMPROPER INDICATION, OR IT NEVER DISPLAYS AT ALL

Probable cause(s)

- Gauge control module defective
- SBW shifter control module defective
- PCM defective

NOTE:

- **Check the F-CAN communication line by using the gauge control module self-diagnostic function** .

- **Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function** .

DESCRIPTION & OPERATION

GEAR SYSTEM DESCRIPTION - ELECTRONIC CONTROL SYSTEM

For locations of each component on the vehicle, refer to Component Location Index.

- **SBW shifter control module, Shift solenoid valve A, Shift solenoid valve B, Transmission fluid pressure sensor**
- **Paddle shifter +, Paddle shifter -, Sport mode switch, Shift position indicator, Deceleration Selector Indicator**
- **Battery condition monitor module, Motor control module, PCU, Traction motor, Generator motor, Transmission fluid temperature sensor**
- **PCM, APP sensor**
- **VSA modulator-control unit**
- **Electric servo brake control unit**
- **Brake pedal position switch**
- **Gauge control module**

Functional Diagram

The electronic control system consists of the PCM, sensors, switches, and shift solenoid valves. The PCM receives input signals from the sensors, switches, and other control units, processes data, and outputs signals for the engine control system and the gear control system. The gear control system includes clutch pressure control. The PCM determines the drive mode based on the information sent from each sensor and control unit. The PCM actuates shift solenoid valves A and B to engage over drive clutch.

*: By filtering the target driving force calculated by the management system through the notch filter which reduces the specific frequency, the fluctuation in the motor torque command value generated by the drive system resonance is suppressed and it generates a fluent motor torque command value.

Clutch Pressure Control

The PCM actuates shift solenoid valves A and B to control the over drive clutch pressure. The PCM receives input signals from the various sensors, switches, and control units, then processes the data, and determines the drive mode. When the drive mode is shifted from HV drive mode to engine drive mode, the PCM actuates shift solenoid valve B and makes the over drive clutch ready to be engaged. To reduce the shock caused during the engagement, the PCM controls the rpm of the engine and traction motor to be synchronized with each other before engaging the over drive clutch. Once speed of the engine and traction motor are synchronized, the PCM actuates shift solenoid valve A, and engages the over drive clutch. When the drive mode is shifted from engine drive mode to HV drive mode, the PCM turns off shift solenoid valves A and B, and releases the over drive clutch.

Deceleration Selector

Deceleration selector is adopted to use an auxiliary brake for engine braking, and produces decelerating power by the regenerative braking system and the coordination of the electric servo brake system. The PCM compares actual driving conditions with programmed driving conditions, based on the input from the paddle shifters, the SBW shifter control module, the motor control module, the battery condition monitor module, the electric servo brake control unit, and others, to control decelerating power while driving in D position/mode without pressing the accelerator.

The vehicle can decelerate by pressing the paddle shifter -, and the decelerating stage returns by pressing the paddle shifter +. There are four stages of the decelerating power in the system, the driver can select the stage by using the paddle shifters. Each time the paddle shifter is pressed, the deceleration selector indicator in the gauge control module displays the current stage.

The extent of the decelerating power and the deceleration selector indicator by pressing the paddle shifters:

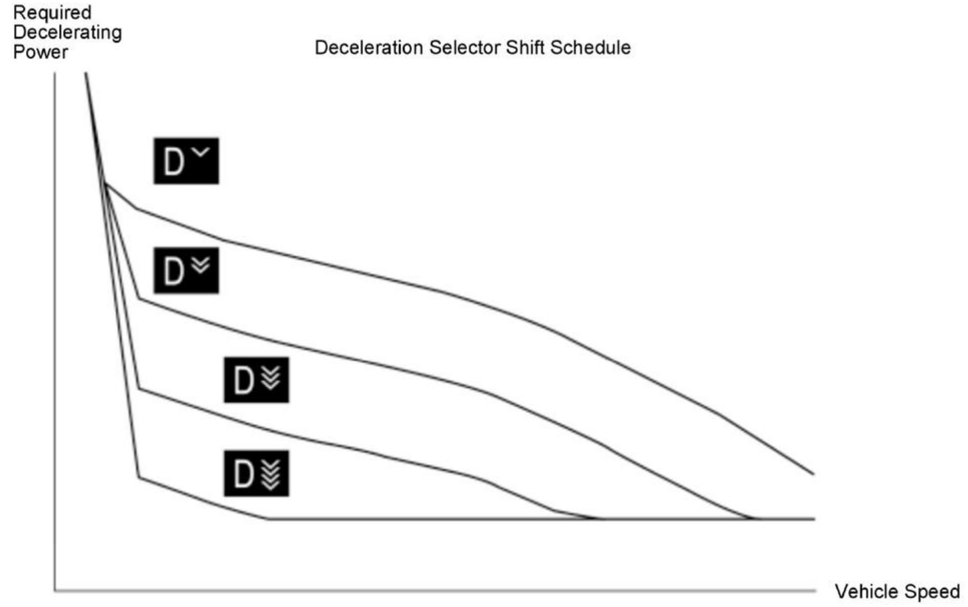
Paddle Shifter	Decelerating Power	Deceleration Selector Indicator
Pressing paddle shifter -	Changing to next higher stage at a press	Number of arrow increases from 1 to 2, 3, then 4
Pressing paddle shifter +	Returning to next lower stage at a press	Number of arrow decreases from 4 to 3, 2, then 1

There are limits to use the deceleration selector under certain conditions. When the deceleration selector makes an unavailable stage of the decelerating power, the PCM commands to change to next lower stage, or to cancel decelerating. If an unavailable stage is selected by pressing the paddle shifter -, the vehicle will not change the stage, and the deceleration selector indicator blinks the arrow(s) of the selected stage several times, then returns to the current stage.

Decelerating Limitations

- When high voltage battery is full-charged.
- When high voltage battery temperature is too low.
- When high voltage battery temperature is too high.
- When the protection of the hybrid system is required.
- The vehicle is coasting at speeds out of the allowable speed when pressing the paddle shifter.
- When the vehicle is stopped while turning on the ACC system with Low Speed Follow (LSF).

Each stage of the decelerating power, which can be selected by the deceleration selector, is set in accordance with the vehicle speed.



When the deceleration selector is selected, the system sets the decelerating power to:

- The 1st stage, when the system determines the vehicle is driving on a flat road.
- The 3rd stage, when the system determines the vehicle is descending a steep hill, and the 2nd and 1st stages are available.

GEAR SYSTEM DESCRIPTION - GENERAL OPERATION

General Description

The Electric Continuously Variable Transmission (e-CVT) is an electronically controlled transmission. The e-CVT provides stepless forward speeds and reverse. The e-CVT allows the vehicle to be driven under electric power, engine power, or combination of both power sources. Both power sources transmit power through the gears inside the transmission.

Transmission

The e-CVT assembly contains four parallel shafts, gears, the over drive clutch, the traction motor, and the generator motor. The input shaft is connected to the flywheel, which is connected to the engine crankshaft through the drive plate. Also, the input shaft is connected to the over drive clutch. When the input shaft is joined with the over drive gear by engaging the over drive clutch, engine power is transmitted through the input shaft, to the over drive gear and the countershaft, then to the final driven gear of the differential to provide drive. The motor shaft is connected to the traction motor, traction motor power is transmitted through the motor shaft, to the motor shaft gear and the countershaft, then to the final driven gear of the differential to provide drive. The generator shaft is connected to the generator motor. To charge the high voltage battery by generator motor, engine power is transmitted through the input shaft and generator shaft.

Electronic Control

The electronic control system consists of the powertrain control module (PCM), sensors, shift solenoid valves, and switches. The e-CVT seamlessly shifts between three drive modes; EV drive mode, HV drive mode, and engine drive mode. The PCM determines the drive mode based on the information sent from each sensor and control unit.

Hydraulic Control

The valve body assembly includes the regulator valve body and the shift valve body. They are installed to the flywheel housing. The regulator valve body contains ATF pumps A and B. ATF pump A is driven by the engine. ATF pump B is driven by the differential. These pumps supply hydraulic pressure to the hydraulic circuit. Transmission fluid pressure sensor is mounted on the outside of the transmission housing. Shift solenoid valves A and B are mounted on the outside of the flywheel housing. The PCM actuates the shift solenoid valves to control hydraulic pressure and engaging the over drive clutch.

Gear Selection

The SBW (Shift By Wire) system is a system that performs the shift operations of the driver electrically instead of using control cables. The SBW shifter has four positions/modes; P: PARK, R: REVERSE, N: NEUTRAL, and D: DRIVE.

Position	Description
P: PARK	Front wheels locked; the parking brake pawl engaged with the parking gear on the motor shaft. Over drive clutch is released. Traction motor does not rotate.
R: REVERSE	Traction motor rotates in reverse direction. The motor shaft drives the countershaft in reverse rotation.
N: NEUTRAL	Over drive clutch is released. Traction motor does not rotate.
D: DRIVE	General driving; D position/mode has three driving modes; EV drive mode, HV drive mode, and engine drive mode.

Shift Position Indicator

The shift position indicator in the gauge control module shows which shift position/mode has been selected without looking down at the console.

Over Drive Clutch

The over drive clutch is the hydraulic-actuated clutch, and is located at the end of the input shaft. The e-CVT applies hydraulic pressure to the over drive clutch to engage or disengage the over drive gear. When hydraulic pressure is introduced into the clutch drum, the clutch piston moves and presses the steel plates and the clutch discs. Power is then transmitted through the engaged clutch pack to its hub-mounted gear. Likewise, when the hydraulic pressure is bled from the clutch drum, the piston releases the steel plates and the clutch discs. Then the steel plates rotate with the clutch drum, and the clutch discs rotate with hub-mounted gear. The clutch discs are released from the steel plates. This allows the clutch disc to spin independently, transmitting no power.

Gear Operation

Gears on the input shaft:

- The input shaft gear is integral with the input shaft, and transmits the input shaft rotation to the generator shaft.
- The over drive gear is engaged/disengaged with the input shaft by the over drive clutch.

Gears on the motor shaft:

- The motor shaft gear is integral with the motor shaft, and transmits the traction motor rotation to the countershaft.
- The parking gear is splined with the motor shaft, and rotates with the motor shaft.

Gears on the generator shaft:

The generator shaft gear is integral with the generator shaft, and transmits the input shaft rotation to the generator motor.

Gears on the countershaft:

- The countershaft gear is integral with the countershaft, and transmits the motor shaft gear or over drive gear rotation to the final drive gear.
- The final drive gear is splined with the countershaft, and rotates with the countershaft.

Gears on the transfer assembly:

- The transfer driven gear is splined with the transfer hypoid drive gear/shaft assembly, and rotates with the transfer hypoid drive gear/shaft assembly.
- The transfer hypoid drive gear is integral with the hypoid drive shaft, and transmits the hypoid drive shaft rotation to the transfer hypoid driven gear.
- The transfer hypoid driven gear rotates the companion flange.

GEAR SYSTEM DESCRIPTION - HYDRAULIC CONTROLS

The valve body assembly includes the regulator valve body and the shift valve body. The regulator valve body contains ATF pumps A and B. ATF pump A is driven by ATF pump drive shaft A which the engine turns. ATF pump drive shaft A is connected to the input shaft which is driven by the engine via the flywheel. Fluid from ATF pump A flows through the main regulator valve to maintain specified pressure through the regulator valve body, directing pressure to each of the shafts, to the motors, and to the over drive clutch. ATF pump B is driven by ATF pump drive shaft B which the differential turns. ATF pump drive shaft B is connected to the final driven gear. Fluid from ATF pump B flows through each of the shafts and the motors. Shift solenoid valves A and B are mounted on the outside of the flywheel housing. Transmission fluid pressure sensor is mounted on the outside of the transmission housing.

GEAR SYSTEM DESCRIPTION - POWER FLOW

P and N Positions/Modes

The traction motor does not rotate; motor power is not transmitted to the countershaft. When the battery module SOC value is low, the engine will run. Engine power transmitted from the flywheel drives the input shaft and generator shaft, but the hydraulic pressure is not applied to the over drive clutch. Power is transmitted from the engine to the generator motor. In P, the motor shaft is locked by the parking brake pawl interlocking the parking gear on the motor shaft.

D Position/Mode

In D, the optimum drive mode is automatically selected for different driving conditions from the EV drive mode, the HV drive mode, and the engine drive mode.

In EV Drive Mode

- Engine does not run; power is not transmitted from the flywheel.
- Traction motor rotates; power is transmitted to the motor shaft.
- Motor shaft transmits the motor power to the countershaft and the final drive gear, which in turn drives the final driven gear.

R Position/Mode

In R, the vehicle runs only with the traction motor. The power flow through the transmission for reverse is identical in D. Reverse operation is enabled by reversing traction motor direction.

In EV Drive Mode

- Engine does not run; power is not transmitted from the flywheel.
- Traction motor rotates to the reverse direction in D; power is transmitted to the motor shaft.
- Motor shaft transmits the motor power to the countershaft and the final drive gear, which in turn drives the final driven gear.

GEAR SYSTEM DESCRIPTION - SHIFT CONTROL SYSTEM

For locations of each component on the vehicle, refer to Component Location Index.

- SBW shifter control module, Park pawl actuator driver unit, Park pawl actuator, Park position sensor
- PCM

Park Mechanism

The park mechanism locks the transmission by engaging the parking brake pawl with the parking gear which is splined with the motor shaft. The motor shaft gear which is integral with the motor shaft engages the countershaft gear which is integral with the countershaft, and the final drive gear which is splined with the countershaft engages the final driven gear.

Selecting the P position/mode switch commands the park pawl actuator turns the detent shaft to the P position. The detent shaft pushes the parking brake rod to engage the parking brake pawl with the park gear. When selecting the position/mode other than P, the park pawl actuator turns the detent shaft to the P release position to disengage the parking brake pawl from the park gear. Even if the end of the parking brake pawl rides on the top of the park gear teeth, slight movement of the vehicle will cause the parking brake pawl and the park gear to mesh with each other completely because the park brake rod spring puts tension on the park cone. The parking brake pawl receives the tension (which acts to separate the parking brake pawl from the parking gear) from the parking brake pawl spring.

General Control Description

When the driver select one position/mode by operating the SBW shifter, the SBW shifter control module transmits a shift position signal to the park pawl actuator driver unit and the PCM. The PCM compares actual driving conditions with programmed conditions, based on the input from the SBW shifter control module and others, to perform the optimum driving under all conditions. The park position sensor outputs P position signal to the SBW shifter control module.

PARK POSITION SENSOR

The shift control system includes the automatic P position/mode selection control, the neutral position holding mode, and the function for prevention of erroneous operation.

Automatic P Position/Mode Selection Control

Automatic P Position/Mode Selection Control with Door Open

When the vehicle stops (vehicle speed is less than 1 mph (2 km/h)) or if a driver disconnects the seat belt and opens the door with any other position/mode than P position/mode, P position/mode is automatically selected.

Operating Condition for Automatic P Position/Mode Selection Control with Door Open
With vehicle stop: See vehicle speed less than 1 mph (2 km/h)
With driver's seat belt disconnection: See seat belt switch OFF signal
Shift position condition: R, N, and D positions/modes
With driver's door open: See door switch OFF signal

After parking the vehicle in P position/mode by this mode you shift the position/mode out of P, the transmission returns to the P position/mode when you release the brake pedal unless the driver's door is closed and the driver's seat belt is fastened.

Automatic P Position/Mode Selection Control with POWER Switch OFF

When the vehicle stops (vehicle speed is less than 1 mph (2 km/h)) or if a driver turns the vehicle to the OFF (LOCK) mode with any other position/mode than P position/mode, P position/mode is automatically selected.

Neutral Position Holding Mode

This system is configured in such a way that the P position/mode is entered automatically when the vehicle is turned to the OFF (LOCK) mode. For this reason, a neutral position holding mode is provided when it is desired to stay in the N position/mode even when the vehicle is in the OFF (LOCK) mode. The neutral position holding mode keeps the transmission in the N position/mode for approximately 15 minutes.

Function for Prevention of Erroneous Operation

A function for prevention of erroneous operation is provided, to ensure that the operating safety is maintained at all times, even in case of a handling error in regard to the SBW shifter assembly.

Operations where the function for prevention of erroneous operation is activated:	Shift position after the function for prevention of erroneous operation was activated:
When the brake pedal is not pressed at the time of shifting from the P position/mode	P
When the accelerator pedal is pressed at the time of shifting from the P position/mode	P

Operations where the function for prevention of erroneous operation is activated:	Shift position after the function for prevention of erroneous operation was activated:
When the brake pedal is not pressed at the time of shifting from the N position/mode	N
When the accelerator pedal is pressed at the time of shifting from the N position/mode	N
When the vehicle speed is above 1 mph (2 km/h) at the time of shifting to the P position/mode	N
When the vehicle speed is above 5 mph (8 km/h) at the time of shifting from the D position/mode to the R position/mode	N
When the vehicle speed is above 7 mph (12 km/h) at the time of shifting from the R position/mode to the D position/mode	N

REMOVAL, INSTALLATION AND INSPECTION

TRANSFER ASSEMBLY REMOVAL, INSTALLATION, AND INSPECTION

Removal and Installation

NOTE:

- Clean the areas where the transfer assembly contacts the transmission (e-CVT) with solvent, and dry with compressed air.
- Keep all foreign particles out of the transmission (e-CVT).
- Apply a light coat of clean ATF on the O-ring before installation.

Procedure

NOTE: **Numbered call-outs in figure pertain to list numbers in following procedure.**

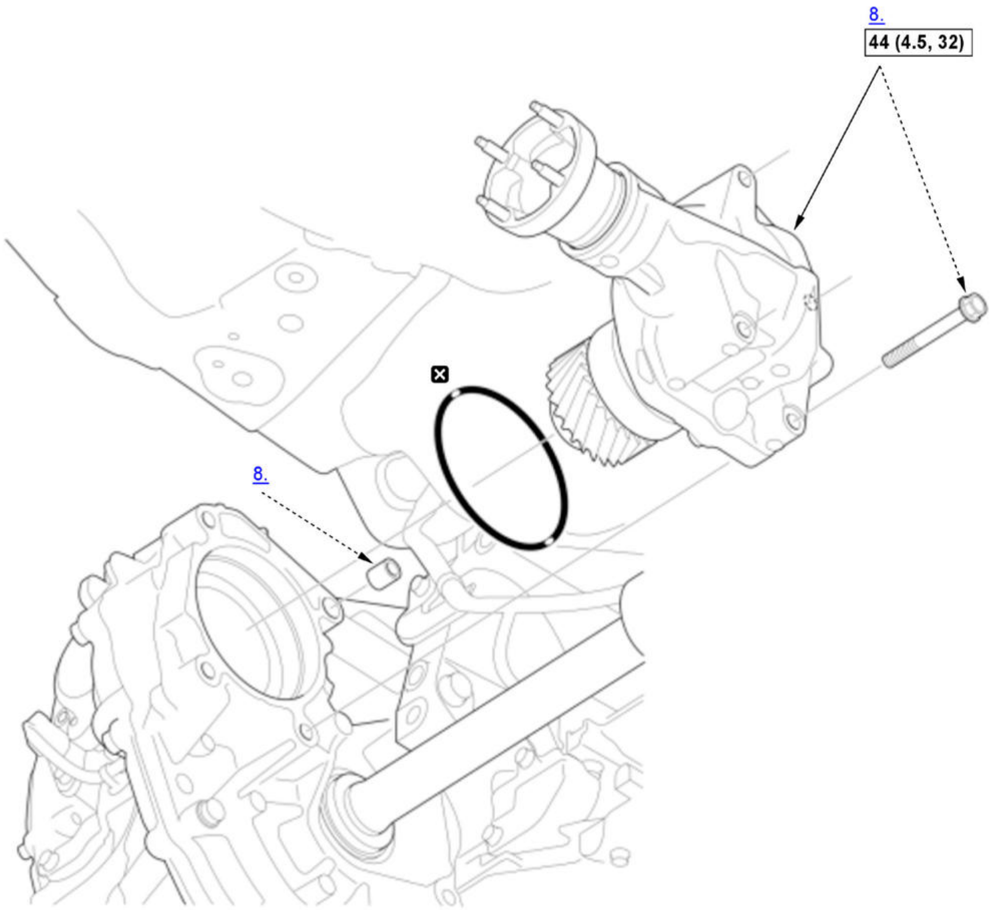

Fig. 1: Exploded View Of Transfer Assembly Components With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Vehicle - Lift
2. Neutral Position Holding Mode - Enter

   NOTE: Even if the negative terminal of the 12 volt battery is disconnected after the neutral position holding mode is actuated, the vehicle continues to keep the N position.

3. 12 Volt Battery Terminal - Disconnect
4. Engine Undercover - Remove
5. ATF - Drain
6. Exhaust Pipe A - Remove
7. Propeller Shaft - Remove
8. Transfer Assembly - Remove
9. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

10. ATF - Refill

Inspection

NOTE: How to read the torque specifications .

Transfer Gear Backlash Measurement

1. Vehicle - Lift
2. Neutral Position Holding Mode - Enter

   NOTE: Even if the negative terminal of the 12 volt battery is disconnected after the neutral position holding mode is actuated, the vehicle continues to keep the N position.

3. 12 Volt Battery Terminal - Disconnect
4. Engine Undercover - Remove
5. Propeller Shaft - Remove
6. Transfer Gear Backlash - Check

	1. Temporarily install the transfer companion flange setting nut (A). 2. Set a dial indicator (B) on the transfer companion flange setting nut as shown. **NOTE:** Position the dial indicator tip (C) on the direct extension of the nut center (D). 3. Measure the transfer gear backlash. 4. If the transfer gear backlash is out of the standard, replace the transfer assembly.

Standard:	
Â	**0.06-0.16 mm (0.0024-0.0063 in)**

7. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

   Fluid Leak Check

8. Vehicle - Lift
9. Engine Undercover - Remove
10. Fluid Leak - Check

    Transmission (e-CVT) Side

    1. Check for fluid leaks between the mating faces of the transfer assembly and the transmission (e-CVT).

    2. If there is leak:

       - Replace the O-ring between the transfer assembly and the transmission (e-CVT).

- Replace the O-ring between the transfer housing and the transfer hypoid drive gear/shaft assembly .

Propeller Shaft Side

1. Check for fluid leaks at the transfer companion flange.

2. If there is leak, replace the transfer oil seal and the O-ring

.

11. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Total Starting Torque Measurement

12. Total Starting Torque - Check

	1. Secure the transfer assembly (A) in a bench vise (B). **NOTE:** To prevent damaging, always use wood blocks (C) or equivalent materials between the transfer housing and the bench vise. 2. Rotate the companion flange (D) several turns to seat the tapered roller bearings. 3. Measure the total starting torque at the companion flange using a torque wrench (E) and a socket (F). 4. If the total starting torque is out of the standard, replace the transfer assembly.

Standard:	
Â	**2.85-7.40 N.m (29.1-75.6 kgf.cm, 25.2-65.5 lbf.in)**

Transfer Hypoid Gear Tooth Contact Pattern Check

13. Transfer Hypoid Gear Tooth Contact Pattern - Check

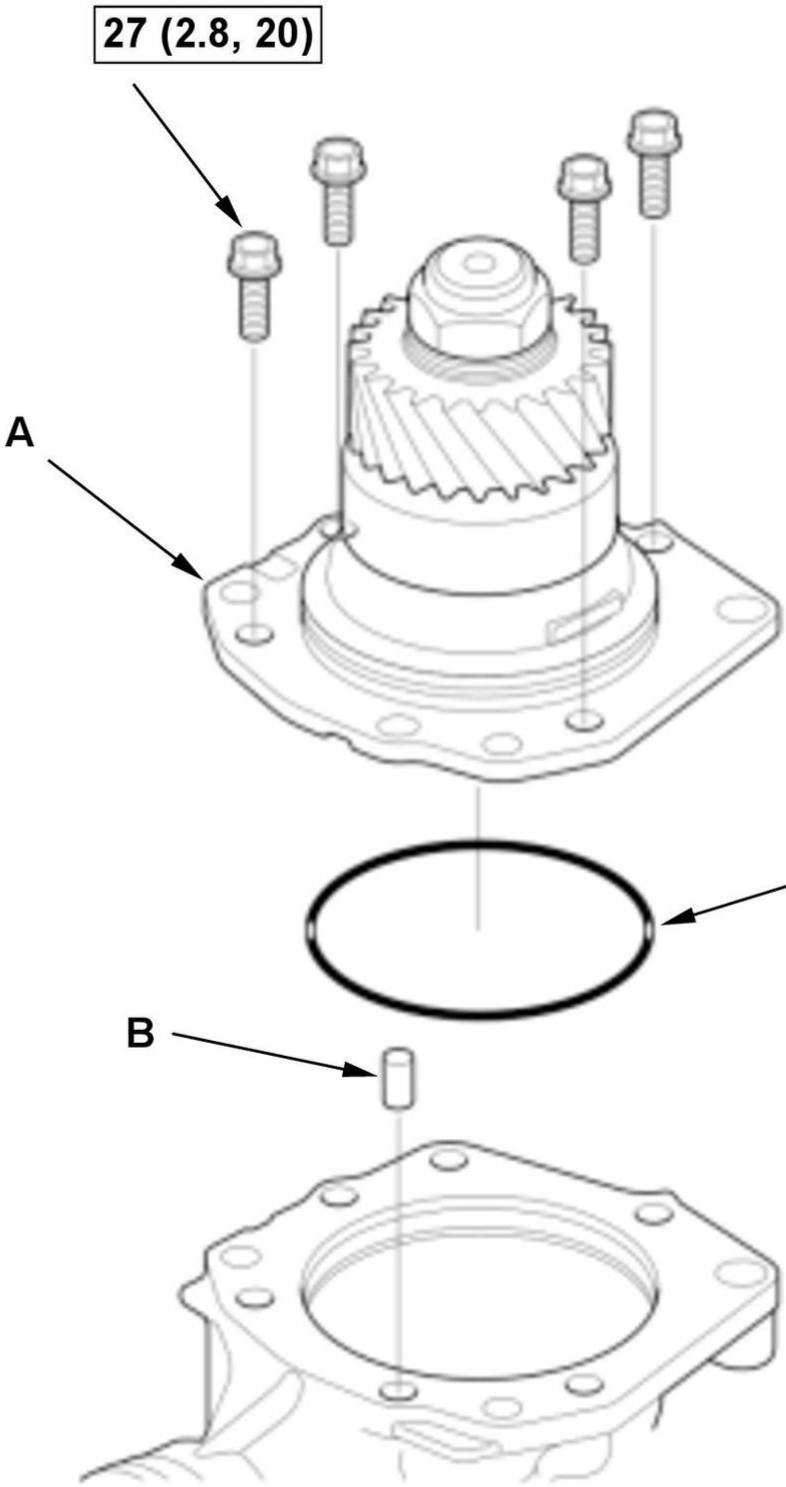

Fig. 2: Transfer Hypoid Drive Gear/Shaft Assembly Bolts With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

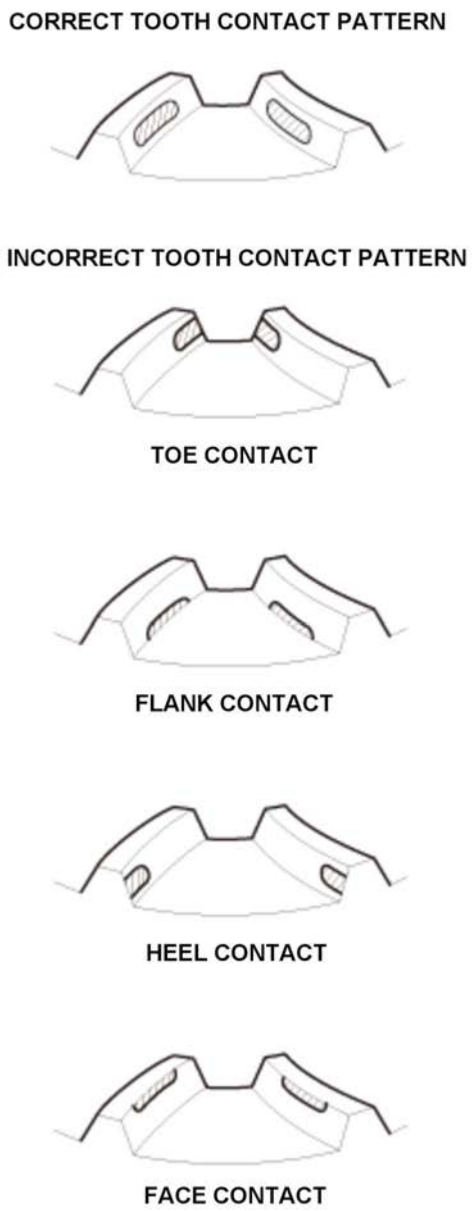
1. Remove the transfer hypoid drive gear/shaft assembly (A) with the dowel pin (B) and the O-ring (C).

2. Apply Prussian Blue to both sides of the transfer hypoid drive gear teeth lightly and evenly.

3. Temporarily install the transfer hypoid drive gear/shaft assembly with the dowel pin and the old O-ring.

4. Rotate the companion flange in both directions until the transfer hypoid drive gear rotates one full turn.

5. Remove the transfer hypoid drive gear/shaft assembly with the dowel pin and the O-ring.



CORRECT TOOTH CONTACT PATTERN
INCORRECT TOOTH CONTACT PATTERN
TOE CONTACT
FLANK CONTACT
HEEL CONTACT
FACE CONTACT

6. Check the transfer hypoid gear tooth contact pattern.

7. If the transfer hypoid gear tooth contact pattern is incorrect, replace the transfer assembly.

GENERAL INFORMATION

HOW TO ENTER NEUTRAL POSITION HOLDING MODE

Procedure

NOTE:

- This function is automatically canceled after elapsed about 15 minutes from entering the neutral position holding mode.
- Even if the negative terminal of the 12 volt battery is disconnected after the neutral position holding mode is started, the vehicle continues to keep the N position/mode.

1. Neutral Position Holding Mode - Enter

1. Park the vehicle on level ground, and block all four wheels.

2. Turn the vehicle to the READY TO DRIVE mode.

3. Press and hold the brake pedal.

4. Press and release the N position/mode to shift the transmission to Neutral.

5. Press N again, and hold it for 2 seconds. The vehicle will enter neutral hold.

SYMPTOM TROUBLESHOOTING INDEX

GEAR UNIT CONTROL SYSTEM SYMPTOM TROUBLESHOOTING INDEX

NOTE: Do an all DTC check with the HDS, and troubleshoot any DTCs first before following the repair procedures listed in the index.

Symptom	Probable cause(s)	Notes
With the vehicle in the ON mode, the shift position indicator displays an improper indication, or it never displays at all	• Gauge control module defective • SBW shifter control module defective • PCM defective	• Check the F-CAN communication line by using the gauge control module self-diagnostic function . • Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function .
Shift position indicator does not indicate at all	• Gauge control module defective • SBW shifter control module defective • PCM defective	• Check the F-CAN communication line by using the gauge control module self-diagnostic function . • Check the indicator drive circuit in the gauge control module by using the gauge control module self-diagnostic function .
The paddle shifters do not operate even though the paddle shifter is operated in D position/mode	• A problem in the paddle shifter circuit • Paddle shifter defective • PCM defective	• Troubleshoot the paddle shifter circuit . • Test the paddle shifter .
HDS does not communicate with the PCM	• DLC circuit error • PCM defective	Troubleshooting the DLC circuit .

Symptom	Probable cause(s)	Notes

Vehicle in READY TO DRIVE mode, but vehicle does not move in any gear	• Traction motor defective: worn or damaged:

	  • Stator
	  • Position sensor
	  • Terminals
	  • 3-phase wire terminals
	• Generator motor stator temperature high
	• Generator motor position sensor not learned
	• Flywheel defective
	• Input shaft worn or damaged
	• Generator shaft worn or damaged
	• Torque limiter defective
		• Check the flywheel for wear and damage, if the flywheel is worn or damaged, replace the flywheel.
		• Inspect the input shaft for wear and damage.
		• Inspect the generator shaft for wear and damage.
		• **Replace the transmission (e-CVT)** .

Symptom	Probable cause(s)	Notes
Excessive shock when changing from hybrid drive mode to EV drive mode	• Flywheel defective • Input shaft worn or damaged • Generator shaft worn or damaged • Torque limiter defective	• Check the flywheel for wear and damage, if the flywheel is worn or damaged, replace the flywheel. • Inspect the input shaft for wear and damage. • Inspect the generator shaft for wear and damage. • **Replace the transmission (e-CVT)** .

Symptom	Probable cause(s)	Notes
Noise from transmission (e-CVT) in engine drive mode	• Traction motor defective: worn or damaged: • • Stator • Rotor • Position sensor • Position sensor line • Terminal plate • Sensor harness • 3-phase wires • Traction motor defective; faulty installations: • • Stator • Position sensor • Terminals • 3-phase wire terminals • Foreign material in traction motor • Generator motor defective: worn or damaged: • • Stator • Rotor • Position sensor • Position sensor line • Terminal plate • 3-phase wires • Generator motor defective; faulty installations: • • Stator • Position sensor • Terminals • 3-phase wire terminals	• Check the flywheel for wear and damage, if the flywheel is worn or damaged, replace the flywheel. • Check the ATF level. If the level is below the lower level, check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines. • Check the motor position sensor harness for poor connections, loose terminals, wear, and damage. • Check the ATF pump drive gears for wear and damage. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. • **Replace the valve body assembly** . • Inspect the input shaft for wear and damage. • Inspect the countershaft for wear and damage. • Inspect the motor shaft for wear and damage. • Inspect the generator shaft for wear and damage. • Check the final gears for wear and damage. • Check the over drive gears for wear and damage. • Check the thrust washers for seizure, wear and damage. • Check the bearings for the input shaft, the countershaft, the generator shaft, the motor shaft, and the differential carrier. • **Replace the transmission (e-CVT)** .

Symptom	Probable cause(s)	Notes
	• Flywheel defective • Low ATF level • ATF pump worn or binding • ATF strainer clogged • Input shaft worn or damaged • Countershaft worn or damaged • Motor shaft worn or damaged • Final gears worn or damaged • Over drive gears worn or damaged • Clutch defective • Thrust washer seized, worn, or damaged • Input shaft bearing, countershaft bearing, generator shaft bearing, motor shaft bearing, or differential carrier bearing defective	

Symptom	Probable cause(s)	Notes
Noise from transmission (e-CVT) in hybrid drive mode	• Traction motor defective: worn or damaged: • • Stator • Rotor • Position sensor • Position sensor line • Terminal plate • Sensor harness • 3-phase wires • Traction motor defective; faulty installations: • • Stator • Position sensor • Terminals • 3-phase wire terminals • Foreign material in traction motor • Generator motor defective: worn or damaged: • • Stator • Rotor • Position sensor • Position sensor line	• Check the flywheel for wear and damage, if the flywheel is worn or damaged, replace the flywheel. • Check the ATF level. If the level is below the lower level, check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines. • Check the motor position sensor harness for poor connections, loose terminals, wear, and damage. • Check the ATF pump drive gears for wear and damage. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. • **Replace the valve body assembly** . • Inspect the input shaft for wear and damage. • Inspect the countershaft for wear and damage. • Inspect the generator shaft for wear and damage. • Inspect the motor shaft for wear and damage. • Check the final gears for wear and damage.

Symptom	Probable cause(s)	Notes
	• Terminal plate • 3-phase wires • Generator motor defective; faulty installations: • • Stator • Position sensor • Terminals • 3-phase wire terminals • Flywheel defective • Low ATF level • ATF pump worn or binding • ATF strainer clogged • Input shaft worn or damaged • Countershaft worn or damaged • Generator shaft worn or damaged • Motor shaft worn or damaged • Final gears worn or damaged • Clutch defective • Clearance between clutch end-plate and top disc incorrect • Torque limiter defective • Thrust washer seized, worn, or damaged • Input shaft bearing, countershaft bearing, generator shaft bearing, motor shaft bearing, or differential carrier bearing defective	• Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, replace the clutch. • Check the thrust washers for seizure, wear and damage. • Check the bearings for the input shaft, the countershaft, the generator shaft, the motor shaft, and the differential carrier. • **Replace the transmission (e-CVT)** .

Symptom	Probable cause(s)	Notes
Noise from transmission (e-CVT) in EV drive mode	• Traction motor defective: worn or damaged: • • Stator • Rotor • Position sensor • Position sensor line • Terminal plate • Sensor harness • 3-phase wires • Traction motor defective; faulty installations: • • Stator	• Check the motor position sensor harness for poor connections, loose terminals, wear, and damage. • Inspect the countershaft for wear and damage. • Inspect the motor shaft for wear and damage. • Check the final gears for wear and damage. • Inspect the clearance between the clutch end-plate and the top disc. If the clearance is out of tolerance, replace the clutch. • Check the thrust washers for seizure, wear and damage.

Symptom	Probable cause(s)	Notes
	- Position sensor - Terminals - 3-phase wire terminals • Foreign material in traction motor • Countershaft worn or damaged • Motor shaft worn or damaged • Final gears worn or damaged • Clutch defective • Clearance between clutch end-plate and top disc incorrect • Thrust washer seized, worn, or damaged • Input shaft bearing, countershaft bearing, generator shaft bearing, motor shaft bearing, or differential carrier bearing defective	• Check the bearings for the input shaft, the countershaft, the generator shaft, the motor shaft, and the differential carrier. • **Replace the transmission (e-CVT)** .

Symptom	Probable cause(s)	Notes
Noise from transmission (e-CVT) while recharging when vehicle stopped	• Foreign material in traction motor • Generator motor defective: worn or damaged: • • Stator • Rotor • Position sensor • Position sensor line • Terminal plate • 3-phase wires • Generator motor defective; faulty installations: • • Stator • Position sensor • Terminals • 3-phase wire terminals • Flywheel defective • Low ATF level • ATF pump worn or binding • ATF strainer clogged • Input shaft worn or damaged • Generator shaft worn or damaged • Torque limiter defective	• Check the flywheel for wear and damage, if the flywheel is worn or damaged, replace the flywheel. • Check the ATF level. If the level is below the lower level, check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines. • Check the ATF pump drive gears for wear and damage. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. • Replace the valve body assembly . • Inspect the input shaft for wear and damage. • Inspect the generator shaft for wear and damage. • Replace the transmission (e-CVT) .

Symptom	Probable cause(s)	Notes
Vehicle does not accelerate above certain speed	• Traction motor defective: worn or damaged: • • Stator • Rotor • Position sensor • Position sensor line • Terminal plate • Transmission fluid temperature sensor • Sensor harness • 3-phase wires • Traction motor defective; faulty installations: • • Stator • Position sensor	• Check the engine control system. • Check the motor position sensor harness for poor connections, loose terminals, wear, and damage. • Check the ATF level. If the level is below the lower level, check the ATF cooler lines for leaks and loose connections. If necessary, clean the ATF cooler lines. • Check the ATF pump drive gears for wear and damage. • Replace the valve body assembly . • Inspect the motor shaft for wear and damage. • Inspect the generator shaft for wear and damage. • Check for a clogged orifice in the separator plate. If the orifice is

Symptom	Probable cause(s)	Notes
	• Terminals • 3-phase wire terminals • Traction motor stator temperature high • Traction motor rotor temperature high • Traction motor position sensor not learned • Generator motor defective: worn or damaged: • • Stator • Rotor • Position sensor • Position sensor line • Terminal plate • 3-phase wires • Generator motor defective; faulty installations: • • Stator • Position sensor • Terminals • 3-phase wire terminals • Generator motor stator temperature high • Generator motor position sensor not learned • Engine output low • Low ATF level • ATF pump worn or binding • Main regulator valve stuck or spring worn • Foreign material in separator plate orifice • Cooler relief valve defective • ATF strainer clogged • ATF cooler clogged	clogged, remove it and clean the separator plate orifice. • Check the ATF strainer for debris. If the strainer is clogged, find the damaged components that caused the debris. • Check the ATF cooler. • **Replace the transmission (e-CVT)** .

Symptom	Probable cause(s)	Notes
Vibration in all shift positions/modes	• Transmission assembly and drive plate installation defective • Flywheel defective	• Check for an incorrectly installed transmission, and check the drive plate for wear and damage. Replace the drive plate if it is worn or damaged. • Check the flywheel for wear and damage, if the flywheel is worn or

Symptom	Probable cause(s)	Notes
		damaged, replace the flywheel.
Transmission does not shift into P position/mode or shift out of P position/mode	• Park pawl actuator defective • Park pawl actuator driver unit defective • Park position sensor defective • SBW shifter control module defective • Park mechanism defective	• Check the park position sensor. • Inspect the park mechanism and the park pawl actuator. • Check SBW shifter control module.
Speedometer and odometer does not operate	• Traction motor position sensor defective • Traction motor position sensor line failure • Traction motor sensor harness failure • Traction motor position sensor failed to install	• Inspect the motor shaft for wear and damage. • Check the motor position sensor harness for poor connections, loose terminals, wear, and damage. • Replace the transmission (e-CVT) .
Vehicle does not turn to the READY TO DRIVE mode	• Park pawl actuator defective • Park pawl actuator driver unit defective • Park position sensor defective • SBW shifter control module defective	• Check the park position sensor. • Inspect the park mechanism and the park pawl actuator. • Check the SBW shifter control module.

REWRITE

PARK PAWL ACTUATOR DRIVER UNIT UPDATE

Procedure

1. Park Pawl Actuator Driver Unit - Update

   NOTE: When updating control units, use the most current version of the HDS software and interface device. Refer to User Manual of the Update Device for more information about updating control units.

INSPECTION

CLUTCH CLEARANCE INSPECTION

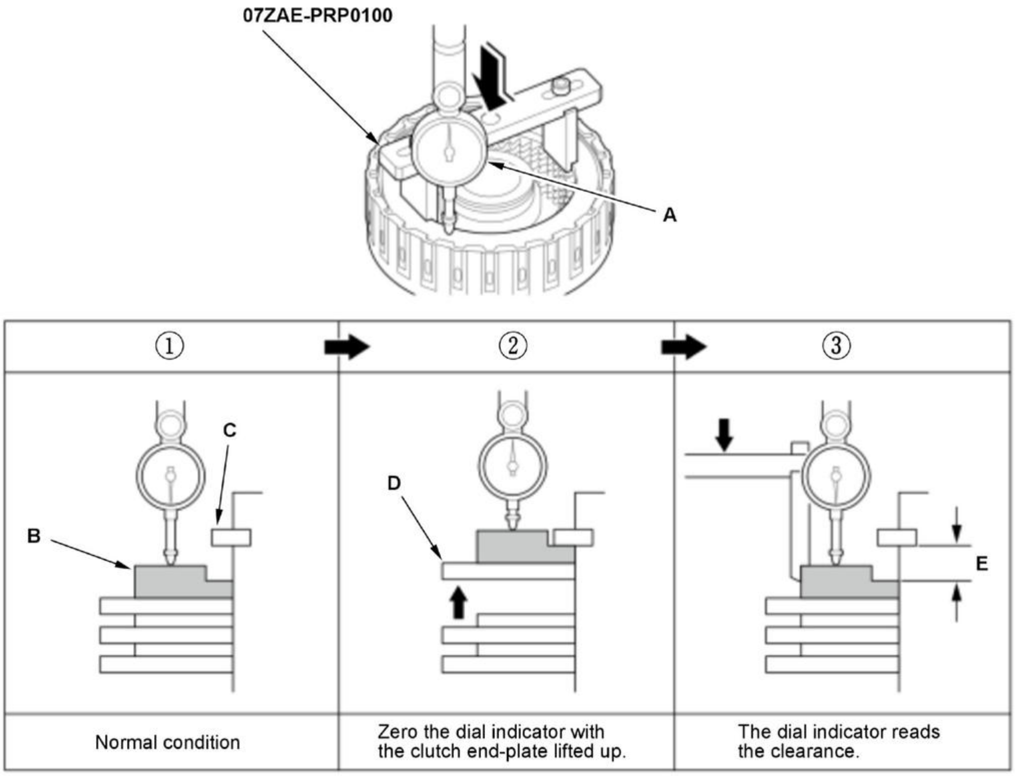
Special Tools Required

Image	Description/Tool Number
	Clutch Compressor Attachment 07ZAE-PRP0100

Inspection

1. Over Drive Clutch Clearance - Inspect

    1. Set a dial indicator (A) on the clutch end-plate (B).



07ZAE-PRP0100
A
①
②
③
C
B
D
E
Normal condition
Zero the dial indicator with the clutch end-plate lifted up.
The dial indicator reads the clearance.

2. Zero the dial indicator with the clutch end-plate lifted up to the snap ring (C) by lifting the top disk (D) up.

3. Release the top disk.

4. Put the clutch compressor attachment on the clutch end-plate.

5. Press the clutch compressor attachment down with 147.1 N (15.00 kgf, 33.07 lbf) (the weight of the clutch compressor attachment is included) using a force gauge or equivalent, and read the dial indicator.The dial indicator reads the clearance (E) between the clutch end-plate and the top disc.

NOTE: Take measurements in at least three places, and use the average as the actual clearance.

Standard:	
Â	**1.2-1.4 mm (0.047-0.055 in)**

6. If the clearance is out of the standard, **replace the over drive clutch** .

COUNTERSHAFT BEARING THRUST CLEARANCE INSPECTION

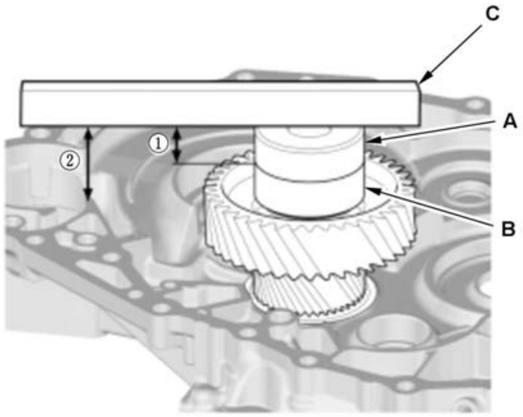
Inspection

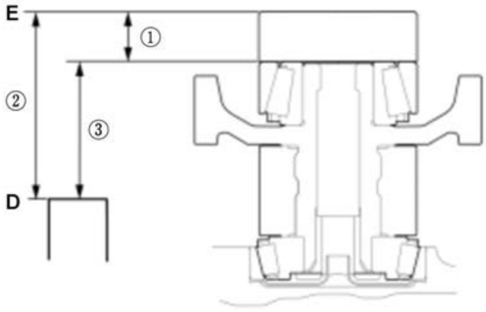
NOTE: Remove all of the old liquid gasket from the sealing surface of the flywheel housing and the transmission housing.

1. **Oil Guide Plate C - Install**
2. **Countershaft Bearing Outer Race (Flywheel Housing Side) - Install**
3. Countershaft - Install

	1. Install the countershaft (A) and the countershaft bearing outer race (B).

4. Countershaft Bearing Thrust Clearance - Inspect





1. Measure an attachment (A) thickness ①

NOTE:

- **Use an attachment of about 1.0 kg (2.2 lbs).**
- **Measure at three locations, and average the reading.**

2. Set the attachment on the countershaft bearing outer race (B).

3. Rotate the countershaft in both directions to seat the bearings.

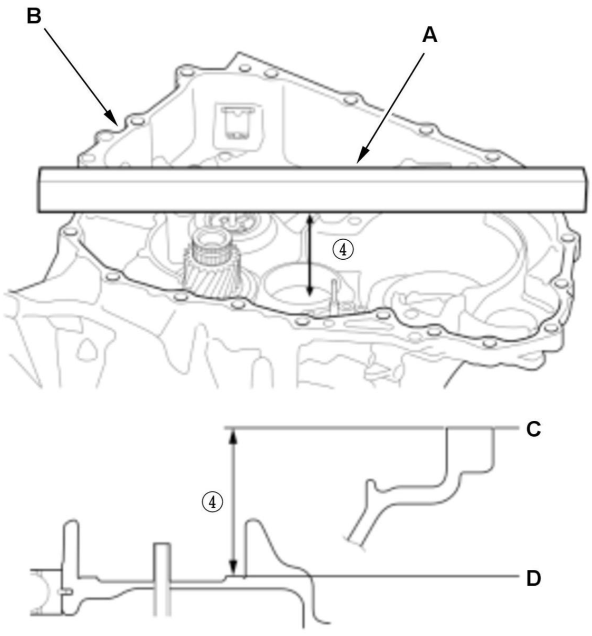
4. Set a straight edge (C) on the attachment.

5. Measure the height ② between the flywheel housing surface (D) and the top (E) of the attachment.

NOTE: Measure at three locations, and average the reading.

6. Calculate the height ③ in accordance with the following formula:

③ = ② - ①



7. Set the straight edge (A) on the transmission housing (B).

8. Measure the height ④ between the transmission housing surface (C) and the shim contact area (D).

NOTE: Measure at three locations, and average the reading.

9. Calculate the optimum shim thickness ⑤ in accordance with the following formula:

⑤ (minimum) = ④ - ③ +0.12 mm (0.0047 in)

⑤ (maximum) = ④ - ③ +0.15 mm (0.0059 in)

10. Refer to the appropriate Parts catalog, then select appropriate shim.

11. Measure the selected shim thickness ⑥ .

NOTE: Measure at three locations, and average the reading.

12. Calculate the countershaft bearing thrust clearance in accordance with the following formula: Countershaft bearing thrust clearance = ④ - ③ - ⑥

Standard:

0.12-0.15 mm (0.0047-0.0059 in)

13. Make sure the thrust clearance is within the standard.

DIFFERENTIAL BACKLASH INSPECTION

Inspection

1. Final Driven Gear - Remove
2. Differential Backlash - Inspect

	1. Install both axles into the differential carrier (A). 2. Place the axles on V-blocks (B). 3. Measure the backlash of the pinion gears (C) with a dial indicator (D). 4. If the backlash is out of the standard, **replace the differential carrier** .

Standard:	
Â	**0.05-0.15 mm (0.0020-0.0059 in)**

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

DIFFERENTIAL INSTALLATION HEIGHT INSPECTION

Inspection

NOTE: Remove all of the old liquid gasket from the sealing surface of the transmission housing.

1. Differential - Install

	1. Install the differential (A) with the spacers (B) and the shim (C).

2. Differential Installation Height - Inspect

	1. Set a straight edge (A) on the shim (B). 2. Measure the height ① between the transmission housing surface (C) and the shim surface (D). **NOTE:** Measure at three locations, and average the reading. 3. Measure the shim thickness. Refer to the Parts catalog, then select appropriate shim so the height ① is to be the standard value. 4. Install the selected shim, then recheck the installation height.

Standard:	
Â	**32.155-32.200 mm (1.26594-1.26771 in)**

GENERATOR SHAFT INSTALLATION HEIGHT INSPECTION

Inspection

NOTE: Remove all of the old liquid gasket from the sealing surface of the transmission housing.

1. **Generator Shaft - Install**

   NOTE: No need to install the parking gear, the cotter, the snap ring, and cotter retainer A in this procedure.

2. Shim - Install

   NOTE: Measure the shim thickness before installing.

3. Generator Shaft Installation Height - Inspect

 	1. Set a straight edge (A) on the generator shaft (B). 2. Measure the height ① between the transmission housing surface (C) and the top (D) of the generator shaft. **NOTE:** Measure at three locations, and average the reading. 3. Measure the height ② between the shim surface (E) and the top (D) of the generator shaft. **NOTE:** Measure at three locations, and average the reading. 4. Calculate the height ③ in accordance with the following formula: ③ = ① - ② 5. If the height ③ is not within the specifications, refer to the parts catalog, then select appropriate a shim so the height ③ is with in the standard value. 6. Install the selected shim, then recheck the installation height.

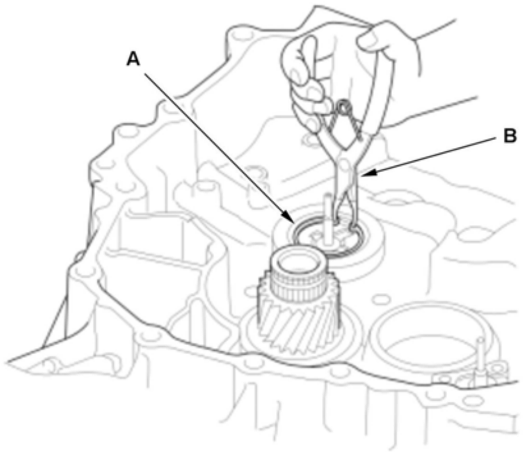
Standard:	
Â	**19.195-19.240 mm (0.75571-0.75748 in)**

INPUT SHAFT INSTALLATION HEIGHT INSPECTION

Inspection

NOTE: Remove all of the old liquid gasket from the sealing surface of the transmission housing.

1. **Feed Pipe A - Install**
2. **Feed Pipe Flange - Install**
3. Internal Snap Ring - Install



1. Install the internal snap ring (A) by compressing it using commercially available snap ring pliers (B).

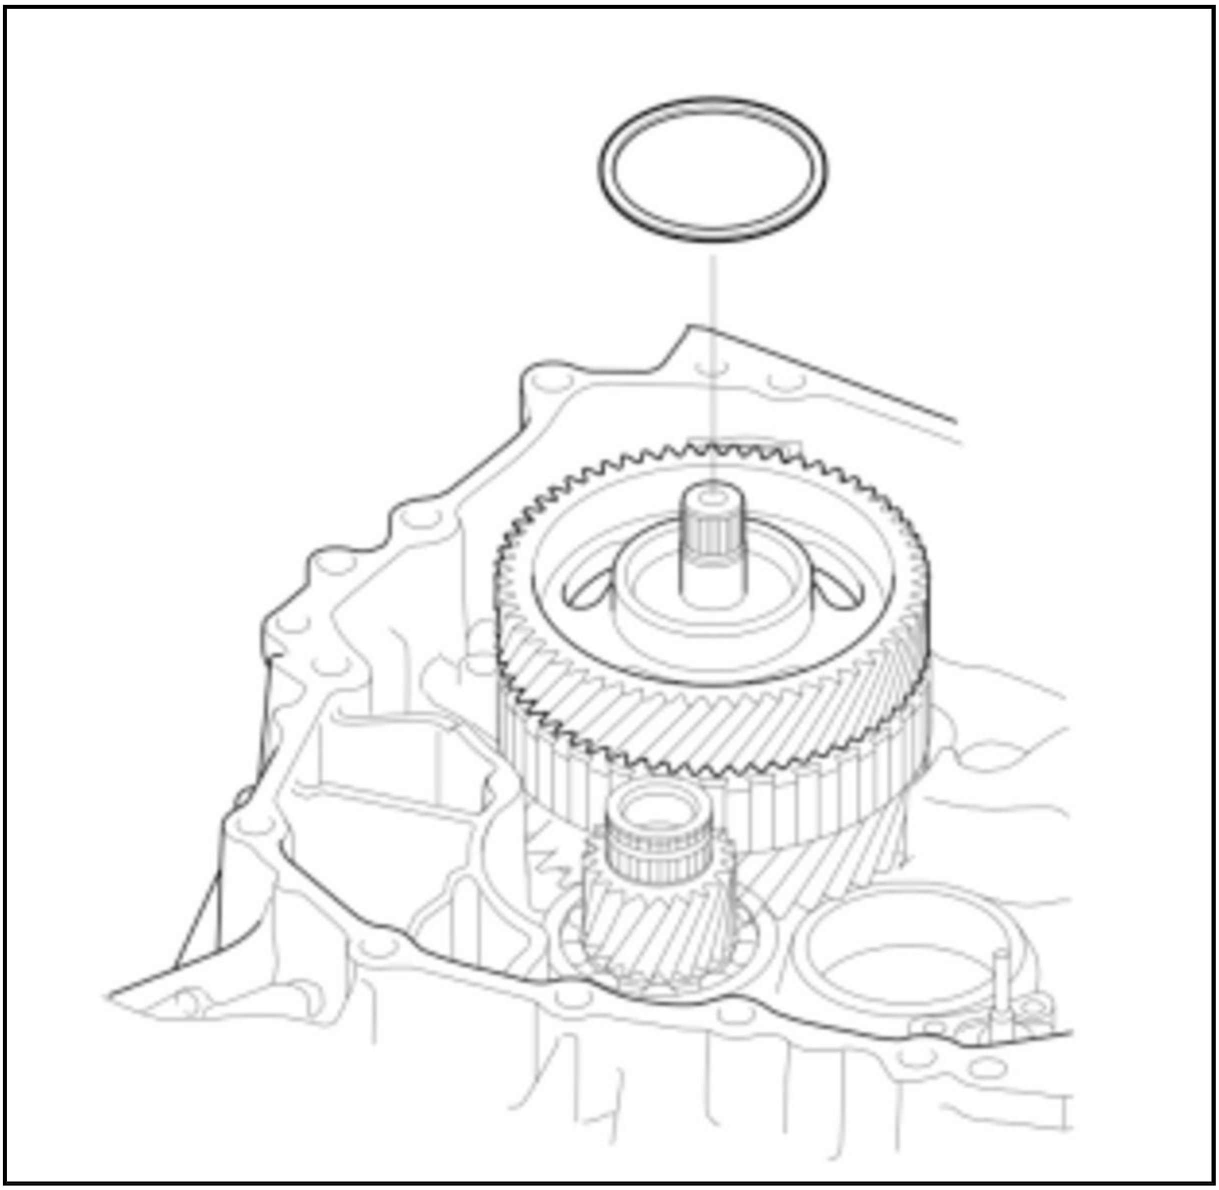
NOTE:

- **Be careful not to deform the snap ring by opening/closing it excessively.**
- **Make sure the snap ring is firmly installed in the groove.**

4. Over Drive Gear Bearing (Transmission Housing Side) - Install
5. Over Drive Gear Bearing (Over Drive Clutch Side) - Install
6. Over Drive Gear - Install
7. Over Drive Clutch - Install
8. Input Shaft - Install

   NOTE: No need to install the O-rings in this procedure.

9. Shim - Install



NOTE: Measure the shim thickness before installing.

10. Input Shaft Installation Height - Inspect

 	1. Set a straight edge (A) on the input shaft (B). 2. Measure the height ① between the transmission housing surface (C) and the top (D) of the input shaft. **NOTE:** Measure at three locations, and average the reading. 3. Measure the height ② between the shim surface (E) and the top of the input shaft. **NOTE:** Measure at three locations, and average the reading. 4. Calculate the height ③ in accordance with the following formula:

	③ = ① - ② 5. If the height ③ is not within the specifications, refer to the parts catalog, then select appropriate a shim so the height ③ is with in the standard value. 6. Install the selected shim, then recheck the installation height.

Standard:	
Â	**16.165-16.210 mm (0.63642-0.63819 in)**

DTC TROUBLESHOOTING INDEX

GEAR UNIT CONTROL SYSTEM DTC TROUBLESHOOTING INDEX

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and **review the General Troubleshooting Information** .

REPLACEMENT

TRANSMISSION OIL SEAL REPLACEMENT

Special Tools Required

Image	Description/Tool Number
	Driver Handle, 15 x 135L 07749-0010000

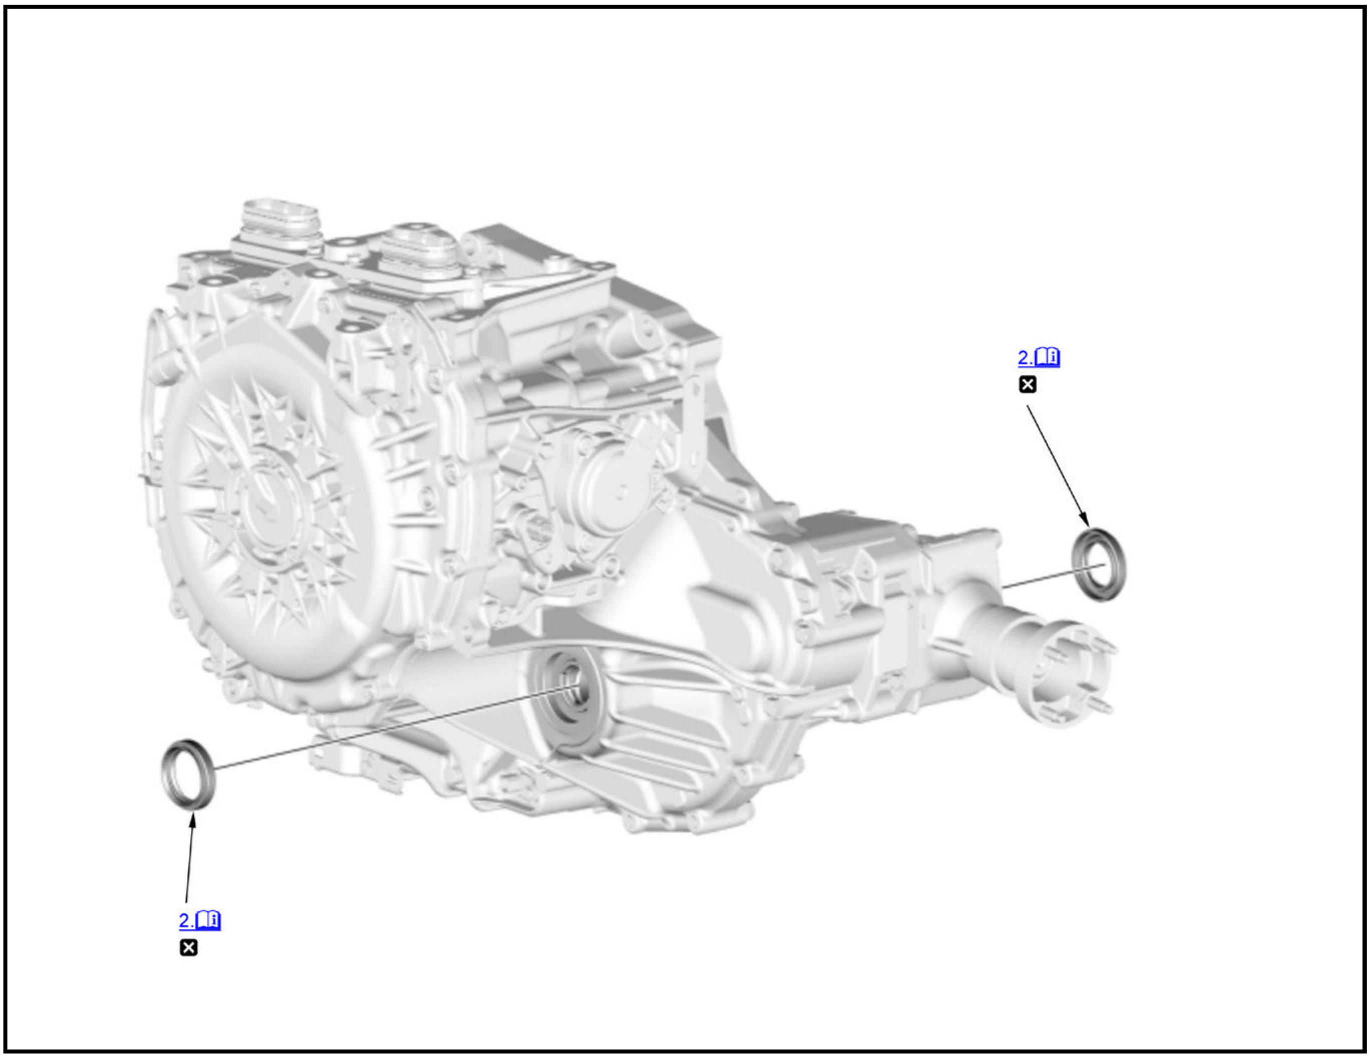
Image	Description/Tool Number
	Oil Seal Driver Attachment 07GAD-PG40100
	Oil Seal Driver Attachment, 64 x 72 mm 07JAD-PN00100

Replacement

NOTE:

- Keep all foreign particles out of the transmission (e-CVT).
- Apply a light coat of clean ATF to the oil seal surface of the press-fit part and the lip part before installation.

Procedure



☒	Replace

Driveshaft Oil Seal

1. **Left Driveshaft Inboard Joint - Disconnect**
2. Driveshaft Oil Seal - Replace

	1. Install the driveshaft oil seal flush with the transmission housing using the 15 x 135L driver handle and the oil seal driver attachment.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Intermediate Shaft Oil Seal

4. **Intermediate Shaft - Remove**
5. Intermediate Shaft Oil Seal - Replace

 07JAD-PN00100 07749-0010000	1. Install the intermediate shaft oil seal flush with the flywheel housing using the 15 x 135L driver handle and the 64 x 72 mm oil seal driver attachment.

6. All Removed Parts - Install

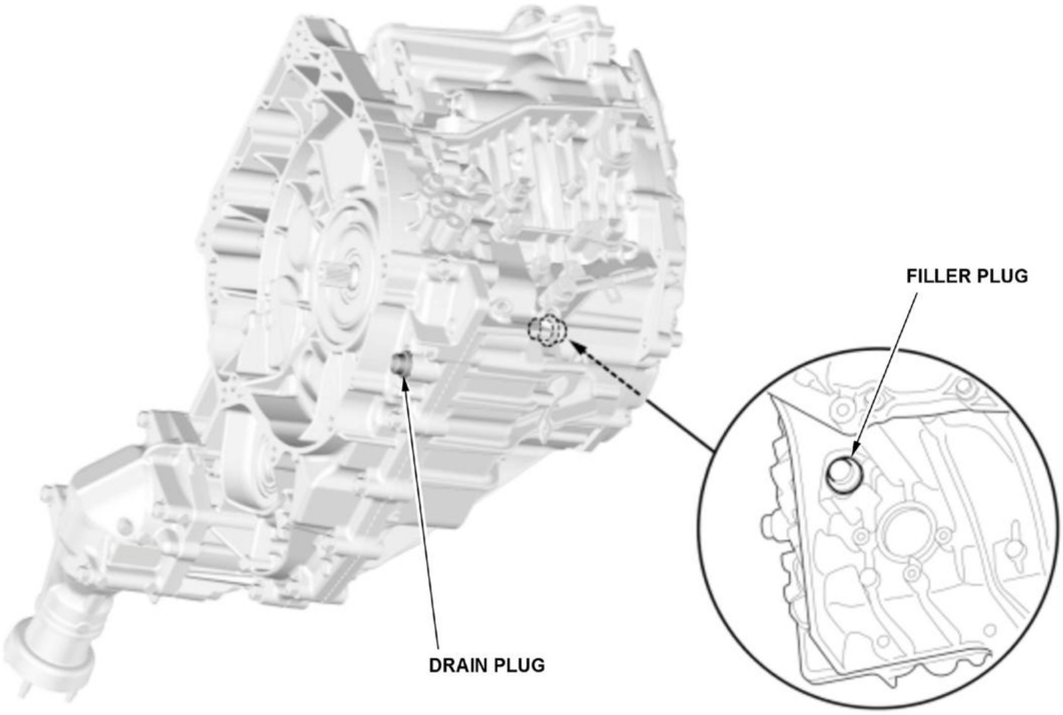
1. Install the parts in the reverse order of removal.

SERVICE PROCEDURE

ATF LEVEL CHECK AND REPLACEMENT

Exploded View

1. ATF Maintenance Plug



FILLER PLUG
DRAIN PLUG

Check

NOTE:

- How to read the torque specifications .
- Keep all foreign particles out of the transmission (e-CVT).
- Check the fluid level within 60-90 seconds after turning the engine off.
- Higher fluid level may be indicated if the radiator fan comes on three times or more.

1. Vehicle - Lift
2. Engine - Warm Up

1. Enter the maintenance mode, then start the engine
2. Warm up the engine by raising the engine speed around 3, 000 rpm until the cooling fan(s) comes on.
3. Turn the engine off.

3. Engine Undercover - Remove
4. ATF Level - Check

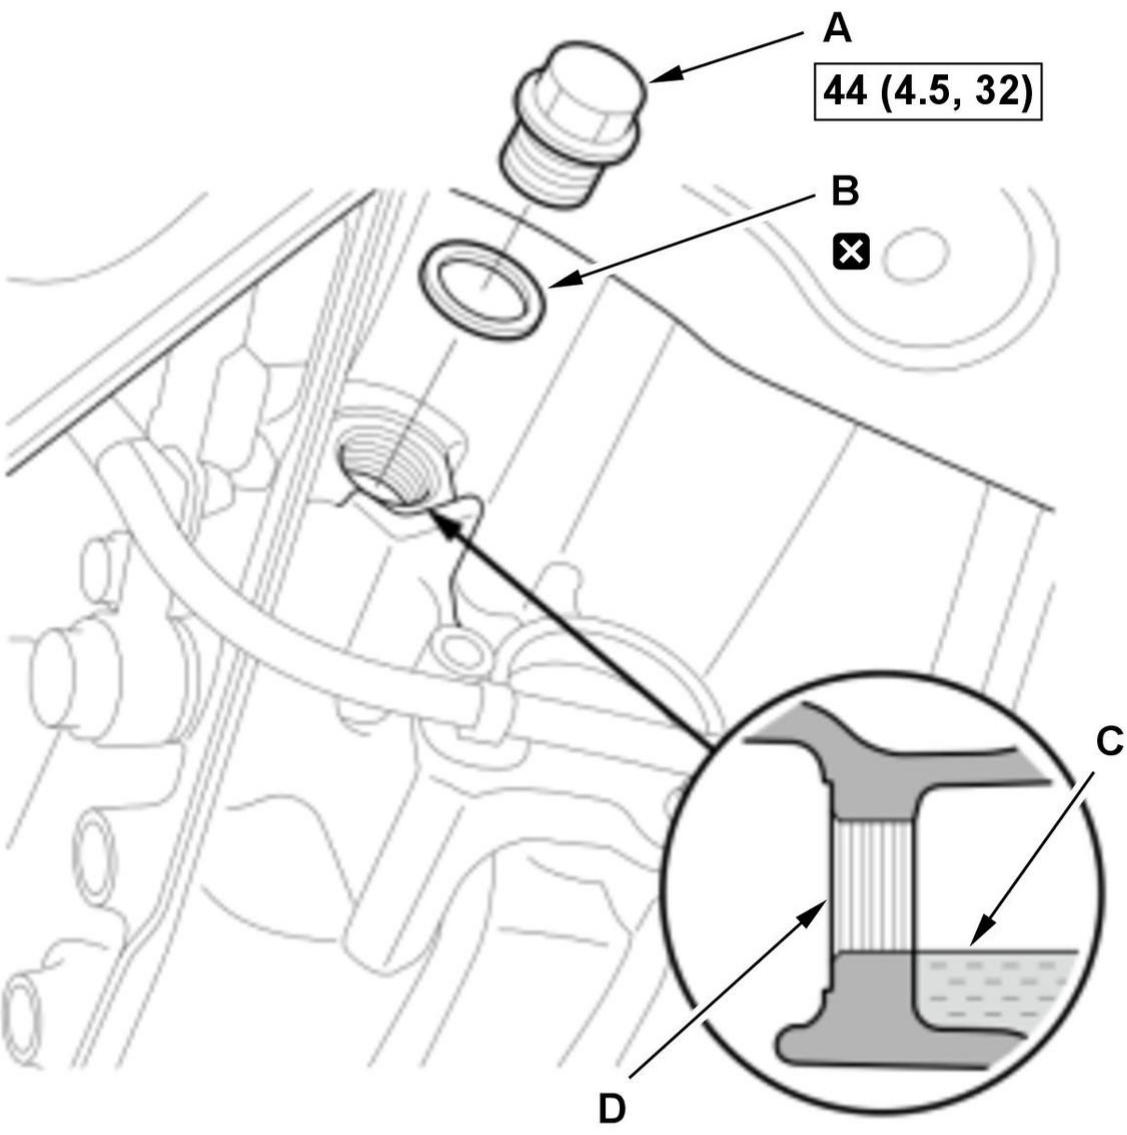


Fig. 3: Filler Plug And Sealing Washer With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the filler plug (A) with the sealing washer (B).

NOTE: Be careful not to burn yourself by the hot part.

2. Make sure the ATF level is at the proper level (C).

- If the ATF is overfilled, drain the ATF from the filler plug hole (D) to the proper level.
- If the ATF is low, inspect and repair any external leaks. If there are no leaks, fill the transmission (e-CVT) with the recommended fluid through the filler plug hole to the proper level. Always use genuine Honda ATF DW

  -1. **NOTE:** Using the wrong type of fluid will damage the transmission (e-CVT).

5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Replacement

NOTE:

- **How to read the torque specifications** .
- Keep all foreign particles out of the transmission (e-CVT).

1. **Vehicle - Lift**
2. Engine - Warm Up

1. **Enter the maintenance mode, then start the engine**

2. Warm up the engine by raising the engine speed around 3, 000 rpm until the cooling fan(s) comes on.

3. Turn the engine off.

3. **Engine Undercover - Remove**
4. ATF - Drain

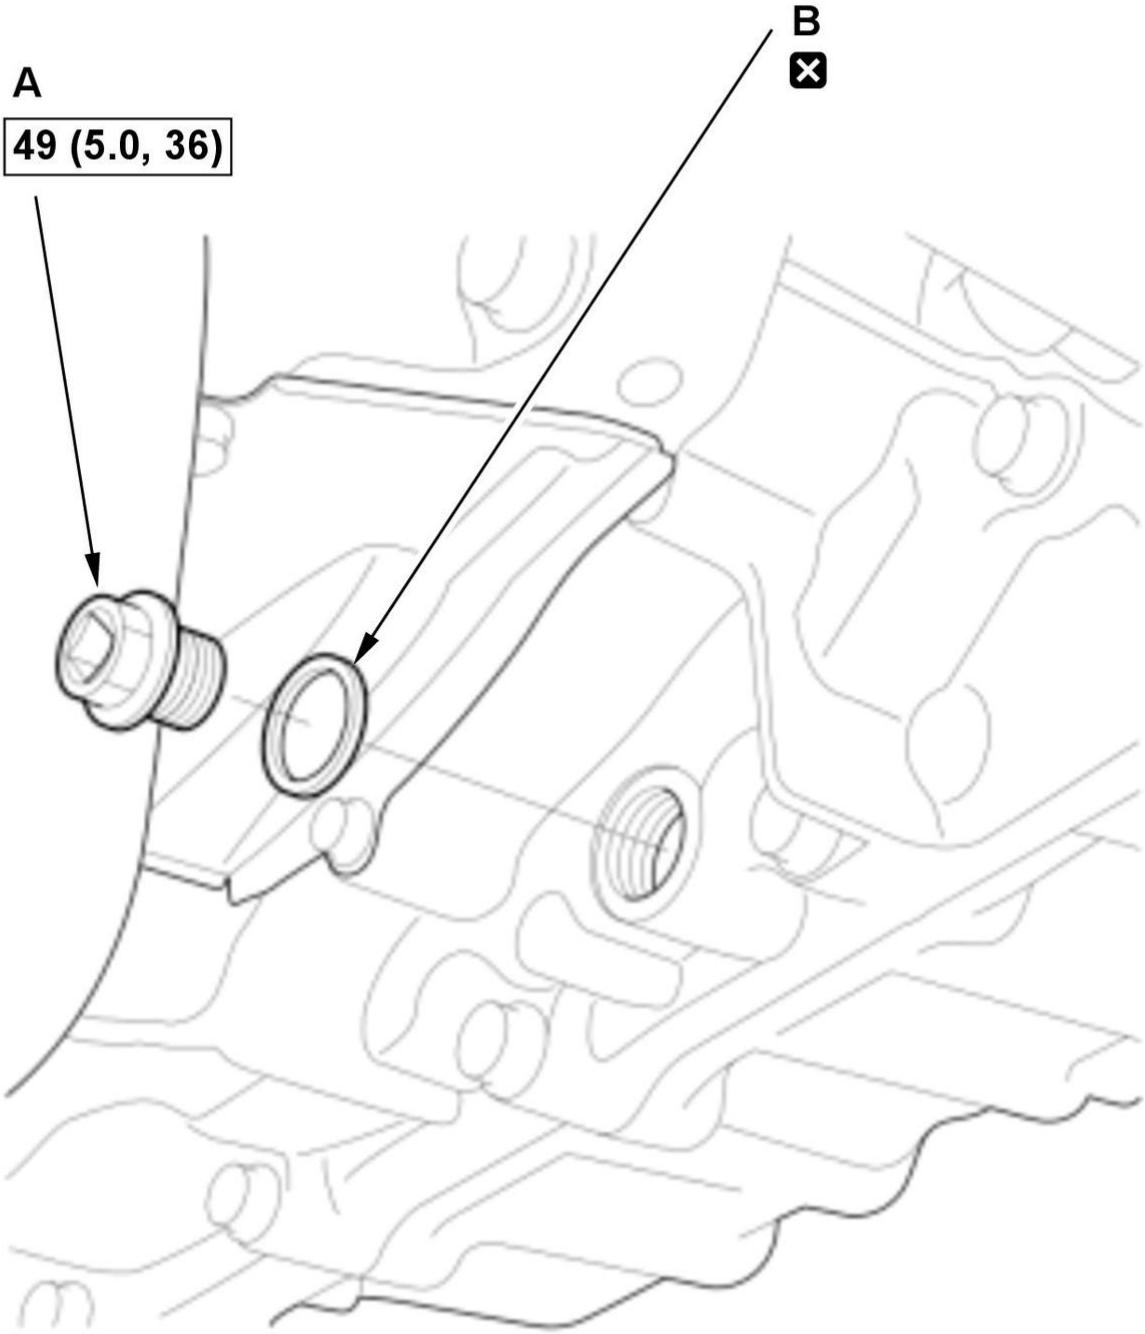

Fig. 4: Drain Plug And Sealing Washer With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the drain plug (A) with the sealing washer (B).

NOTE: Be careful not to burn yourself by the hot part.

2. Drain the ATF.

3. Reinstall the drain plug with a new sealing washer.

5. ATF - Refill

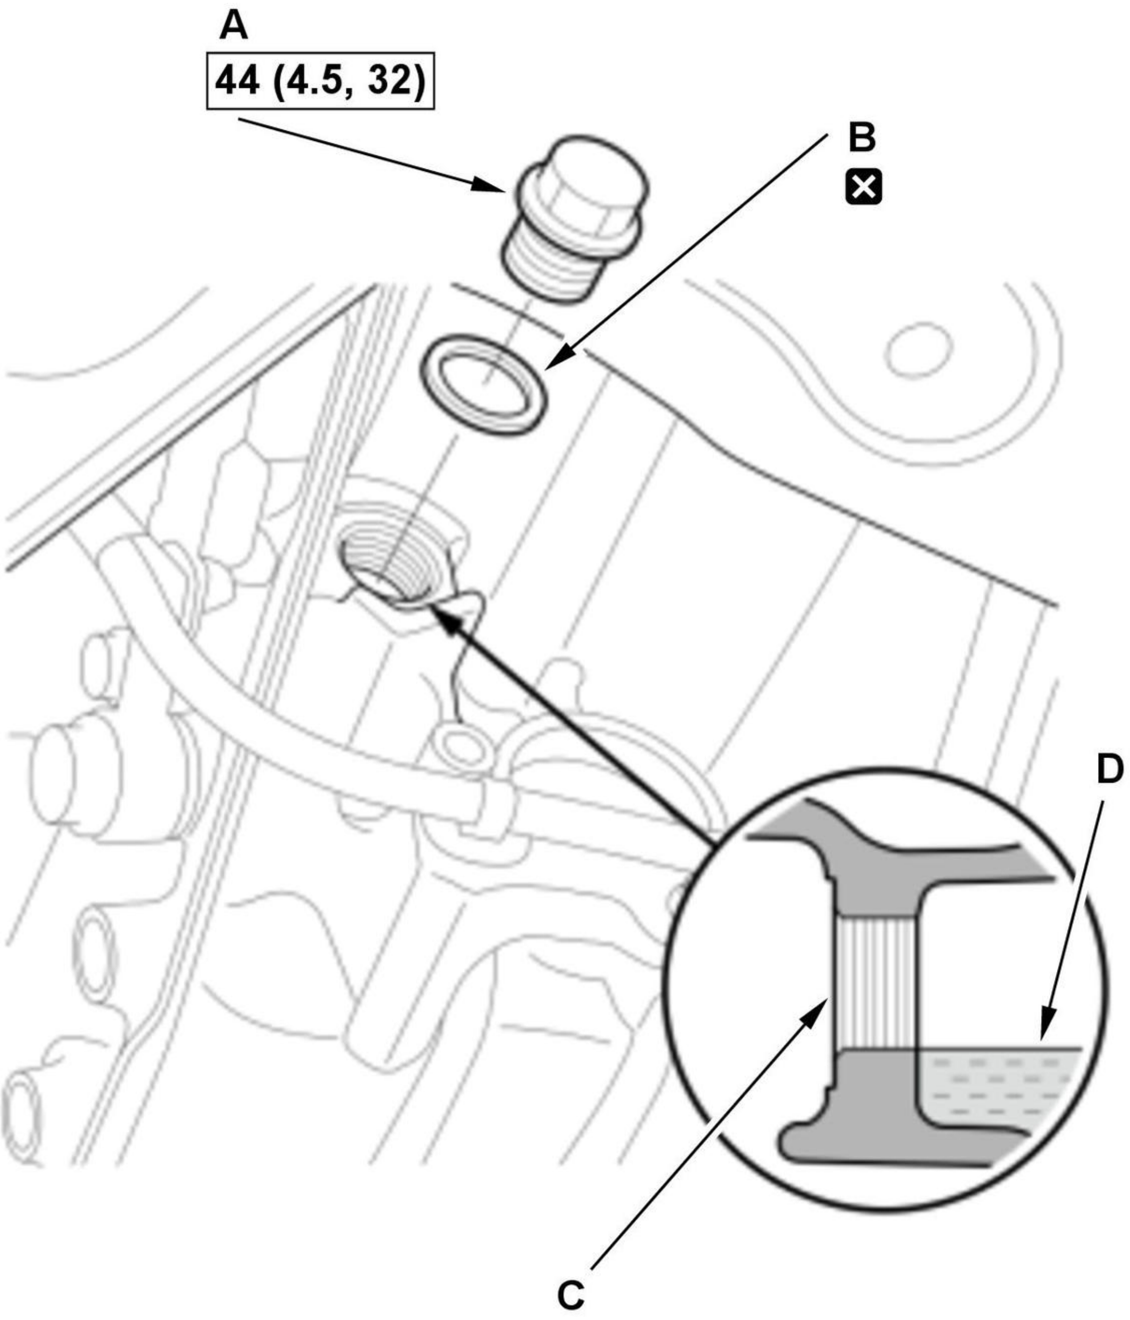

Fig. 5: Filler Plug And Sealing Washer With Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the filler plug (A) with the sealing washer (B).

2. Refill the transmission (e-CVT) with the recommended fluid through the filler plug hole (C) to the proper level (D). Always use genuine Honda ATF DW-1.

NOTE: Using the wrong type of fluid will damage the transmission (e-CVT).

Transmission Fluid (ATF) Capacity:

3.5 L (3.7 US qt) at overhaul

2.4 L (2.5 US qt) at change

6. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

7. Maintenance Minder - Reset

1. If the Maintenance Minder required to replace the engine oil, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder"). If the Maintenance Minder did not require to replace the engine oil, **reset the Maintenance Minder with the HDS** (see "Resetting the Individual Maintenance Items").

TEST

GEAR PRESSURE TEST

Special Tools Required

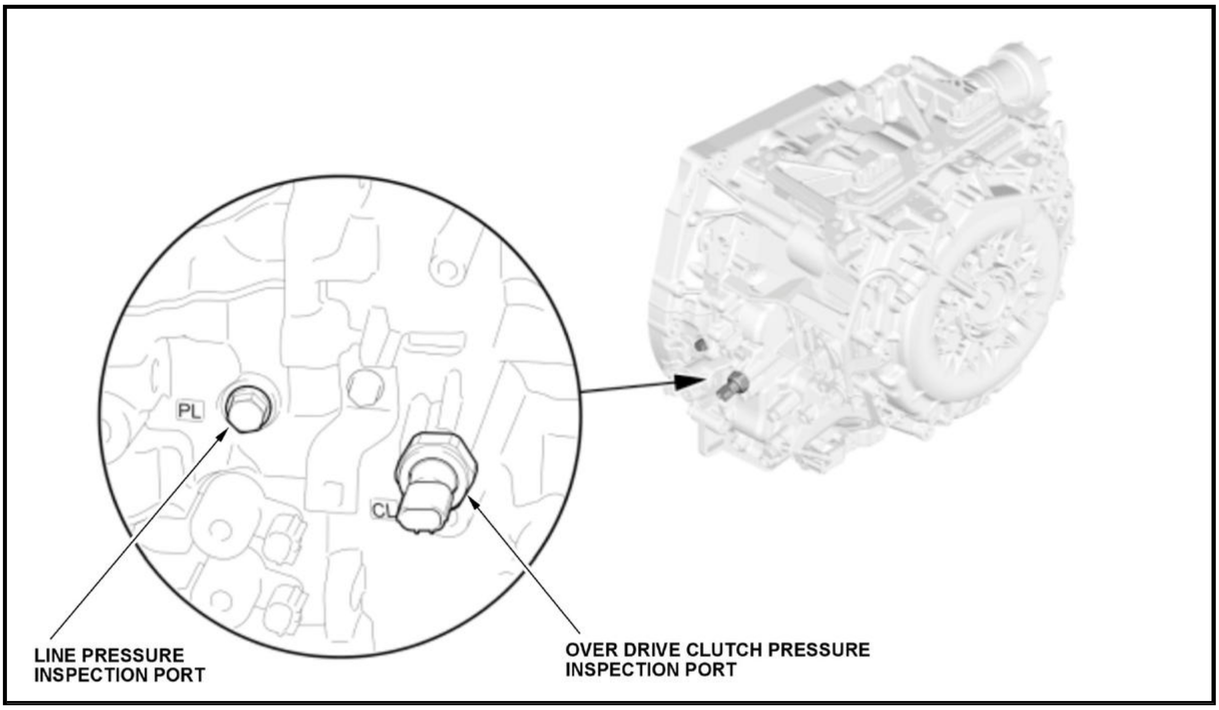
Image	Description/Tool Number
	Pressure Gauge Adapter 070AJ-RT4A100 or 070AJ-RT4A101
	A/T Pressure Adapter 07MAJ-PY40120
	A/T Oil Pressure Gauge Set 07406-0020401 or 07406-0020400

Image	Description/Tool Number
	A/T Pressure Test Hose 07AAJ-PY4A100

Exploded View

1. Pressure Inspection Port

Pressure Inspection Port - Exploded View



PL
CL
LINE PRESSURE INSPECTION PORT
OVER DRIVE CLUTCH PRESSURE INSPECTION PORT

Test

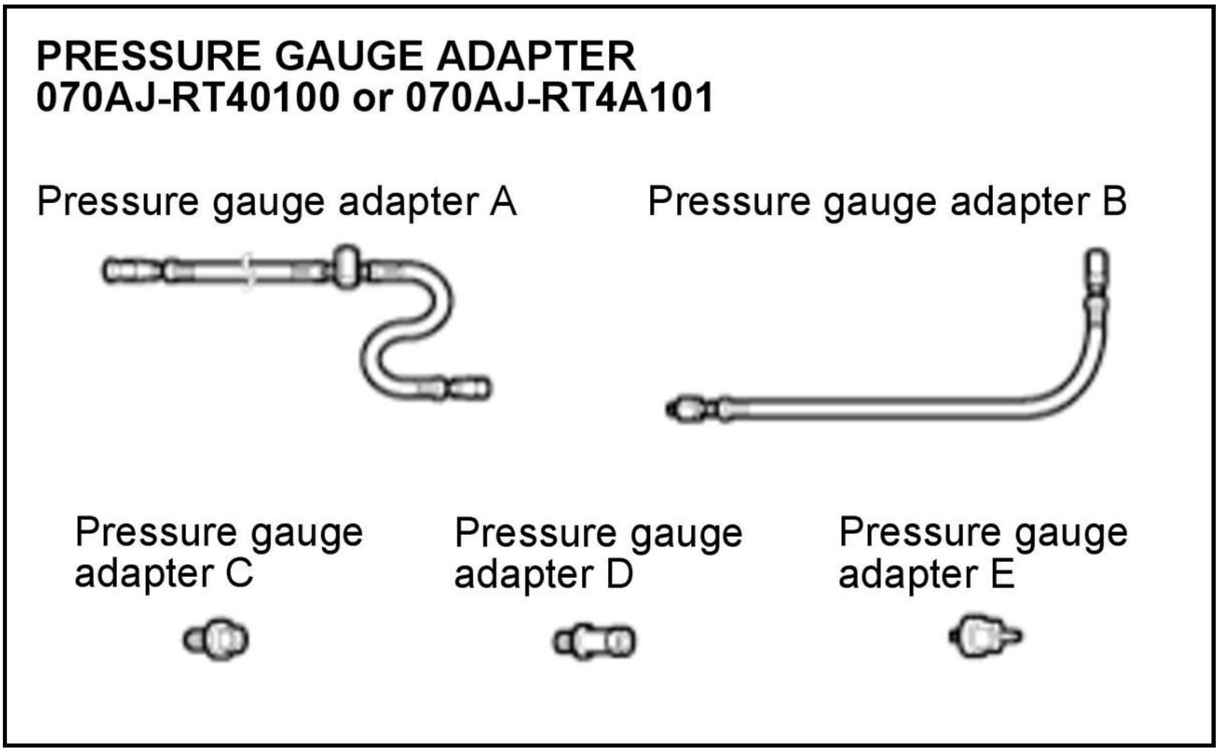
NOTE:

- **How to read the torque specifications** .
- Check for DTCs. If any DTCs are stored, troubleshoot and clear them first.
- Do not allow dust or other foreign particles to enter the port while installing the pressure gauge adapter.
- Be sure to check the ATF level after each pressure port test. When installing or removing the pressure gauge adapter, ATF may run out of the pressure inspection ports.
- Do not test pressure for more than 10 seconds at a time.
- Do not shift the transmission while raising the engine speed.
- VSA DTC(s) may come on during the test-drive. If the VSA DTC(s) come on, clear the DTC(s) after testing is done with the HDS.

1. A/T Oil Pressure Gauge - Set

1. When testing the hydraulic pressure at each inspection port, select a suitable adapter from the following table, and connect each adapter to the A/T oil pressure gauge.

Inspection Port	Tool
Line pressure	Pressure gauge adapter B
Over drive clutch pressure	• Pressure gauge adapter A • Pressure gauge adapter E

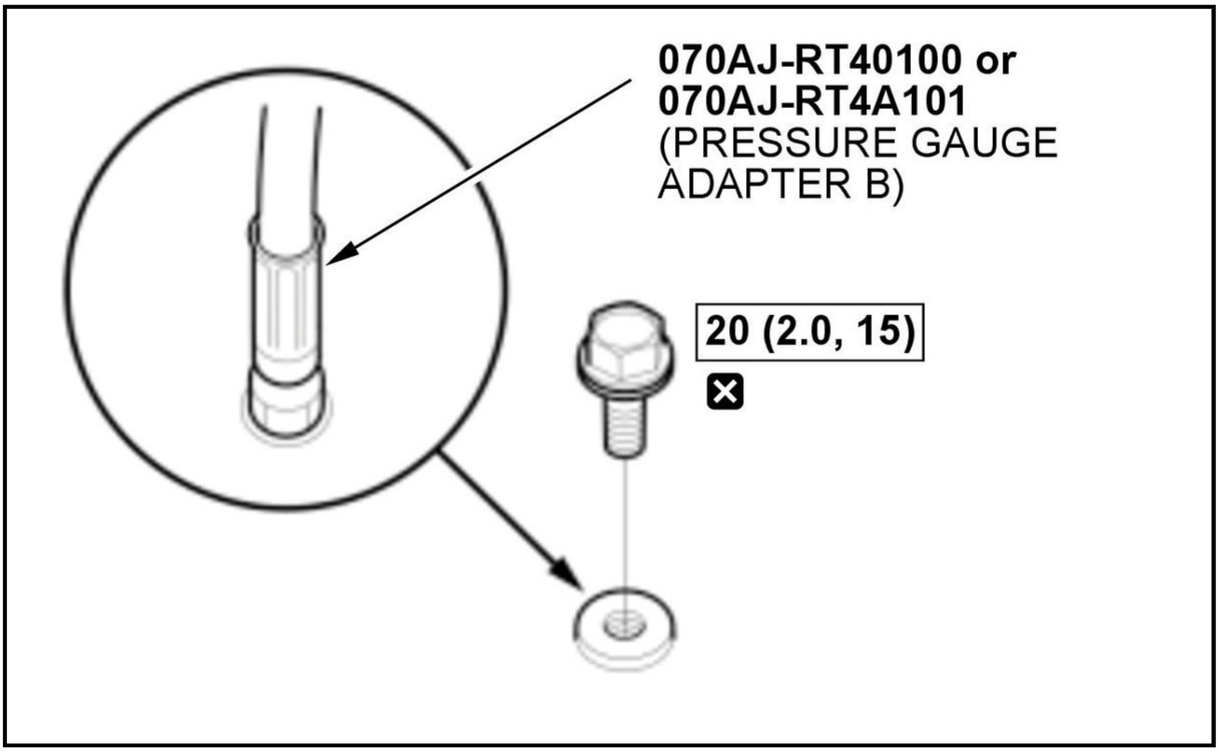


PRESSURE GAUGE ADAPTER
070AJ-RT40100 or 070AJ-RT4A101
Pressure gauge adapter A
Pressure gauge adapter B
Pressure gauge adapter C
Pressure gauge adapter D
Pressure gauge adapter E

2. **Vehicle - Lift**
3. **Engine Undercover - Remove**
4. **ATF Level - Check**
5. **HDS - Connect**
6. Line Pressure - Test

 07406-0020401 or 07406-0020400 070AJ-RT40100 or 070AJ-RT4A101 (PRESSURE GAUGE ADAPTER B)	1. Install pressure gauge adapter B to the A/T oil pressure gauge set.

2. Remove the sealing bolt.



3. Install the A/T oil pressure gauge to the line pressure inspection port.

4. **Enter the maintenance mode, then start the engine**

5. Shift the transmission to D position/mode.

6. Measure the line pressure from the A/T oil pressure gauge while holding the engine speed at 1, 500 rpm and at 3, 000 rpm by monitoring with the HDS.

CAUTION: **Do not apply the brake hard when working on a running vehicle. It may cause some damage to the drive-line.**

Pressure	Fluid Pressure	
	Standard	Service Limit
Line (1, 500 rpm)	**750-850 kPa (7.65-8.67 kgf/cm 2, 108.8-123.3 psi)**	**700 kPa (7.14 kgf/cm 2, 101.5 psi)**
Line (3, 000 rpm)	**250-310 kPa (2.55-3.16 kgf/cm 2, 36.3-44.9 psi)**	-

7. If the line pressures are out of the service limit, refer to the problem and probable cause(s) listed in the table.

Problem	Probable cause(s)
No or low line pressure	• ATF pump • Clogged ATF strainer • Valve body assembly (regulator valve) • Shift solenoid valve B • Over drive clutch • Feed pipe (at over drive clutch)

8. Turn the engine off.

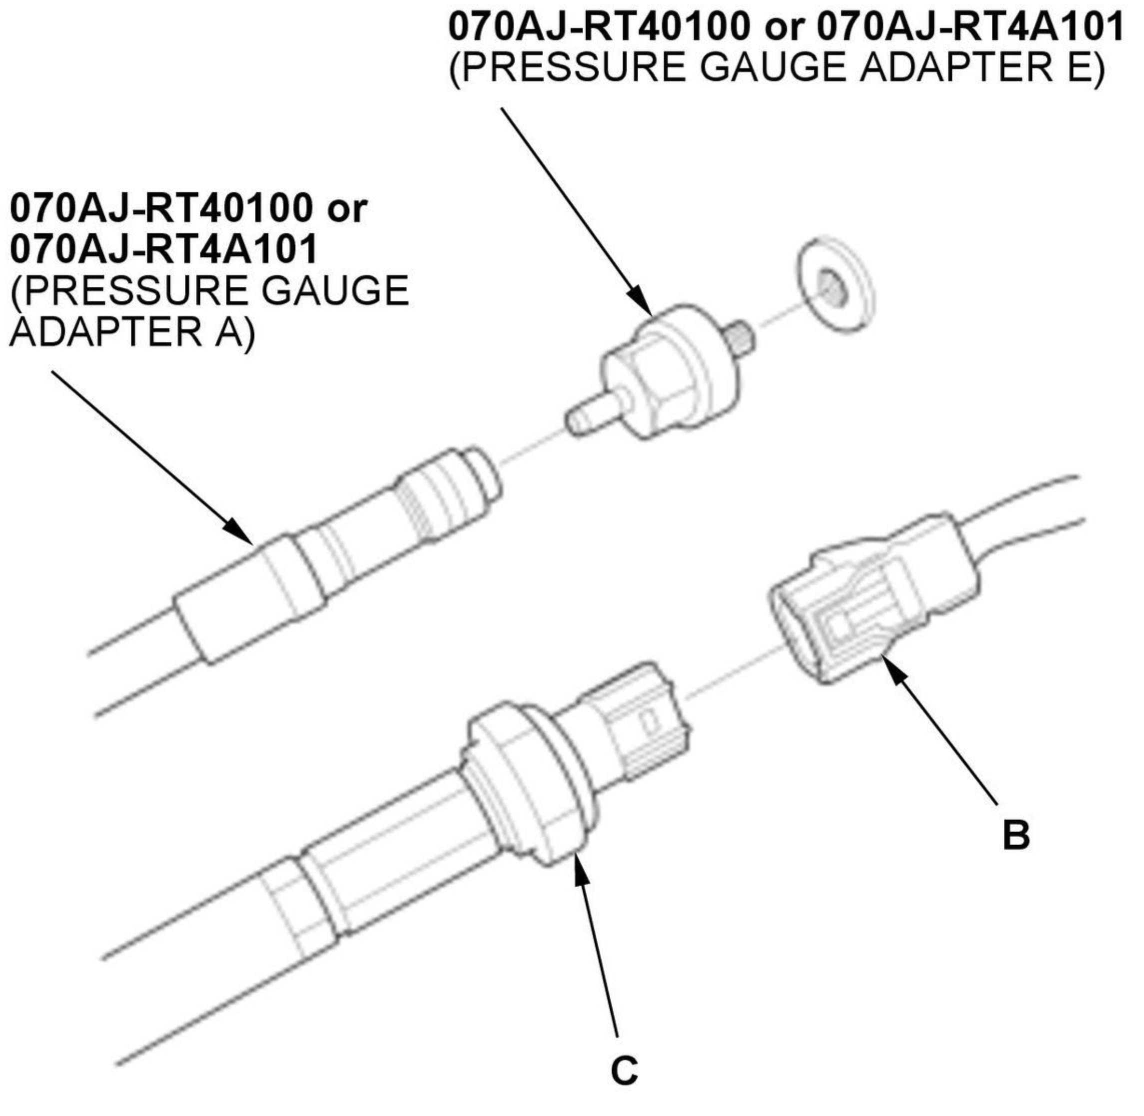
9. Remove the A/T oil pressure gauge.

10. Install a new sealing bolt.

7. Over Drive Clutch Pressure - Test

 D 07406-0020401 or 07406-0020400 B 070AJ-RT40100 or 070AJ-RT4A101 (PRESSURE GAUGE ADAPTER B) C	1. **Remove the transmission fluid pressure sensor (B)** 2. Temporarily install the transmission fluid pressure sensor with the sealing washer (C) to pressure gauge adapter A. 3. Install pressure gauge adapter A to the A/T oil pressure gauge set (D).

4. Install pressure gauge adapter E (quick connector) to the over drive clutch pressure inspection port.



070AJ-RT40100 or 070AJ-RT4A101
(PRESSURE GAUGE ADAPTER E)
070AJ-RT40100 or
070AJ-RT4A101
(PRESSURE GAUGE
ADAPTER A)
B
C

5. Install pressure gauge adapter A to pressure gauge adapter E (quick connector).

6. Connect the connector (B) to the transmission fluid pressure sensor (C).

7. **Enter the maintenance mode, then start the engine**

8. Shift the transmission to D position/mode.

9. Measure the over drive clutch pressure from the A/T oil pressure gauge while holding the engine speed at 1, 500 rpm by monitoring with the HDS.

CAUTION: **Do not apply the brake hard when working on a running vehicle. It may cause some damage to the drive-line.**

Pressure	Fluid Pressure	
	Standard	Service Limit
Over drive clutch (1, 500 rpm)	**756-844 kPa (7.71-8.61 kgf/cm 2, 109.7-122.5 psi)**	**700 kPa (7.14 kgf/cm 2, 101.5 psi)**

10. If the over drive clutch pressure is out of the service limit, refer to the problem and probable cause(s) listed in the table.

Problem	Probable cause(s)
No or low over drive clutch pressure	• Valve body assembly (shift valve A) • Shift solenoid valve A

11. Turn the engine off.

12. Disconnect the connector from transmission fluid pressure sensor.

13. Remove the A/T oil pressure gauge.

14. Remove the transmission fluid pressure sensor from pressure gauge adapter A.

15. **Install the transmission fluid pressure sensor**

8. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

9. **ATF Level - Check**
10. DTC - Check

1. Do an all DTC check with the HDS. If necessary, clear the DTC(s) with the HDS.

LEARNING RESET CLEAR

PCM RESET (GEAR UNIT)

Procedure

1. **HDS - Connect**
2. PCM - Reset

1. Select the A/T system with the HDS.
2. Select the ECU Reset while the engine is stopped.
3. Turn the vehicle to the OFF (LOCK) mode.
4. Turn the vehicle to the ON mode, and wait 30 seconds.
5. Turn the vehicle to the OFF (LOCK) mode, and disconnect the HDS from the DLC.

REMOVAL & INSTALLATION TEST

AUXILIARY TRANSMISSION FLUID PUMP REMOVAL, INSTALLATION, AND TEST (2020 2021)

Special Tools Required

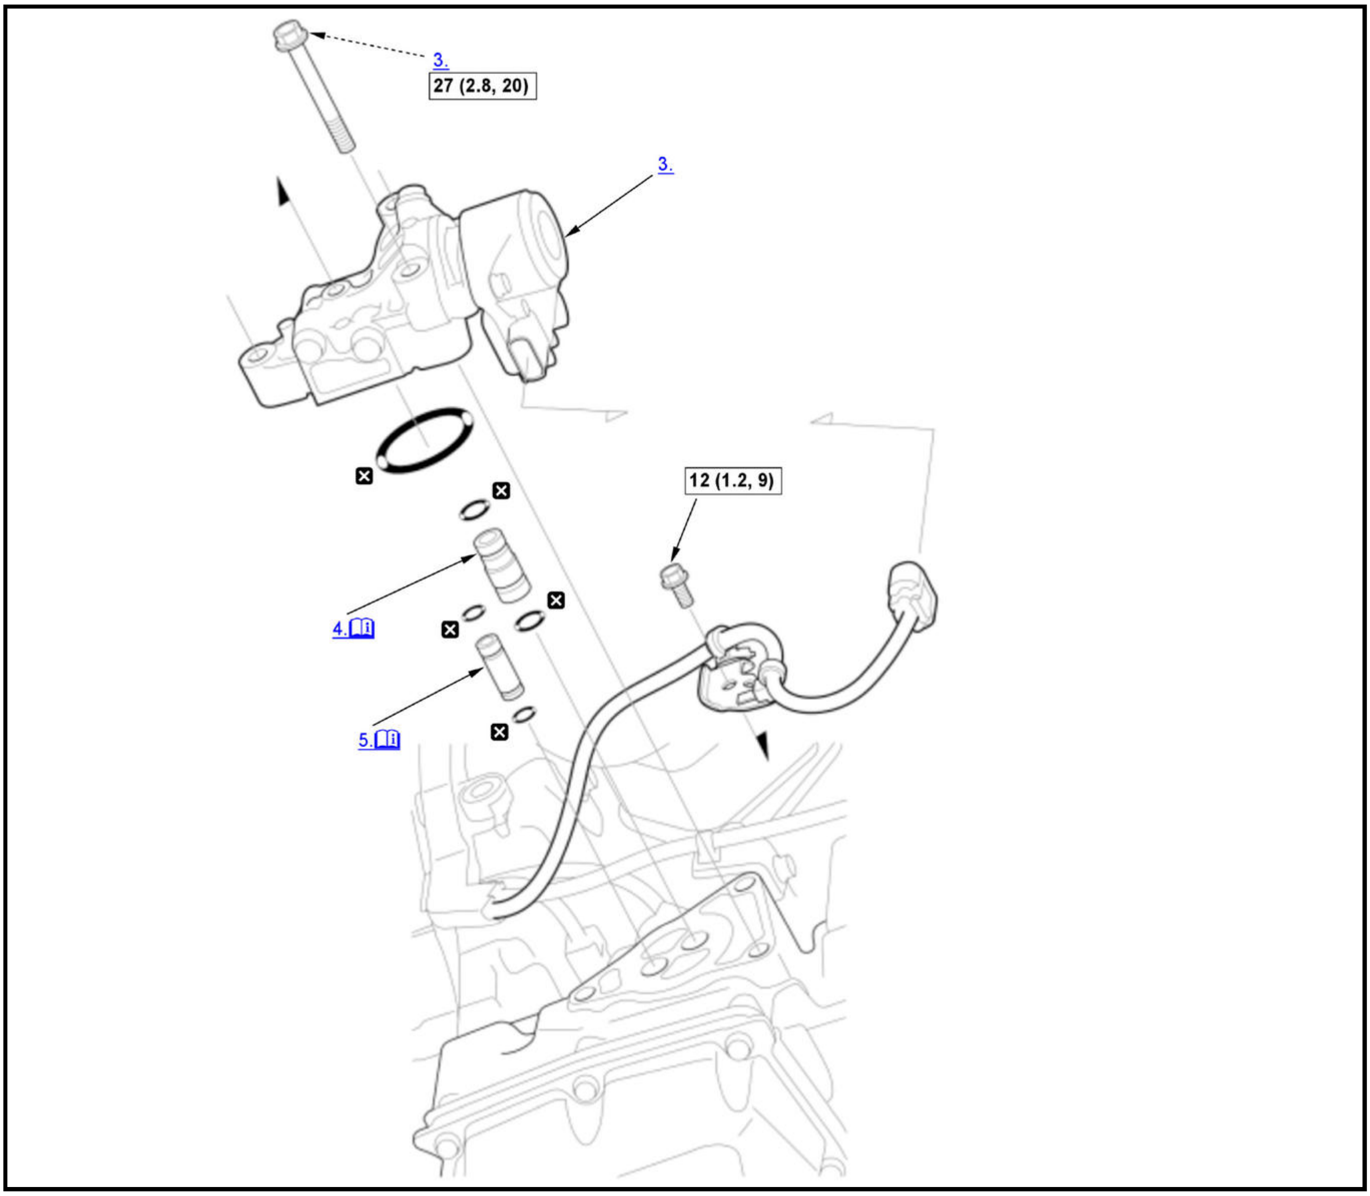
Image	Description/Tool Number
	Pressure Gauge Adapter 070AJ-RT4A100 or 070AJ-RT4A101
	A/T Low Pressure Gauge w/Panel 07406-0070301
	A/T Pressure Test Hose 07AAJ-PY4A100
	A/T Pressure Adapter 07MAJ-PY40120

Removal and Installation

NOTE:

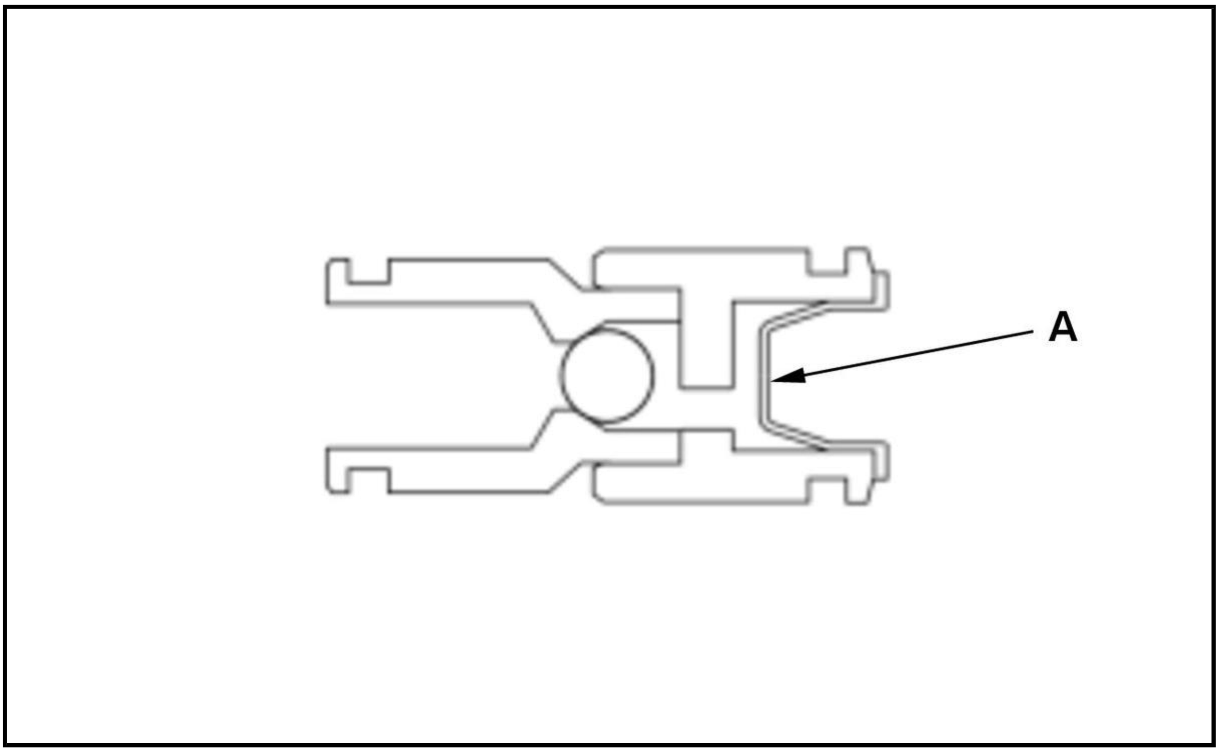
- 📖 Where icon is shown, further information shown below.
- Keep all foreign particles out of the transmission.

1



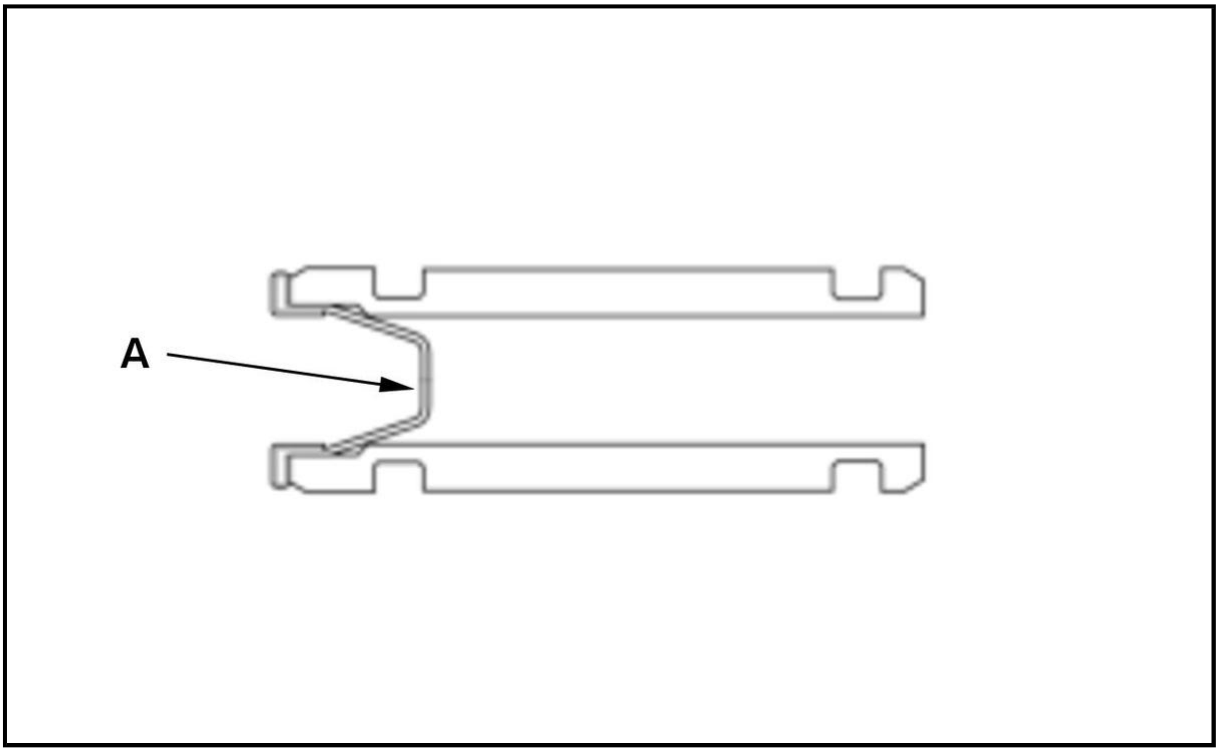
📖	Detailed information, notes and precautions
☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. **Vehicle - Lift**
2. **Engine Undercover - Remove**
3. Auxiliary Transmission Fluid Pump - Remove
4. Delivery Pipe - Remove



NOTE: The delivery pipe has the filter (A). The filter end should face the transmission side.

5. 10.9 x 31.5 mm Pipe - Remove



NOTE: The 10.9 x 31.5 mm pipe has the filter (A). The filter end should face the auxiliary transmission fluid pump side.

6. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

- **Be sure to use new O-rings which**

should be applied a light coat of clean transmission fluid before installation.

- **Check the connector for corrosion, dirt, or oil, and clean or repair if necessary.**

7. Auxiliary Transmission Fluid Pump - Air Bleed
8. Transmission Fluid Level - Check

Test

NOTE:

- Hydraulic pressure measurement of the auxiliary transmission fluid pump is performed by the driven pulley pressure inspection port .
- Check for DTCs. If any DTCs are stored, troubleshoot and clear them first.
- Keep all foreign particles out of the transmission.
- Be sure to check the transmission fluid level after the test. When installing or removing the A/T oil pressure gauge, transmission fluid may run out of the inspection port.

1. A/T Oil Pressure Gauge - Set

 PRESSURE GAUGE ADAPTER 070AJ-RT40100 or 070AJ-RT40101 PRESSURE GAUGE ADAPTER A PRESSURE GAUGE ADAPTER B PRESSURE GAUGE ADAPTER C PRESSURE GAUGE ADAPTER D PRESSURE GAUGE ADAPTER E	1. When testing the auxiliary transmission fluid pump pressure at the driven pulley pressure inspection port, select pressure gauge adapters A and E. **NOTE:** **Other pressure gauge adapters are not used.**

Inspection port	Tool
Forward clutch pressure	Pressure gauge adapter B
CVT drive pulley pressure	Pressure gauge adapter B
CVT driven pulley pressure	- Pressure gauge adapter A - Pressure gauge adapter E
Reverse brake pressure	Pressure gauge adapter B

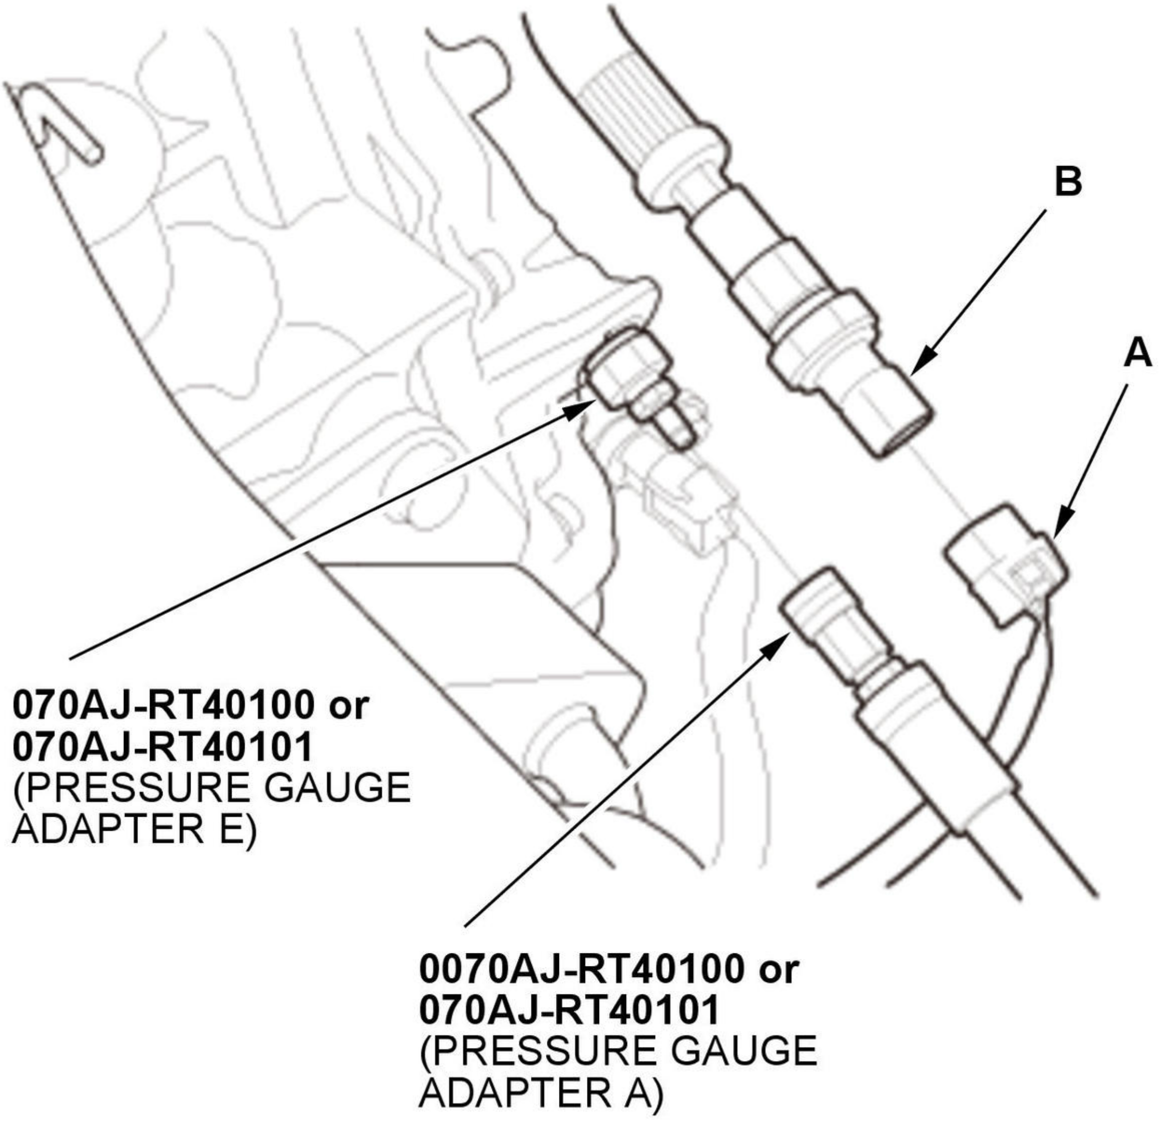
B
A
070AJ-RT40100 or 070AJ-RT40101
(PRESSURE GAUGE ADAPTER A)

1. **Remove the air cleaner** .
2. **Remove the CVT driven pulley pressure sensor (A)**

3. Temporarily install the CVT driven pulley pressure sensor with the sealing washer (B) to pressure gauge adapter A.

4. Assemble the pressure gauge; install the A/T low pressure gauge set to pressure gauge adapter A.

5. Install pressure gauge adapter E (quick connector) to the CVT driven pulley pressure inspection port.



B
A
070AJ-RT40100 or
070AJ-RT40101
(PRESSURE GAUGE
ADAPTER E)
0070AJ-RT40100 or
070AJ-RT40101
(PRESSURE GAUGE
ADAPTER A)

6. Install pressure gauge to pressure gauge adapter E (quick connector).

7. Connect the connector (A) to the CVT driven pulley pressure sensor (B).

8. Temporarily install the air cleaner.

9. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on twice).

10. Turn the engine off.

11. Select the Electrical Oil Pump Activation in the Miscellaneous Test Menu with the HDS, and measure the driven pulley pressure while driving the auxiliary transmission fluid pump.

NOTE: **Do not drive the auxiliary transmission fluid pump for more than 160 seconds at a time.**

Pressure	Standard
CVT driven Pulley	216-270 kPa (2.20-2.75 kgf/cm 2, 31.3-39.2 psi)

12. If the pressure is out of the standard, replace the auxiliary transmission fluid pump.

13. Remove the air cleaner.

14. Disconnect the connector from the CVT driven pulley pressure sensor.

15. Remove the pressure gauge and pressure gauge adapter E (quick connector).

16. Remove the CVT driven pulley pressure sensor.

17. **Install the CVT driven pulley pressure sensor**

18. **Install the air cleaner** .

5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

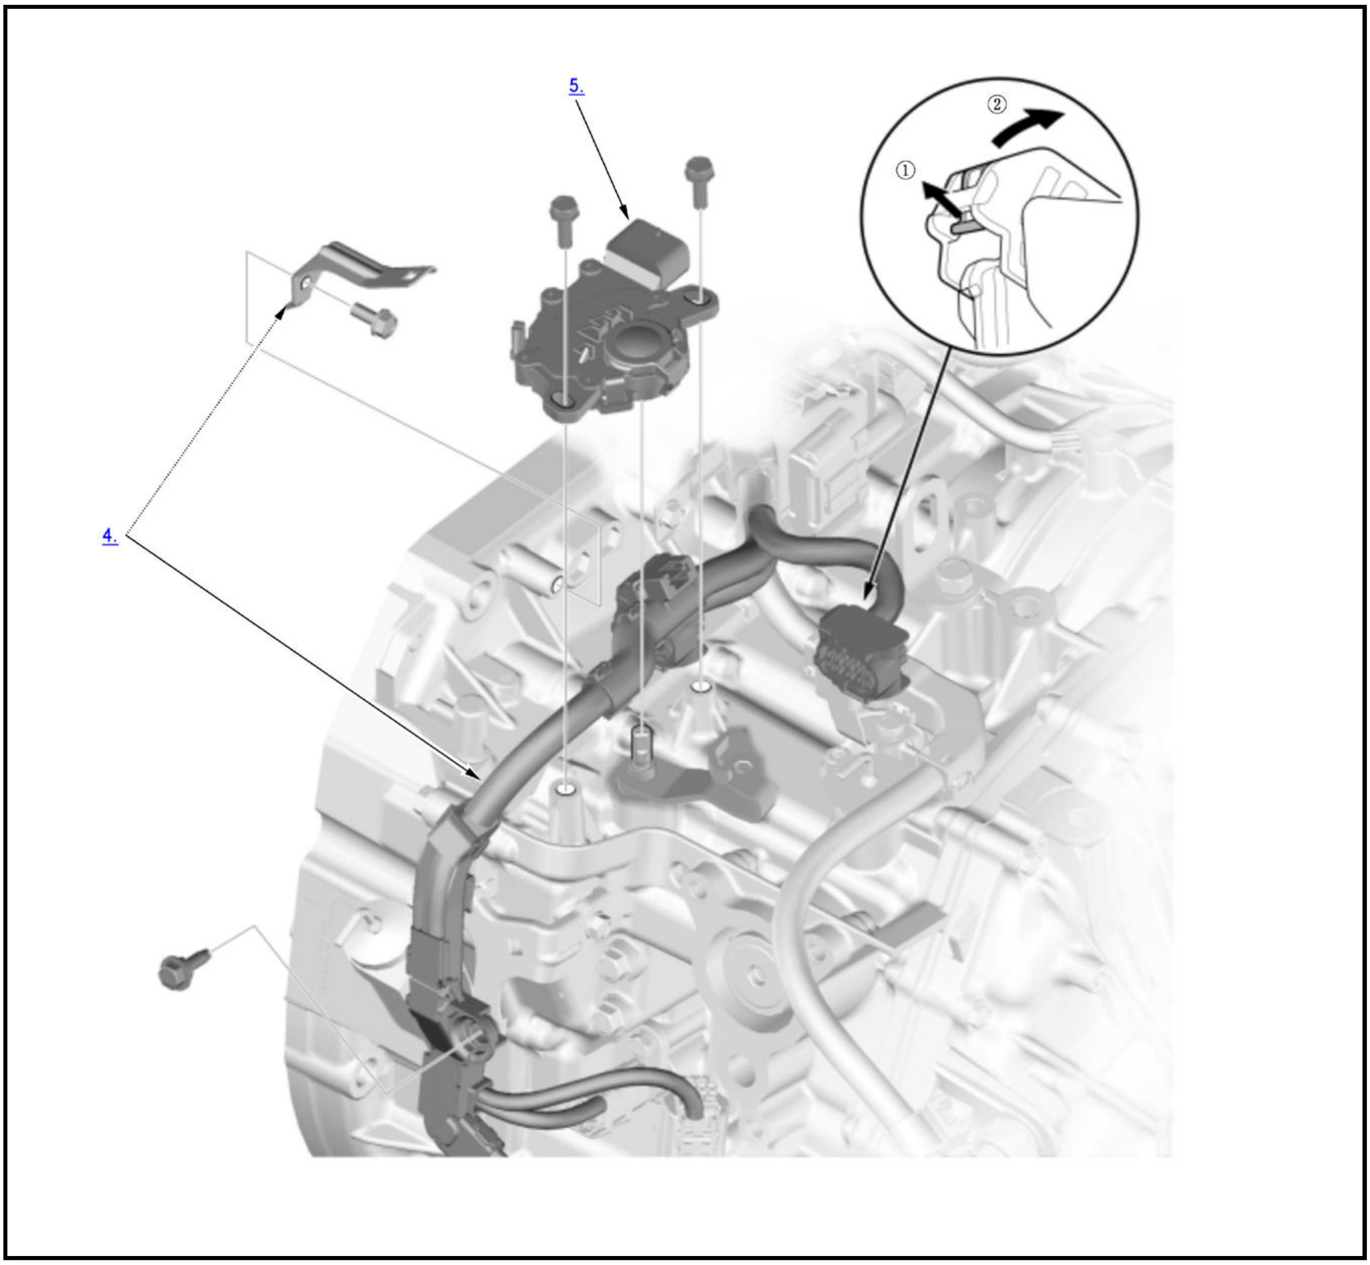
6. **Transmission Fluid Level - Check**

TRANSMISSION RANGE SWITCH REMOVAL, INSTALLATION, AND TEST

Removal

NOTE: Unless otherwise indicated, illustrations used in the procedure are for 1.5 L engine.

1



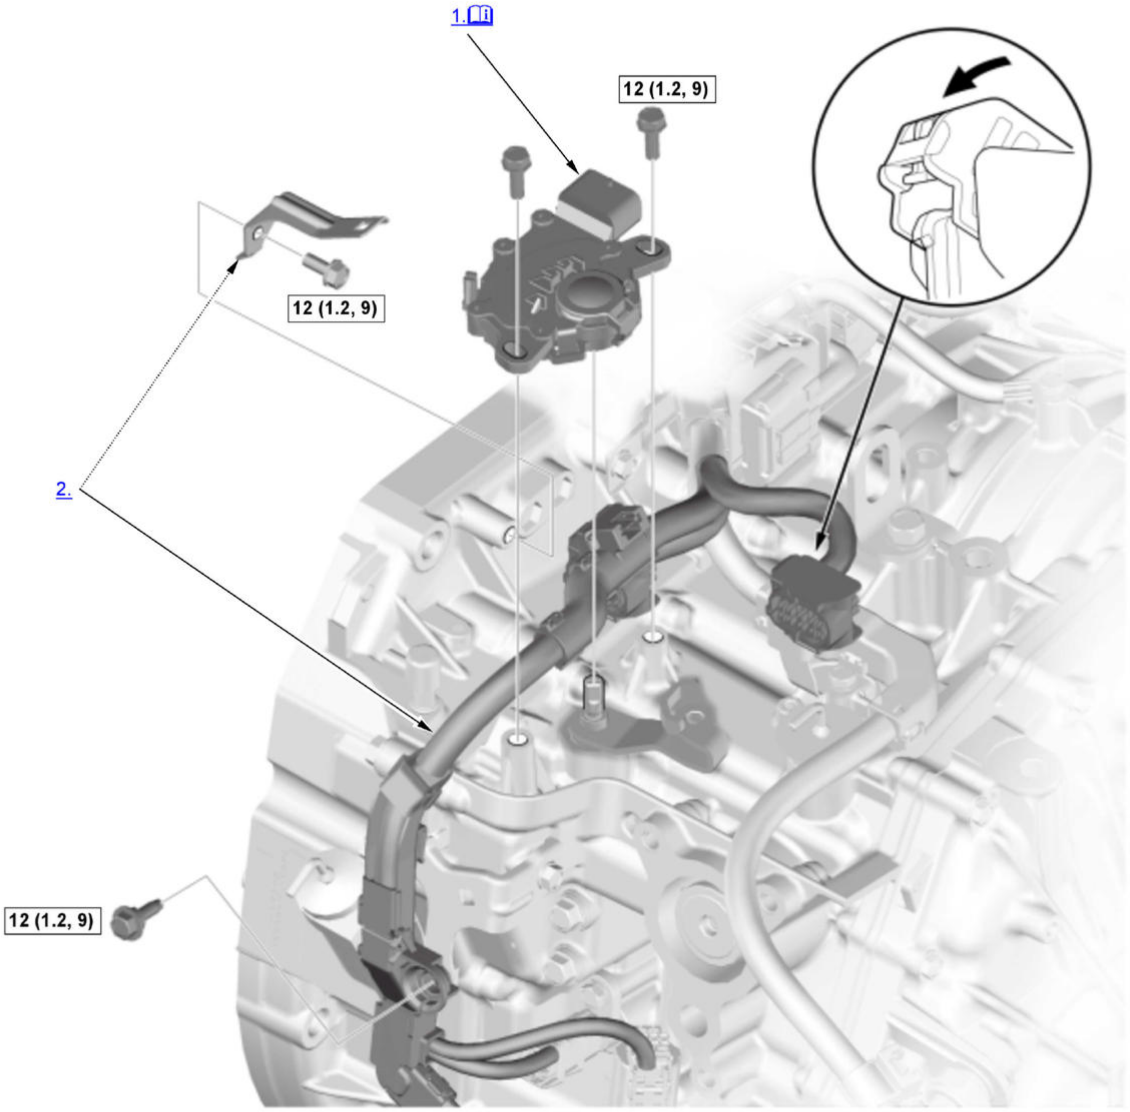
1. **Air Cleaner - Remove**
2. **Throttle Body Inlet Pipe - Remove** (1.5 L engine)
3. **Shift Cable (Shift Lever Side) - Remove**
4. Transmission Harness - Remove
5. Transmission Range Switch - Remove

Installation

NOTE:

- 🛈 Where icon is shown, further information shown below.
- Unless otherwise indicated, illustrations used in the procedure are for 1.5 L engine.

1

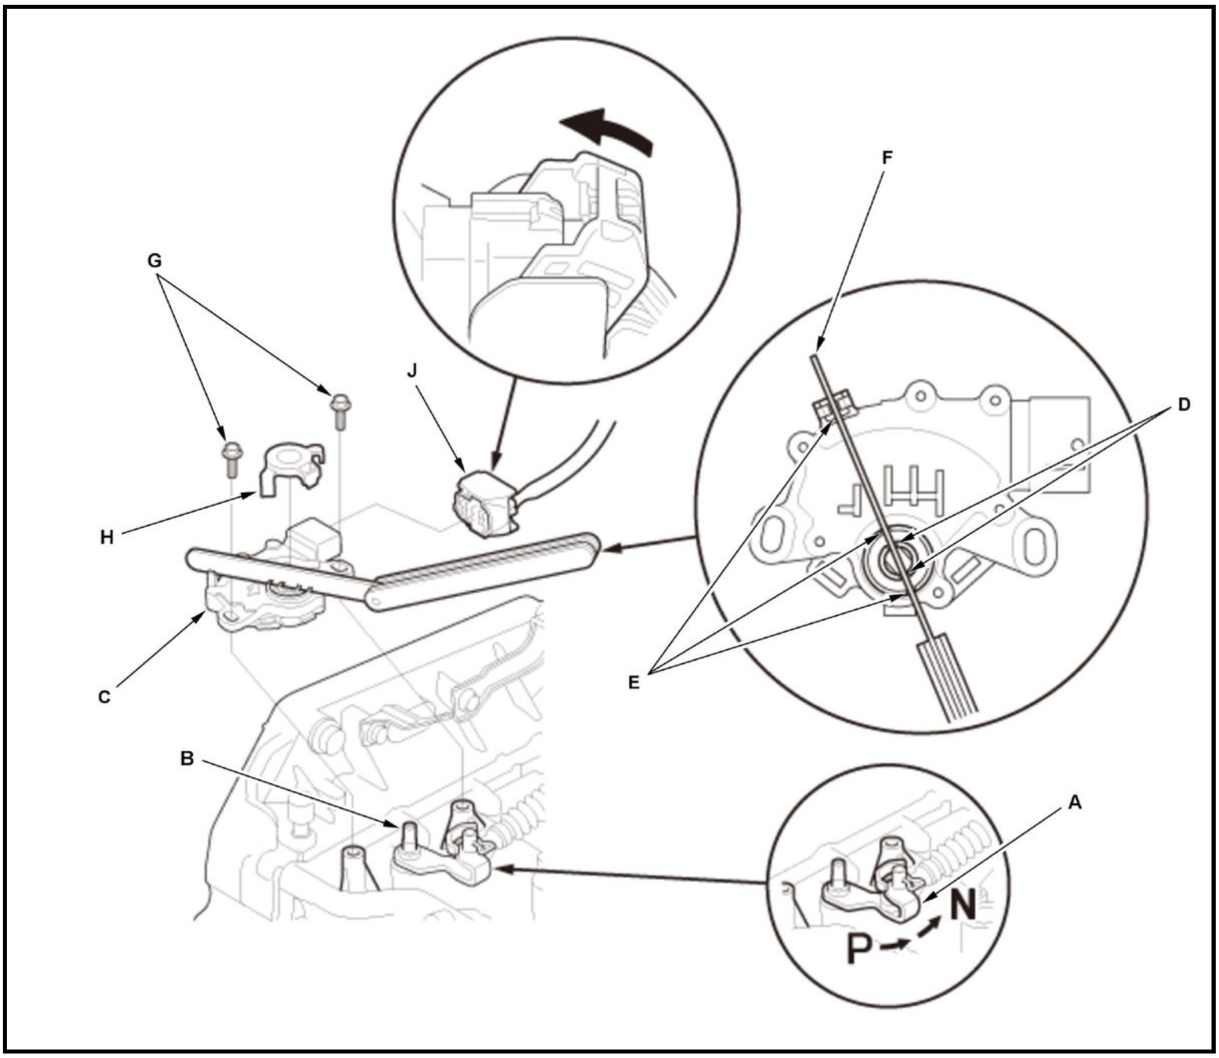


📖	Detailed information, notes and precautions
▭	Torque: N.m (kgf.m, lbf.ft)

1. Transmission Range Switch - Install

   1. Make sure the control lever (A) is in the N position/mode. If necessary, move the control lever to the N position/mode.

NOTE: **Do not use the control shaft (B) to adjust the shift position. If the control shaft tips are squeezed together, it will cause a faulty signal or position due to play between the control shaft and the transmission range switch.**



2. Set the transmission range switch (C) to the N position/mode. Align the cutouts (D) on the rotary-frame with the N positioning cutouts (E) on the transmission range switch, then put a 2.0 mm (0.079 in) feeler gauge blade (F) in the cutouts to hold the transmission range switch in the N position/mode.

NOTE: **Be sure to use a 2.0 mm (0.079 in) feeler gauge blade or equivalent to hold the transmission range switch in the N position/mode.**

3. Loosely install the transmission range switch gently on the control shaft while holding it in the N position/mode with the 2.0 mm (0.079 in) feeler gauge blade.

4. Tighten the bolts (G) on the transmission range switch while you continue holding the N position/mode.

NOTE: **Do not move the transmission range switch when tightening the bolts.**

5. Remove the feeler gauge.

6. Install the control shaft cover (H).

7. Connect the connector (J), and make sure it is fully seated.

NOTE: **Check the connector for corrosion, dirt, or oil, and clean or repair if necessary.**

2. Transmission Harness - Install
3. **Shift Cable (Shift Lever Side) - Install**
4. **Throttle Body Inlet Pipe - Install** (1.5 L engine)

5. Air Cleaner - Install
6. Transmission Range Switch - After Install Check

1. Turn the vehicle to the ON mode.

2. Move the shift lever through all positions/modes, and check that the shift position indicator follows the shift lever operation.

3. Start the engine.

NOTE:

Check that the engine starts in P or N position/mode, and does not start in any other positions/modes.

4. Check that the back-up lights come on when the transmission is in R position/mode.

Test

1. Air Cleaner - Remove
2. Throttle Body Inlet Pipe - Remove (1.5 L engine)
3. Transmission Range Switch - Test

1. Disconnect the connector (A) by pulling the lock (B) and the lever (C) in the numbered sequence shown in illustration.

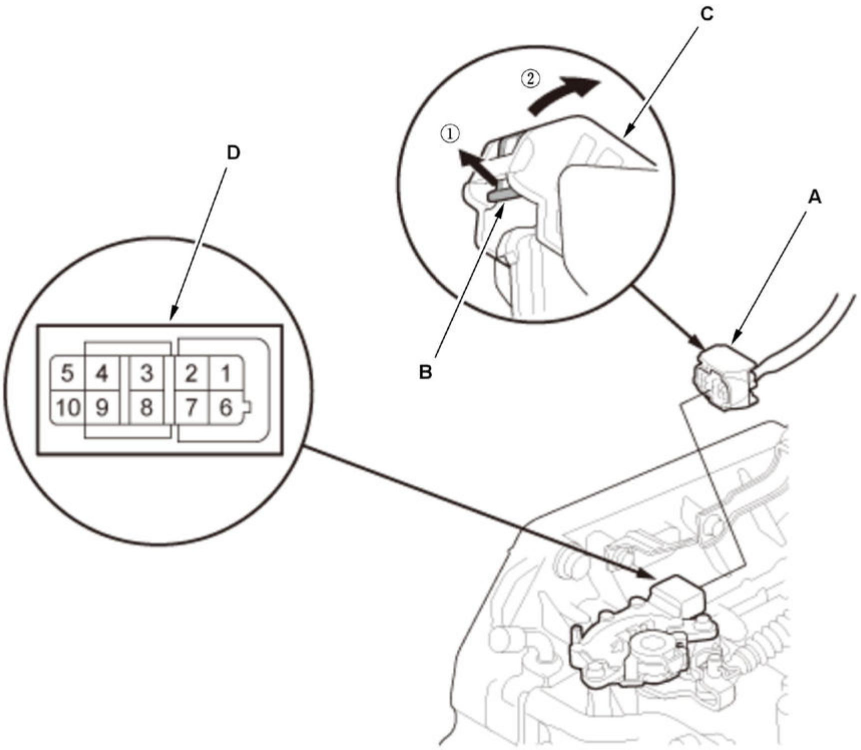


Fig. 1: Disconnecting Connector And Lever In Sequence
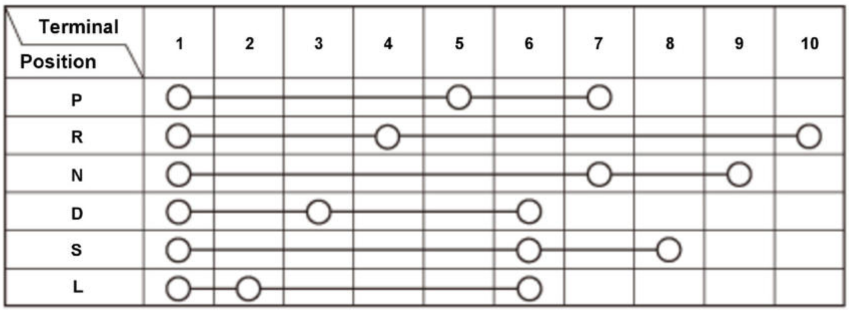
Courtesy of HONDA, U.S.A., INC.

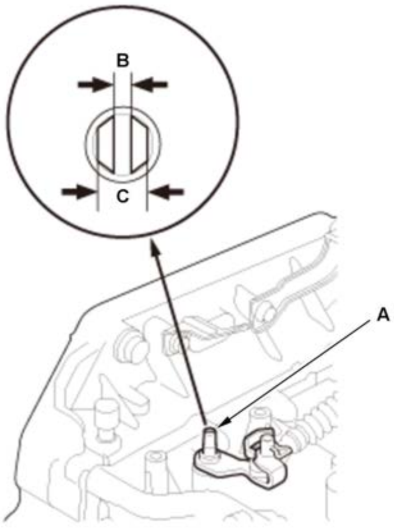


Terminal / Position	1	2	3	4	5	6	7	8	9	10
P	○				○		○			
R	○			○						○
N	○						○		○	
D	○		○			○				
S	○					○		○		
L	○	○				○				

2. Check for continuity between the terminals at the connector (male terminals) (D). There should be continuity between the terminals in the table for each transmission range switch position.

- If the test results are OK, the transmission range switch test is finished, and install all removed parts.
- If there is no continuity between any terminals, check the transmission range switch installation. If the switch installation is OK, go to step 5.

4. Transmission Range Switch - Remove
5. Control Shaft End Clearance - Check



1. Check the end of the control shaft (A).
   - If the measurement at the end of the control shaft is within the specification, replace the transmission range switch.
   - If the measurement is out of the specification, repair the control shaft end, and recheck the transmission range switch continuity.

Control Shaft Specification	
End Gap (B):	**1.8-2.0 mm (0.071-0.079 in)**
Width (C):	**6.1-6.2 mm (0.240-0.244 in)**

6. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

Check the connector for corrosion, dirt, or oil, and clean or repair if necessary.

DISASSEMBLY AND REASSEMBLY

CVT DIFFERENTIAL CARRIER DISASSEMBLY AND REASSEMBLY

Special Tools Required

Image	Description/Tool Number
	Driver Handle, 15 x 135L 07749-0010000
	Oil Seal Driver Attachment, 66 mm 07MAD-SP00100
	Installer Attachment 40 mm 07LAD-PW50601

Disassembly

NOTE:

- ℹ Where icon is shown, further information shown below.
- The bearing and the bearing outer race should be replaced as a set.

Disassembly

NOTE:

- ℹ Where icon is shown, further information shown below.
- Mark or place all removed parts in order in a parts rack so they can be reassembled in their original places.
- Keep all foreign particles out of the transmission.
- Unless otherwise indicated, illustrations used in the procedure are for AWD models.

TRANSMISSION HOUSING

ℹ	Detailed information, notes and precautions
☒	Replace

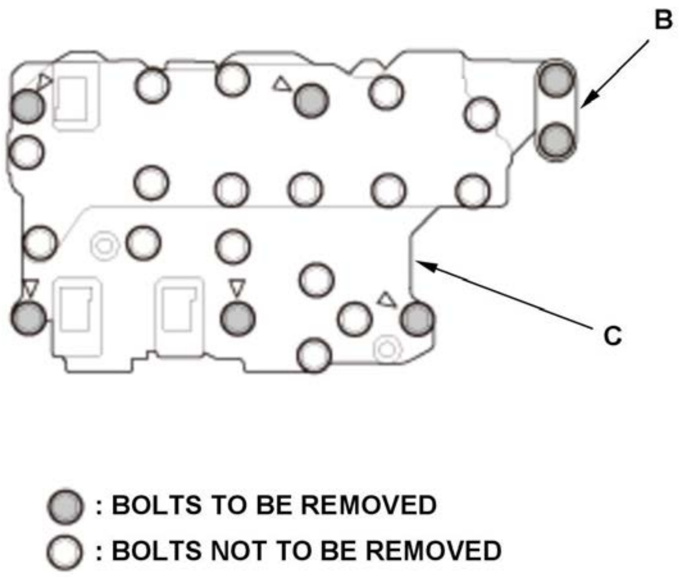
1. Auxiliary Transmission Fluid Pump - Remove (With Auto Idle Stop System)
2. Delivery Pipe - Remove (With Auto Idle Stop System)
3. 10.9 x 31.5 mm Pipe - Remove (With Auto Idle Stop System)
4. Transmission Hanger - Remove
5. Filler Cap A - Remove
6. Filler Cap B - Remove
7. Breather Cap - Remove

8. Left Differential Oil Seal - Remove
9. TCM - Remove (1.5 L engine)
10. Transmission Range Switch - Remove
11. CVT Speed Sensor - Remove
12. CVT Drive Pulley Speed Sensor - Remove
13. Torque Converter Turbine Speed Sensor - Remove
14. CVT Driven Pulley Pressure Sensor - Remove
15. Sealing Bolt - Remove
16. Check Bolt - Remove
17. Drain Plug - Remove
18. Transmission Fluid Pan - Remove
19. Magnet - Remove
20. Transmission Fluid Strainer - Remove
21. Transmission Fluid Strainer - Check

	1. Clean the inlet opening (A) of the transmission fluid strainer (B) thoroughly with compressed air. 2. Check that it is in good condition and that the inlet opening is not clogged. 3. Test the strainer by pouring clean transmission fluid through the inlet opening, and replace it if it is clogged or damaged.

22. Valve Body Assembly - Remove

	1. Remove the transmission fluid temperature sensor (A). 2. Disconnect the connectors (B).



B
C
● : BOLTS TO BE REMOVED
○ : BOLTS NOT TO BE REMOVED

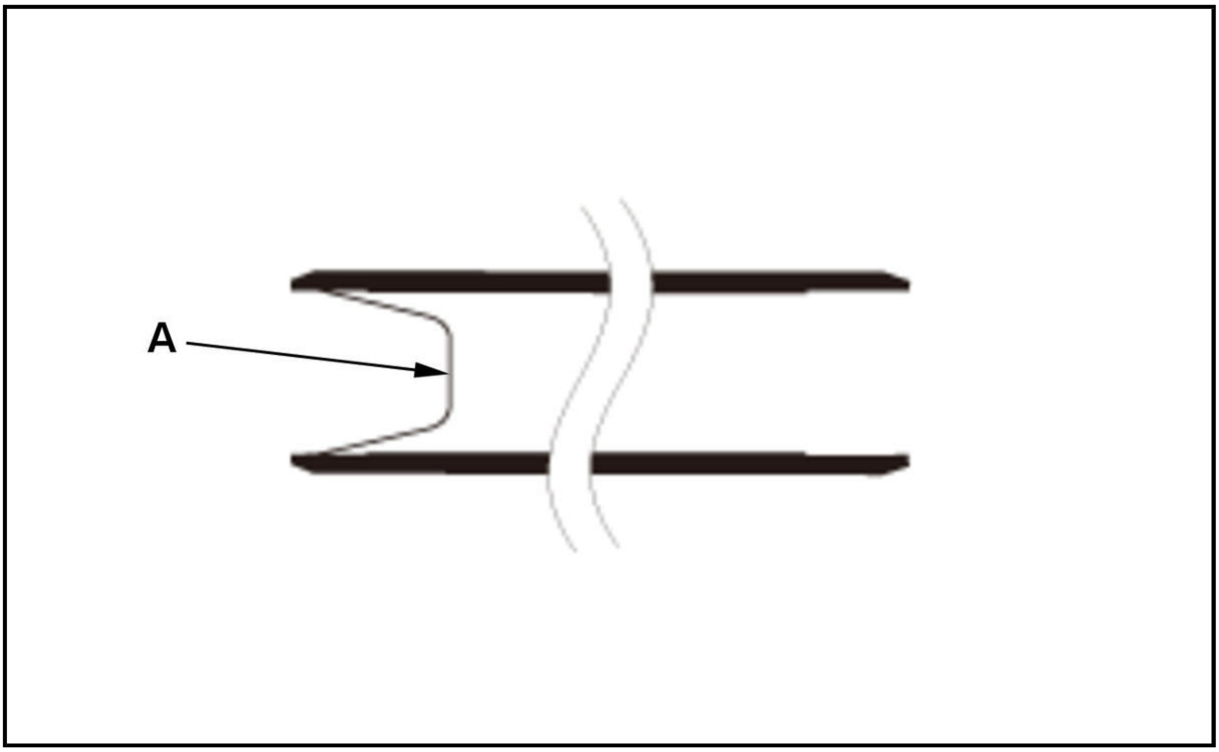
3. Remove the guide plate (B).

4. Remove the valve body assembly (C).

NOTE:

- **Do not remove the bolts with no ' marked on them.**
- **Check that the valve body assembly is free from solenoid wire harness A.**
- **Be careful not to damage solenoid wire harness A.**

23. 10.9 x 26 mm Pipe - Remove
24. 8 x 133.5 mm Pipe - Remove
25. 12 x 56.7 mm Pipe - Remove
26. Joint Pipe - Remove



NOTE: **Be careful not to drop the filter (A).**

27. 10.9 x 18.5 mm Pipe - Remove
28. 14.3 x 36.2 mm Pipe - Remove
29. 18 x 18 mm Pipe - Remove
30. Solenoid Wire Harness A - Remove
31. Transmission Fluid Pump - Remove
32. Shift Solenoid Valve O/P - Remove
33. End Cover - Remove
34. 12 x 89 mm Pipe - Remove
35. Lubrication Pipe D - Remove
36. Lubrication Pipe E - Remove
37. 22 mm Sealing Ring - Remove
38. Snap Ring - Remove

	1. Remove the snap ring (A) using commercially available snap ring pliers (B).

39. Driven Pulley Shaft Bearing (End Cover Side) - Remove

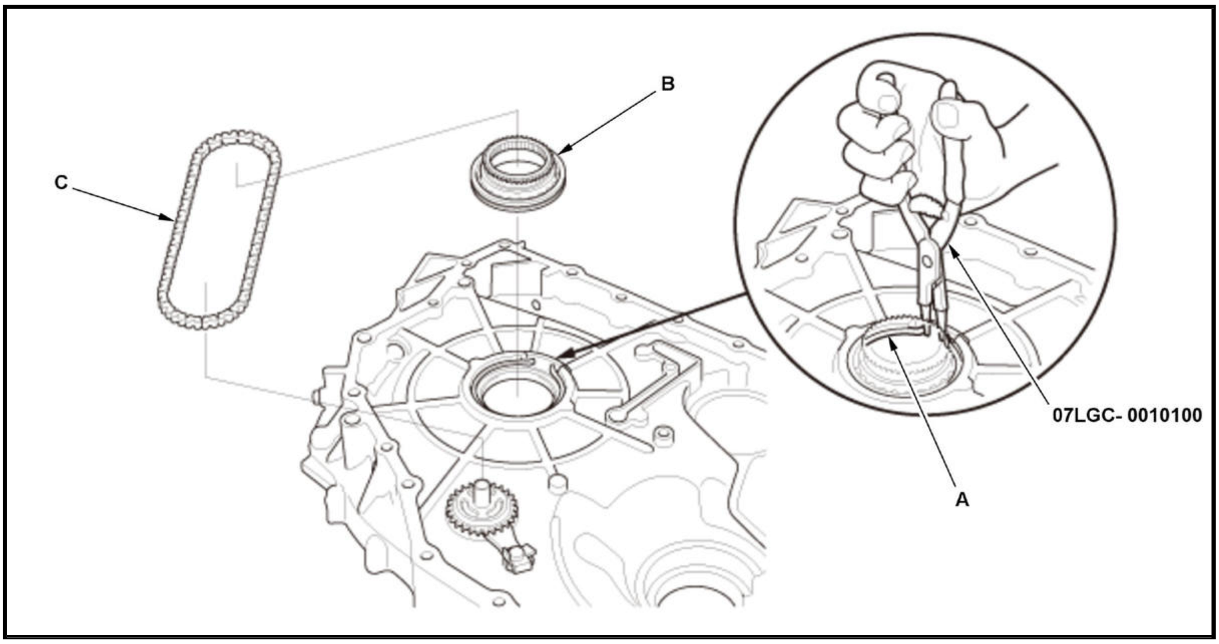
	1. Remove the driven pulley shaft bearing (A) using the 45-75 mm adjustable bearing puller and a commercially available 3/8"-16 slide hammer (B).

40. Parking Brake Pawl - Remove
41. Parking Shaft - Remove
42. Parking Pawl Spring - Remove
43. Parking Brake Rod Holder - Remove

	1. Pry down the lock tabs of the lock washer (A). 2. Remove the parking brake rod holder (B) with the lock washer.

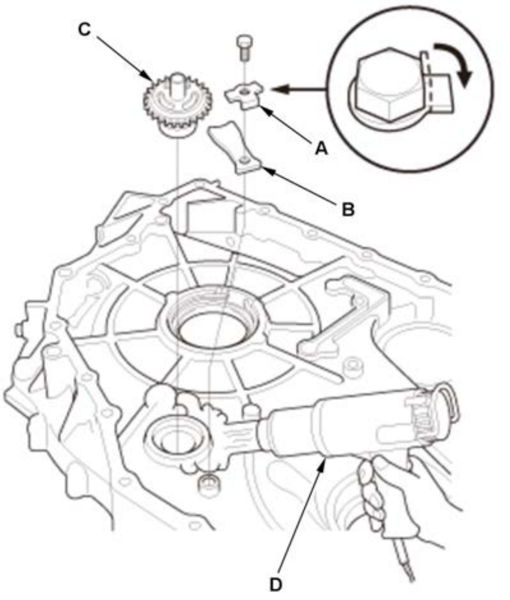
44. Torque Converter Housing - Remove
45. Input Shaft Oil Seal - Remove
46. Right Differential Oil Seal - Remove
47. Oil Guide Plate - Remove
48. Lubrication Plate - Remove
49. Transmission Fluid Pump Drive Sprocket and Transmission Fluid Pump Drive Chain - Remove

1. While expanding the snap ring (A) using the snap ring pliers, remove the transmission fluid pump drive sprocket (B) and the transmission fluid pump drive chain (C).



2. Remove the snap ring.

50. Transmission Fluid Pump Driven Sprocket - Remove



1. Pry down the lock tab of the lock washer (A).

2. Remove the bearing set plate (B).

3. Remove the transmission fluid pump driven sprocket (C) by heating the torque converter housing to about 212B°F (100B°C) using a heat gun (D).

NOTE:

Do not heat the torque converter housing more than 212B°F (100B°C).

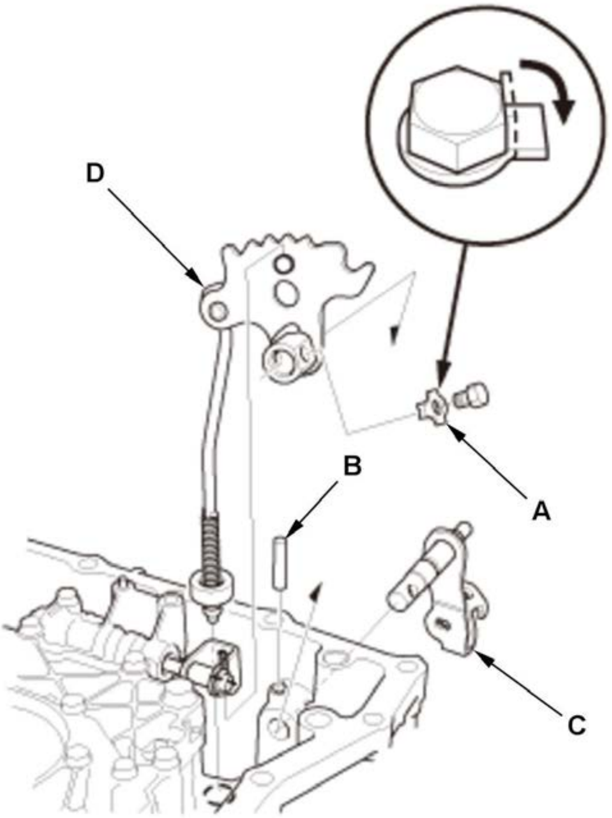
51. Differential Carrier Tapered Roller Bearing Outer Race (Torque Converter Housing Side) - Remove

	1. Remove the differential tapered roller bearing outer race, the spacer (A), and the thrust shim (B) by heating the torque converter housing to about 212B°F (100B°C) using a heat gun (C). **NOTE:** **Do not heat the torque converter housing more than 212B°F (100B°C).**

52. Final Drive Shaft Tapered Roller Bearing Outer Race (Torque Converter Housing Side) - Remove

	1. Remove the final drive shaft tapered roller bearing outer race, the thrust shim (A), and the oil guide plate (B) by heating the torque converter housing to about 212B°F (100B°C) using a heat gun (C). **NOTE:** **Do not heat the torque converter housing more than 212B°F (100B°C).**

53. Final Drive Shaft Assembly - Remove
54. Differential Assembly - Remove
55. Detent Spring - Remove
56. Control Shaft and Detent Lever - Remove



1. Pry down the lock tab of the lock washer (A).

2. Remove the roller (B).

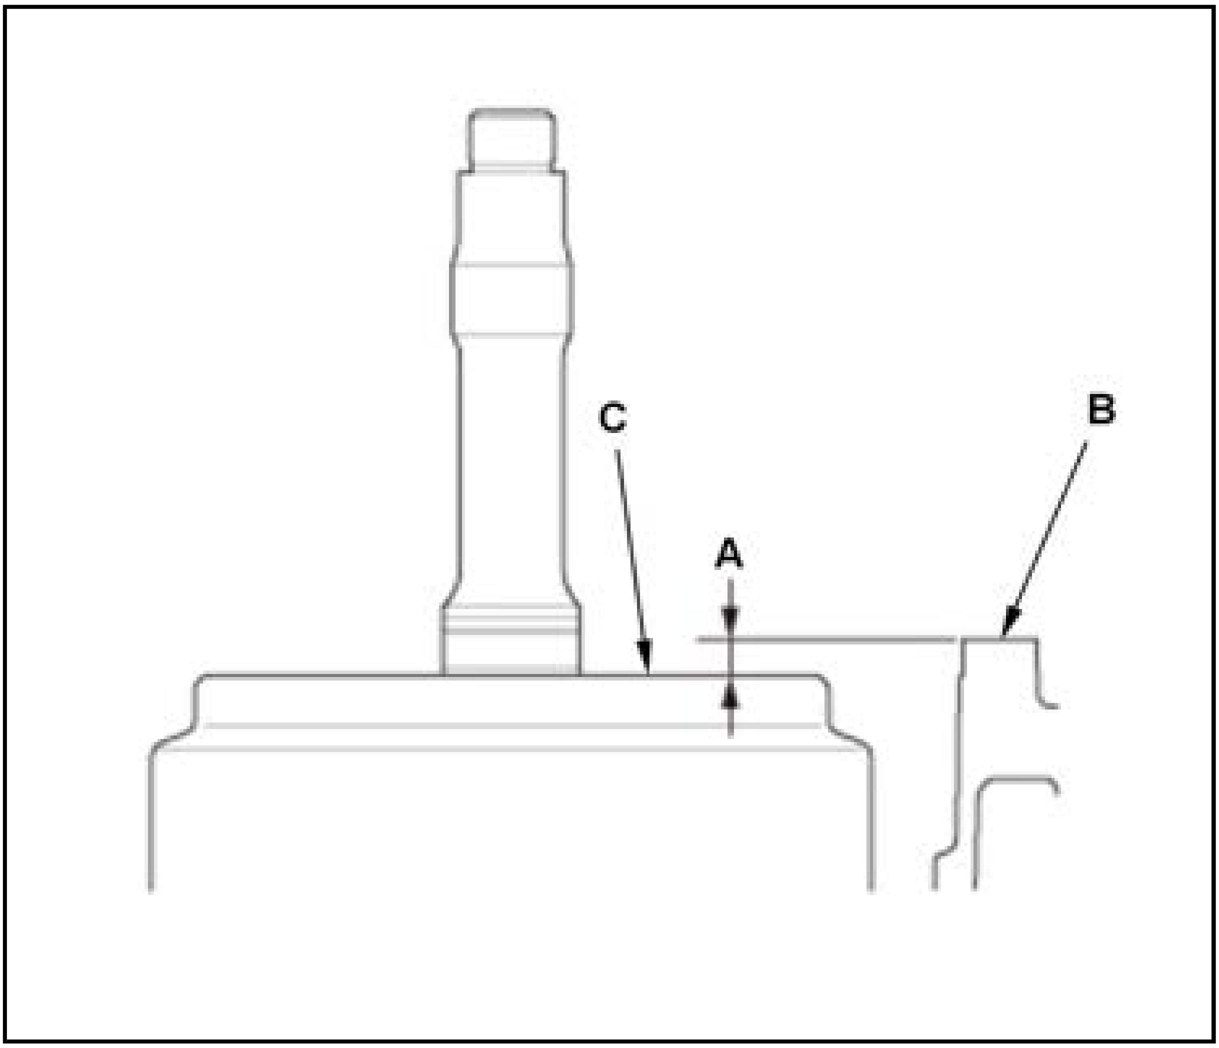
3. Remove the control shaft (C) and the detent lever (D).

57. Control Shaft Oil Seal - Remove
58. Manual Valve Body - Remove
59. Manual Valve - Remove
60. Check Ball - Remove

NOTE:

- Be careful not to drop the check balls.
- Do not use a magnet to remove the check balls, it may magnetize the check balls.

61. Stator Shaft Flange - Remove
62. Stator Shaft - Remove
63. 40 mm Sealing Ring - Remove
64. 47 mm Sealing Ring - Remove
65. Thrust Shim - Remove
66. Thrust Needle Bearing - Remove
67. Input Shaft Assembly - Remove

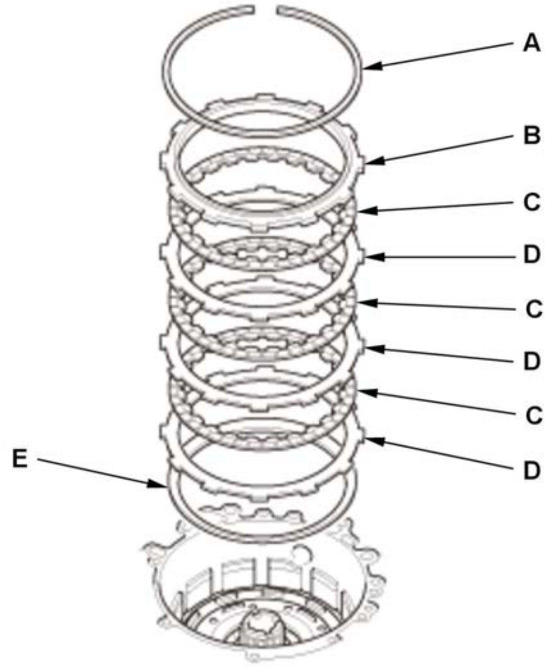


NOTE: **Note the depth (A) between the surface of the transmission housing (B) and the clutch guide (C). The recorded value of the depth will be the standard when installing the input shaft assembly.**

68. 27 mm Sealing Ring - Remove
69. 24 mm Sealing Ring - Remove
70. Needle Bearing - Remove
71. Thrust Needle Bearing - Remove
72. Ring Gear - Remove
73. Snap Ring - Remove

	1. Remove the snap ring (A) using the snap ring pliers.

74. Cotter Retainer - Remove
75. Cotter - Remove
76. Sun Gear - Remove
77. Planetary Carrier Assembly - Remove
78. Thrust Washer - Remove
79. Washer - Remove
80. Reverse Brake - Remove



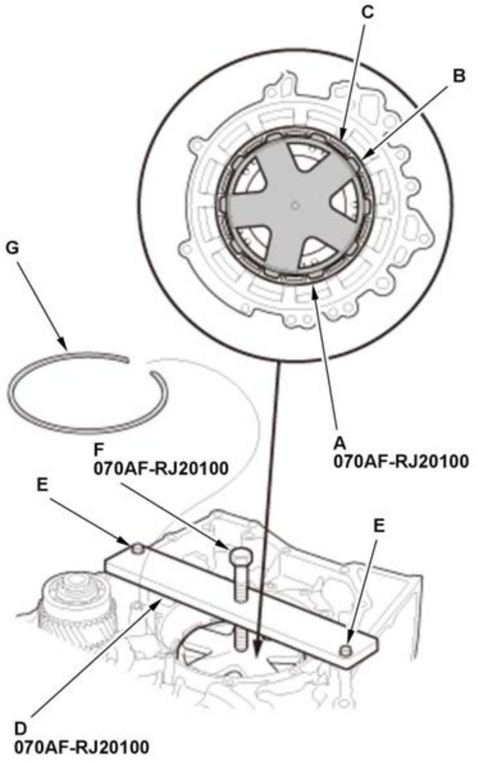
1. Remove the snap ring (A).

2. Remove the reverse brake end-plate (B).

3. Remove the reverse brake discs (C) and the reverse brake plates (D).

4. Remove the disc spring (E).

81. Snap Ring - Remove



1. Put the reverse brake spring compressor attachment (A) on the spring retainer/return spring assembly (B).

NOTE:

Be sure the attachment is set over the return springs, not on the reverse brake piston (C).

2. Install the reverse brake spring compressor plate (D) with the UP mark facing up using bolts (E).

3. Make sure that the reverse brake spring compressor bolt (F) is properly installed on the pins (E).

	4. Compress the return springs using the reverse brake spring compressor until the snap ring securing the spring retainer/return spring can be removed. 5. Remove the snap ring (G). 6. Remove the reverse brake spring compressor.

82. Spring Retainer/Return Spring Assembly - Remove
83. Reverse Brake Piston - Remove

	1. Remove the reverse brake piston (A) with the O-rings (B) while applying air pressure to the reverse brake hydraulic circuit hole (C). **NOTE:** **Cover the hydraulic circuit hole using a shop towel to prevent scatter of the transmission fluid.**

84. Final Drive Shaft Tapered Roller Bearing Outer Race (Transmission Housing Side) - Remove

	1. Remove the final drive shaft tapered roller bearing outer race (A) by heating the transmission housing to about 212B°F (100B°C) using a heat gun (B). **NOTE:** **Do not heat the transmission housing more than 212B°F (100B°C).**

85. Differential Carrier Tapered Roller Bearing Outer Race (Transmission Housing Side) - Remove

	1. Remove the differential carrier tapered roller bearing outer race (A) by heating the transmission housing to about 212B°F (100B°C) using a heat gun (B). **NOTE:** **Do not heat the transmission housing more than**

	212B°F (100B°C).

86. Spacer - Remove
87. Snap Ring - Remove

	1. Remove the snap ring (A) using the snap ring pliers.

88. Cotter Retainer - Remove
89. Cotter - Remove
90. Driven Pulley Shaft Bearing (Transmission Housing Side) - Remove

	1. Remove the driven pulley shaft bearing (A) using a commercially available bearing puller (B) and a commercially available spacer (C).

91. Secondary Drive Gear - Remove

	1. Remove the secondary drive gear (A) using a commercially available bearing puller (B) and a commercially available spacer (C).

Reassembly

NOTE:

- ℹ Where icon is shown, further information shown below.
- Keep all foreign particles out of the transmission.
- When you reassemble the transmission, apply a light coat of clean transmission fluid on all oil seals, O-rings, bearings, and shaft splines. Also soak the forward clutch assembly and the reverse brake discs, in clean transmission fluid for at least 30 minutes prior to installation.
- Be careful not to damage the O-rings.
- Unless otherwise indicated, illustrations used in the procedure are for AWD.

*1	1.5 L engine
*2	With auto idle stop system

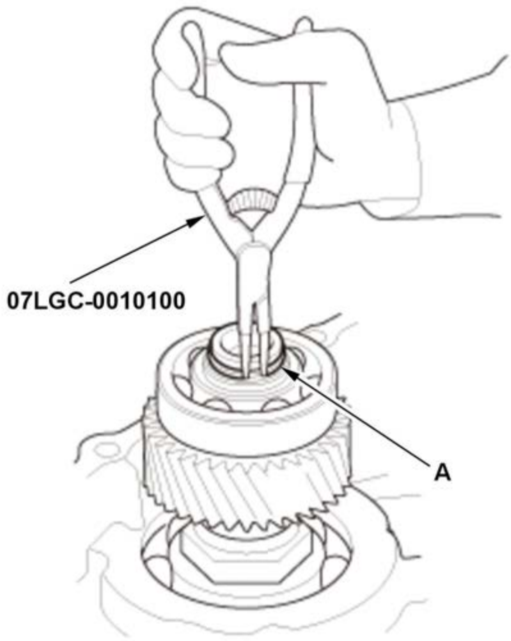
1. Secondary Drive Gear - Install

 07746-0030100 A 07746-0030300	1. Install the secondary drive gear (A) until it bottoms out in the direction shown using the I.D. driver handle and the I.D. bearing driver attachment.

2. Driven Pulley Shaft Bearing (Transmission Housing Side) - Install

 07746-0030100 A 07746-0030300	1. Install the driven pulley shaft bearing (A) until it bottoms out using the I.D. driver handle and the I.D. bearing driver attachment.

3. Cotter - Install
4. Cotter Retainer - Install
5. Snap Ring - Install

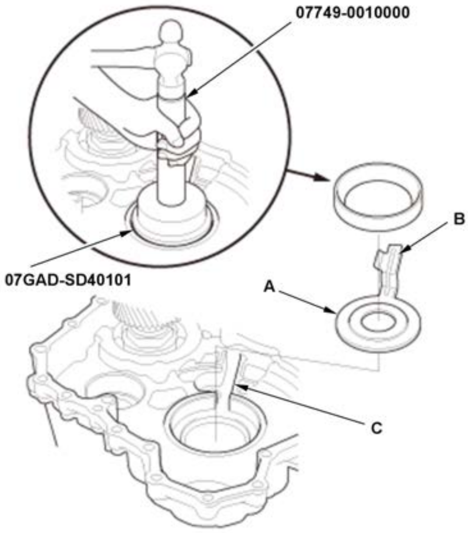


1. Install the snap ring (A) using the snap ring pliers.

NOTE:

- **Be careful not to deform the snap ring by opening/closing it excessively.**
- **Make sure the snap ring is firmly installed in the groove.**

6. Differential Carrier Tapered Roller Bearing Outer Race (Transmission Housing Side) - Install



1. Install the spacer (A) by aligning the tab (B) with the groove (C).

2. Install the differential tapered roller bearing outer race using the driver handle and the attachment so there is no clearance between the bearing outer race, the spacer, and the transmission housing.

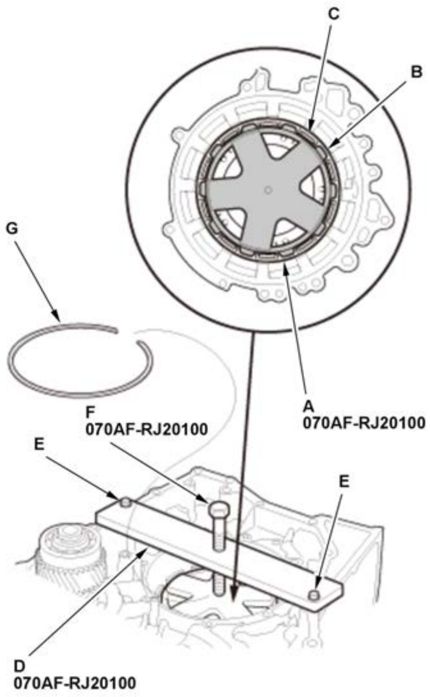
7. Final Drive Shaft Tapered Roller Bearing Outer Race (Transmission Housing Side) - Install

	1. Install the final drive shaft tapered roller bearing outer race until it bottoms out using the driver handle and the bearing driver attachment.

8. Reverse Brake Piston - Install
9. Spring Retainer/Return Spring Assembly - Install

	1. Install the spring retainer/return spring assembly (A) by aligning their holes (B) with the bosses (C).

10. Snap Ring - Install



1. Put the reverse brake spring compressor attachment (A) on the spring retainer/return spring assembly (B).

NOTE:

Be sure the attachment is set over the return springs, not on the reverse brake piston (C).

2. Install the reverse brake spring compressor plate (D) with facing the UP mark to the upside using bolts (E).

3. Make sure that the reverse brake spring compressor bolt (F) is properly installed on the dent in the surface of the reverse brake spring compressor attachment.

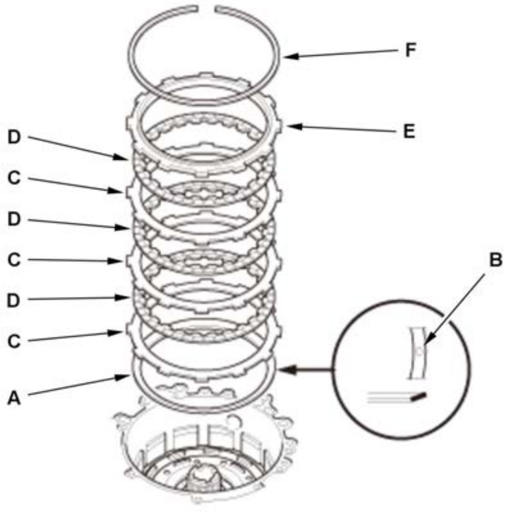
4. Compress the return springs using the reverse brake spring compressor until the snap ring securing the spring retainer/return spring can be installed.

5. Install the snap ring (G).

- Be careful not to deform the snap ring by opening/closing it excessively.
- Make sure the snap ring is firmly installed in the groove.

6. Remove the reverse brake spring compressor.

11. Reverse Brake - Install



1. Install the disc spring (A).

NOTE:

Be sure to install the disc spring with the indented mark (B) facing the upward.

2. Starting with the reverse brake plate (C), alternately install the reverse brake plates and the reverse brake discs (D).

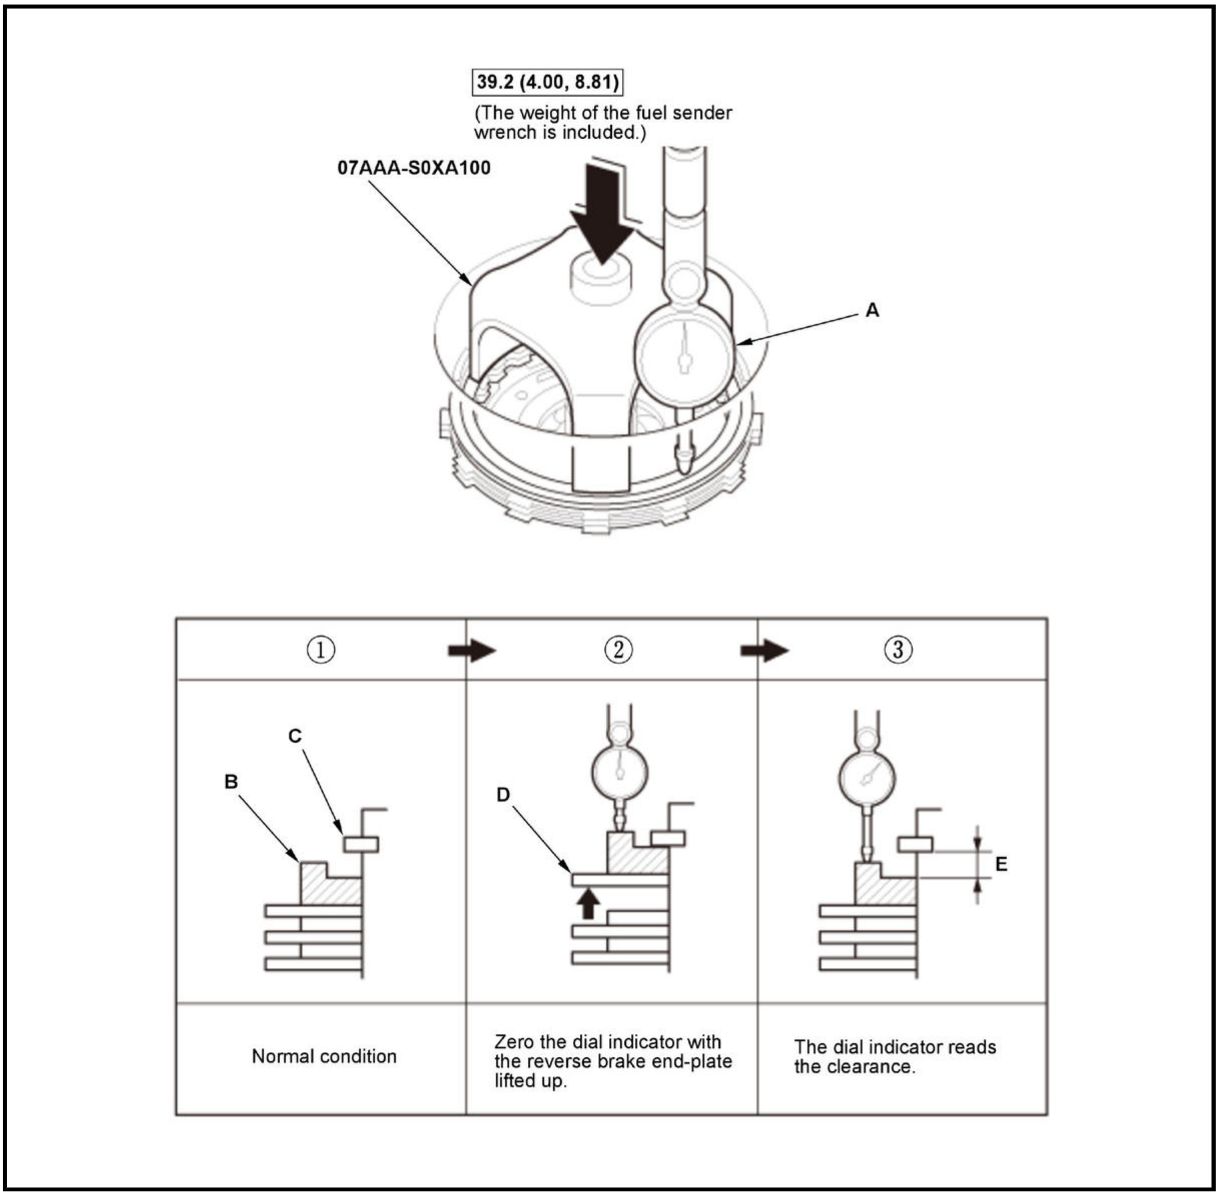
3. Install the reverse brake end-plate (E) with the flat side toward the top disc.

4. Install the snap ring (F).

	- Be careful not to deform the snap ring by opening/closing it excessively. - Make sure the snap ring is firmly installed in the groove.

12. Reverse Brake Clearance - Adjust

1. Set a dial indicator (A) on the reverse brake end-plate (B).



39.2 (4.00, 8.81)
(The weight of the fuel sender wrench is included.)
07AAA-S0XA100
A
①
②
③
C
B
D
E
Normal condition
Zero the dial indicator with the reverse brake end-plate lifted up.
The dial indicator reads the clearance.

2. Zero the dial indicator with the reverse brake end-plate lifted up to the snap ring (C) by lifting the top disk (D) up.

3. Release the top disk.

4. Put the fuel sender wrench on the reverse brake end-plate.

5. Press the fuel sender wrench down with 39.2 N (4.00 kgf, 8.81 lbf) (the weight of the fuel sender wrench is included) using a force gauge, and read the dial indicator. The dial indicator reads the clearance (E) between the reverse brake end-plate and the top disc.

NOTE: **Take measurements in at least three places, and use the average as the actual clearance.**

Standard:	**0.9-1.1 mm (0.035-0.043 in)**

    6. Refer to the Parts catalog, then select appropriate reverse brake end-plate.

    7. Install a selected reverse brake end-plate, then recheck the clearance.

13. Washer - Install

NOTE: **Make sure the washer is installed in the correct direction.**

14. Thrust Washer - Install
15. Planetary Carrier Assembly - Install
16. Sun Gear - Install
17. Cotter - Install
18. Cotter Retainer - Install
19. Snap Ring - Install

	1. Install the snap ring (A) using the snap ring pliers. **NOTE:** - **Be careful not to deform the snap ring by opening/closing it excessively.** - **Make sure the snap ring is firmly installed in the groove.**

20. Ring Gear - Install
21. Thrust Needle Bearing - Install

NOTE: Make sure the thrust needle bearing is installed in the correct direction.

22. Needle Bearing - Install
23. 24 mm Sealing Ring - Install
24. 27 mm Sealing Ring - Install
25. Input Shaft Assembly - Install

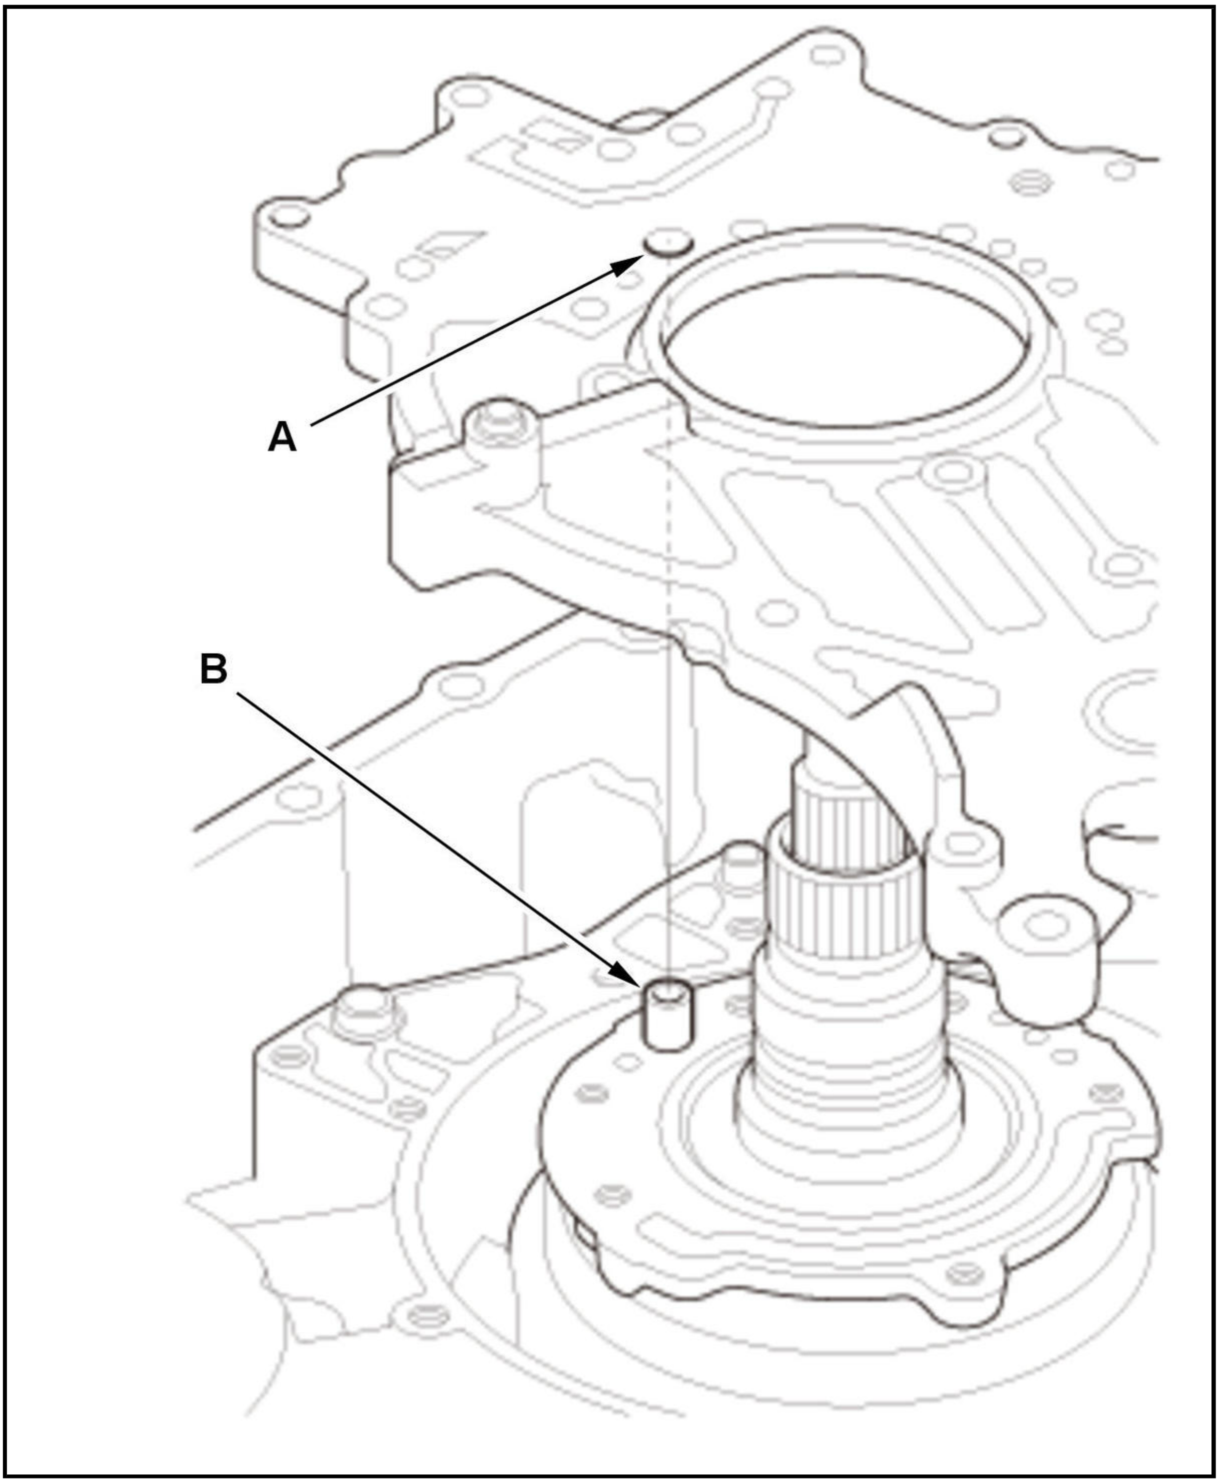
	1. Install the input shaft assembly (A) by aligning the clutch discs (B) with the sun gear (C), and aligning the clutch guide (D) with the ring gear (E).

	2. Measure the depth (A) between the surface of the transmission housing (B) and the clutch guide (C), then make sure the measured value of the depth is within the recorded value before it was removed.

26. Thrust Needle Bearing - Install

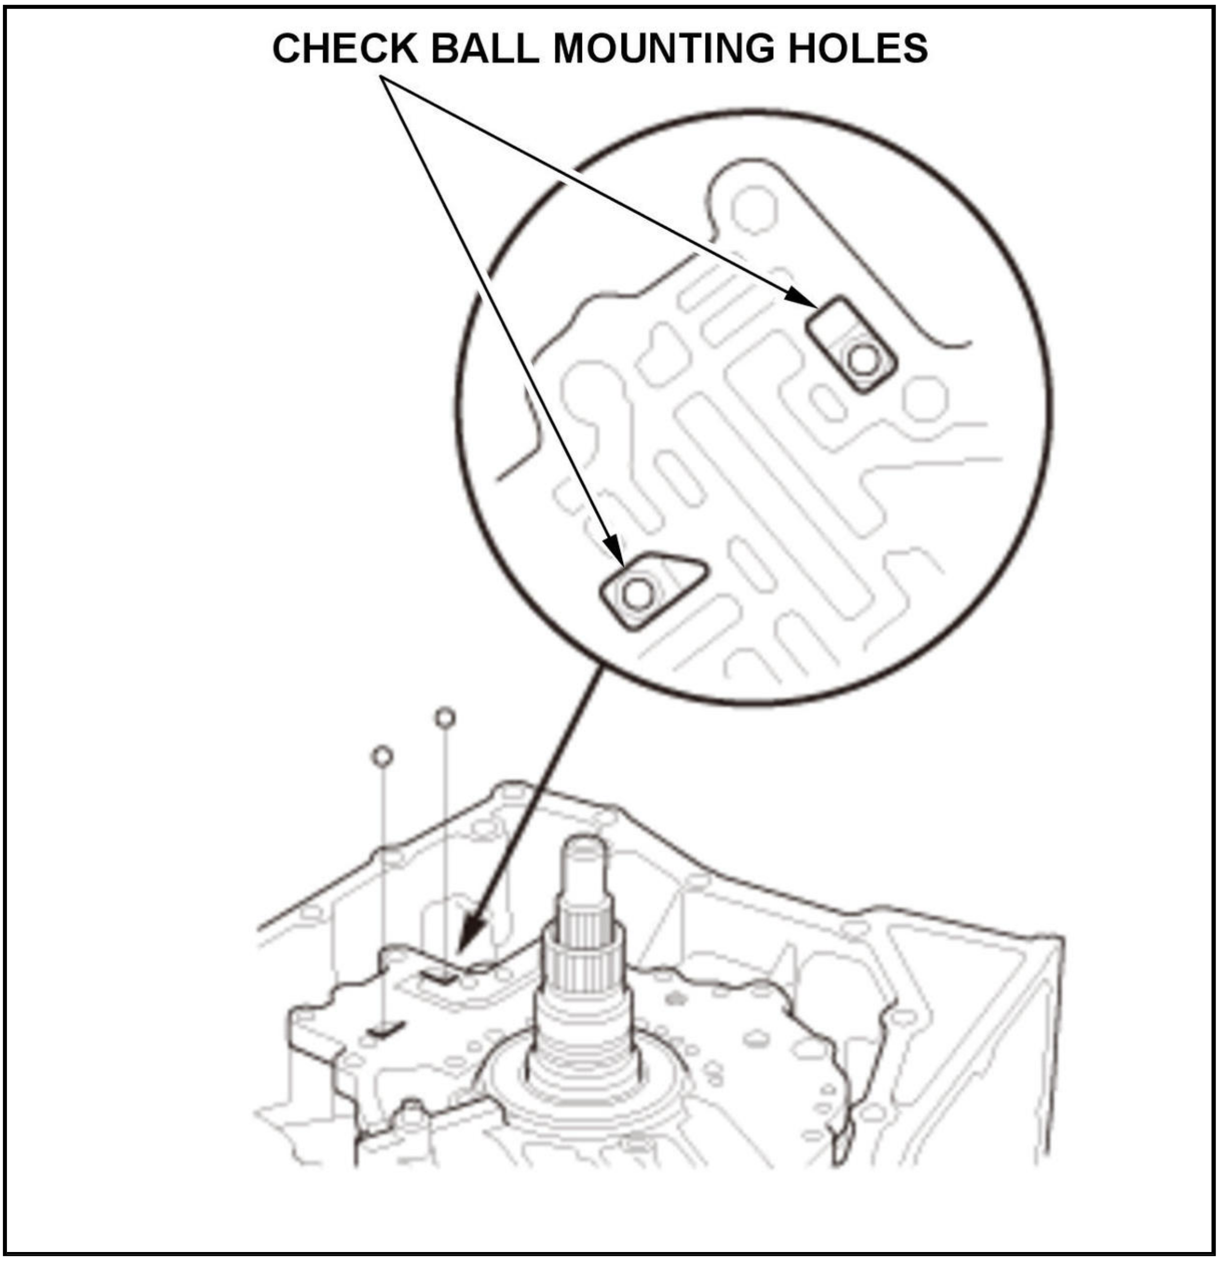
    NOTE: Make sure the thrust needle bearing is installed in the correct direction.

27. Thrust Shim - Install
28. 47 mm Sealing Ring - Install
29. 40 mm Sealing Ring - Install
30. Stator Shaft - Install
31. Stator Shaft Flange - Install



NOTE: Align the hole (A) of the stator shaft flange with the dowel pin (B) of the stator shaft when installing the stator shaft flange.

32. Check Ball - Install



CHECK BALL MOUNTING HOLES

NOTE:

- Be careful not to drop the check balls.
- Do not use a magnet to install the check balls, it may magnetize the check balls.

33. Manual Valve - Install
34. Manual Valve Body - Install
35. Control Shaft Oil Seal - Install

	1. Install the control shaft oil seal (A) to a depth (B) of 0.5-1.5 mm (0.020-0.059 in) below the transmission housing surface (C) using the driver handle and the bearing driver attachment. **NOTE:** **Before installation, apply a light coat of clean transmission fluid to the surfaces of the press fit and the lip of the oil seal.**

36. Control Shaft and Detent Lever - Install

	1. Install the detent lever (A) by aligning the guide tab (B) of the detent lever with the opening (C) of the manual valve. 2. Insert the control shaft (D) into the transmission housing and the detent lever, then install the roller (E). 3. Secure the control shaft and the detent lever with the mounting bolt (F) and the lock washer (G). 4. Pry up the lock tab of the lock washer.

37. Detent Spring - Install
38. Differential Assembly and Final Drive Shaft Assembly - Install

    NOTE: Make sure to assemble the final drive shaft and the final driven gear correctly (Combination A or B) as shown in the chart if either one or both are to be replaced. Correct combinations of the shaft and gear can be identified by the presence or the absence of the groove as shown in the chart.

	Final Drive Shaft	**Final Driven Gear**
Combination A (With Groove)		Combination B (Without Groove)		
39. Final Drive Shaft Tapered Roller Bearing Outer Race (Torque Converter Housing Side) - Install

	1. Install the oil guide plate (A) and the thrust shim (B). 2. Install the final drive shaft tapered roller bearing outer race using the driver handle and the bearing driver attachment so there is no clearance between the bearing outer race, the thrust shim, the oil guide plate, and the torque converter housing.

40. Differential Carrier Tapered Roller Bearing Outer Race (Torque Converter Housing Side) - Install

 	1. Install the thrust shim (A) and the spacer (B). 2. Install the differential tapered roller bearing outer race using the driver handle and the bearing driver attachment so there is no clearance between the bearing outer race, the spacer, the thrust shim, and the torque converter housing.

41. Transmission Fluid Pump Driven Sprocket - Install

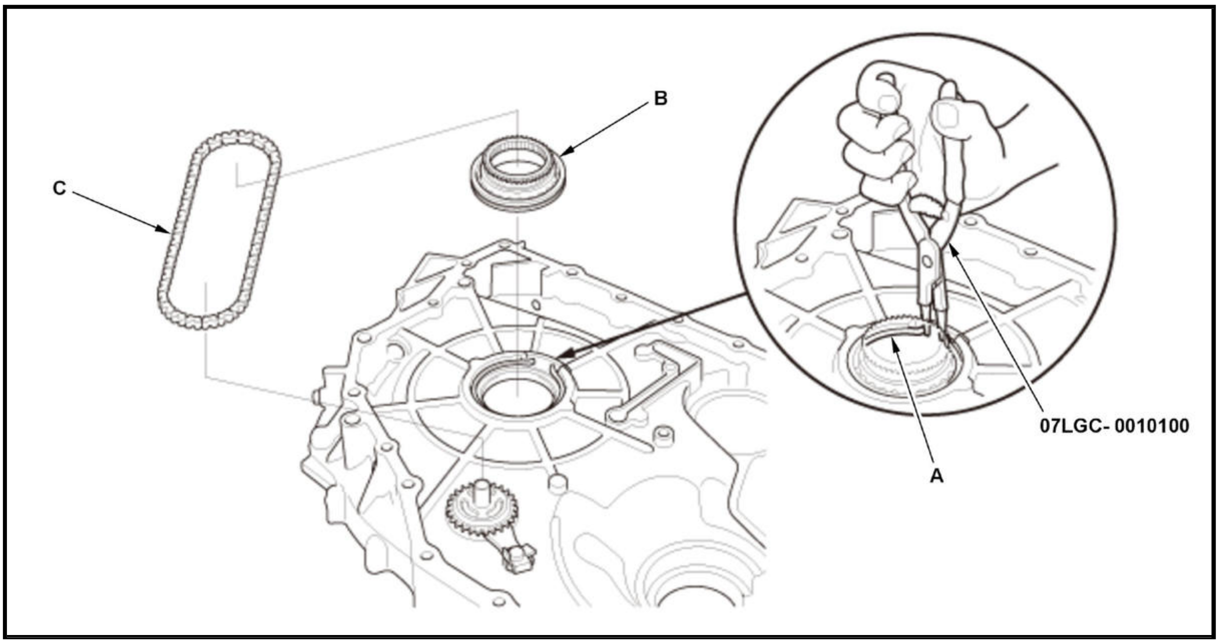
 	1. Install the transmission fluid pump driven sprocket (A). 2. Install the bearing set plate (B) with the lock washer (C). 3. Pry up the lock tab of the lock washer.

42. Transmission Fluid Pump Drive Sprocket and Transmission Fluid Pump Drive Chain - Install

1. Install the snap ring (A).

NOTE:

- **Be careful not to deform the snap ring by opening/closing it excessively.**
- **Make sure the snap ring is firmly installed in the groove.**



2. While expanding the snap ring using the snap ring pliers, install the transmission fluid pump drive sprocket (B) and the transmission fluid pump drive chain (C).

NOTE:

- **Be careful not to deform the snap ring by opening/closing it excessively.**
- **Make sure the snap ring is firmly installed in the groove.**

43. Lubrication Plate - Install

44. Oil Guide Plate - Install

45. Right Differential Oil Seal - Install

	1. Install the right differential oil seal (A) flush with the torque converter housing using the 65 mm oil seal driver. **NOTE:** **Before installation, apply a light coat of clean transmission fluid to the surfaces of the press fit and the lip of the oil seal.**

46. Input Shaft Oil Seal - Install

	1. Install the input shaft oil seal (A) flush with the torque converter housing using the driver handle and the attachment. **NOTE:** **Before installation, apply a light coat of clean transmission fluid to the surface both of the press-fit and the lip that are on the oil seal.**

47. Torque Converter Housing - Install

NOTE:

- Tighten the torque converter housing mounting bolts in a crisscross pattern in at least two steps.
- Be careful not to drop the oil guide plate.

48. Parking Brake Rod Holder - Install

	1. Install the parking brake rod holder (A) with the lock washer (B). 2. Pry up the lock tabs of the lock washer.

49. Parking Brake Pawl, Parking Shaft, and Parking Pawl Spring - Install

 	1. Install the parking brake pawl (A), the parking shaft (B), and the parking pawl spring (C) as shown.

50. Driven Pulley Shaft Bearing (End Cover Side) - Install

 07749-0010000 A 07LAD-PW50500	1. Install the driven pulley shaft bearing (A) until it bottoms out using the driver handle and the attachment.

51. Snap Ring - Install

	1. Install the snap ring (A) using commercially available snap ring pliers (B). **NOTE:** • **Be careful not to deform the snap ring by opening/closing it excessively.** • **Make sure the snap ring is firmly installed in the groove.**

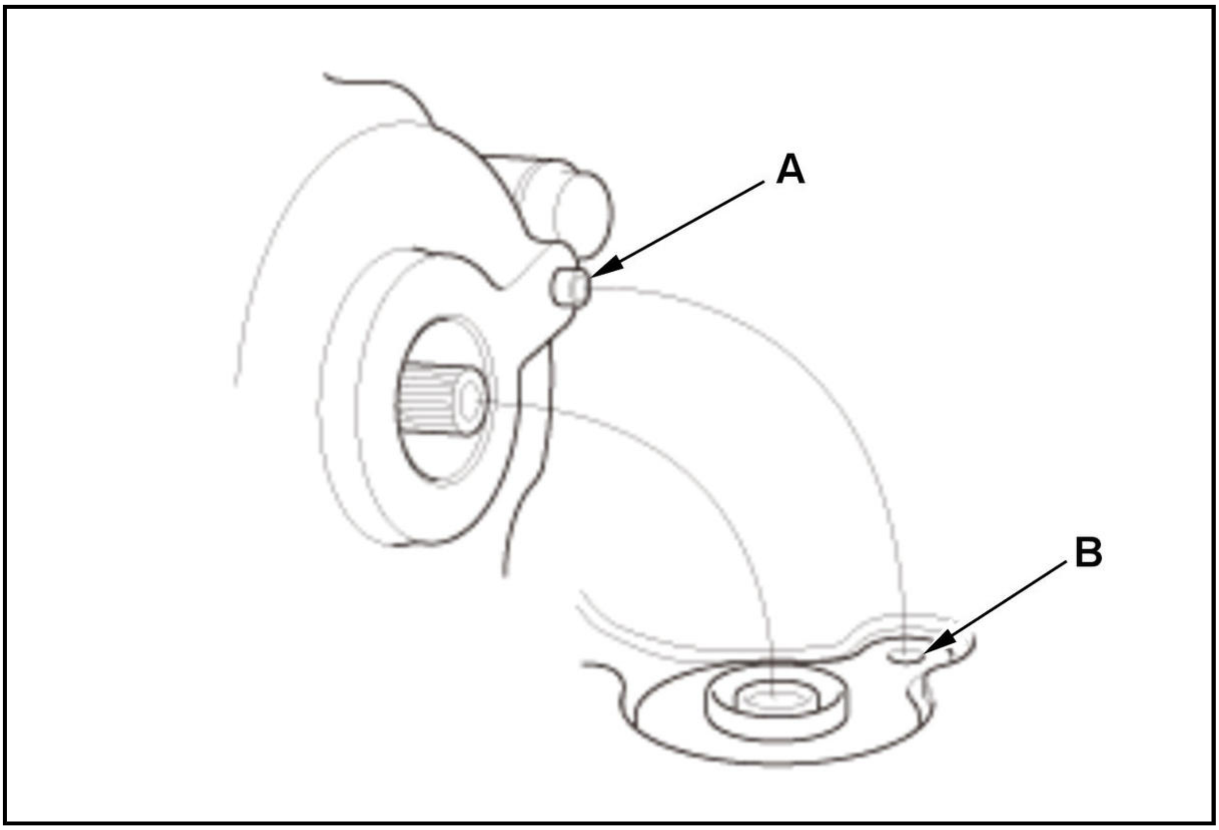
52. 22 mm Sealing Ring - Install
53. Lubrication Pipe D and E - Install

	1. Install lubrication pipes D and E as shown.

54. 12 x 89 mm Pipe - Install
55. End Cover - Install

    NOTE: Tighten the end cover mounting bolts in a crisscross pattern in at least two steps.

56. Shift Solenoid Valve O/P - Install
57. Transmission Fluid Pump - Install

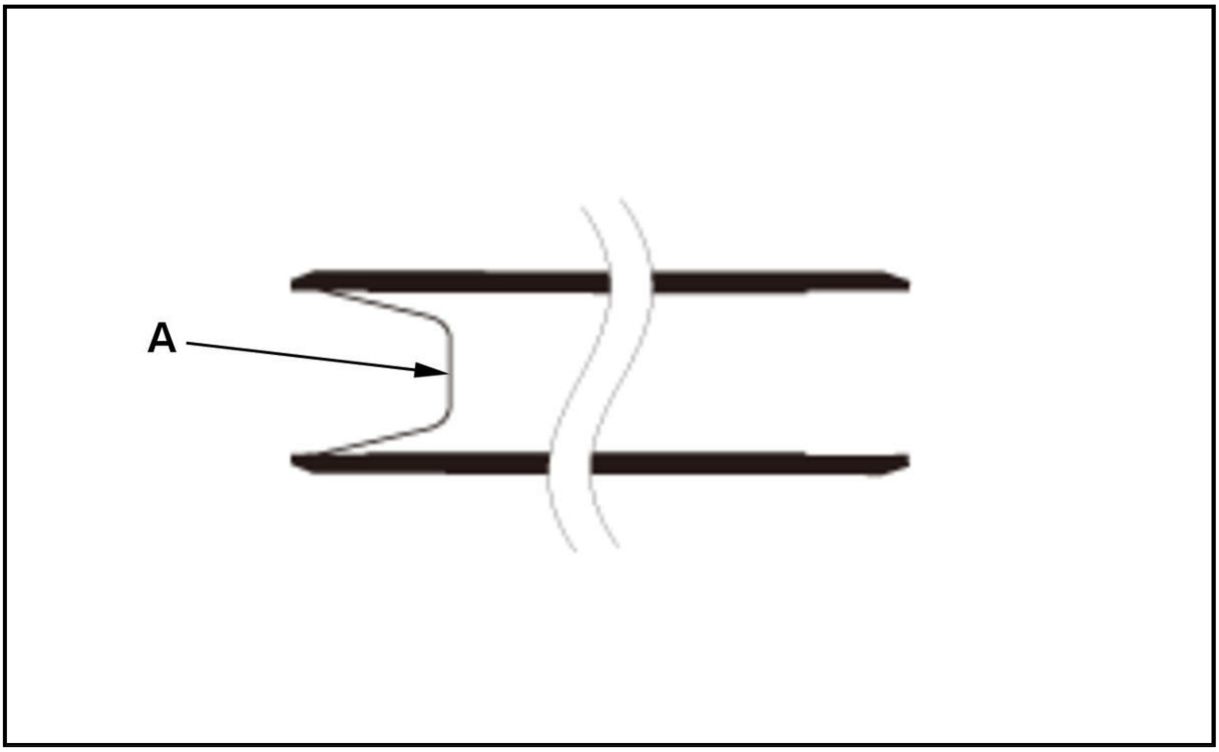


NOTE: Align the guide pin (A) of the transmission fluid pump with the guide hole (B) of the stator shaft flange.

58. Solenoid Wire Harness A - Install
59. 18 x 18 mm Pipe - Install
60. 14.3 x 36.2 mm Pipe - Install

NOTE: You can install the pipe regardless of its direction.

61. 10.9 x 18.5 mm Pipe - Install
62. Joint Pipe - Install



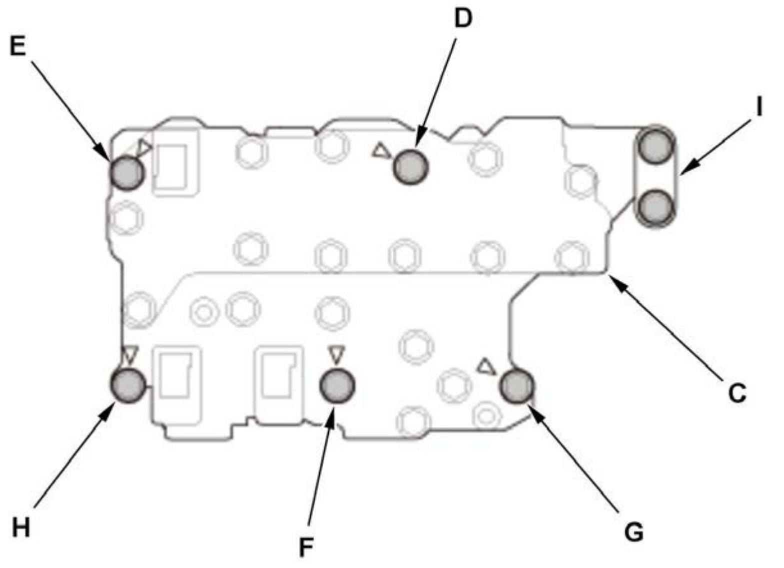
NOTE:

- The joint pipe has the filter (A). The filter end should face the valve body assembly side.
- Be careful not to drop the filter.

63. 12 x 56.7 mm Pipe - Install

NOTE: You can install the pipe regardless of its direction.

64. 8 x 133.5 mm Pipe - Install
65. 10.9 x 26 mm Pipe - Install
66. Valve Body Assembly - Install



1. Install the valve body assembly (C) straightly.

NOTE:

Do not pinch solenoid wire harnesses A and B.

2. Install the guide plate (I).

Bolt	Length
D	90 mm (3.54 in)
E	80 mm (3.15 in)
F	65 mm (2.56 in)
G	55 mm (2.17 in)
H	40 mm (1.57 in)

	3. Make sure each branch of solenoid wire harness A is routed to the correction locations as shown, especially areas (B) and (C). 4. Connect the connectors (D). 5. Install the transmission fluid temperature sensor (E).

67. Transmission Fluid Strainer - Install

    NOTE: Do not pinch solenoid wire harnesses A and B.

68. Magnet - Install
69. Transmission Fluid Pan - Install

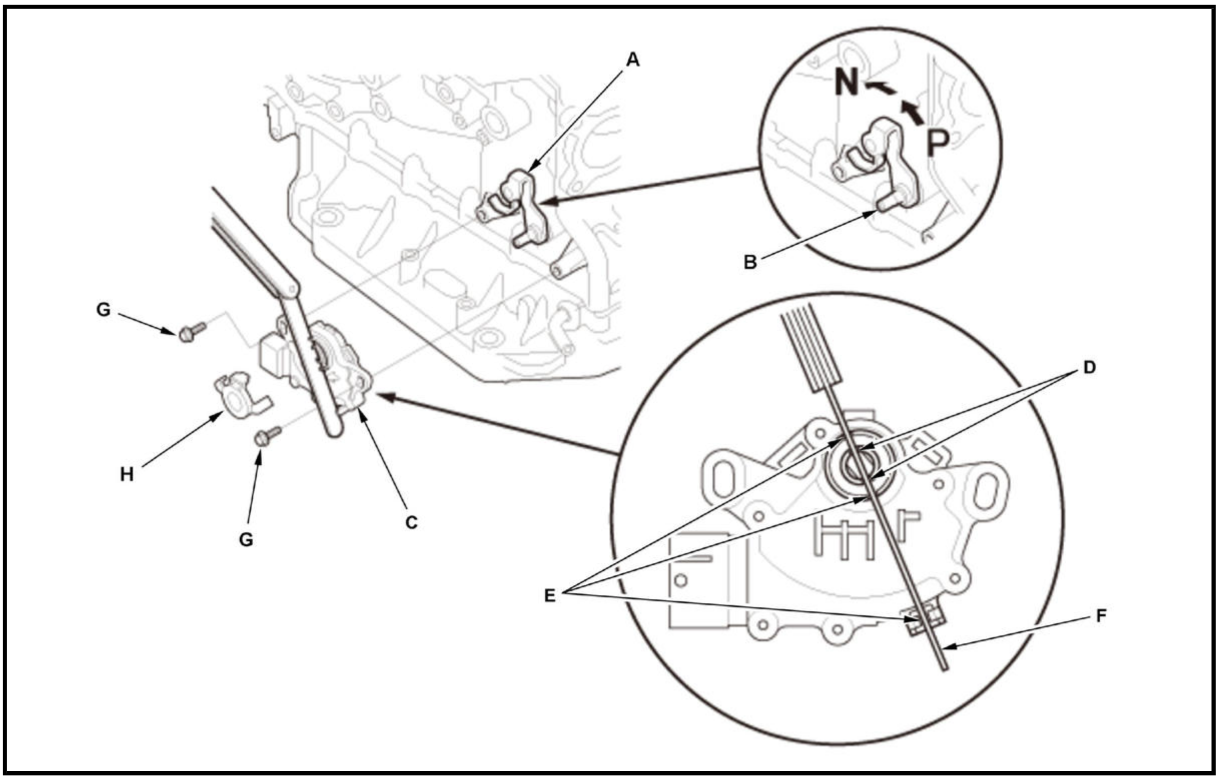
    NOTE:

    - Tighten the transmission fluid pan mounting bolts in a crisscross pattern in two steps.
    - Do not pinch solenoid wire harnesses A and B.

70. Drain Plug - Install
71. Check Bolt - Install
72. Sealing Bolt - Install
73. CVT Driven Pulley Pressure Sensor - Install
74. Torque Converter Turbine Speed Sensor - Install
75. CVT Drive Pulley Speed Sensor - Install
76. CVT Speed Sensor - Install
77. Transmission Range Switch - Install

    1. Turn the control lever (A) to the P position.

NOTE: **Do not use the control shaft (B) to adjust the shift position. If the control shaft tips are squeezed together, it will cause a faulty signal or position due to play between the control shaft and the transmission range switch.**



2. Turn the control lever back two clicks to the N position.

3. Set the transmission range switch (C) to the N position. Align the cutouts (D) on the rotary-frame with the N positioning cutouts (E) on the transmission range switch, then put a 2.0 mm (0.079 in) feeler gauge blade (F) in the cutouts to hold the transmission range switch in the N position.

NOTE: **Be sure to use a 2.0 mm (0.079 in) feeler gauge blade or equivalent to hold the transmission range switch in the N position.**

4. Loosely install the transmission range switch gently on the control shaft while holding it in the N position with the 2.0 mm (0.079 in) feeler gauge blade.

5. Tighten the bolts (G) on the transmission range switch while you continue holding the N position.

NOTE: **Do not move the transmission range switch when tightening the bolts.**

6. Remove the feeler gauge.

7. Install the control shaft cover (H).

78. TCM - Install (1.5 L engine)
79. Left Differential Oil Seal - Install

	1. Install the left differential oil seal (A) flush with the transmission housing using the 15 x 135L driver handle and the oil seal driver attachment. **NOTE:** **Before installation, apply a light coat of clean transmission fluid to the surface both of the press-fit and the lip that are on the oil seal.**

80. Breather Cap - Install

    NOTE: Be sure to install the suction hole of the breather cap to the torque converter side.

81. Filler Cap B - Install

    NOTE: Turn the lever toward the front of the vehicle, and install it.

82. Filler Cap A - Install

    NOTE: Turn the lever toward the front of the vehicle, and install it.

83. Transmission Hanger - Install
84. 10.9 x 31.5 mm Pipe - Install (With Auto Idle Stop System)
85. Delivery Pipe - Install (With Auto Idle Stop System)
86. Auxiliary Transmission Fluid Pump - Install (With Auto Idle Stop System)

FINAL DRIVE SHAFT DISASSEMBLY AND REASSEMBLY

Special Tools Required

3.
3.

🕮	Detailed information, notes and precautions
▭	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Transfer Oil Seal - Install

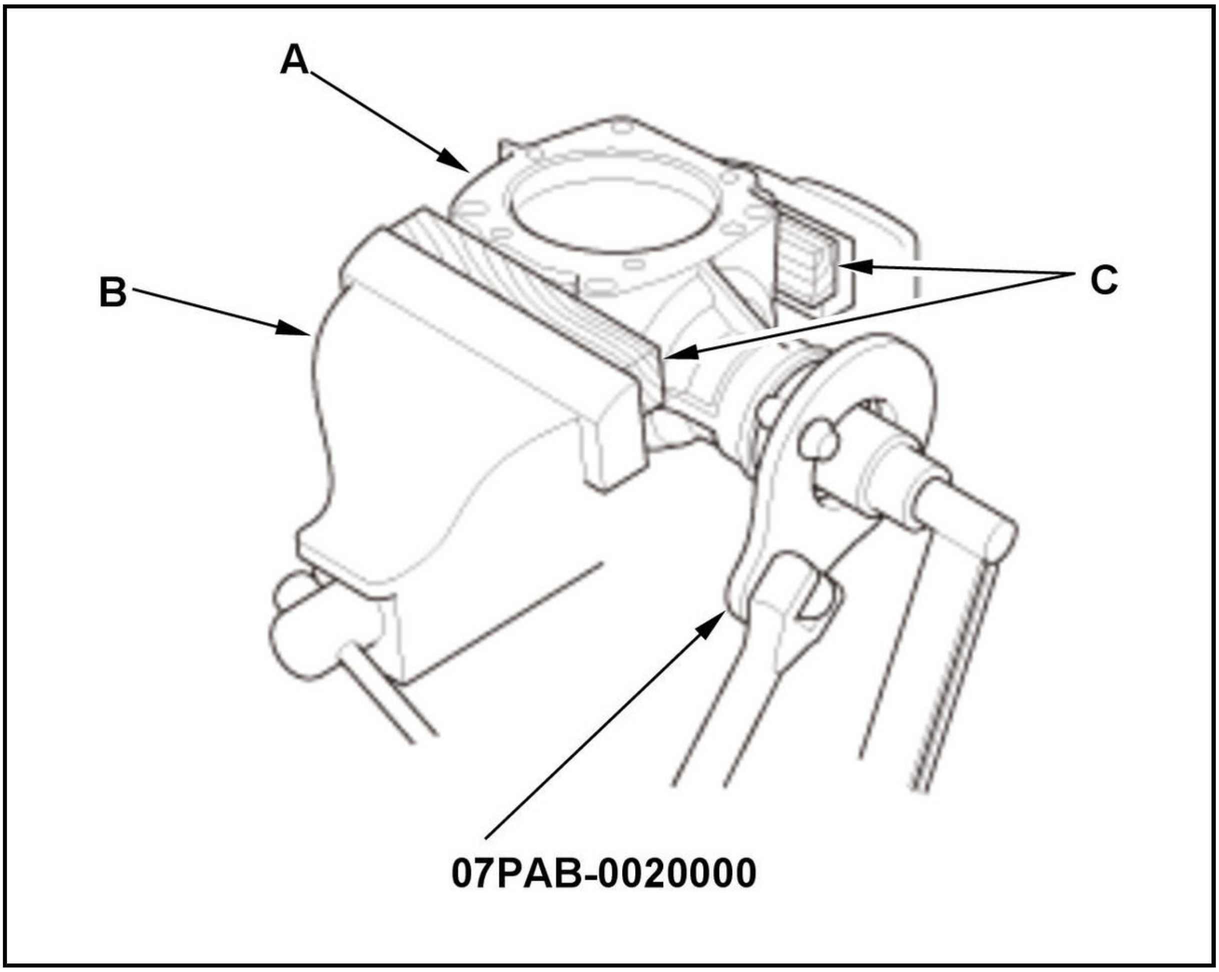
	1. Install a new transfer oil seal (A) flush with the transfer housing surface (B) using the 15 x 135L driver handle and the 58 mm oil seal driver attachment. **NOTE:** **Apply a light coat of clean transmission fluid on oil seal before installation.**

2. Transfer Hypoid Driven Gear - Install

3. Companion Flange - Install

1. Secure the transfer housing (A) in a bench vise (B).

NOTE: **To prevent damaging the transfer housing, always use wood blocks or equivalent materials (C) between the transfer housing and the bench vise.**



2. Install the companion holder.

3. Tighten the locknut while measuring the starting torque of the transfer output shaft (hypoid gear) so the starting torque is within 0.98-1.39 N.m (10.0-14.2 kgf.cm, 8.7-12.3 Ibf.in). Tighten the locknut to the

lower torque specification, then check the starting torque. If the starting torque is low, increase the torque on the locknut until the starting torque is acceptable.

Tightening Torque:	
B	**132-260 N.m (13.5-26.5 kgf.m, 97-192 Ibf.ft)**
Starting Torque:	
B	**0.98-1.39 N.m (10.0-14.2 kgf.cm, 8.7-12.3 Ibf.in)**

NOTE:

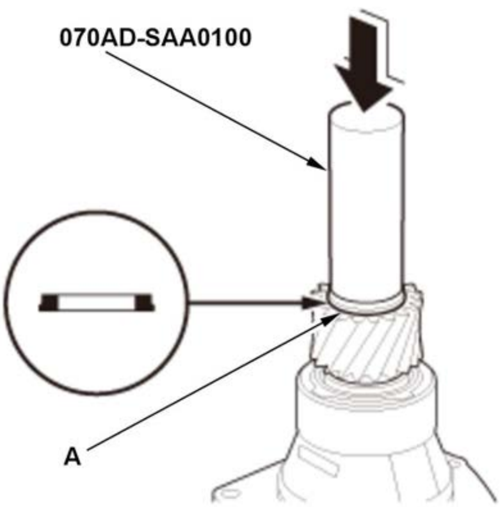
- Rotate the companion flange several times to seat the tapered roller bearings, then measure the starting torque.
- If the starting torque exceeds 1.39 N.m (14.2 kgf.cm, 12.3 Ibf.in), replace the transfer spacer and reassemble the parts. Do not adjust the torque with the locknut loose.
- If the tightening torque exceeds 260 N.m (26.5 kgf.m, 192 Ibf.ft), replace the transfer spacer and reassemble the parts.

4. Remove the companion holder.

	5. Stake the locknut to a depth (A) of at least 0.7 mm (0.028 in) using a 3.0 - 3.5 mm (0.118 - 0.138 in) punch (B). **NOTE:** **Be careful not to crack the locknut when staking.**

4. Transfer Driven Gear - Install

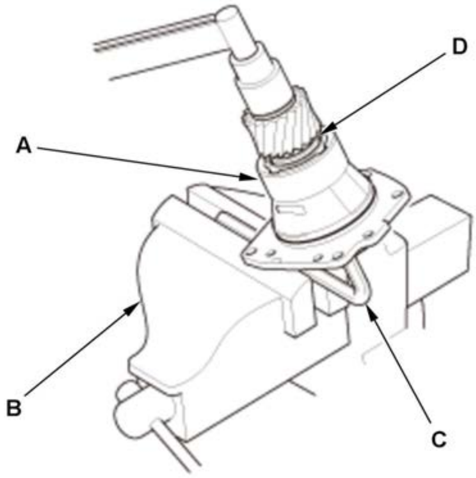
	1. Install the transfer driven gear (A) using the 32.5 mm driver attachment. **NOTE:** **Install the transfer driven gear in the direction shown.**



2. Install a new thrust washer (A) using the 32.5 mm driver attachment.

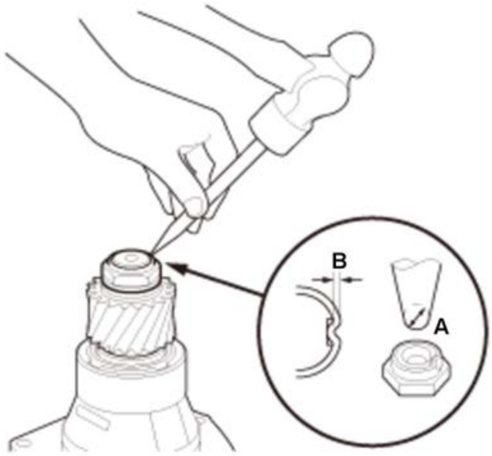
NOTE:

Install the thrust washer in the direction shown.



3. Secure the transfer hypoid drive gear/shaft assembly (A) in a bench vise (B) with hex wrench (C).

4. Install a new locknut (D).



5. Stake the locknut to a depth (A) of at least 0.7 mm (0.028 in) using a 3.0 - 3.5 mm (0.118 - 0.138 in) (B).

NOTE:

Be careful not to crack the locknut when staking.

 	6. Secure the transfer hypoid drive gear/shaft assembly (A) in a bench vise (B). **NOTE:** **To prevent damaging the transfer hypoid drive gear/shaft assembly, always use wood blocks or equivalent materials (C) between the transfer hypoid drive gear/shaft assembly and the bench vise.** 7. Rotate the transfer driven gear (D) in both directions to seat the bearings. 8. Measure the starting torque of the transfer hypoid drive gear/shaft assembly using the torque wrench (E), and a socket (F). 9. If the starting torque is out of the standard, replace the transfer assembly .

Starting Torque:
1.63-5.23 N.m (16.6-53.4 kgf.cm, 14.4-46.3 Ibf.in)

5. Transfer Hypoid Drive Gear - Tooth Contact Pattern Check
6. Transfer Hypoid Drive Gear/Shaft Assembly - Install
7. Transfer Assembly - Total Starting Torque Check
8. Transfer Assembly - Transfer Gear Backlash Check

REMOVAL AND INSTALLATION

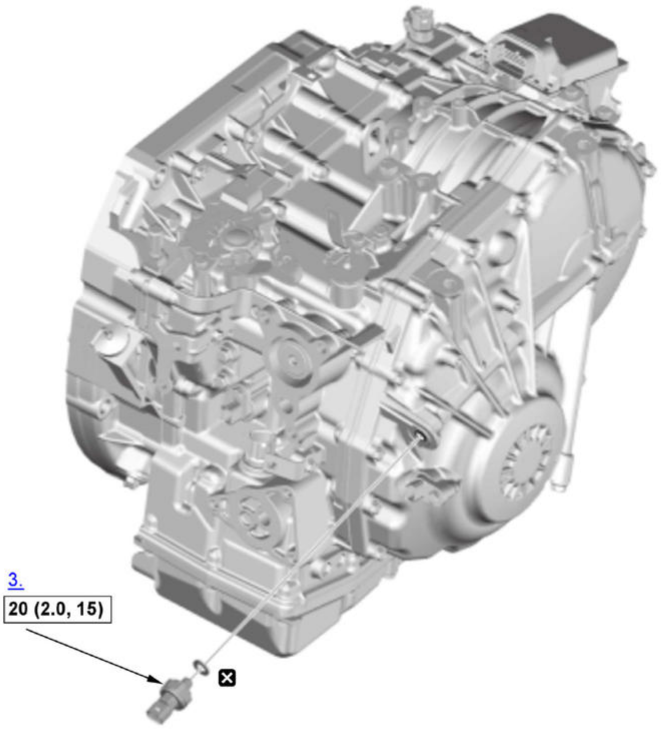
CVT DRIVEN PULLEY PRESSURE SENSOR REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- Be careful not to damage the plastic part.
- Keep all foreign particles out of the transmission.
- Unless otherwise indicated, illustrations used in the procedure are for 1.5 L engine.

1



☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. 12 Volt Battery Terminals - Disconnect (2.4 L engine)

   NOTE: **Make sure to reset the learned value of CVT system when replacing hydraulically-controlled parts in order not to cause any damage the transmission. The learned value of the CVT system is reset when the negative battery terminal is disconnected.**

2. Air Cleaner - Remove
3. CVT Driven Pulley Pressure Sensor - Remove
4. All Removed Parts - Install

   1. Install the parts in the reverse order of removal.

   NOTE:

   - **Be sure to use a new sealing washer.**
   - **Check the connector for corrosion, dirt, or oil,**

and clean or repair if necessary.

5. TCM - Reset (1.5 L engine)

   NOTE:

   - This procedure is not required, only for replacing CVT driven pulley pressure sensor.
   - This procedure is not required, if the CVT driven pulley pressure sensor and the TCM are replaced simultaneously.

Removal

NOTE:

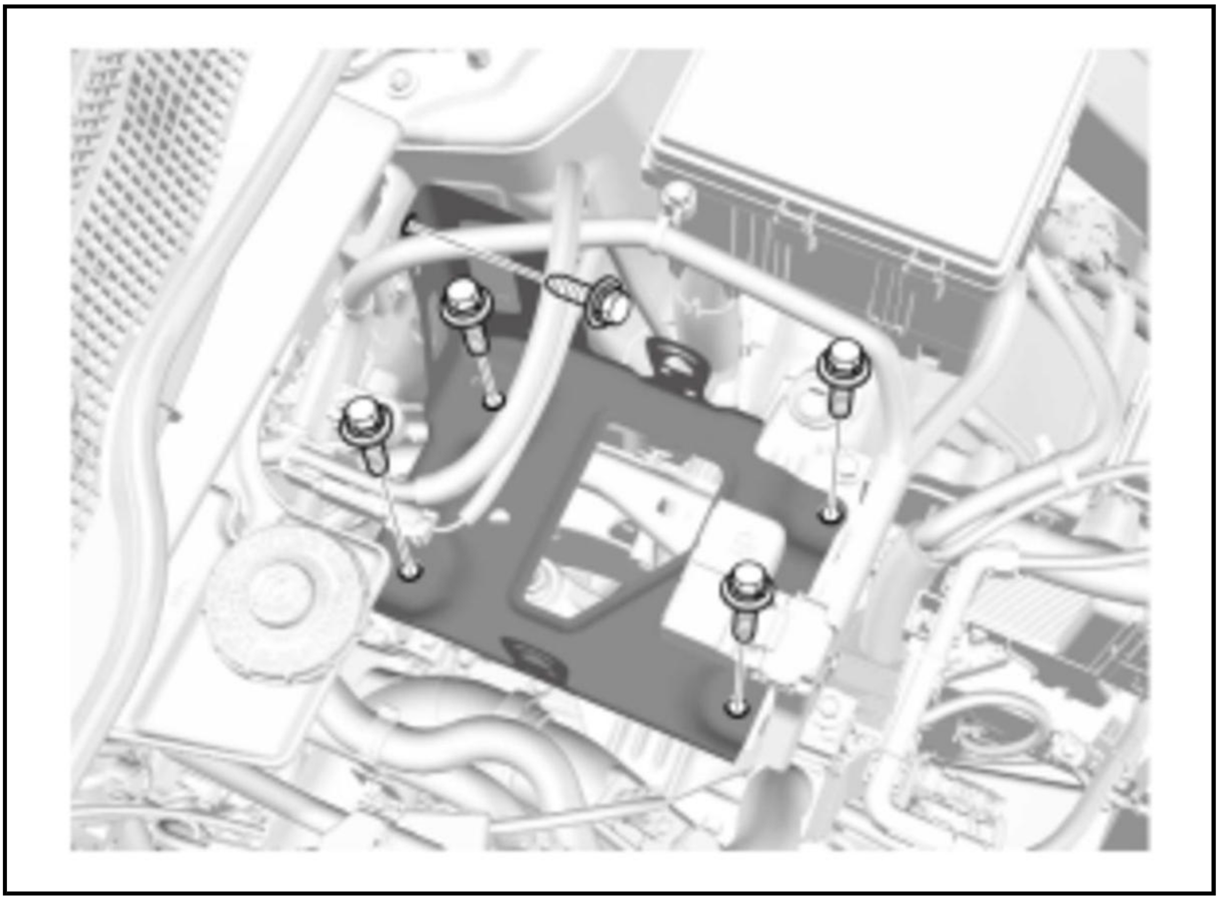
- How to read the torque specifications .
- Use fender covers to avoid damaging painted surfaces.
- Keep all foreign particles out of the transmission.
- Engine support hanger AAR-T1256-J00 must be used with the side engine mount installed.

1. Vehicle - Lift Set
2. Engine Undercover - Remove
3. Transmission Fluid - Drain
4. Vehicle - Lift Down
5. Hood - Wide Open
6. Steering Joint - Disconnect

   NOTE: **Hold the steering wheel with a steering wheel holder tool.**

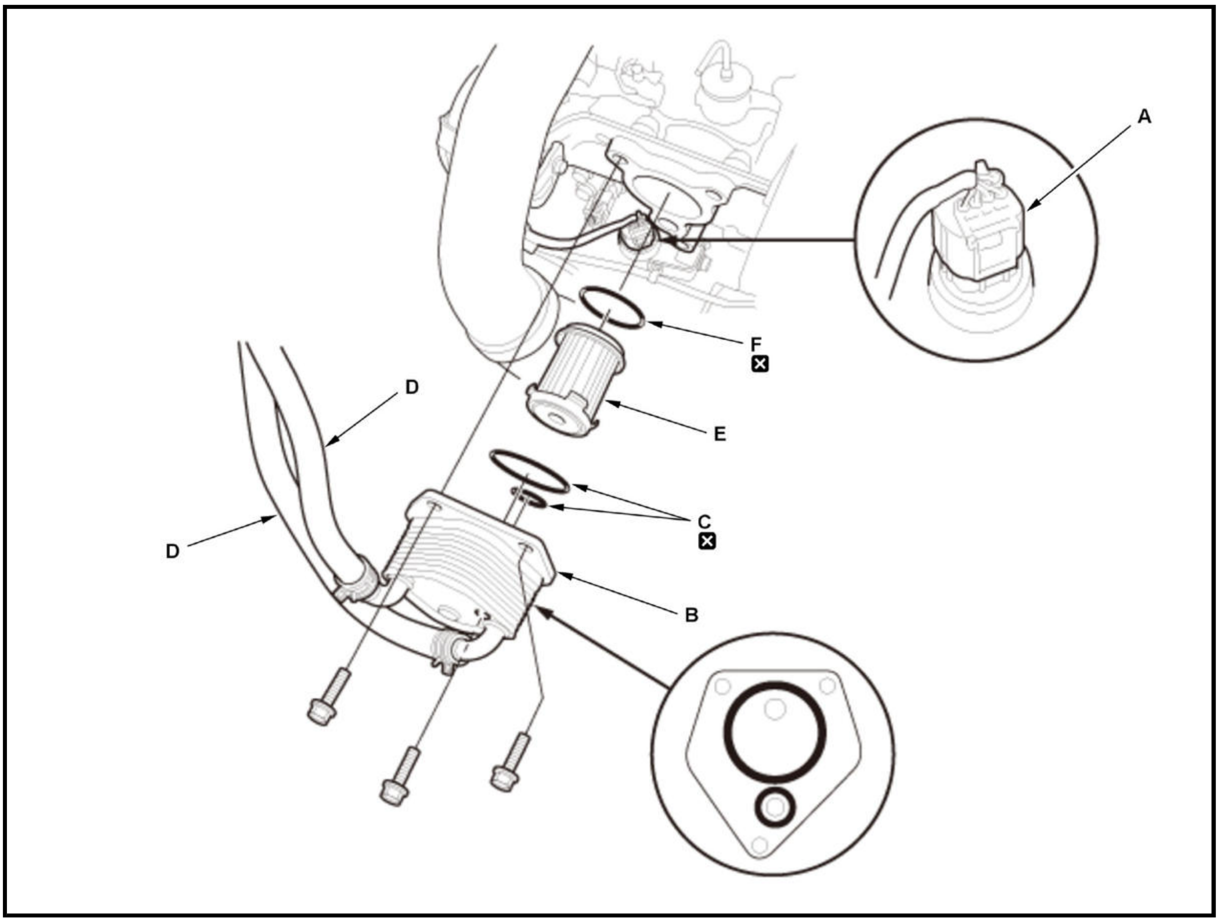
7. Front Wheel - Remove (Both Sides)
8. Front Bulkhead Cover - Remove

9. Air Cleaner - Remove
10. 12 Volt Battery - Remove
11. 12 Volt Battery Base - Remove



12. 12 Volt Battery Base Bracket - Remove
13. Throttle Body Inlet Pipe - Remove
14. Throttle Body Duct - Remove
15. Shift Cable (Transmission Side) - Remove
16. CVTF Warmer - Remove

    1. To prevent damage, cover the connector (A) located under the CVTF warmer (B) using a shop towel.



2. Remove the CVTF warmer with the O-rings (C) without disconnecting the CVTF warmer hoses (D).

NOTE: **The CVTF warmer is an aluminum part. Be careful not to damage the CVTF warmer.**

3. Put a plastic bag over the CVTF warmer, then move it out of the way.

4. Remove the CVTF warmer strainer (E) with the O-ring (F).

5. Clean the CVTF warmer strainer if necessary. Replace the CVTF warmer strainer, if it is clogged or damaged.

   - Do not use compressed air to clean the CVTF warmer strainer.
   - Soak the CVTF warmer strainer thoroughly in transmission fluid.

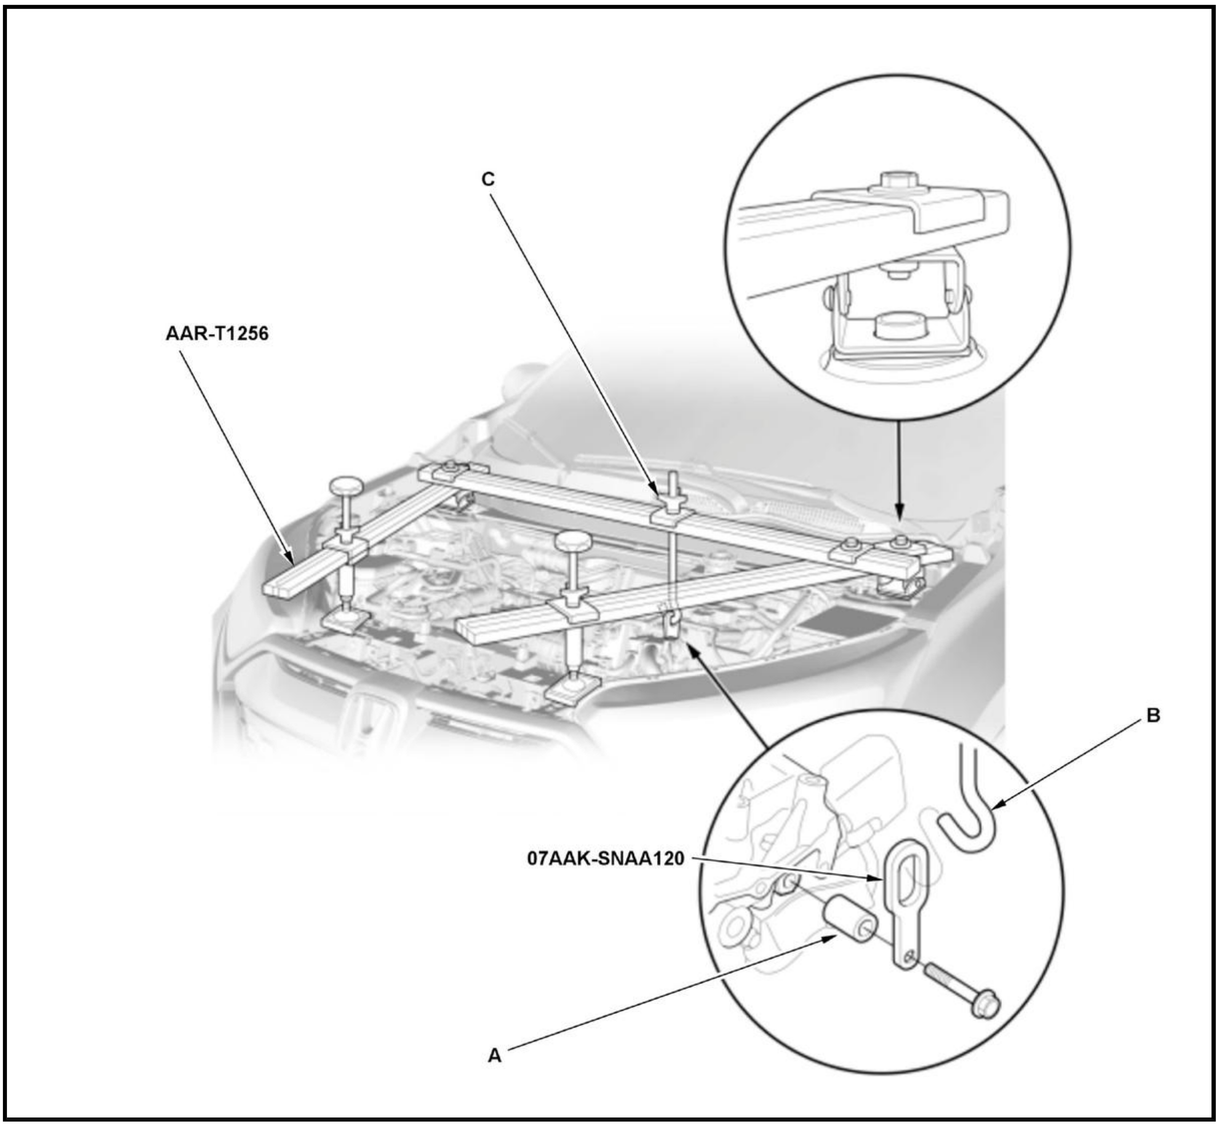
17. Intake Air Resonator - Remove
18. Engine Wire Harness Bracket - Remove

    NOTE: Refer to the Exploded View as needed during this procedure.

19. TCM Harness - Disconnect
20. Windshield Wiper Arm - Remove
21. Center Cowl Cover - Remove
22. Engine Support Hanger - Install

    NOTE: Be careful when working around the windshield.

    1. Remove the front damper caps.



2. Install the sub hanger stay with an approximately 50 mm (2.00 in) commercially available spacer (A).

3. Install the engine support hanger onto the vehicle as shown.

4. Attach the hook (B) to the slotted hole in the sub hanger stay.

5. Tighten the wing nut (C) by hand, and lift and support the engine/transmission.

23. Upper Transmission Assembly Mounting Bolt - Remove

NOTE: Refer to the Exploded View as needed during this procedure.

24. Transmission Mount - Remove
25. Vehicle - Lift Up
26. Exhaust Pipe A - Remove
27. Connector (EPS Subharness) - Disconnect
28. Tie-Rod End Ball Joint - Disconnect (Both Sides)
29. Stabilizer Link Ball Joint - Disconnect (Both Sides)
30. Lower Arm Ball Joint - Disconnect (Both Sides)
31. Propeller Shaft - Remove (AWD)
32. Transfer Assembly - Remove (AWD)
33. Torque Rod Mounting Bolt - Remove
34. Front Lower Arm Mounting Bolt - Remove

	1. **Remove both sides of the front lower arm mounting bolt from the body** .

35. Front Subframe - Support

	1. Set the subframe adapter (VSB02C000016) on a transmission jack (A), line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts. 2. Attach the subframe adapter to the front subframe (B).

36. **Front Subframe - Remove**
37. Transmission - Support

1. Support the transmission with the transmission jack.

38. Drive Plate - Disconnect

	1. Remove the torque converter cover (A). 2. Remove the eight torque converter bolts (B) while rotating the crankshaft pulley.

39. **Driveshaft Inboard Joint - Disconnect (Both Sides)**

    NOTE: Secure the driveshaft to the body with a nylon strap on both sides.

40. **Intermediate Shaft - Remove**
41. Lower Transmission Assembly Mounting Bolt - Remove

    NOTE: Refer to the Exploded View as needed during this procedure.

42. Transmission - Remove

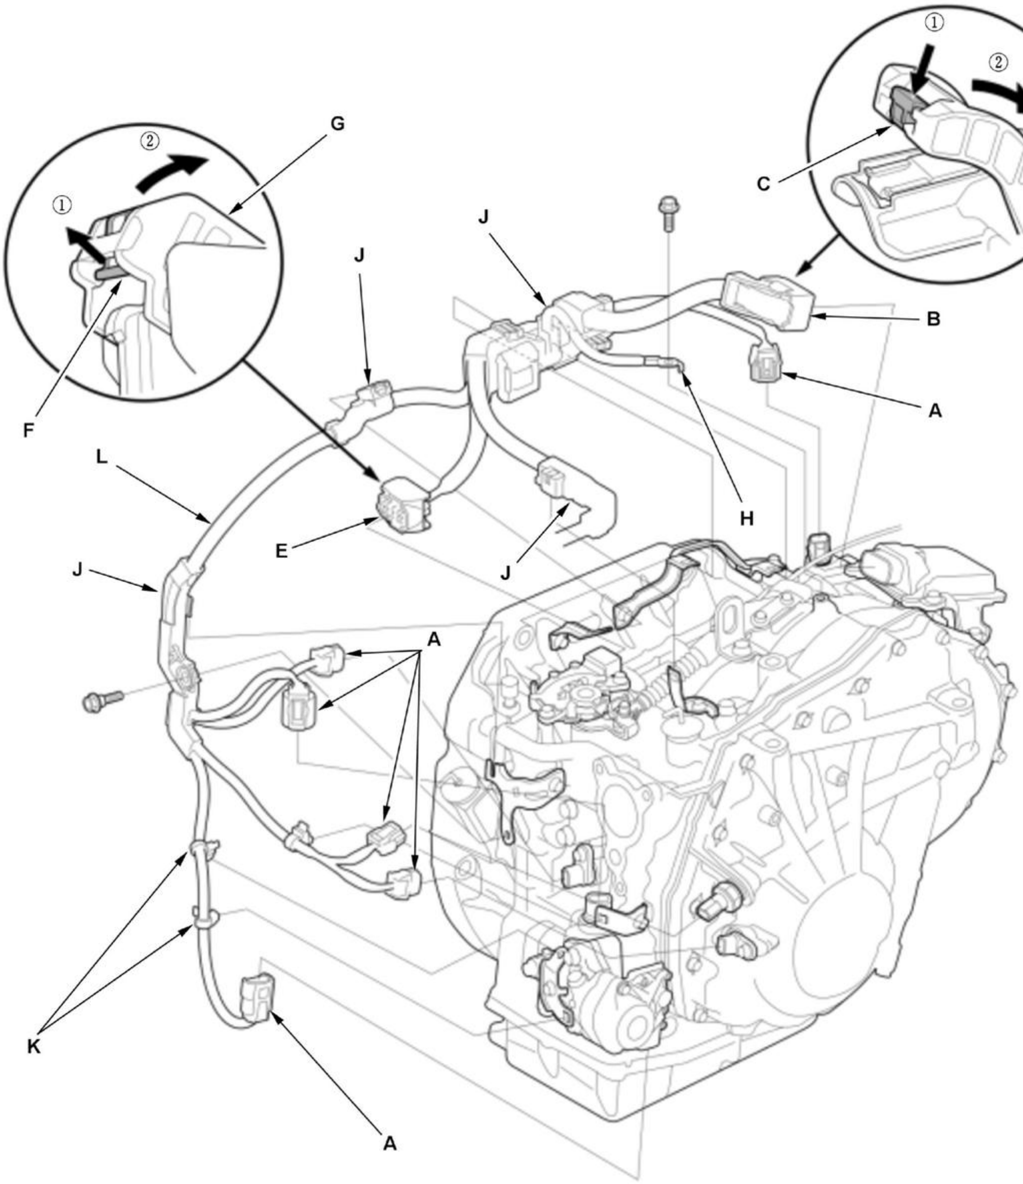
	1. Check once that the transmission (A) is free of hoses and electrical wiring. 2. Secure the transmission on the transmission jack. 3. Lower the transmission by loosening the wing nut of the engine support hanger, and tilt the engine just enough for the transmission to clear its end from the frame. 4. Slide the transmission away from the engine, then remove it from the vehicle. **NOTE:** **Be careful not to drop the torque converter.** 5. Lower the transmission carefully.

43. Torque Converter - Remove

	1. Remove the torque converter (A). 2. Remove the dowel pins (B).

44. TCM Harness - Remove

1. Disconnect the connectors (A).



This illustration shows with auxiliary transmission fluid pump.

Fig. 2: Disconnecting TCM Harness Connector And Lever In Sequence
Courtesy of HONDA, U.S.A., INC.

2. Disconnect the connector (B) by pushing the lock (C) and pulling the lever (D) in the numbered sequence shown in illustration.

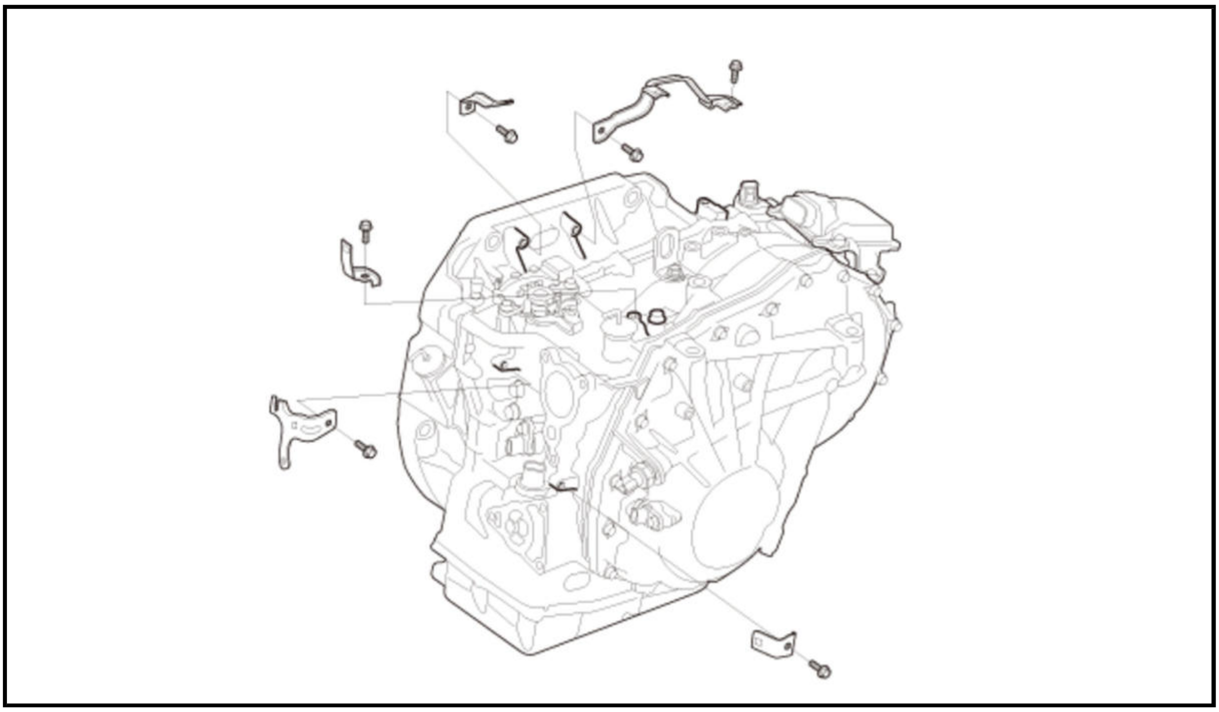
3. Disconnect the connector (E) by pulling the lock (F) and the lever (G) in the numbered sequence shown in illustration.

4. Remove the ground cable (H).

5. Remove the harness covers (J) and the harness clamp (K), then swing the TCM harness (L) out of the way.

45. Harness Bracket - Remove

1. If necessary, remove the harness brackets.



46. Drive Plate - Inspect

    1. Inspect the drive plate, and **replace it if it is damaged**.

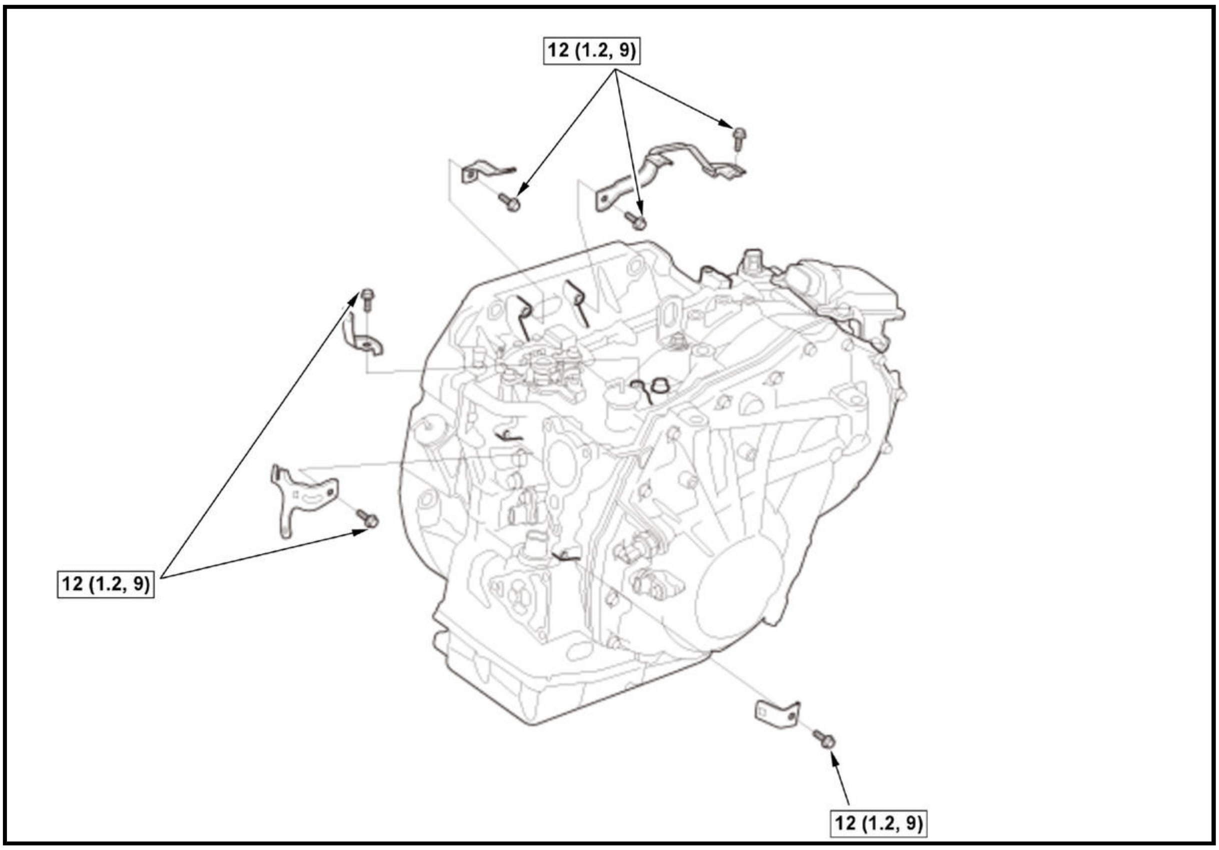
Installation

NOTE:

- **How to read the torque specifications** .
- Use fender covers to avoid damaging painted surfaces.
- Keep all foreign particles out of the transmission.
- Apply a light coat of clean transmission fluid on all O-rings before installation.
- When connecting the connector, check for corrosion, dirt, or oil, and clean or repair if necessary.

1. Harness Bracket - Install

    1. If necessary, install the harness brackets.



12 (1.2, 9)
12 (1.2, 9)

This illustration shows with auxiliary transmission fluid pump.

2. Install the ground cable (C).

3. Connect the connectors (D), and make sure they are fully seated.

3. Torque Converter - Install

	1. Install the dowel pins (A). 2. Install the torque converter (B). **NOTE:** **Make sure the torque converter is fully engaged on the input shaft, the stator shaft, and the transmission fluid pump drive sprocket. Failure to do so will result in severe transmission or engine damage.**

4. Transmission - Install

	1. Secure the transmission (A) on a transmission jack, and raise it to engine level. **NOTE:** **Be careful not to drop the torque converter.** 2. Attach the transmission to the engine.

5. Transmission - Support

1. Support the transmission with the transmission jack.

6. Lower Transmission Assembly Mounting Bolt - Install

NOTE: Refer to the Exploded View as needed during this procedure.

7. **Intermediate Shaft - Install**
8. **Driveshaft Inboard Joint - Connect (Both Sides)**

9. Drive Plate - Connect

	1. Attach the drive plate (A) to the torque converter with eight torque converter bolts (B). 2. Rotate the crankshaft pulley as necessary to tighten the bolt to half of the specified torque, then to the final torque, in a crisscross pattern. 3. Check that the crankshaft rotates freely. 4. Install the torque converter cover (C).

10. Front Subframe - Support

	1. Set the subframe adapter (VSB02C000016) on a transmission jack (A), line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts. 2. Attach the subframe adapter to the front subframe (B).

11. **Front Subframe - Install**
12. **Torque Rod Mounting Bolt - Loosely Install**
13. **Transfer Assembly - Install (AWD)**
14. **Propeller Shaft - Install (AWD)**
15. Front Lower Arm Mounting Bolt - Install

	1. **Install both sides of the front lower arm mounting bolt to the body** .

16. **Lower Arm Ball Joint - Connect (Both Sides)**
17. **Stabilizer Link Ball Joint - Connect (Both Sides)**
18. **Tie-Rod End Ball Joint - Connect (Both Sides)**

20. **Exhaust Pipe A - Install**
21. Vehicle - Lift Down
22. **Transmission Mount - Loosely Install**
23. Upper Transmission Assembly Mounting Bolt - Install

    NOTE: Refer to the Exploded View as needed during this procedure.

24. Engine Support Hanger - Remove

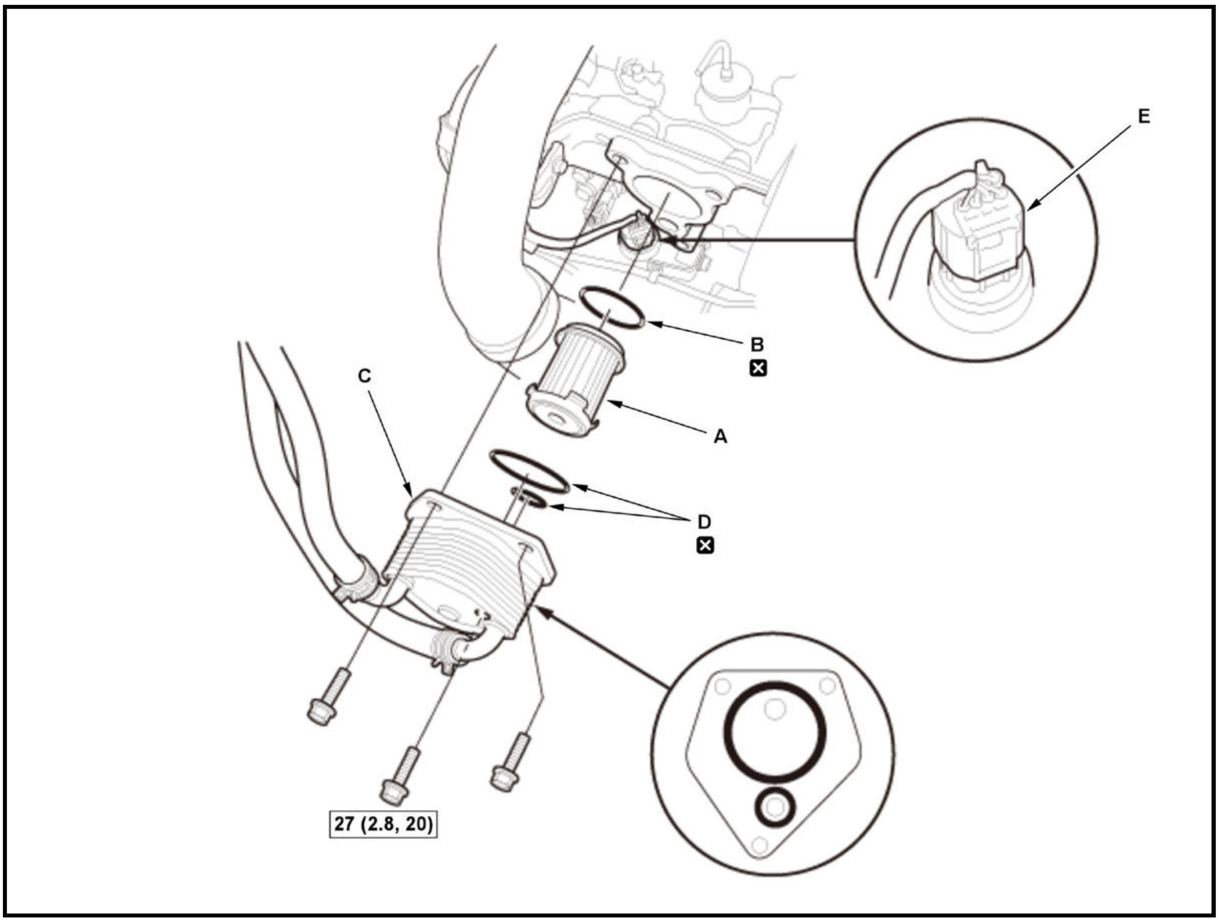
1. Remove the engine support hanger and the sub hanger stay. 2. Install the front damper caps.

25. **Engine/Transmission Mount, Torque Rod Mounting Bolt - Tightening Procedure**
26. **TCM Harness - Connect**
27. **Center Cowl Cover - Install**
28. **Windshield Wiper Arm - Install**
29. Engine Wire Harness - Install

    NOTE: Refer to the Exploded View as needed during this procedure.

30. **Intake Air Resonator - Install**
31. CVTF Warmer - Install

    1. Install the CVTF warmer strainer (A) with a new O-ring (B) in the direction shown.



2. Install the CVTF warmer (C) with new O-rings (D).

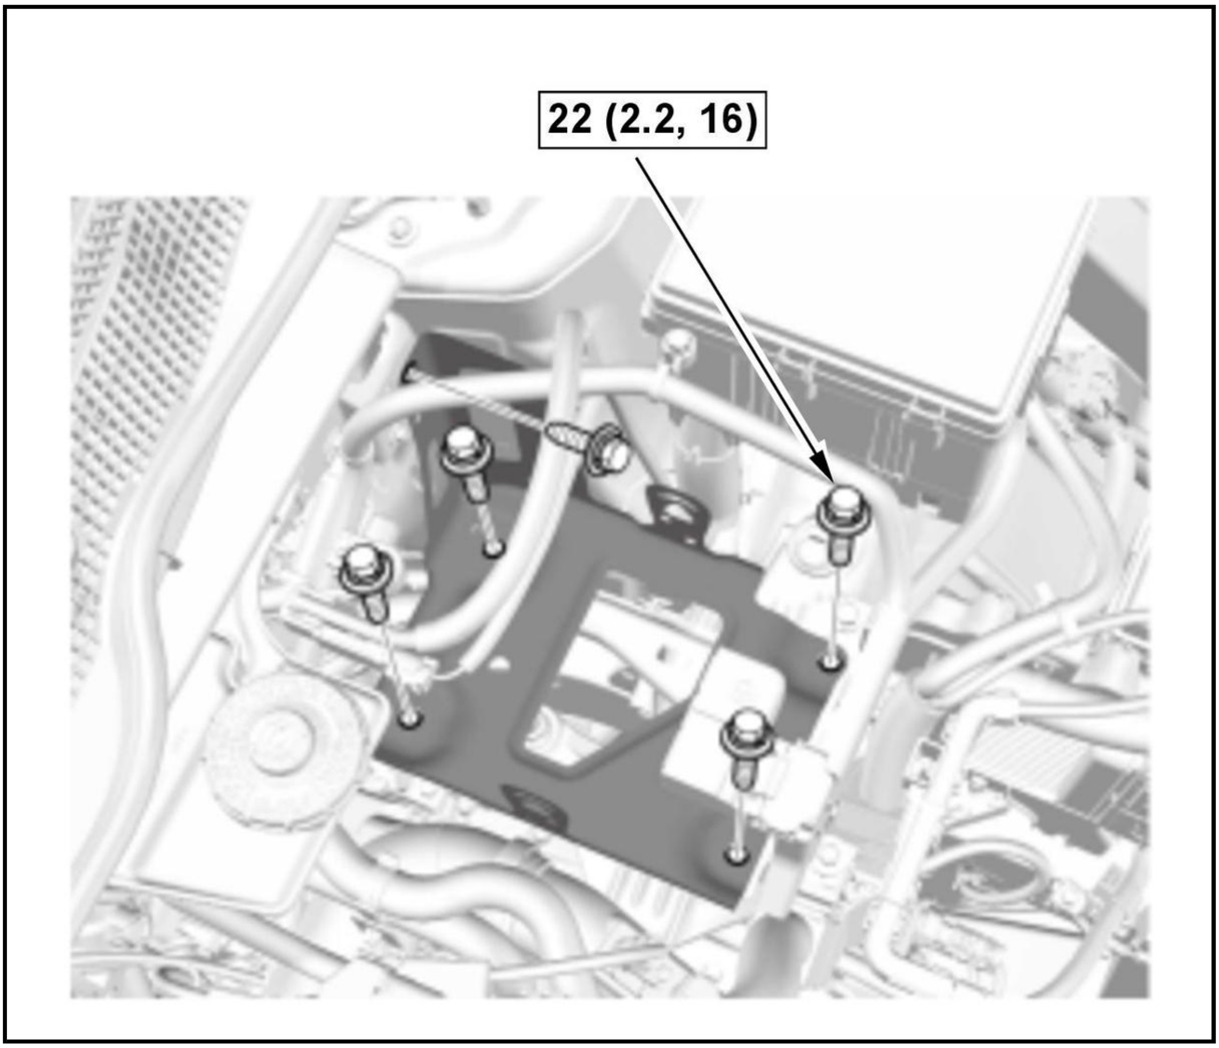
NOTE:

- **The CVTF warmer is an aluminum part. Be careful not to damage the CVTF warmer.**
- **Make sure the O-rings are firmly installed in the grooves.**
- **Check the connector (E) for corrosion, dirt, or oil, and clean or repair if necessary.**

32. Shift Cable (Transmission Side) - Install

NOTE: Be sure to adjust the shift cable after installing the shift cable.

33. Throttle Body Duct - Install
34. Throttle Body Inlet Pipe - Install
35. 12 Volt Battery Base Bracket - Install
36. 12 Volt Battery Base - Install



37. **12 Volt Battery - Install**
38. **Front Bulkhead Cover - Install**
39. **Air Cleaner - Install**
40. **Front Wheel - Install (Both Sides)**
41. **Steering Joint - Connect**
42. **Transmission Fluid - Refill**
43. **Transmission Fluid Level - Check**
44. **Auxiliary Transmission Fluid Pump - Air Bleed** (With auto idle stop system)
45. Transmission - After Install Check

1. Make sure all four wheels to rotate freely.

2. Turn the vehicle to the ON mode.

3. Move the shift lever to each position, and check that the shift position indicator follows the shift lever operation.

4. Start the engine.

NOTE:

Check that the engine starts in the P or N position/mode, and does not

start in any other positions/modes.

5. Check the shift lever operation.

6. Make sure the vehicle is turned to the OFF (LOCK) mode with the shift lever in P position/mode. If it is not, **adjust the shift cable**

again.

46. **Engine Undercover - Install**
47. **TCM - Reset** (Only for Replacing Transmission)

NOTE:

- **This procedure is not required, if the transmission and the TCM are replaced together.**

48. **Front Wheel Alignment - Check**
49. **VSA Sensor Neutral Position - Memorize**
50. **Vehicle - Road Test**

CVT TRANSMISSION REMOVAL AND INSTALLATION (2.4 L ENGINE) (2017 2018 2019)

*: Available from Snap-on Tools International, LLC.

Special Tools Required

Image	Description/Tool Number
	Universal Lifting Eyelet 07AAK-SNAA120
	Engine Support Hanger, A and Reds AAR-T1256*

Image	Description/Tool Number
	Subframe Adapter VSB02C000016*

*: Available from Snap-on Tools International, LLC.

Removal

NOTE:

- How to read the torque specifications .
- Use fender covers to avoid damaging painted surfaces.
- Keep all foreign particles out of the transmission.
- Engine support hanger AAR-T1256-J00 must be used with the side engine mount installed.

1. Vehicle - Lift Set
2. Engine Undercover - Remove
3. Transmission Fluid - Drain
4. Vehicle - Lift Down
5. Hood - Wide Open
6. Steering Joint - Disconnect

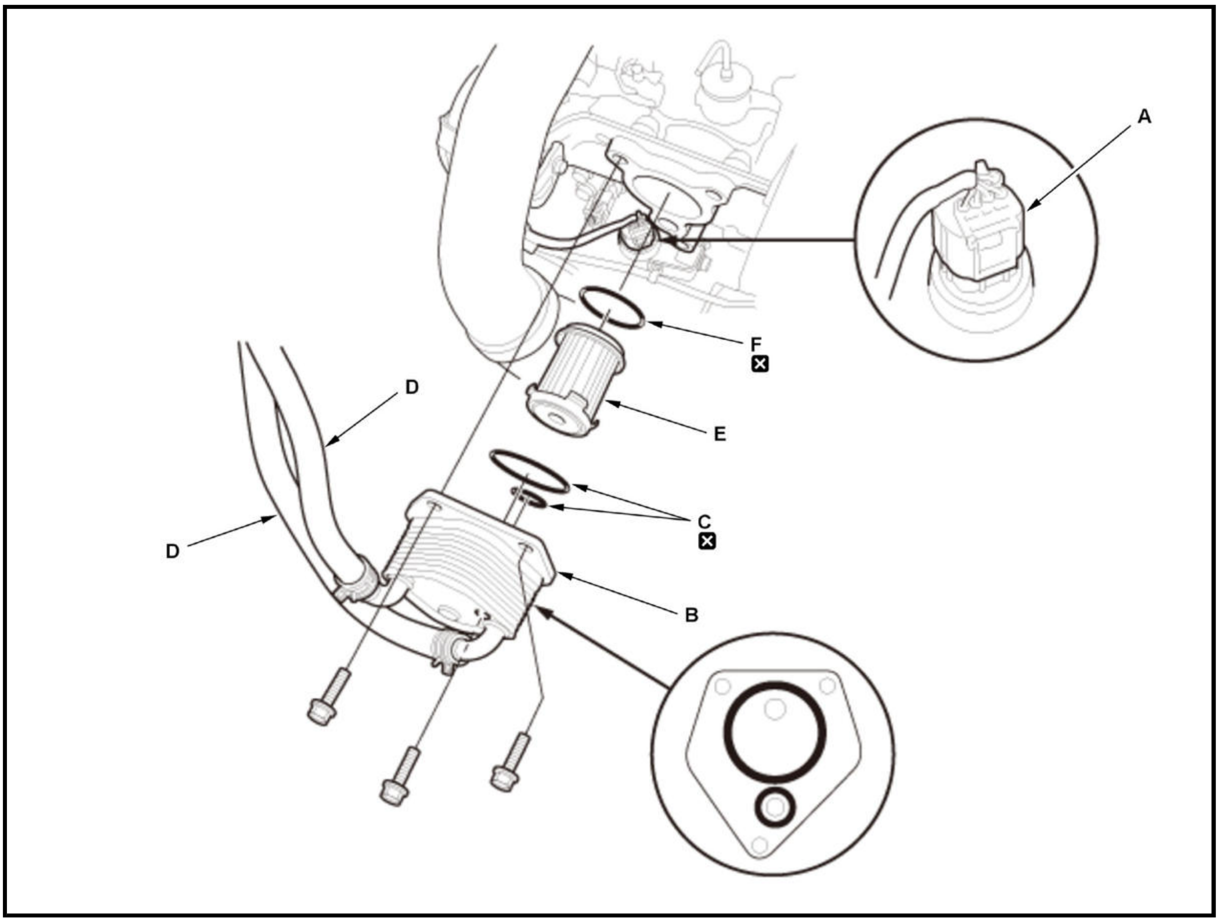
   NOTE: Hold the steering wheel with the steering wheel holder tool.

7. Front Wheel - Remove (Both Sides)
8. Front Bulkhead Cover - Remove
9. Air Cleaner - Remove
10. 12 Volt Battery - Remove

    NOTE: **Make sure to reset the learned value of CVT system when replacing hydraulically-controlled parts in order not to cause any damage the transmission. The learned value of the CVT system is reset when the negative battery terminal is disconnected.**

11. 12 Volt Battery Base - Remove
12. 12 Volt Battery Base Bracket - Remove
13. Intake Air Duct - Remove
14. Shift Cable (Transmission Side) - Remove
15. CVTF Warmer - Remove

    1. To prevent damage, cover the connector (A) located under the CVTF warmer (B) using a shop towel.



2. Remove the CVTF warmer with the O-rings (C) without disconnecting the CVTF warmer hoses (D).

NOTE: **The CVTF warmer is aluminum part. Be careful not to damage the CVTF warmer.**

3. Put plastic bag over the CVTF warmer, then swing it out of the way.

4. Remove the CVTF warmer strainer (E) with the O-ring (F).

5. Clean the CVTF warmer strainer if necessary. Replace the CVTF warmer strainer, if it is clogged or damaged.

- Do not use compressed air to clean the CVTF warmer strainer.
- Soak the CVTF warmer strainer thoroughly in transmission fluid.

16. **Fuel Bracket - Remove**

    NOTE: Refer to the Exploded View as needed during this procedure.

17. EVAP Canister - Remove

    NOTE: Refer to the Exploded View as needed during this procedure.

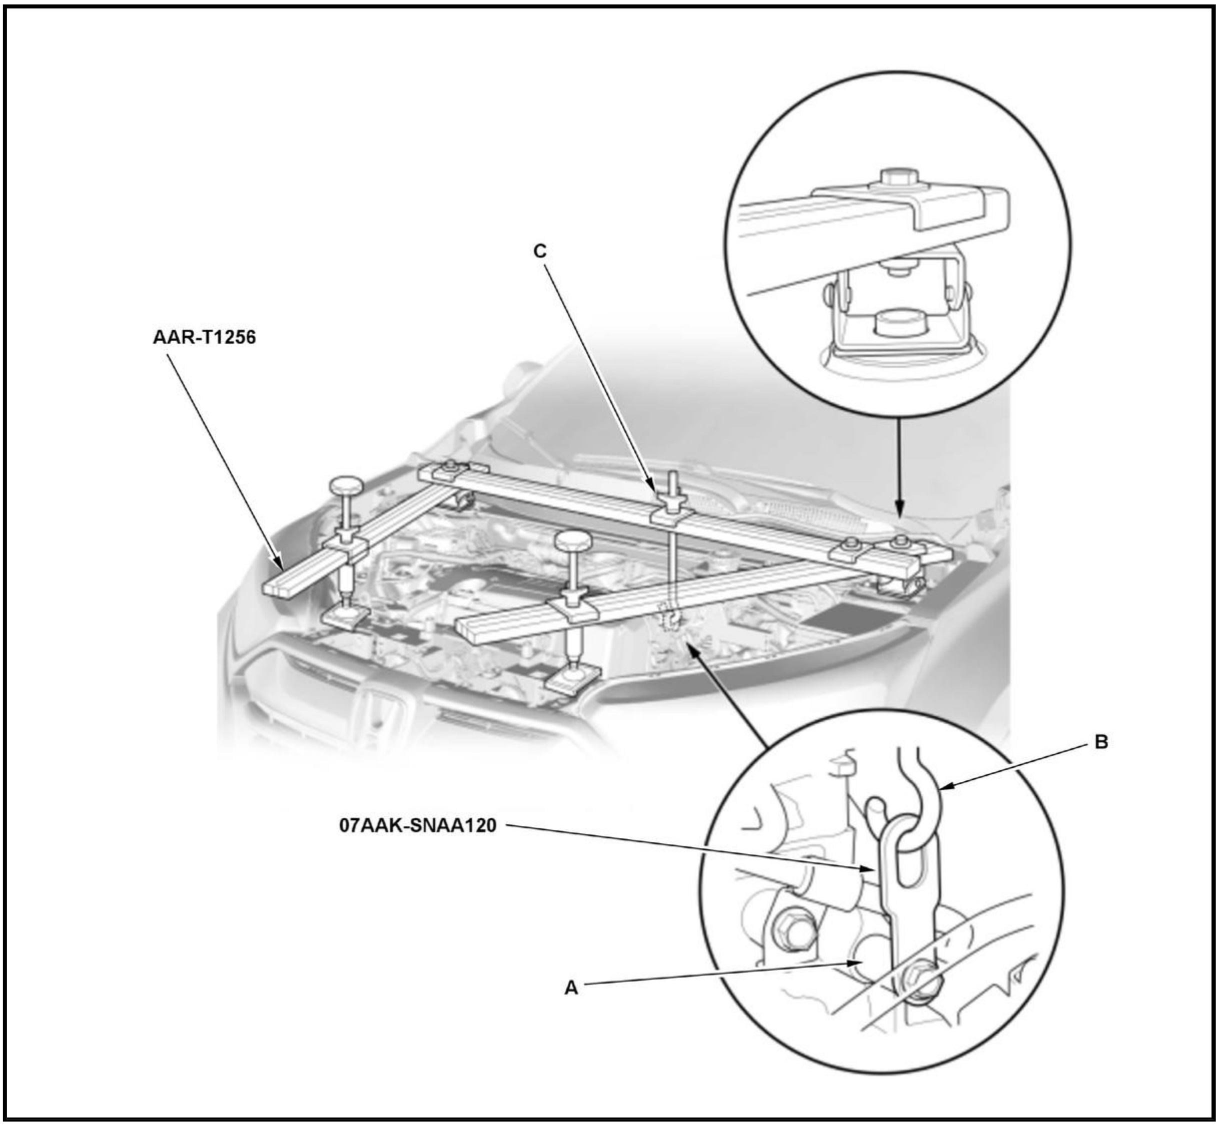
18. Transmission Wire Harness - Disconnect

    NOTE: Refer to the Exploded View as needed during this procedure.

19. **Windshield Wiper Arm - Remove**
20. **Center Cowl Cover - Remove**
21. Engine Support Hanger - Install

    NOTE: Be careful when working around the windshield.

1. Remove the front damper caps.



2. Install the sub hanger stay with a spacer (A).

3. Install the engine support hanger onto the vehicle as shown.

4. Attach the hook (B) to the slotted hole in the sub hanger stay.

5. Tighten the wing nut (C) by hand, and lift and support the engine/transmission.

22. Upper Transmission Assembly Mounting Bolt - Remove

    NOTE: Refer to the Exploded View as needed during this procedure.

23. Transmission Mount - Remove
24. Vehicle - Lift Up
25. Exhaust Pipe A - Remove
26. Connector (EPS Subharness) - Disconnect
27. Tie-Rod End Ball Joint - Disconnect (Both Sides)
28. Stabilizer Link Ball Joint - Disconnect (Both Sides)
29. Lower Arm Ball Joint - Disconnect (Both Sides)
30. Torque Rod Mounting Bolt - Remove
31. Propeller Shaft - Remove (AWD)
32. Transfer Assembly - Remove (AWD)

33. Front Subframe - Remove

	1. Set the subframe adapter (VSB02C000016) on a transmission jack (A), line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts. 2. Attach the subframe adapter to the front subframe (B). 3. **Remove the front subframe** .

34. Front Lower Arm Mounting Bolt - Remove

	1. **Remove both sides of the front lower arm mounting bolt from the body** .

35. **Front Subframe - Remove**

36. Transmission - Support

1. Support the transmission with the transmission jack.

37. Drive Plate - Disconnect

	1. Remove the torque converter cover (A). 2. Remove eight torque converter bolts (B) while rotating the crankshaft pulley.

38. **Driveshaft Inboard Joint - Disconnect (Both Sides)**

    NOTE: Secure the driveshaft to the body with a nylon strap on both sides.

39. **Intermediate Shaft - Remove**
40. Lower Transmission Assembly Mounting Bolt - Remove

    NOTE: Refer to the Exploded View as needed during this procedure.

41. Transmission - Remove

	1. Check once again that the transmission (A) is free of hoses and electrical wiring. 2. Hold the transmission on the transmission jack. 3. Lower the transmission by loosening the wing nut of the engine support hanger, and tilt the engine just enough for the transmission to clear its end from the side frame. 4. Slide the transmission away from the engine, then remove it from the vehicle. **NOTE:** **Be careful not to drop the torque converter.** 5. Lower the transmission carefully.

42. Torque Converter - Remove

<table>
<tr><td> </td><td>1. Remove the torque converter (A).
2. Remove the dowel pins (B).</td></tr>
</table>

43. Harness Bracket - Remove

1. If necessary, remove the harness brackets. **NOTE:** **Refer to the Exploded View as needed during this procedure.**

44. Drive Plate - Inspect

1. Inspect the drive plate, and **replace it if it is damaged**.

Installation

NOTE:

- Use fender covers to avoid damaging painted surfaces.
- Keep all foreign particles out of the transmission.
- Apply a light coat of clean transmission fluid on all O-rings before installation.
- When connecting the connector, check for corrosion, dirt, or oil, and clean or repair if necessary.

1. Harness Bracket - Install

   NOTE: Refer to the Exploded View as needed during this procedure.

2. Torque Converter - Install

	1. Install the dowel pins (A). 2. Install the torque converter (B). **NOTE:** **Make sure the torque converter is fully engaged on the input shaft, the stator shaft, and the transmission fluid pump drive sprocket. Failure to do so will result in severe transmission or engine damage.**

3. Transmission - Install

	1. Hold the transmission (A) on a transmission jack, and raise it to engine level. **NOTE:** **Be careful not to drop the torque converter.** 2. Attach the transmission to the engine.

4. Transmission - Support

1. Support the transmission with the transmission jack.

5. Lower Transmission Assembly Mounting Bolt - Install

NOTE: Refer to the Exploded View as needed during this procedure.

6. **Intermediate Shaft - Install**
7. **Driveshaft Inboard Joint - Connect (Both Sides)**

8. Drive Plate - Connect

	1. Attach the drive plate (A) to the torque converter with eight torque converter bolts (B). 2. Rotate the crankshaft pulley as necessary to tighten the bolt to half of the specified torque, then to the final torque, in a crisscross pattern. 3. Check that the crankshaft rotates freely. 4. Install the torque converter cover (C).

9. Front Subframe - Support

	1. Set the subframe adapter (VSB02C000016) on a transmission jack (A), line up the slots in the arms with the bolt holes on the corner of the jack base, and tighten the bolts. 2. Attach the subframe adapter to the front subframe (B).

10. **Front Subframe - Install**

11. Front Lower Arm Mounting Bolt - Install

	1. **Install both sides of the front lower arm mounting bolt to the body** .

12. Transfer Assembly - Install (AWD)
13. Propeller Shaft - Install (AWD)
14. Torque Rod Mounting Bolt - Loosely Install
15. Lower Arm Ball Joint - Connect (Both Sides)
16. Stabilizer Link Ball Joint - Connect (Both Sides)
17. Tie-Rod End Ball Joint - Connect (Both Sides)
18. Connector (EPS Subharness) - Connect
19. Exhaust Pipe A - Install
20. Vehicle - Lift Down
21. Transmission Mount - Loosely Install
22. Upper Transmission Assembly Mounting Bolt - Install

    NOTE: Refer to the Exploded View as needed during this procedure.

23. Engine Support Hanger - Remove

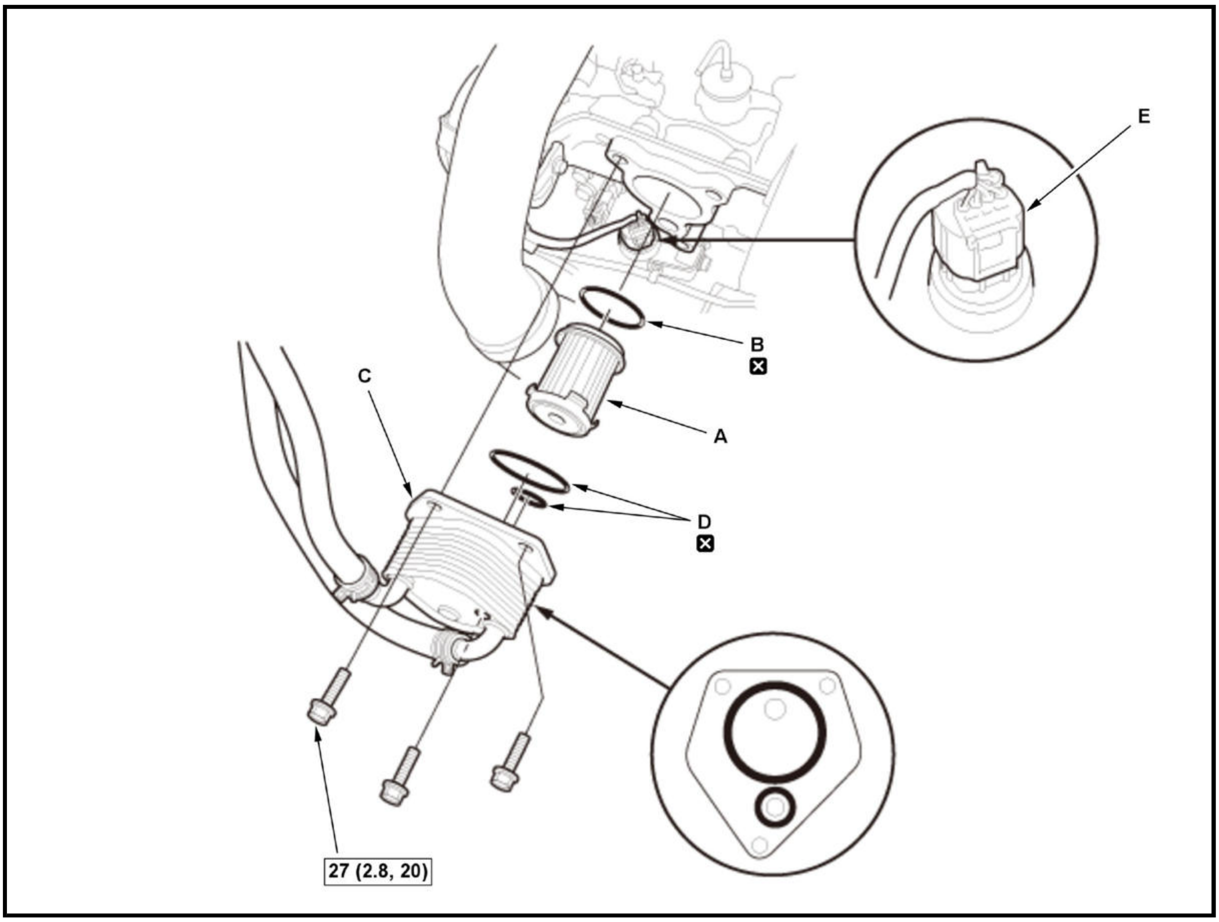
1. Remove the engine support hanger and the sub hanger stay.
2. Install the front damper caps.

24. Engine/Transmission Mount - Tightening Procedure
25. Engine Wire Harness - Install

    NOTE: Refer to the Exploded View as needed during this procedure.

26. Center Cowl Cover - Install
27. Windshield Wiper Arm - Install
28. CVTF Warmer - Install

    1. Install the CVTF warmer strainer (A) with a new O-ring (B) in the direction shown.



2. Install the CVTF warmer (C) with new O-rings (D).

NOTE:

- **The CVTF warmer is aluminum part. Be careful not to damage the CVTF warmer.**
- **Make sure the O-rings are firmly installed in the grooves.**
- **Check the connector (E) for corrosion, dirt, or oil, and clean or repair if necessary.**

29. Shift Cable (Transmission Side) - Install

NOTE: Be sure to adjust the shift cable after installing the shift cable.

30. Intake Air Duct - Install
31. 12 Volt Battery Base Bracket - Install
32. 12 Volt Battery Base - Install
33. 12 Volt Battery - Install
34. Air Cleaner - Install
35. Front Bulkhead Cover - Install
36. Front Wheel - Install (Both Sides)
37. Steering Joint - Connect
38. Transmission Fluid - Refill
39. Transmission Fluid Level - Check
40. Transmission - After Install Check

1. Make sure all four wheels to rotate freely.

2. Turn the vehicle to the ON mode.

3. Move the shift lever to each position, and check that the shift position indicator follows the shift lever operation.

4. Start the engine.

NOTE:

Check that the engine starts in P or N position/mode, and does not start in any other positions/modes.

5. Check the shift lever operation.

6. Make sure the vehicle is turned to the OFF (LOCK) mode with the shift lever in P position/mode. If it is not, **adjust the shift cable**

again.

41. **Engine Undercover - Install**
42. **Front Wheel Alignment - Check**
43. **VSA Sensor Neutral Position - Memorize**
44. **Vehicle - Road Test**

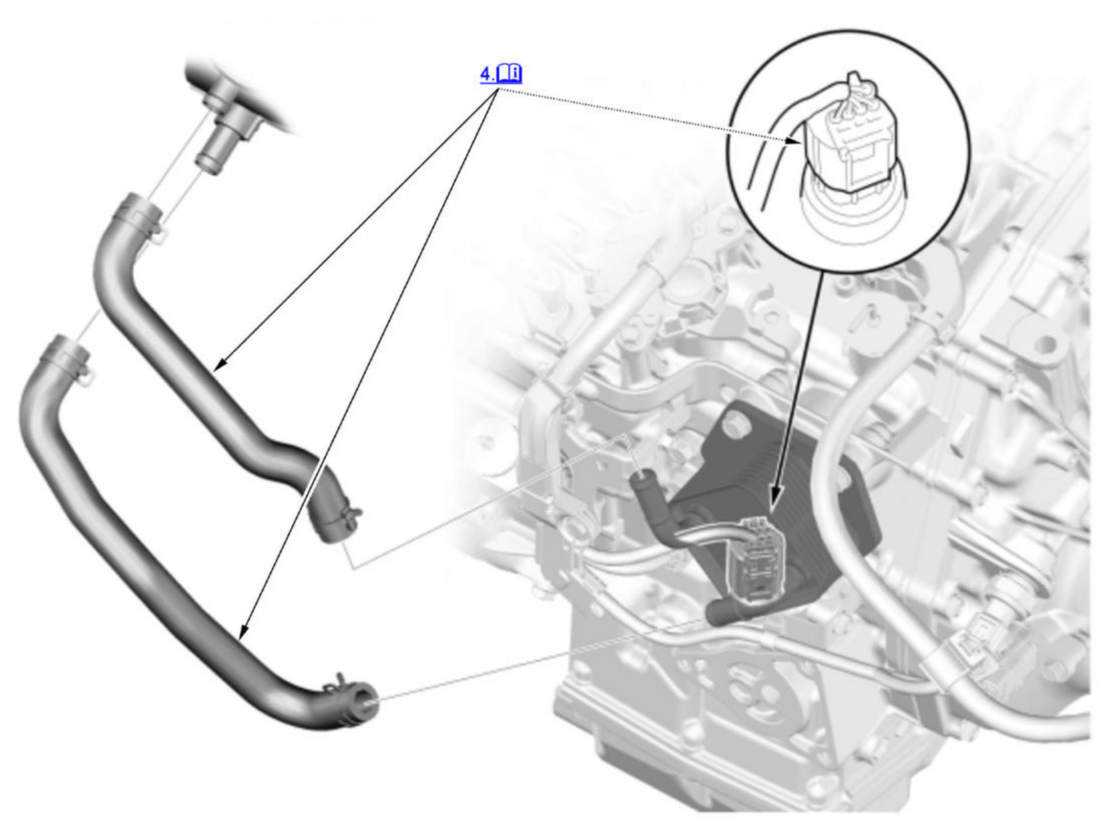
CVTF WARMER HOSE REMOVAL AND INSTALLATION

Removal

NOTE:

- ℹ Where icon is shown, further information shown below.
- Unless otherwise indicated, illustrations used in the procedure are for 1.5 L engine.

1



ℹ	Detailed information, notes and precautions

1. **Engine Coolant - Drain**
2. **Air Cleaner - Remove**
3. **Throttle Body Inlet Pipe - Remove** (1.5 L engine)
4. CVTF Warmer Hose - Disconnect

   NOTE:

   - When disconnecting/connecting the hoses, do not bend the warmer pipes excessively, or they will be damaged or deformed.
   - To prevent damage, cover the connector located under the CVTF warmer using a shop towel.
5. CVTF Warmer Hose - Connect

	1. Connect the CVTF warmer inlet hose and outlet hose to each bulge of the CVTF warmer lines by aligning the paint marks (A) on the lines with the paint marks (B) on the hose ends. **NOTE:** **When disconnecting/connecting the hoses, do not bend the warmer pipes excessively, or they will be damaged or deformed.** 2. Secure the CVTF warmer hoses with the clamps (C). - When securing the clamps, make sure they do not interfere with the surrounding parts.

	• Check the connector for corrosion, dirt, or oil, and clean or repair if necessary.

6. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

7. **Engine Coolant - Refill**

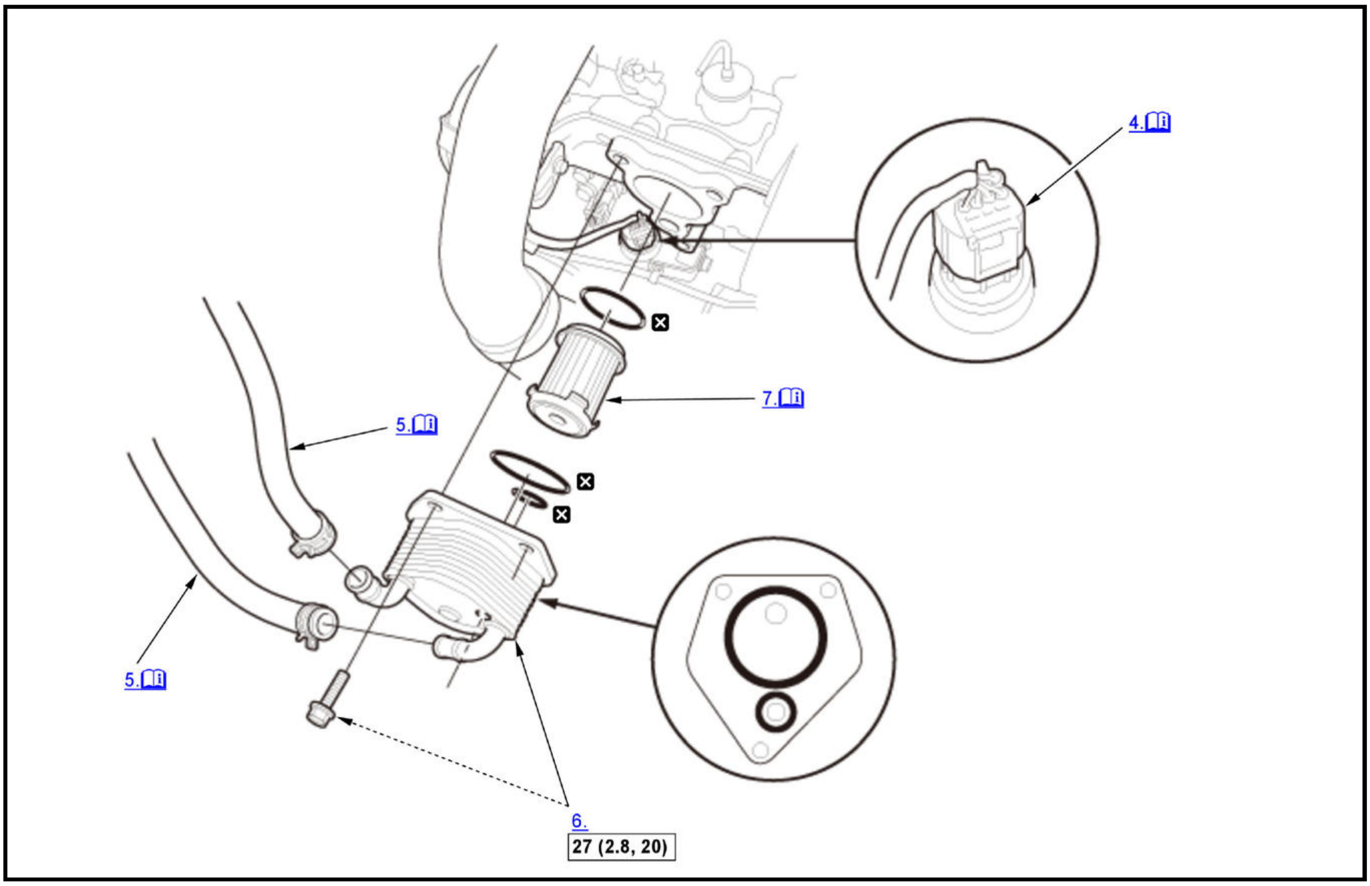
CVTF WARMER REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- 📖 Where icon is shown, further information shown below.
- Keep all foreign particles out of the transmission.

1



📖	Detailed information, notes and precautions
☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. **Engine Coolant - Drain**
2. **Air Cleaner - Remove**
3. **Throttle Body Inlet Pipe - Remove** (1.5 L engine)
4. Connector (Solenoid Wire Harness A) - Cover

NOTE: To prevent damage, cover the connector located under the CVTF warmer using a shop towel.

5. CVTF Warmer Hose - Disconnect

NOTE: When disconnecting/connecting the hoses, do not bend the warmer pipes excessively, or they will be damaged or deformed.

6. CVTF Warmer - Remove
7. CVTF Warmer Strainer - Remove

1. Clean the CVTF warmer strainer if necessary. Replace the CVTF warmer strainer, if it is clogged or damaged.

NOTE:

- **Do not use compressed air to clean the CVTF warmer strainer.**
- **Soak the CVTF warmer strainer thoroughly in transmission fluid.**

8. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

- **Apply a light coat of clean transmission fluid on all O-rings before installation.**
- **Make sure the O-rings are firmly installed in the grooves.**
- **Make sure the CVTF warmer strainer is installed in the correct direction.**
- **Check the connector**

for corrosion, dirt, or oil, and clean or repair if necessary. - If necessary, add transmission fluid to the proper level .

9. Engine Coolant - Refill

DRIVE PLATE REMOVAL AND INSTALLATION

Removal and Installation

NOTE: How to read the torque specifications .

1. Transmission - Remove
2. Drive Plate - Remove

	1. Remove the drive plate (A) with the washer (B).

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal. **NOTE:** **Tighten eight bolts in a crisscross pattern in at**

least two steps.

SHIFT LEVER REMOVAL AND INSTALLATION

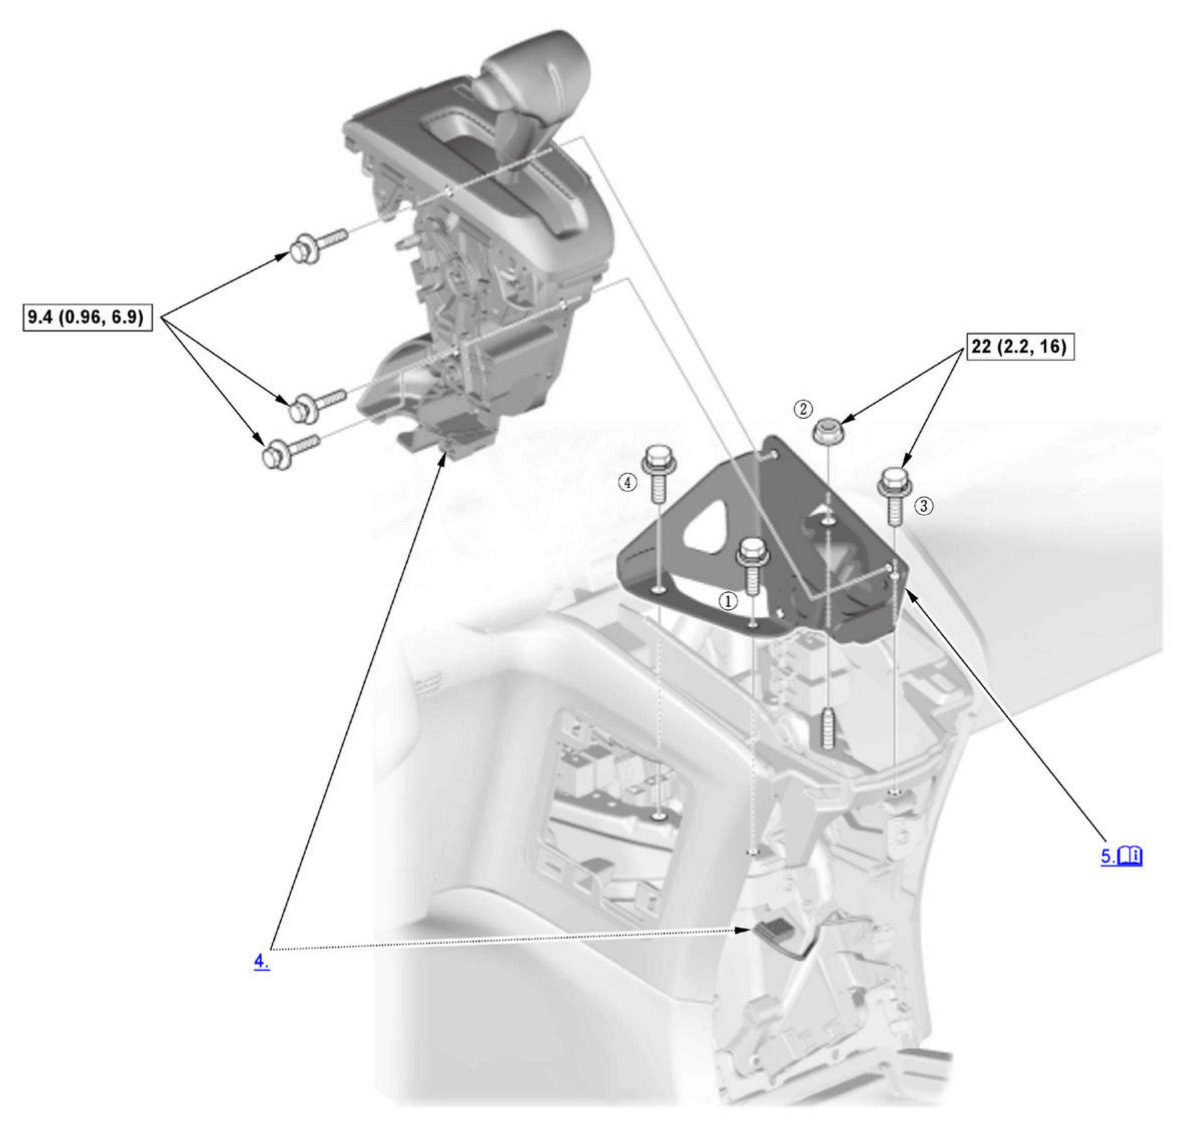
Removal and Installation

SRS components are located in this area. Review **the SRS component locations** and **the precautions and procedures** before doing repair or service.

NOTE:

- ℹ Where icon is shown, further information shown below.

1



ℹ	Detailed information, notes and precautions
▭	Torque: N.m (kgf.m, lbf.ft)

1. **Shift Lever Panel - Remove**

2. Center Console - Remove
3. Shift Cable (Shift Lever Side) - Remove
4. Shift Lever - Remove
5. Shift Lever Bracket Base - Remove

1. If necessary, removed the shift lever bracket base.

6. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

- **Tighten the shift lever bracket base bolts and nut in the sequence shown in exploded view above.**
- **Be sure to adjust the shift cable before installing the shift cable.**

7. Shift Lever - After Install Check

1. Turn the vehicle to the ON mode.

2. Move the shift lever to each position, and check that the shift position indicator follows the shift lever operation.

3. Shift the transmission to P position/mode, and check that the shift lock works properly.

4. Push the shift lock release, and check that the shift lever releases. Also check that the shift lever locks when it is shifted back to P.

5. Start the engine.

NOTE:

Check that the engine starts in P or N position/mode, and does not start in any other positions/modes.

6. Make sure the vehicle is turned to the OFF (LOCK) mode with the shift lever in P position/mode. If it is not, **adjust the shift cable** again.

SHIFT SOLENOID VALVE O/P REMOVAL AND INSTALLATION

Removal and Installation

NOTE:

- **How to read the torque specifications** .
- Keep all foreign particles out of the transmission.

1. **Transmission Fluid - Drain**
2. **12 Volt Battery Terminals - Disconnect**

   NOTE: Make sure to reset the learned value of CVT system when replacing hydraulically-controlled parts in order not to cause any damage the transmission. The learned value of the CVT system is reset when the negative battery terminal is disconnected.

3. **Transmission Fluid Pan - Remove**

   NOTE: The actual transmission fluid (HCF-2) capacity will vary from the specified capacity based on the length of time the transmission fluid pan is off the transmission. Avoid leaving the transmission fluid pan off for extend periods of time.

4. Shift Solenoid Valve O/P - Remove

	1. Remove the shift solenoid valve O/P (A).

5. All Removed Parts - Install

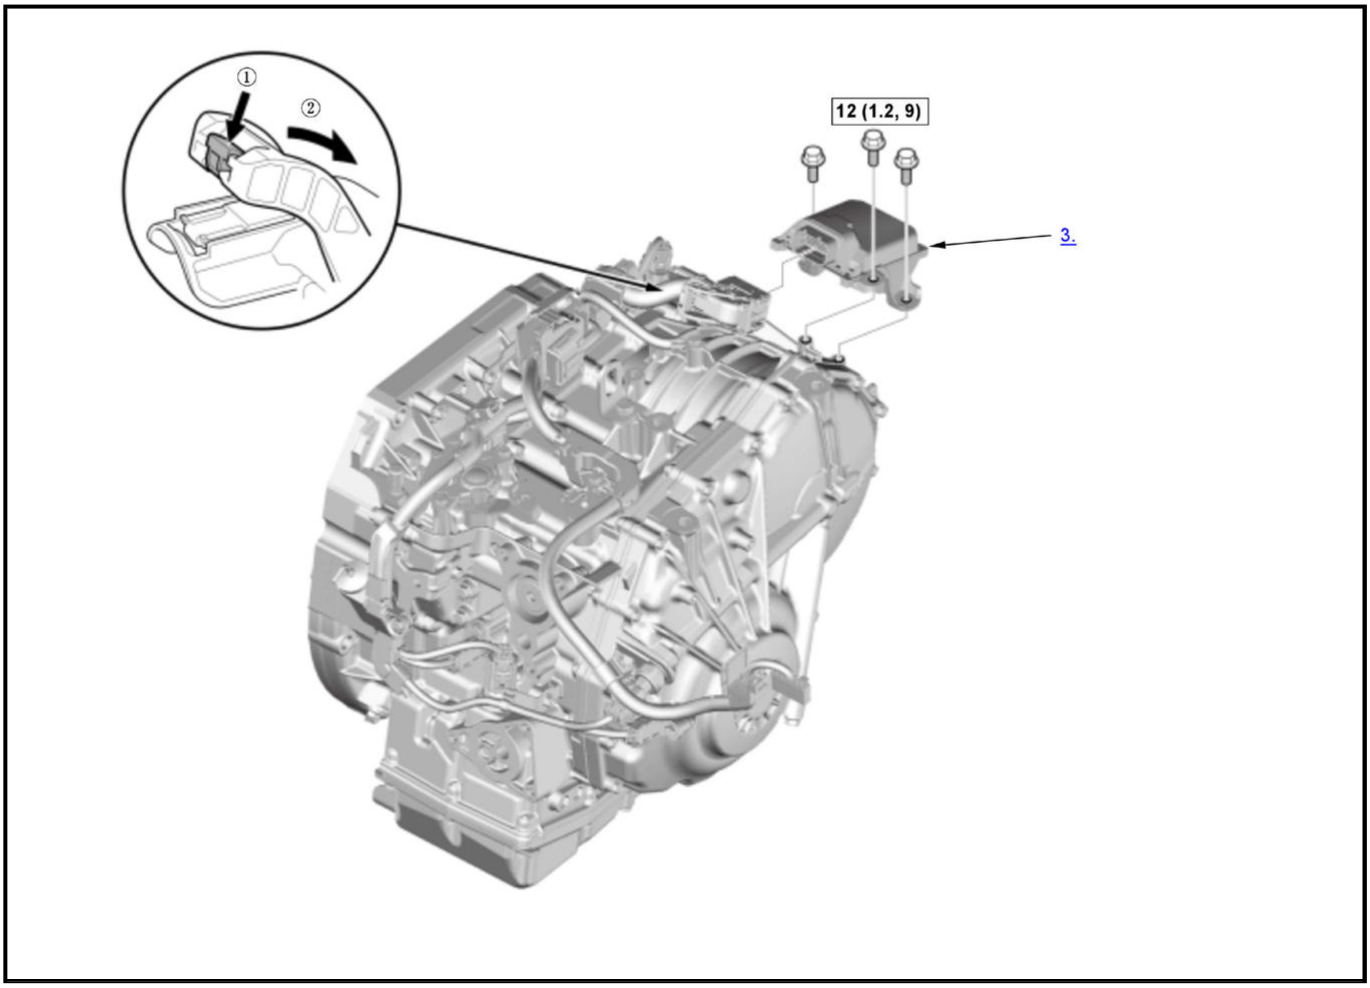
1. Install the parts in the reverse order of removal.

6. Transmission Fluid - Refill
7. 12 Volt Battery Terminals - Reconnect
8. Transmission Fluid Level - Check

TCM REMOVAL AND INSTALLATION (1.5 L ENGINE)

Removal and Installation

1



▭	Torque: N.m (kgf.m, lbf.ft)

1. 12 Volt Battery - Remove
2. 12 Volt Battery Base - Remove
3. TCM - Remove
4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

NOTE:

- **Check the connector for corrosion, dirt, or oil, and clean** or repair if necessary.

- Make sure the connector is fully seated.

Procedure After Replacing the TCM

5. Auxiliary Transmission Fluid Pump - Air Bleed (With auto idle stop system)
6. Transmission Fluid Level - Check (With auto idle stop system)
7. TCM - Update

TRANSMISSION FLUID PUMP REMOVAL AND INSTALLATION

☒	Replace

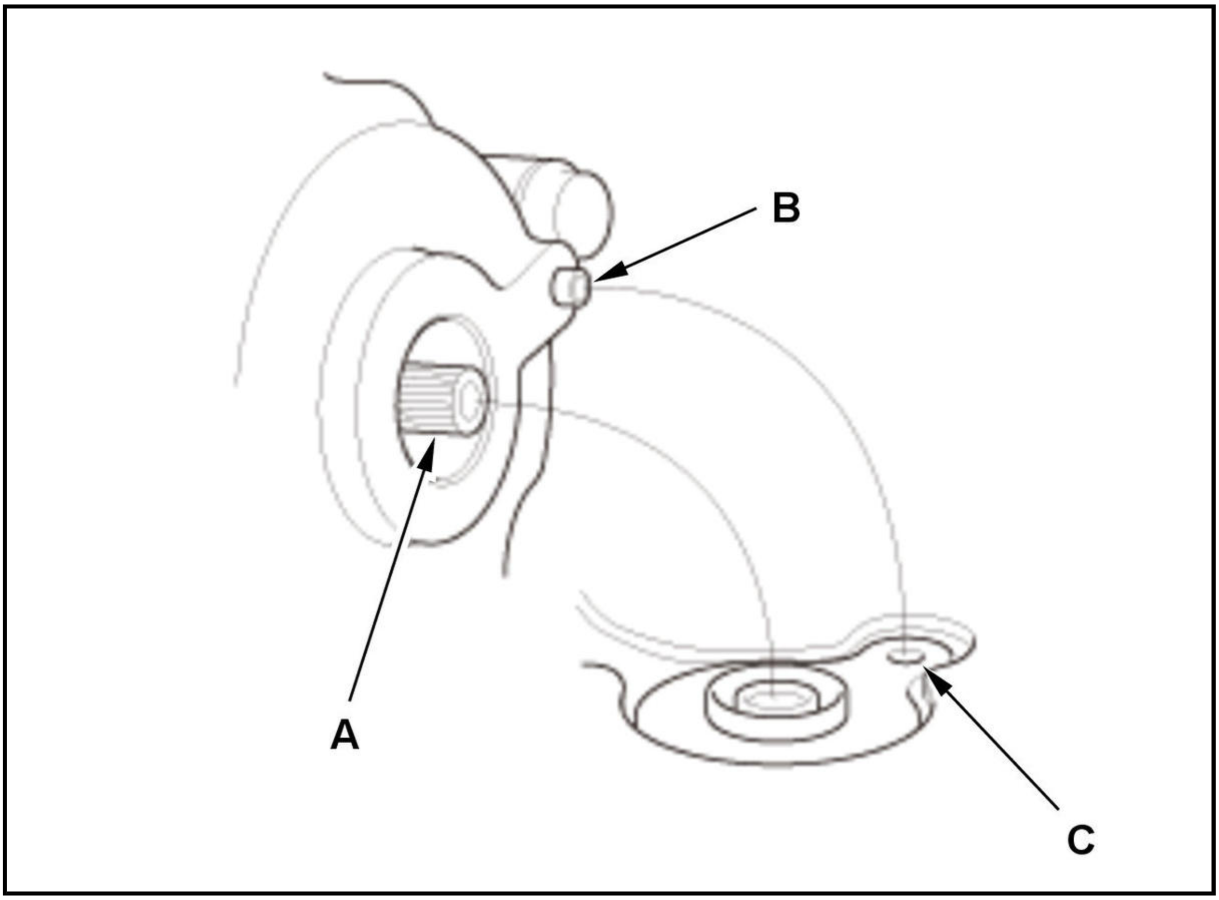
1. Transmission Fluid Pump - Install



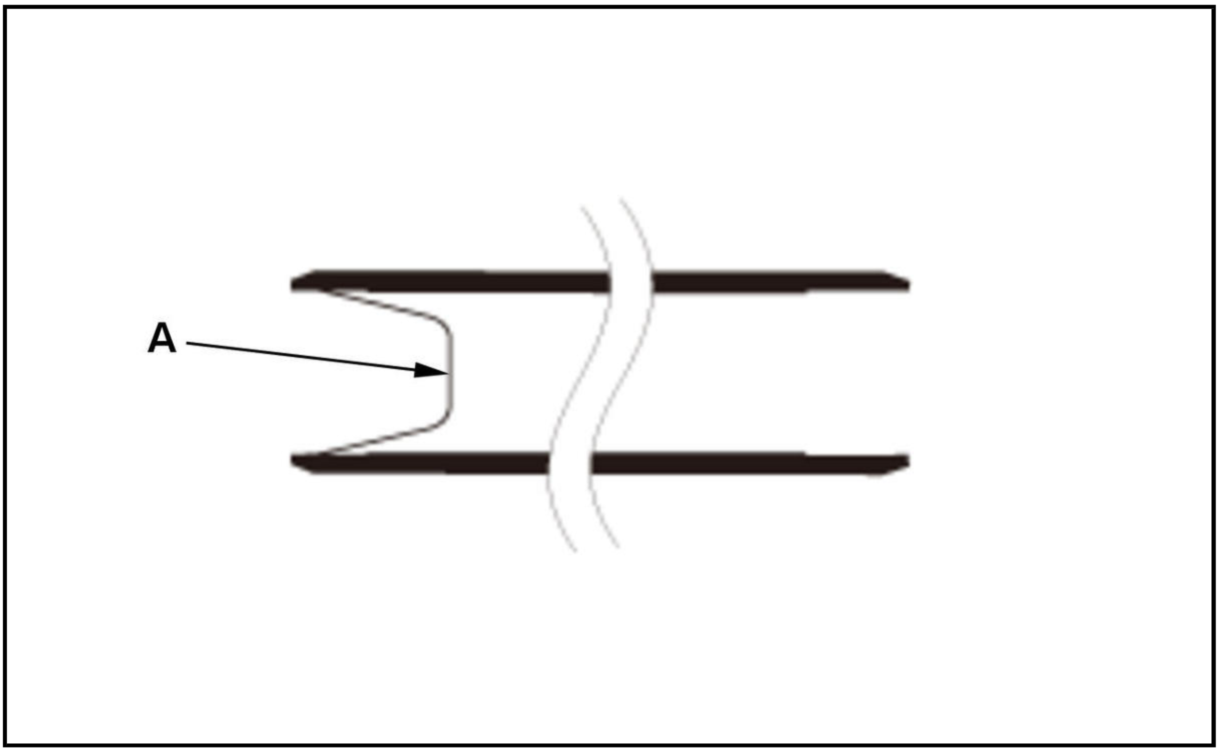
NOTE:

- Apply transmission fluid to the transmission fluid pump shaft splines (A).
- Align the guide pin (B) of the transmission fluid pump with the guide hole (C) of the stator shaft flange.

2. 18 x 18 mm Pipe - Install
3. 14.3 x 36.2 mm Pipe - Install

NOTE: You can install the pipe regardless of its direction.

4. 10.9 x 18.5 mm Pipe - Install
5. Joint Pipe - Install



NOTE:

- The joint pipe has the filter (A). The filter end should face the valve body assembly side.
- Be careful not to drop the filter.

6. 12 x 56.7 mm Pipe - Install

   NOTE: You can install the pipe regardless of its direction.

7. 8 x 133.5 mm Pipe - Install
8. 10.9 x 26 mm Pipe - Install
9. **Valve Body Assembly - Install**
10. Transmission Fluid Strainer - Install

    NOTE: Do not pinch solenoid wire harnesses A and B.

11. Magnet - Install
12. Transmission Fluid Pan - Install

    NOTE:

    - Tighten the transmission fluid pan mounting bolts in a crisscross pattern in two steps.
    - Do not pinch solenoid wire harnesses A and B.

13. **Transmission Fluid - Refill**
14. **12 Volt Battery Terminals - Reconnect** (2.4 L engine)
15. **Auxiliary Transmission Fluid Pump - Air Bleed** (With auto idle stop system)
16. **Transmission Fluid Level - Check**
17. **Engine Undercover - Install**
18. **TCM - Reset** (1.5 L engine)

    NOTE:

    - Make sure to reset the learned value of CVT system when replacing hydraulically-controlled parts in order to prevent damage to the transmission.

  - This procedure is not required if the transmission fluid pump and the TCM are replaced together.

VALVE BODY ASSEMBLY REMOVAL AND INSTALLATION

Removal

NOTE:

- ℹ Where icon is shown, further information shown below.
- Keep all foreign particles out of the transmission.
- Unless otherwise indicated, illustrations used in the procedure are for the 1.5 L engine model.
- Solenoid wire harness A and the transmission fluid temperature sensor are not available separately. Replace them as a set.
- For models with the auto idle stop system, The auxiliary transmission fluid pump and the lower valve body assembly are connected with the delivery pipe and the 10.9 x 31.5 mm pipe. Make sure to remove them.
- The valve body assembly and the following parts are not available separately. Replace them as a set.
-
  - -

    CVT clutch pressure control solenoid valve
  - -

    CVT drive pulley pressure control solenoid valve
  - -

    CVT driven pulley pressure control solenoid valve
  - -

    CVT lock-up clutch control solenoid valve
  - -

    Shift solenoid valve B

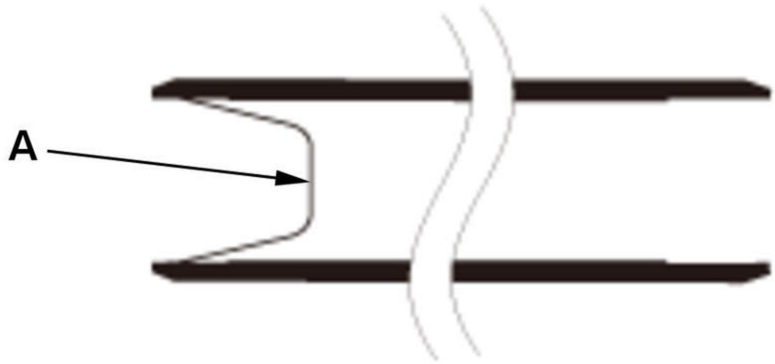
1. Solenoid Wire Harness A - Install
2. 18 x 18 mm Pipe - Install
3. 14.3 x 36.2 mm Pipe - Install

   NOTE: You can install the pipe regardless of its direction.

4. 10.9 x 18.5 mm Pipe - Install

5. Joint Pipe - Install



NOTE:

- The joint pipe has the filter (A). The filter end should face the valve body assembly side.
- Be careful not to drop the filter.

6. 12 x 56.7 mm Pipe - Install

NOTE: You can install the pipe regardless of its direction.

7. 8 x 133.5 mm Pipe - Install
8. 10.9 x 26 mm Pipe - Install
9. Valve Body Assembly - Install

 D E I C H F G ● : BOLTS TO BE REMOVED ○ : BOLTS NOT TO BE REMOVED	1. Install the valve body assembly (C). **NOTE:** **Do not pinch solenoid wire harnesses A and B.** 2. Install the guide plate (I).

Bolt	Length
D	90 mm (3.54 in)
E	80 mm (3.15 in)
F	65 mm (2.56 in)
G	55 mm (2.17 in)
H	40 mm (1.57 in)

	3. Make sure each branch of solenoid wire harness A is routed to the correction locations as shown, especially areas (B) and (C). 4. Connect the connectors (D). 5. Install the transmission fluid temperature sensor (E).

10. Transmission Fluid Strainer - Install

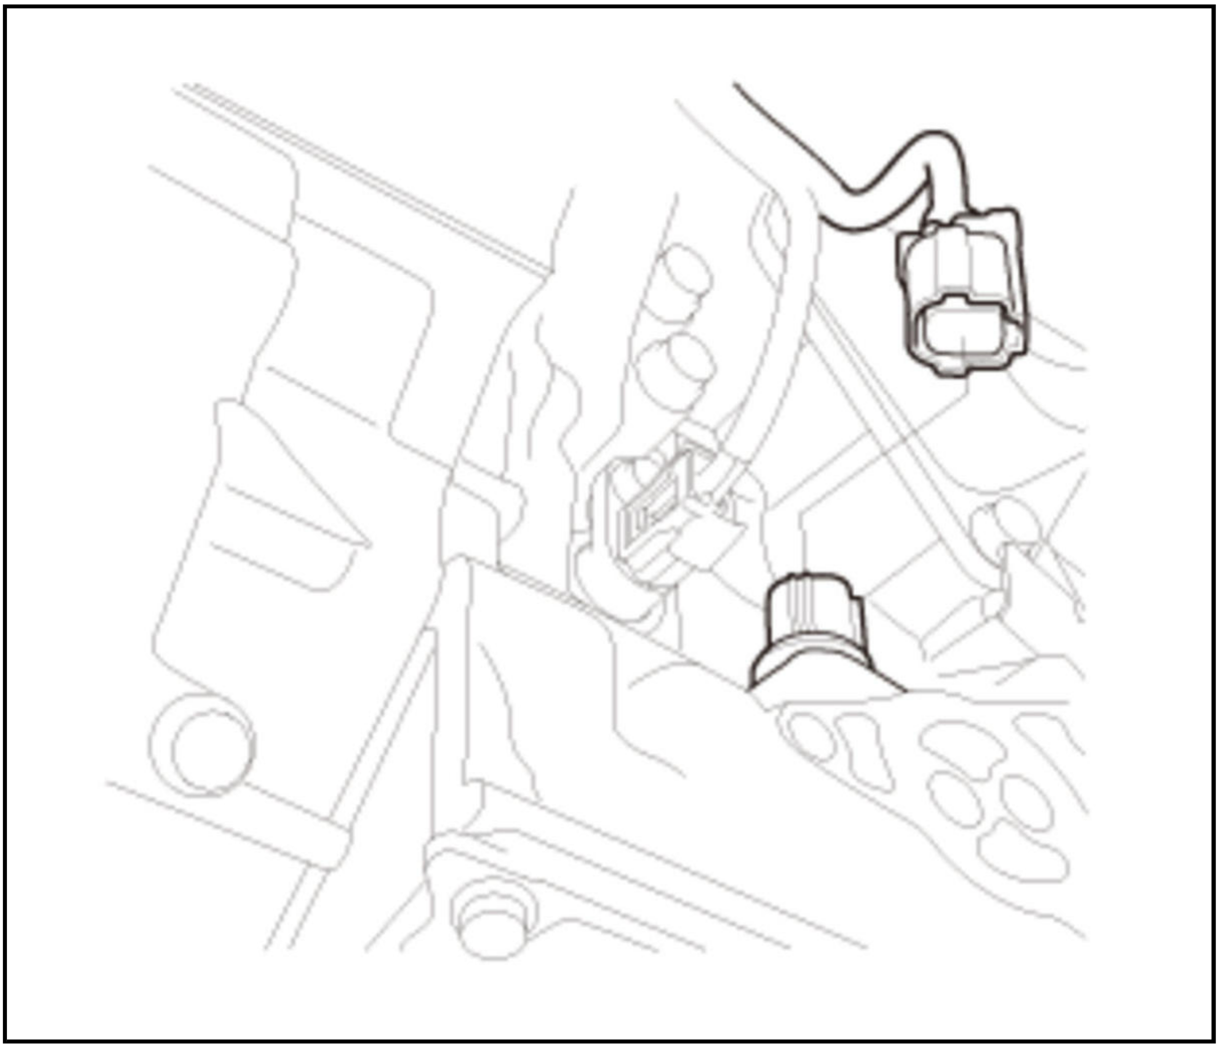
    NOTE: Do not pinch solenoid wire harnesses A and B.

11. Magnet - Install
12. Transmission Fluid Pan - Install

    NOTE:

    - Tighten the transmission fluid pan mounting bolts in a crisscross pattern in two steps.
    - Do not pinch solenoid wire harnesses A and B.

13. Connector (Solenoid Wire Harness A) - Connect



NOTE: Check the connector for corrosion, dirt, or oil, and clean or repair it if necessary.

14. 10.9 x 31.5 mm Pipe - Install (With auto idle stop system)
15. Delivery Pipe - Install (With auto idle stop system)
16. Auxiliary Transmission Fluid Pump - Install (With auto idle stop system)
17. Transmission Fluid - Refill
18. 12 Volt Battery Terminals - Reconnect (2.4 L engine)
19. Auxiliary Transmission Fluid Pump - Air Bleed (With auto idle stop system)
20. Transmission Fluid Level - Check
21. Engine Undercover - Install
22. TCM - Reset (1.5 L engine)

NOTE:

- Make sure to reset the learned value of CVT system when replacing hydraulically-controlled to prevent damage to the transmission.
- This procedure is not required if the valve body assembly and the TCM are replaced together.

REPLACEMENT

CVT OIL SEAL REPLACEMENT

Special Tools Required

Image	Description/Tool Number
	Driver Handle, 15 x 135L 07749-0010000
	Oil Seal Driver Attachment 07GAD-PG40100
	Oil Seal Driver, 65 mm 07JAD-PL90100

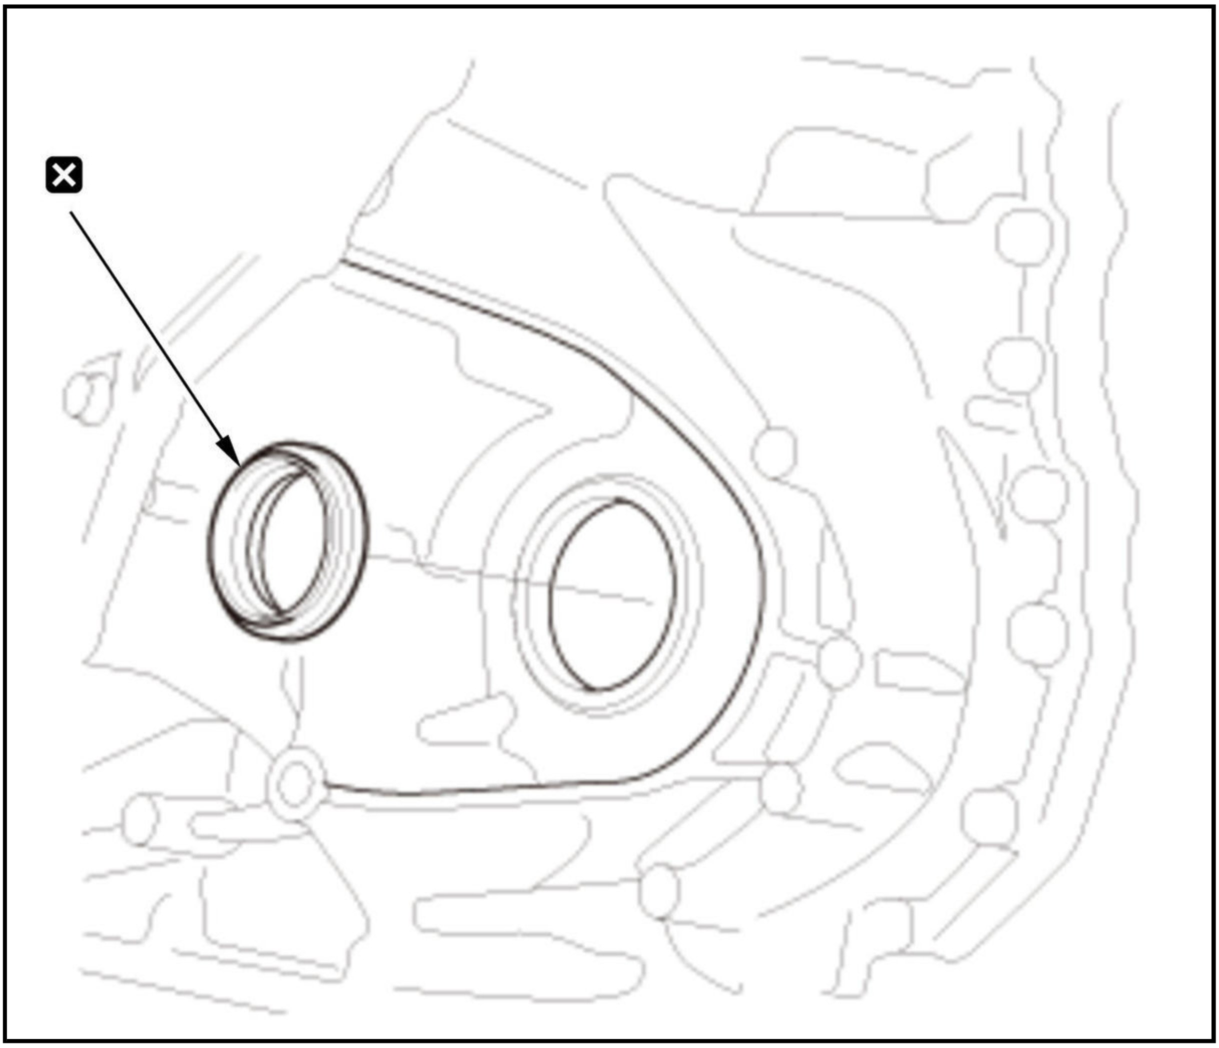
Replacement

NOTE: Keep all foreign particles out of the transmission.

Left Differential Oil Seal

1. Vehicle - Lift

2. **Engine Undercover - Remove**
3. **Transmission Fluid - Drain**
4. **Left Driveshaft Inboard Joint - Disconnect**
5. Left Differential Oil Seal - Remove



6. Left Differential Oil Seal - Install

	1. Install the left differential oil seal (A) flush with the transmission housing using the 15 x 135L driver handle and the oil seal driver attachment. **NOTE:** Before installation, apply a light coat of clean transmission fluid to the surface both of the press-fit and the lip that are on the oil seal.

7. **Left Driveshaft Inboard Joint - Connect**
8. **Transmission Fluid - Refill**
9. **Transmission Fluid Level - Check**
10. **Engine Undercover - Install**

Right Differential Oil Seal

11. **Vehicle - Lift**
12. **Engine Undercover - Remove**
13. **Transmission Fluid - Drain**

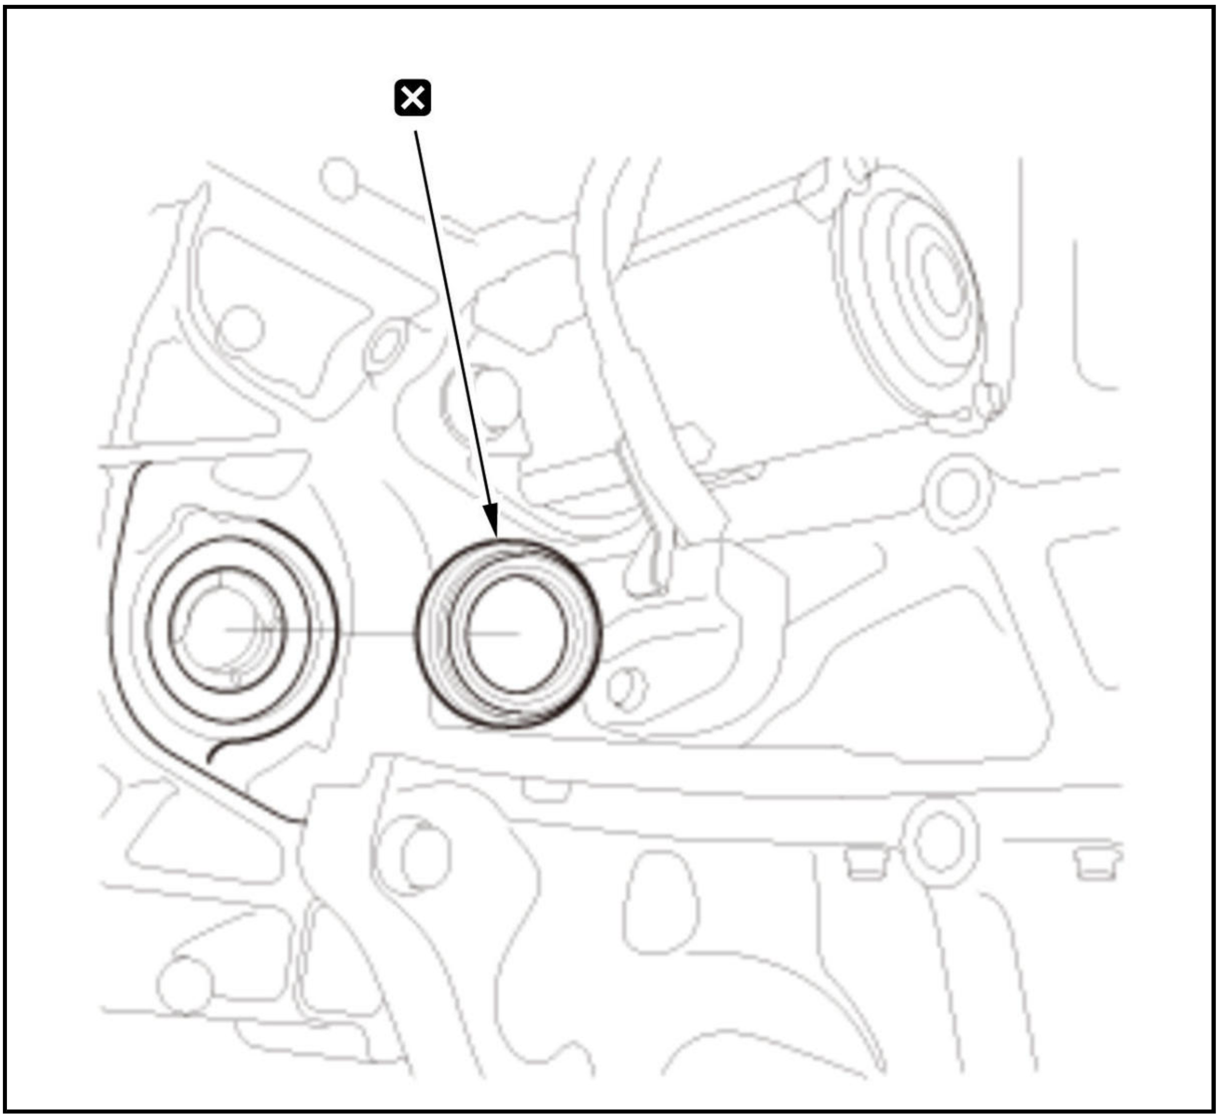
15. Right Differential Oil Seal - Remove



16. Right Differential Oil Seal - Install

	1. Install the right differential oil seal (A) flush with the torque converter housing using the 65 mm oil seal driver. **NOTE:** Before installation, apply a light coat of clean transmission fluid to the surface both of the press-fit and the lip that are on the oil seal.

17. **Intermediate Shaft - Install**
18. **Transmission Fluid - Refill**
19. **Transmission Fluid Level - Check**

20. **Engine Undercover - Install**

DESCRIPTION AND OPERATION

CVT SYSTEM DESCRIPTION

Clutches

Forward Clutch, Reverse Brake, Planetary Gear Train, and Pulleys

Forward Clutch

The forward clutch is the hydraulic-actuated clutch, and engages and disengages the sun gear. When hydraulic pressure is introduced into the forward clutch drum, the forward clutch piston moves. This presses the friction discs and the steel plates together, locking them so they do not slip. Power is then transmitted through the engaged clutch pack to the forward clutch hub/sun gear. Likewise, when hydraulic pressure is bled from the clutch pack, the piston releases the friction discs and the steel plates, and they are free to slide past each other. This allows the sun gear to spin independently on the forward clutch, transmitting no power. The forward clutch is integrated with the input shaft, and located at the end of the drive pulley shaft. The forward clutch is supplied with hydraulic pressure by a circuit connected to the internal hydraulic circuit.

Reverse Brake

The reverse brake is the hydraulic-actuated brake, and engages and disengages the planetary carrier with the transmission housing. When hydraulic pressure is introduced into the reverse brake piston cavity, the reverse brake piston moves. This presses the friction discs and the steel plates together, locking them so the planetary carrier locks. Power from the forward clutch drum and the ring gear is then transmitted through the planetary pinion gears and the sun gear. Likewise, when hydraulic pressure is bled from the reverse brake piston cavity, the piston releases the friction discs and the steel plates, and they are free to slide past each other. This allows the planetary carrier to free from the reverse brake, transmitting no power. The reverse brake is mounted in the transmission housing. The reverse brake is supplied with hydraulic pressure by a circuit connected to the internal hydraulic circuit.

Planetary Gear Train

The planetary gear train is only used for switching the rotational direction of the pulley shafts in R. The planetary gear train consists of the sun gear, the planetary pinion gears, the planetary carrier, and the ring gear. The sun gear is connected to the drive pulley shaft by the splines. The planetary pinion gears are installed on the planetary carrier. The planetary carrier assembly is located on the drive pulley shaft, the carrier is mounted in the reverse brake, and the pinion gears are engaged with the sun gear. The ring gear is connected with the forward clutch drum, and engaged with the planetary pinion gears. In R, the reverse brake locks the planetary carrier, and the ring gear drives the planetary pinion gears to rotate. The pinion gears drive the sun gear in the reverse direction from the rotational direction of the input shaft. The engine power from the input shaft drives the sun gear and the drive pulley shaft via the forward clutch drum, the ring gear, and the planetary pinion gears.

Pulleys

The drive pulley and the driven pulley consist of a movable face and a fixed face, and the effective pulley ratio changes with engine speed. The drive pulley and the driven pulley are linked by the steel belt. To achieve a high pulley ratio; low speed range, high hydraulic pressure works on the movable face of the driven pulley and reduces the effective diameter of the drive pulley, and lower hydraulic pressure works on the movable face of the drive pulley to eliminate the steel belt slippage. To achieve a low pulley ratio; high speed range, high hydraulic pressure works on the movable face of the drive pulley and reduces the effective diameter of the driven pulley, and lower hydraulic pressure works on the movable face of the driven pulley to eliminate the steel belt slippage.

Electronic Control System

Functional Diagram

The electronic control system consists of the TCM or the PCM, sensors, switches, and solenoid valves. Shifting and lock-up are electronically controlled for comfortable driving under all conditions. The TCM or the PCM receives input signals from the sensors and the other control units, processes data, and outputs signals for the engine control system and the CVT control system. The CVT control system includes the shift control, the pulley pressure control, the clutch pressure control, the lock-up control, the transmission fluid pump pressure control, and the indicator control. The TCM or the PCM switches the shift solenoid valves and the CVT pulley control solenoid valves to control shifting position and lock-up torque converter clutch.

Shift Control/Pulley Pressure Control

To reduce the steel belt slippage and increase the steel belt life, the TCM or the PCM calculates signals from sensors and switches, and actuates the pulley pressure control solenoid valves to maintain optimum pulley pressure. When the pulley ratio is high (low vehicle speed), high hydraulic pressure works on the movable face of the driven pulley and reduces the effective diameter of the drive pulley, and lower hydraulic pressure works on the movable face of the drive pulley to eliminate the steel belt slippage. When the pulley ratio is low (high vehicle speed), high hydraulic pressure works on the movable face of the drive pulley and reduces the effective diameter of the driven pulley, and lower hydraulic pressure works on the movable face of the driven pulley to eliminate the steel belt slippage.The TCM or the PCM compares actual driving conditions with programmed driving conditions to control shifting, and it instantly determines a drive pulley ratio from various signals sent from sensors and switches. The TCM or the PCM activates the CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve to control pulley pressure to the pulleys.The shift control includes the grade logic control and the shift-hold control.

Shift Control - Grade Logic Control

The grade logic control system has been adopted to control shifting in D position/mode and S position/mode. The TCM or the PCM compares actual driving conditions with memorized driving conditions, based on the input signal from the various sensors and switches, to control shifting while the vehicle is ascending or descending a slope.

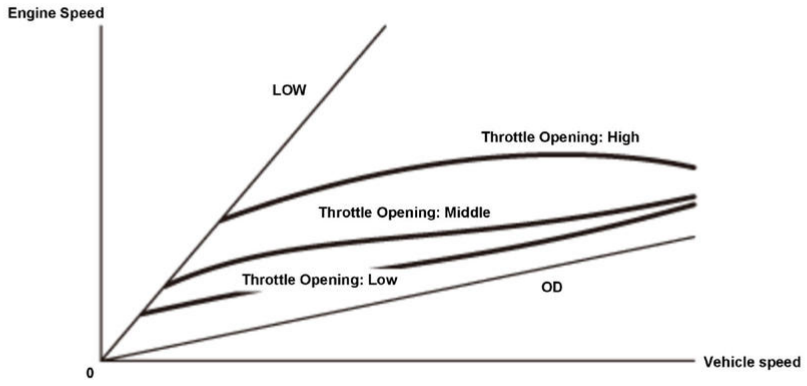
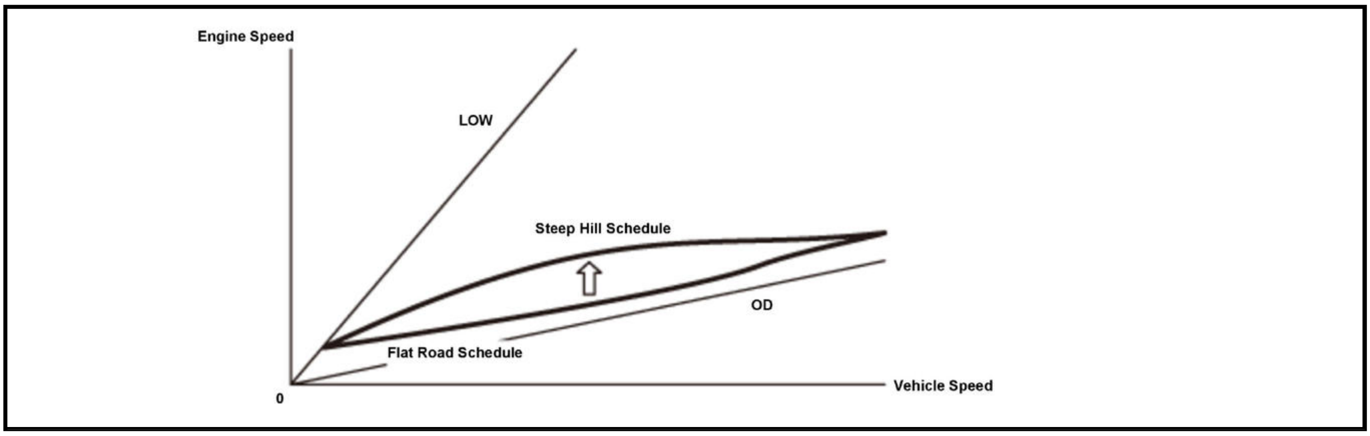
Grade Logic Control: Ascending Control

When the TCM or the PCM determines that the vehicle is climbing a hill in D position/mode or S position/mode, the system selects the most suitable shift schedule according to the magnitude of a gradient, so the vehicle can run smooth and have more power when needed.



Grade Logic Control: Descending Control

When the TCM or the PCM determines that the vehicle is going down a hill in D position/mode or S position/mode, the system selects the most suitable shift schedule according to the magnitude of a gradient, so the vehicle can run smooth in combination with engine braking.



Shift-Hold Control

When negotiating winding roads, the throttle is suddenly released and the brakes are applied, as is the case when decelerating at the entrance of a corner, Shift-Hold Control keeps the transmission in its current (lower) ratio as it negotiates the corner and accelerates out. When the vehicle is driven aggressively on a winding road, the TCM or the PCM will keep the engine speed on a higher-than-normal setting, so the vehicle can run smooth and have more power. The transmission will resume the normal setting after the TCM or the PCM determines that normal driving has resumed.

Clutch Pressure Control

The TCM or the PCM actuates the CVT clutch pressure control solenoid valve to control the forward clutch pressure and the reverse brake pressure. When the transmission is in-gear, the forward clutch pressure and the reverse brake pressure regulated by the CVT clutch pressure control solenoid valve engage and disengage the forward clutch and the reverse brake smoothly.The TCM or the PCM receives input signals from the various sensors and switches, processes data, and outputs current to the CVT clutch pressure control solenoid valve.

Lock-Up Control

Shift solenoid valve B controls hydraulic pressure to lock-up ON and OFF. The TCM or the PCM actuates shift solenoid valve B and the CVT lock-up clutch control solenoid valve to start lock-up. The CVT lock-up clutch control solenoid valve applies and regulates hydraulic pressure to control the volume of the lock-up. The lock-up mechanism operates in D position/mode, S position/mode, at transmission fluid temperature exceeding 68 deg.F (20 deg.C).

Auxiliary Transmission Fluid Pump Control (With Auto Idle Stop System)

The auxiliary transmission fluid pump supplies hydraulic pressure to the hydraulic circuit during the operation of the auto idle stop system.When the vehicle comes to an engine stop in the operation of the auto idle stop system, the transmission fluid pump also stops, then the TCM starts the auxiliary transmission fluid pump to supply hydraulic pressure to the hydraulic circuit. The auxiliary transmission fluid pump continues to supply enough hydraulic pressure for the clutch to engage until the engine restarts. When the engine restarts, the TCM stops the auxiliary transmission fluid pump.The auxiliary transmission fluid pump is installed out of the transmission housing, and consists of the relief valve, the pump, the motor, and the driver.

General Operation

The continuously variable transmission (CVT) is an electronically controlled automatic transmission with drive and driven pulleys, steel belt, and new transmission fluid (HCF-2). The CVT provides non-stage speeds forward and non-stage speeds reverse. The entire unit is positioned in line with the engine.

Transmission

The torque converter consists of a pump, a turbine, and a stator assembly in a single unit. The torque converter is connected to the engine crankshaft and turns as the engine turns. Around the outside of the torque converter is a ring gear which meshes with the starter drive gear when the engine is being started. The entire torque converter assembly serves as a flywheel, transmitting power to the transmission input shaft. The transmission has four parallel shafts: the input shaft, the drive pulley shaft, the driven pulley shaft, and the final drive shaft. The input shaft is connected to the torque converter turbine, and integrates the forward clutch on the drive pulley shaft end. The drive pulley shaft and the driven pulley shaft consist of movable and fixed face pulleys. Both pulleys are linked by the steel belt. The input shaft includes the forward clutch. The drive pulley shaft includes the drive pulley. The input shaft is connected with the drive pulley shaft by the forward clutch hub/sun gear, and by the ring gear, the planetary pinion gears, and the sun gear. The planetary carrier is positioned between the ring gear and the sun gear, and engaged with the planetary pinion gears. The driven pulley shaft includes the driven pulley (with the park gear). The secondary drive gear is splined to the driven pulley shaft. The final drive shaft is positioned between the secondary drive gear and the final driven gear. The final drive shaft integrates the secondary driven gear and the final drive gear which serves to change the rotational direction of the drive and driven pulley shafts, because the drive pulley shaft and driven pulley shaft rotate the same direction. When the input shaft is joined with the drive pulley shaft by engaging the forward clutch or the reverse brake, the power is transmitted through the input shaft, the drive pulley shaft, and the driven pulley shaft to the final drive shaft provide drive.

Gear Selection

The shift lever has following position/mode;

Position/Mode	Description
P: PARK	Front wheels locked; the parking brake pawl engages with the park gear on the driven pulley. The forward clutch disengages.

Position/Mode		Description
R: REVERSE		The reverse brake engages, and it locks with the planetary carrier to the transmission housing.
N: NEUTRAL		The forward clutch disengages.
D: DRIVE		Transmission automatically adjusts to keep the engine at the best rpm for driving under all conditions. The lock-up mechanism operates in this position/mode. The WOT Step Shift Mode * operates in this position/mode. (with 1.5 L engine)
S: SPORT	Sport driving mode (non-stage speeds)	Transmission automatically adjusts to keep the engine at a higher rpm than in D position/mode driving conditions for sport driving. The lock-up mechanism operates in this position/mode. The WOT Step Shift Mode* operates in this position/mode. (with 1.5 L engine)
L: LOW		For engine braking and power for climbing; the transmission shifts into the lowest pulley ratio. The lock-up mechanism operates in this position/mode.

*: When accelerating and the engine speed reaches the maximum while the accelerator pedal is depressed deeply and the vehicle is driving at high speed, the CVT system switches the gear shift method to provide an automatic transmission-like multistage gear shift.

Starting the engine is possible only the transmission is in P or N position/mode because of a neutral-safety switch.

Shift Position Indicator

The shift position indicator in the gauge control module shows which shift lever position/mode has been selected without having look down at the console.

1.5 L engine

Electronic Control

The electronic control system consists of the transmission control module (TCM), sensors, and solenoid valves. Shifting and lock-up are electronically controlled for comfortable driving under all conditions. The TCM is located in the engine compartment.

Shift Control

The TCM actuates the CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve to change drive and driven pulley pressures. The drive pulley pressure is applied to the drive pulley, and the driven pulley pressure is applied to the driven pulley, and pulley ratio is changed to their effective ratio.

Hydraulic Control

The hydraulic control system is controlled by the TCM, the transmission fluid pump, and the valves and the solenoid valves in the valve body. The transmission fluid pump is driven by the engine. The transmission fluid pump drive sprocket is connected to the torque converter housing, as the engine turns, it drives the transmission fluid pump driven sprocket by the transmission fluid pump drive chain. The transmission fluid pump supplies hydraulic pressure to the hydraulic circuit. Fluid from the transmission fluid pump passes to the various control valves, the drive/driven pulleys, the forward clutch, and the reverse brake.

Lock-Up Mechanism

The lock-up mechanism of the torque converter clutch operates in D position/mode, S position/mode, and L position/mode (without paddle shifter), at transmission fluid temperature exceeding 68 deg.F (20 deg.C). The pressurized fluid is drained from the back of the torque converter through a fluid passage, causing the torque converter clutch piston to be held against the transmission fluid pump. As this takes place, the input shaft and the drive pulley shaft rotate as the same as the engine crankshaft. Together with hydraulic control, the TCM optimizes the timing of the lock-up mechanism. When shift solenoid valve B is turned ON by the TCM, shift solenoid valve B pressure switches lock-up ON and OFF. The CVT lock-up clutch control solenoid valve controls the volume of lock-up.

Except 1.5 L engine

Electronic Control

The electronic control system consists of the powertrain control module (PCM), sensors, and solenoid valves. Shifting and lock-up are electronically controlled for comfortable driving under all conditions. The PCM is located in the engine compartment.

Hydraulic Control

The hydraulic control system is controlled by the PCM, the transmission fluid pump, and the valves and the solenoid valves in the valve body. The transmission fluid pump is driven by the engine turns. The transmission fluid pump drive sprocket is connected to the torque converter housing, turns as the engine turns, and drives the transmission fluid pump driven sprocket by the transmission fluid pump drive chain. The transmission fluid pump supplies hydraulic pressure to the hydraulic circuit. Fluid from the transmission fluid pump passes to the various control valves, the drive/driven pulleys, the forward clutch, and the reverse brake.

Shift Control

The PCM controls shift solenoid valve B, the shift solenoid valve O/P, the CVT drive pulley pressure control solenoid valve, the CVT driven pulley pressure control solenoid valve, the CVT clutch pressure control solenoid valve, and the CVT lock-up clutch control solenoid valve while receiving input signals from various sensors and switches located throughout the vehicle. The PCM actuates the CVT drive pulley pressure control solenoid valve and the CVT driven pulley pressure control solenoid valve to change drive and driven pulley pressures. The drive pulley pressure is applied to the drive pulley, and the driven pulley pressure is applied to the driven pulley, and pulley ratio is changed to their effective ratio.

Lock-Up Mechanism

The lock-up mechanism of the torque converter clutch operates in D position/mode, S position/mode, and L position/mode (without paddle shifter), at transmission fluid temperature exceeding 68 deg.F (20 deg.C). The pressurized fluid is drained from the back of the torque converter through a fluid passage, causing the torque converter clutch piston to be held against the transmission fluid pump. As this takes place, the input shaft and the drive pulley shaft rotate as the same as the engine crankshaft. Together with hydraulic control, the PCM optimizes the timing of the lock-up mechanism. When shift solenoid valve B is turned ON by the PCM, shift solenoid valve B pressure switches lock-up ON and OFF. The CVT lock-up clutch control solenoid valve controls the volume of lock-up.

Hydraulic Controls

The hydraulic control system is controlled by the TCM or the PCM, the transmission fluid pump, and the valves and the solenoid valves in the valve body. The transmission fluid pump is driven by the engine turns. The transmission fluid pump drive sprocket is connected to the torque converter housing, turns as the engine turns, and drives the transmission fluid pump driven sprocket by the transmission fluid pump drive chain. The transmission fluid pump supplies hydraulic pressure to the hydraulic circuit. Fluid from the transmission fluid pump passes to the various control valves, the drive/driven pulleys, the forward clutch, and the reverse brake.

Lock-Up System

The lock-up mechanism of the torque converter clutch operates in D position/mode, S position/mode, and L position/mode, at transmission fluid temperature exceeding 68 deg.F (20 deg.C). The pressurized fluid is drained from the back of the torque converter through a fluid passage, causing the torque converter clutch piston to be held against the transmission fluid pump. As this takes place, the input shaft and the drive pulley shaft rotate as the same as the engine crankshaft. Together with hydraulic control, the TCM or the PCM optimizes the timing of the lock-up mechanism. When shift solenoid valve B is turned ON by the TCM or the PCM, shift solenoid valve B pressure switches lock-up ON and OFF. The CVT lock-up clutch control solenoid valve controls the volume of lock-up.

Torque Converter Clutch Lock-Up ON (Engaging Torque Converter Clutch)

Fluid in the chamber between the torque converter cover and the torque converter clutch piston is drained off, and fluid entering from the chamber between the pump and the stator exerts pressure through the torque converter clutch piston against the torque converter cover. The torque converter clutch piston engages with the torque converter cover; torque converter clutch lock-up ON, and the input shaft rotates at the same as the engine.

FINAL DRIVEN GEAR
TRANSFER (AWD)
TRANSFER SHAFT DRIVEN GEAR
TRANSFER OUTPUT SHAFT (HYPOID GEAR)

R Position

- Hydraulic pressure is applied to the reverse brake, and the planetary carrier locks with the reverse brake.
- The ring gear joined with the forward clutch drum and input shaft drives the planetary sun gear via the planetary pinion gears.
- The sun gear rotates in the reverse direction from input shaft rotational direction, and drives the drive pulley shaft.
- Drive pulley shaft drives the driven pulley shaft and the secondary drive gear, and secondary driven gear.
- Power is transmitted to the final drive gear, which in turn drives the final driven gear.
- AWD: The final driven gear drives the transfer drive gear (hypoid gear) and the transfer output shaft (hypoid gear).

NOTE: The illustration shows the AWD transmission; 2WD transmission does not have the transfer mechanism.

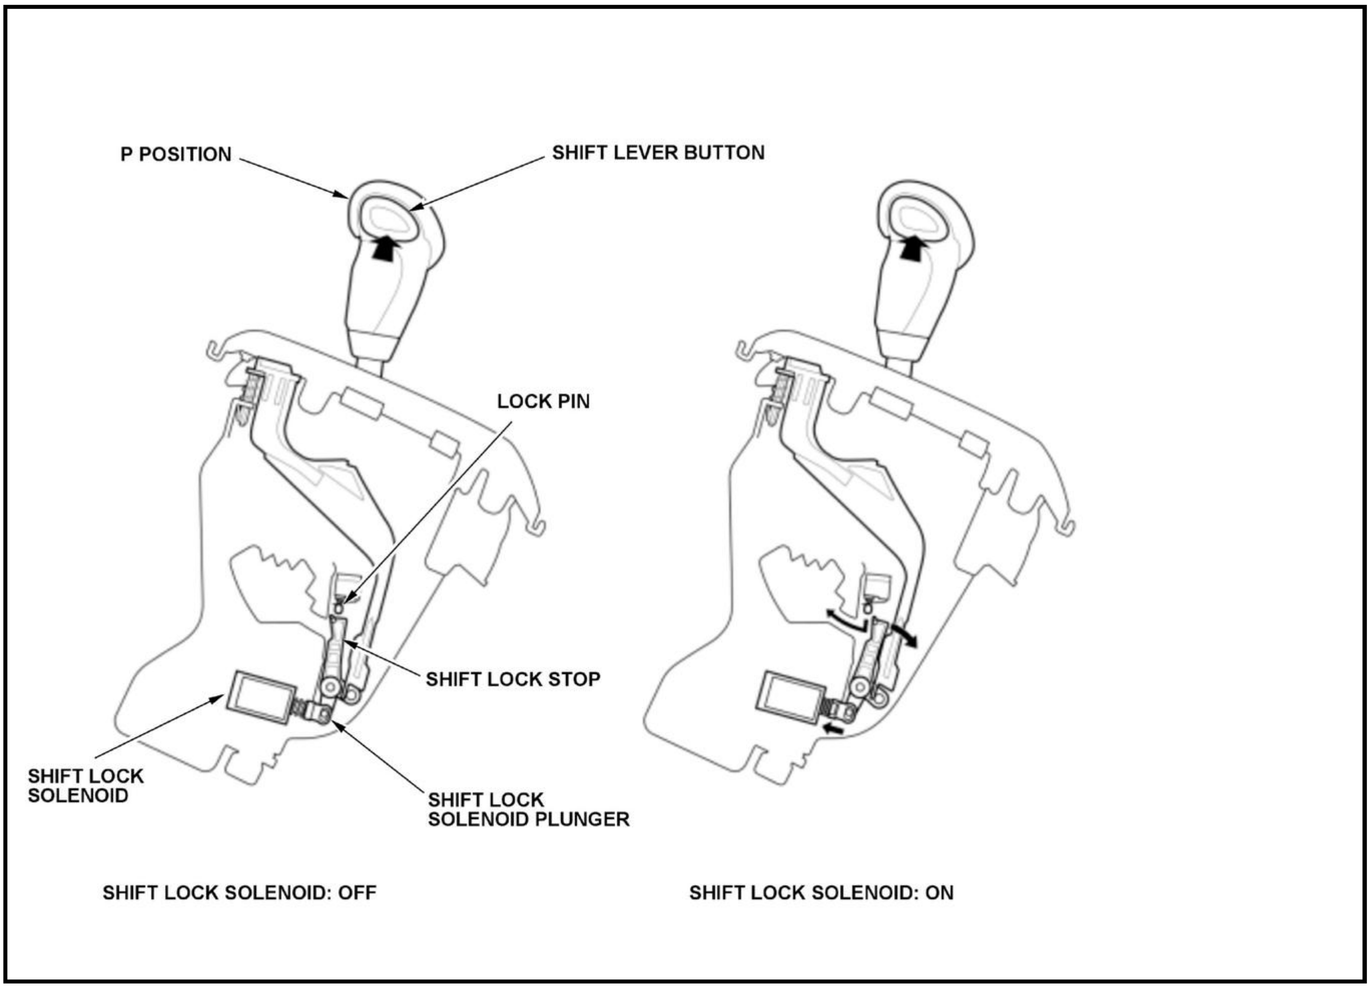
Shift Lock System

Shift Lever Assembly

The shift lever is equipped with the shift lock function to prevent the miss-handling when selecting the position.Also, the park pin switch is used for one of the key interlock system and installed on the shift lever, and sends the park position signal (lever is in P position) to the TCM or the PCM.

Shift Lock System

The shift lock system prevents the shift lever from miss shifting when starting the engine. The shift lock solenoid is usually OFF. After starting the engine in P, the shift lever cannot move to any other position from P because the shift lock stop stops the lock pin unless pressing the brake pedal. When the brake pedal is pressed and the accelerator pedal is not pressed, the shift lock solenoid is ON; the shift lock solenoid plunger in the shift lock solenoid pulls the shift lock stop to release the lock pin. Then push the shift lever button, and the shift lever can move to any other position. When the brake pedal and the accelerator pedal are pressed at the same time, the shift lock system is not unlocked.



P POSITION
SHIFT LEVER BUTTON
LOCK PIN
SHIFT LOCK STOP
SHIFT LOCK SOLENOID
SHIFT LOCK SOLENOID PLUNGER
SHIFT LOCK SOLENOID: OFF
SHIFT LOCK SOLENOID: ON

Shift Lock Release

When the shift lock system does not operate due to a mechanical or electrical trouble, you can unlock the shift lock temporarily by inserting the mechanical key into the shift lock release hole and pressing the shift lock release. When the shift lock release is pressed, the shift lock stop releases the lock pin, and the shift lever can move to any other position.

TROUBLESHOOTING

SHIFT LOCK SYSTEM CIRCUIT TROUBLESHOOTING (1.5 L ENGINE)

NOTE:

- Check for PGM-FI DTCs and CVT DTCs. If any DTCs are present, troubleshoot those first.
- Before you troubleshoot, record all freeze data and any on-board snapshots, and review the **General Troubleshooting Information**.

PGM-FI System

DTC Description	Confirmed DTC	Pending DTC
B	B	B

CVT System

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (CVT)

1. Shift lock solenoid operation check

   -1. **Connect the HDS to the DLC** .

   -2. Turn the vehicle to the ON mode.

   -3. Select the Shift Lock Solenoid Test in the Miscellaneous Test Menu, and check that the shift lock solenoid operates with the HDS.

   Does the shift lock solenoid work properly?

   YES

   The shift lock solenoid is OK. Go to step 6.

   NO

   Go to step 2.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check the following fuse.

Fuse	No. D7 (10 A)
Location	Under-dash fuse/relay box

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 3.

   NO

   Replace the No. D7 (10 A) fuse, and recheck. If the fuse blows again, repair a short to ground in the No. D7 (10 A) fuse circuit.

3. Open wire check (IG1 METER line)

   -1. Disconnect the following connector.

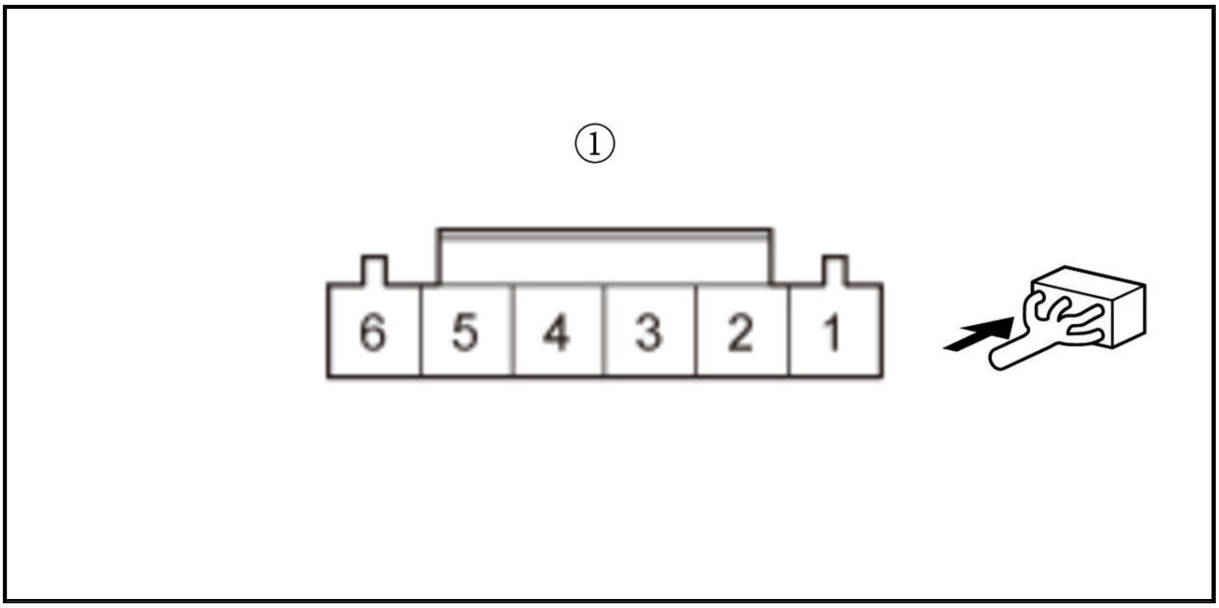
Shift lever 6P connector

   -2. Turn the vehicle to the ON mode.

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Shift lever 6P connector: disconnected

Test point 1	Shift lever 6P connector (female terminals) No. 5 : ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 METER wire is OK. Go to step 4.

NO

Repair an open in the IG1 METER wire between the shift lock solenoid and the No. D7 (10 A) fuse in the under-dash fuse/relay box.

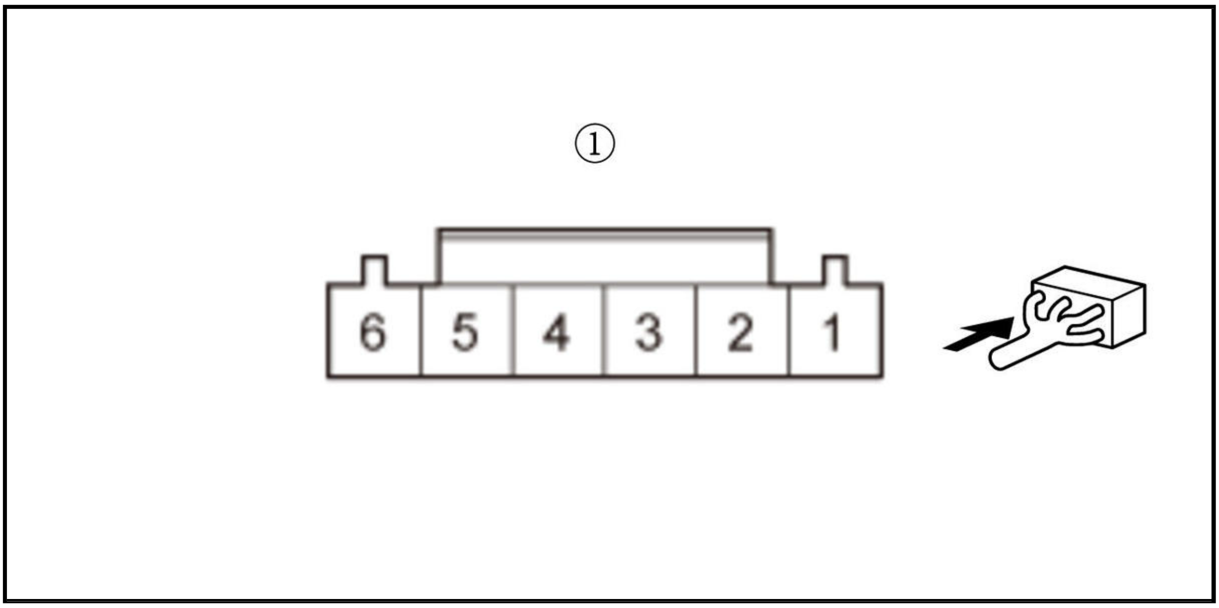
4. Determine possible failure area (shift lock solenoid, others)

-1. With the transmission in P position/mode, press the brake pedal.

NOTE: Do not press the accelerator pedal.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Shift lever 6P connector: disconnected
Test point 1	Shift lever 6P connector (female terminals) No. 5 : ①
Test point 2	Shift lever 6P connector (female terminals) No. 6 : ①



Is there battery voltage?

YES

Check the shift lock mechanism . If the mechanism is OK, replace the shift lock solenoid .

NO

Go to step 5.

5. Open wire check (SLS/SHIFT LOCK SOL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

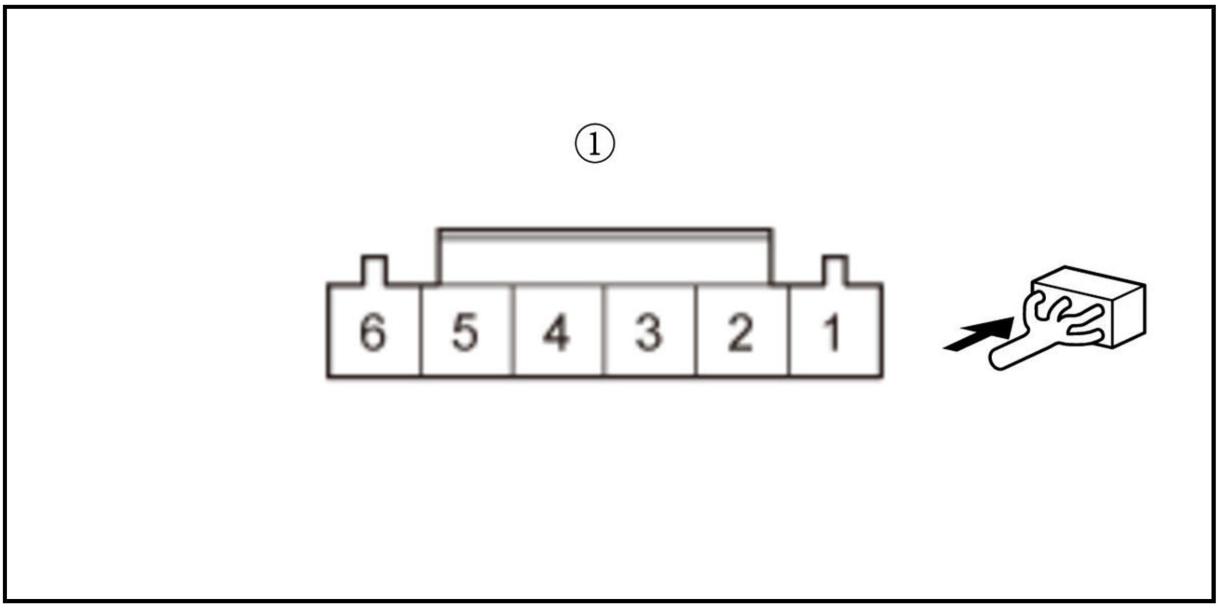
NOTE: This step must be done to protect the TCM from damage.

-3. Disconnect the following connector.

TCM 50P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Shift lever 6P connector: disconnected
	TCM 50P connector: disconnected
Test point 1	Shift lever 6P connector (female terminals) No. 6 : ①
Test point 2	TCM 50P connector No. 26



Is there continuity?

YES

The SLS/SHIFT LOCK SOL wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Repair an open in the SLS/SHIFT LOCK SOL wire between the shift lock solenoid and the TCM.

6. Brake pedal position switch operation check

-1. Check the parameter(s) below with the HDS while pressing the brake pedal.

Signal	**Threshold**		**Current conditions**	
	Values	**Unit**	**Values**	**Unit**
Brake Switch	ON	B	B	B

Do the current condition(s) match the threshold?

YES

The brake pedal position switch is OK. Go to step 8.

NO

If the brake lights come on, go to step 7. If the brake lights do not work, repair faulty brake light circuit.

7. Open wire check (STOP SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector A (50P)

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (50P): disconnected
Test point 1	**PCM connector A (50P) No. 26**
Test point 2	Body ground

Is there battery voltage while pressing the brake pedal and about 0 V when the pedal is released?

YES

The STOP SW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair an open in the STOP SW wire between the PCM and the brake pedal position switch.

8. Transmission range switch parameter check

-1. Shift the transmission to P position/mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
A/T P Switch	ON	B	B	B

Do the current condition(s) match the threshold?

YES

The transmission range switch is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Go to step 9.

9. Transmission range switch check

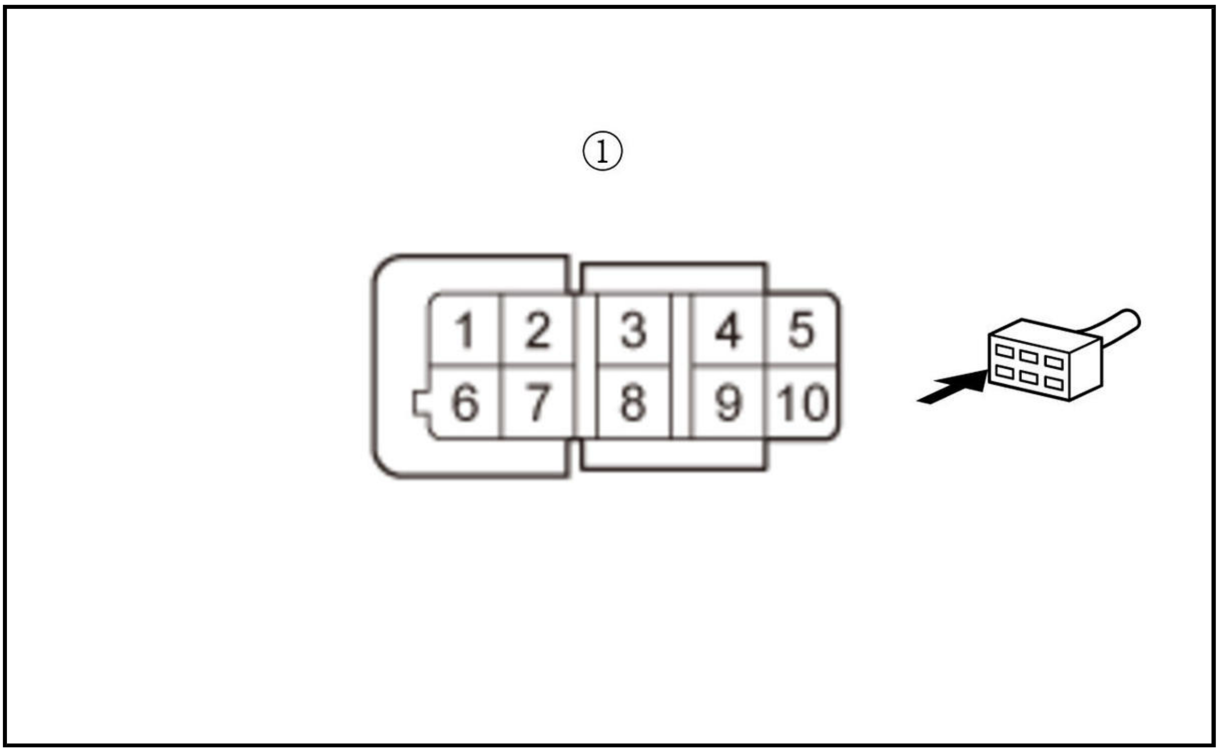
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Transmission range switch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Transmission range switch 10P connector (female terminals) No. 5 : ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
A/T P Switch	ON	B	B	B

Do the current condition(s) match the threshold?

YES

Replace the transmission range switch .

NO

The transmission range switch is OK. Go to step 10.

10. Open wire check (ATPP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM from damage.

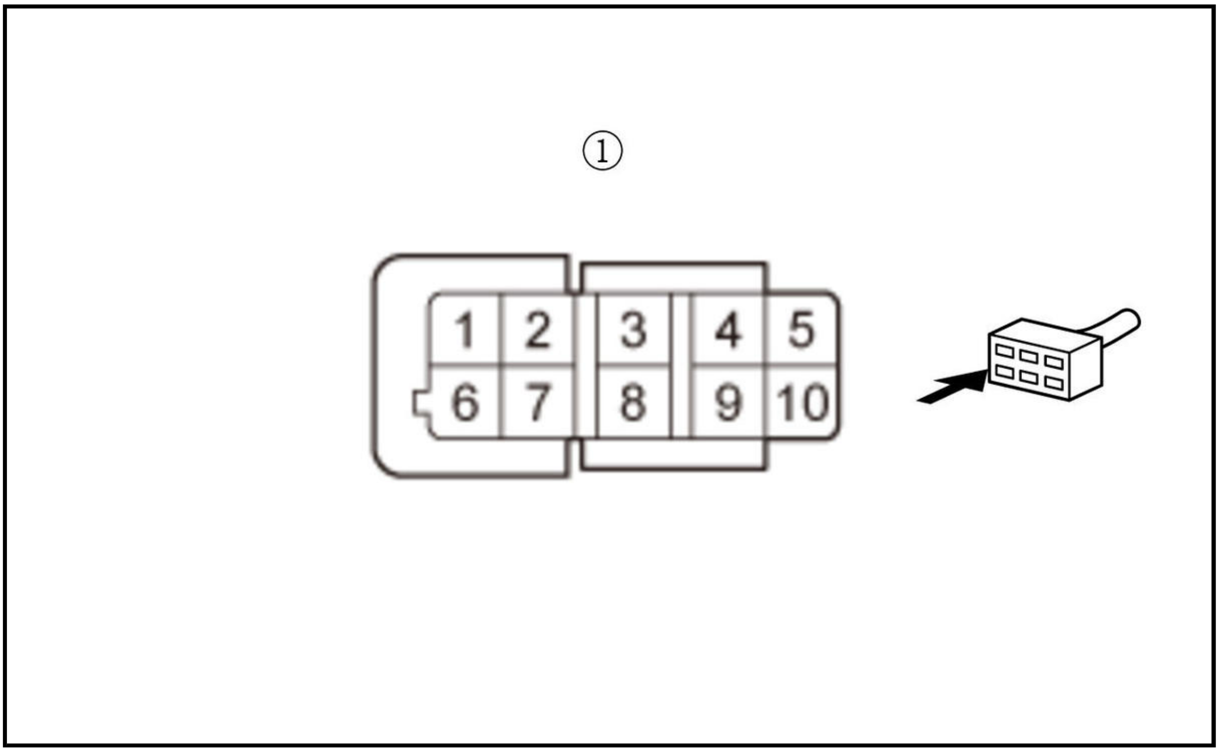
-4. Disconnect the following connector.

TCM 50P connector

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmission range switch 10P connector: disconnected
B	TCM 50P connector: disconnected

Test point 1	Transmission range switch 10P connector (female terminals) No. 5 : ①
Test point 2	TCM 50P connector No. 48



Is there continuity?

YES

The ATPP wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or replace the original TCM .

NO

Repair an open in the ATPP wire between the transmission range switch and the TCM.

SHIFT LOCK SYSTEM CIRCUIT TROUBLESHOOTING (2.4 L ENGINE) (2017 2018 2019)

NOTE:

- Check for PGM-FI DTCs and CVT DTCs. If any DTCs are present, troubleshoot those first.
- Before you troubleshoot, record all freeze data and any on-board snapshots, and review the General Troubleshooting Information.

PGM-FI System

DTC Description	Confirmed DTC	Pending DTC
B	B	B

CVT System

DTC Description	Confirmed DTC	Pending DTC	Freeze Frame
B	B	B	B

DTC (CVT)

1. Shift lock solenoid operation check

-1. Connect the HDS to the DLC .

-2. Turn the vehicle to the ON mode.

-3. Select the Shift Lock Solenoid Test in the Miscellaneous Test Menu, and check that the shift lock solenoid operates with the HDS.

Does the shift lock solenoid work properly?

YES

The shift lock solenoid is OK. Go to step 6.

NO

Go to step 2.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuse.

Fuse	No. D7 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the No. D7 (10 A) fuse, and recheck. If the fuse blows again, repair a short to ground in the No. D7 (10 A) fuse circuit.

3. Open wire check (IG1 METER line)

-1. Disconnect the following connector.

Shift lever 6P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

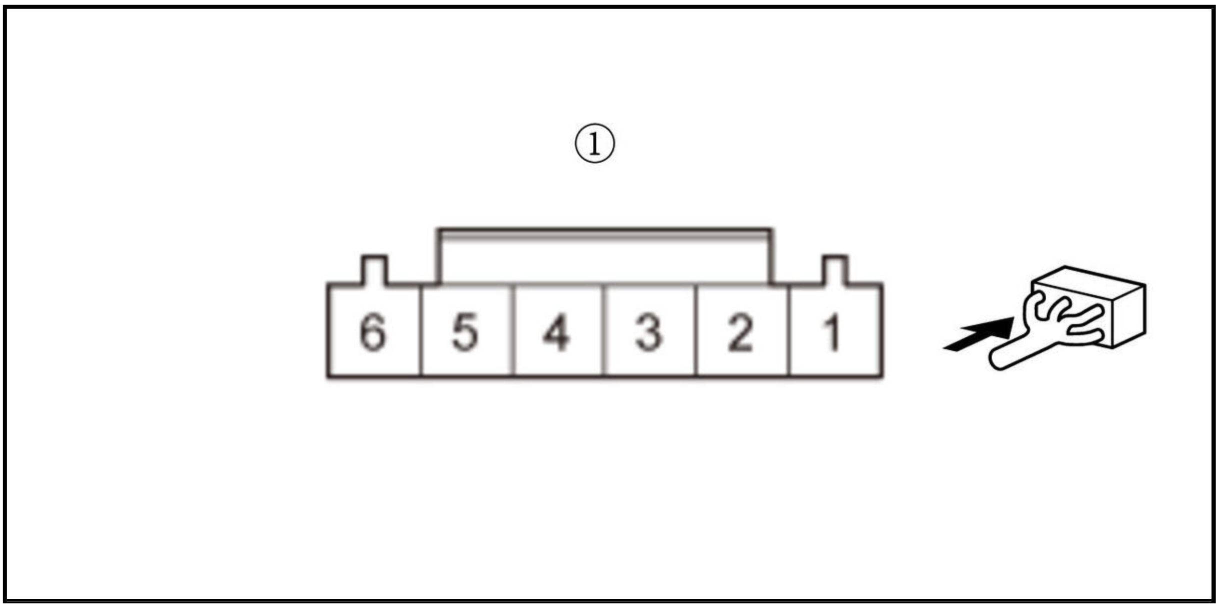
Test point 1	Shift lever 6P connector (female terminals) No. 5 : ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1 METER wire is OK. Go to step 4.

NO

Repair an open in the IG1 METER wire between the shift lock solenoid and the No. D7 (10 A) fuse in the under-dash fuse/relay box.

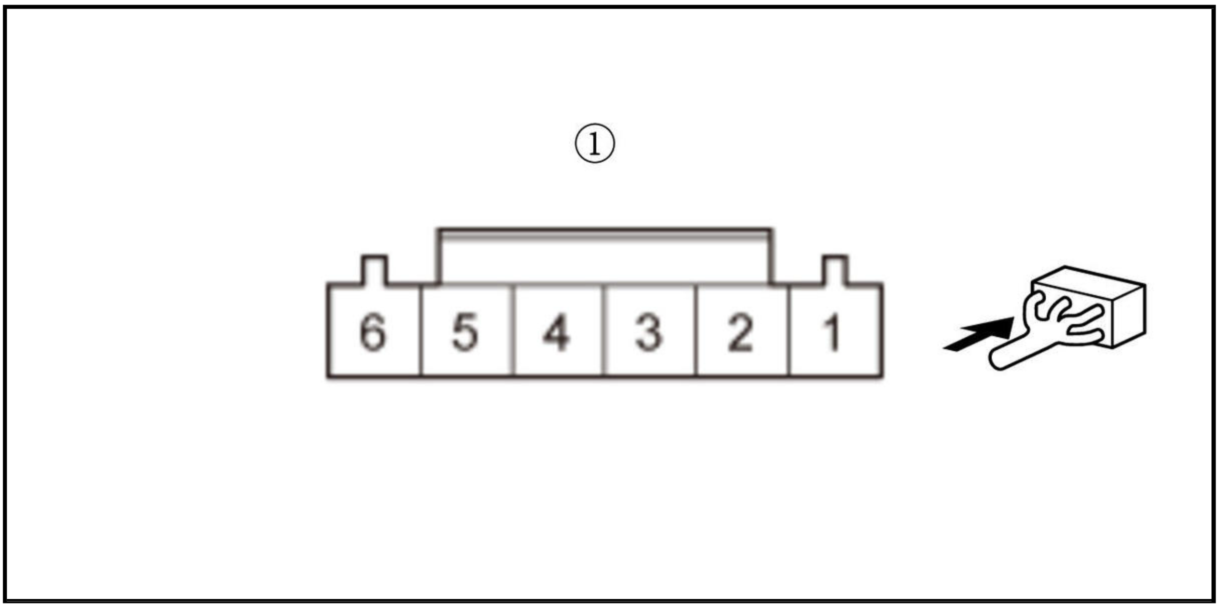
4. Determine possible failure area (shift lock solenoid, others)

-1. With the transmission in P position/mode, press the brake pedal.

NOTE: Do not press the accelerator pedal.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	Shift lever 6P connector: disconnected
Test point 1	Shift lever 6P connector (female terminals) No. 5 : ①
Test point 2	Shift lever 6P connector (female terminals) No. 6 : ①



Is there battery voltage?

YES

Check the shift lock mechanism . If the mechanism is OK, **replace the shift lock solenoid** .

NO

Go to step 5.

5. Open wire check (SLS/SHIFT LOCK SOL line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

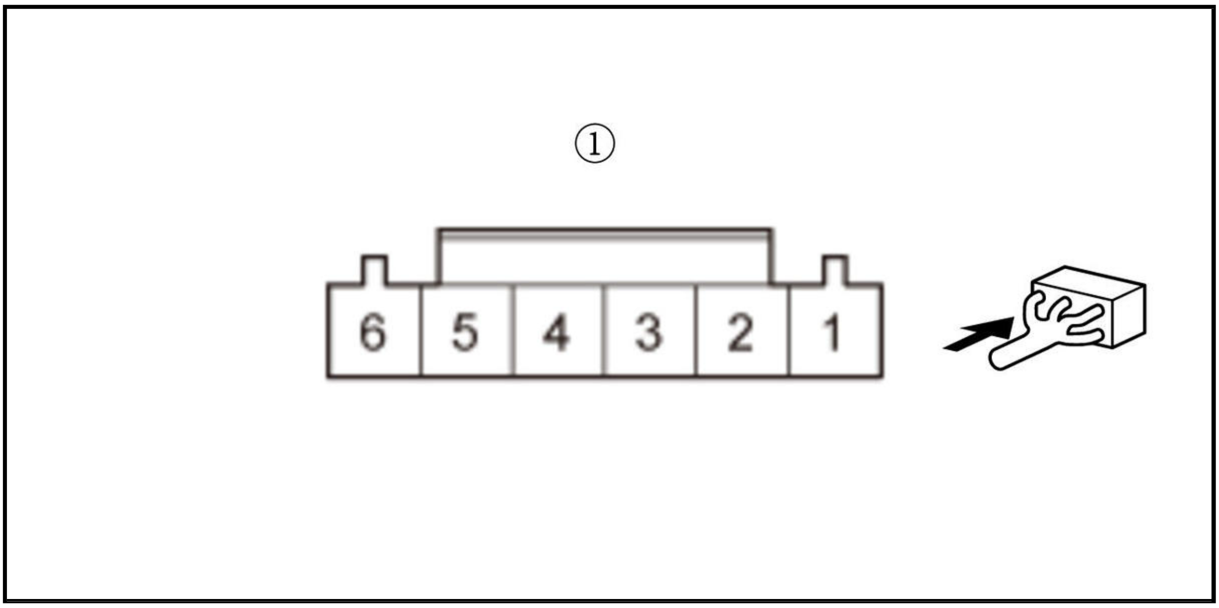
NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	Shift lever 6P connector: disconnected
	PCM connector A (51P): disconnected
Test point 1	Shift lever 6P connector (female terminals) No. 6 : ①
Test point 2	**PCM connector A (51P) No. 12**



Is there continuity?

YES

The SLS/SHIFT LOCK SOL wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair an open in the SLS/SHIFT LOCK SOL wire between the shift lock solenoid and the PCM.

6. Brake pedal position switch operation check

-1. Check the parameter(s) below with the HDS while pressing the brake pedal.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Brake Switch	ON	B	B	B

Do the current condition(s) match the threshold?

YES

The brake pedal position switch is OK. Go to step 8.

NO

If the brake lights come on, go to step 7. If the brake lights do not work, repair faulty brake light circuit.

7. Open wire check (STOP SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

-3. Disconnect the following connector.

PCM connector A (51P)

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	PCM connector A (51P): disconnected
Test point 1	**PCM connector A (51P) No. 37**
Test point 2	Body ground

Is there battery voltage while pressing the brake pedal and about 0 V when the pedal is released?

YES

The STOP SW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair an open in the STOP SW wire between the PCM and the brake pedal position switch.

8. Transmission range switch parameter check

-1. Shift the transmission to P position/mode.

-2. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
A/T P Switch	ON	B	B	B

Do the current condition(s) match the threshold?

YES

The transmission range switch is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Go to step 9.

9. Transmission range switch check

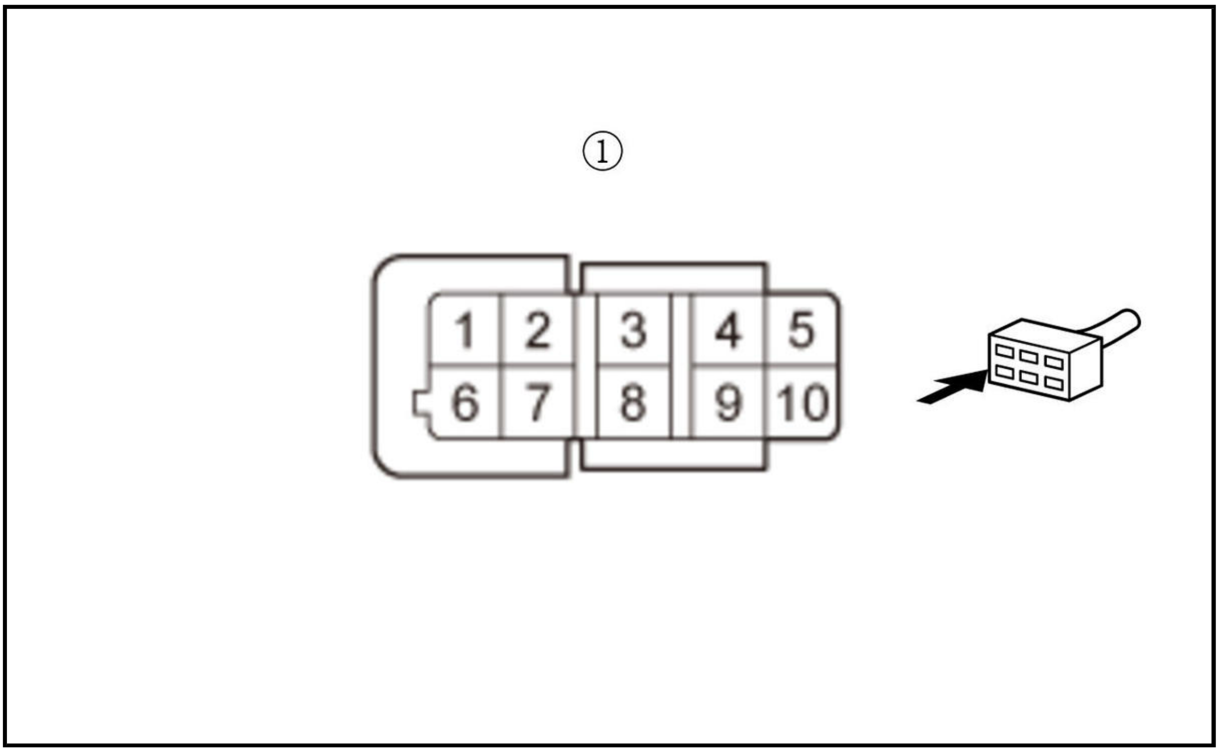
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Transmission range switch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Transmission range switch 10P connector (female terminals) No. 5 : ①
Terminal B	Body ground



-4. Turn the vehicle to the ON mode.

-5. Check the parameter(s) below.

Signal	Threshold		Current conditions	
	Values	**Unit**	**Values**	**Unit**
A/T P Switch	ON	B	B	B

Do the current condition(s) match the threshold?

YES

Replace the transmission range switch .

NO

The transmission range switch is OK. Go to step 10.

10. Open wire check (ATPP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

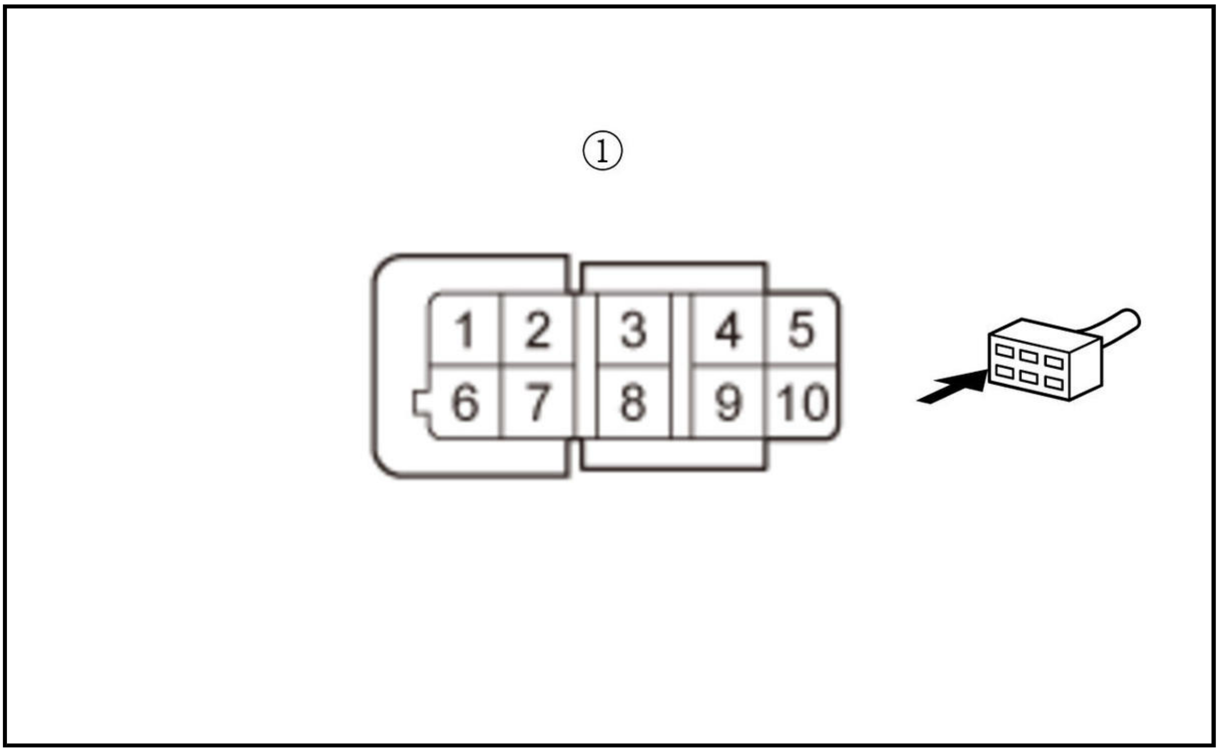
-4. Disconnect the following connector.

PCM connector C (51P)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Transmission range switch 10P connector: disconnected
B	PCM connector C (51P): disconnected

Test point 1	Transmission range switch 10P connector (female terminals) No. 5 : ①
Test point 2	**PCM connector C (51P) No. 34**



Is there continuity?

YES

The ATPP wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original PCM** .

NO

Repair an open in the ATPP wire between the transmission range switch and the PCM.

REPAIR PROCEDURES AND TESTS

AUXILIARY TRANSMISSION FLUID PUMP AIR BLEEDING (2020 2021)

Bleeding

NOTE: The auxiliary transmission fluid pump air bleeding procedure must be done when:

- The auxiliary transmission fluid pump is removed.
- The transmission fluid is replaced.
- The TCM is replaced.
- The transmission is replaced.
- The valve body assembly is replaced.

Procedure With HDS

1. **HDS - Connect**
2. **Transmission Fluid Level - Check**
3. Engine - Warm Up

> 1. Start the engine, and warm up the engine by raising the engine speed around 3, 000 rpm until the cooling fans comes on.
>
> 2. Turn the engine off.

4. Auxiliary Transmission Fluid Pump - Air Bleed

> 1. Select the Function Test in the A/T SYSTEM, and drive the auxiliary transmission fluid pump for at least 15 seconds with the HDS.
> **NOTE:** Do not drive the auxiliary transmission fluid pump for more than 160 seconds at a time.

5. **Transmission Fluid Level - Check**

Procedure Without HDS

6. **Transmission Fluid Level - Check**
7. Engine - Warm Up

> 1. Start the engine, and warm up the engine by raising the engine speed around 3, 000 rpm until the cooling fans comes on.

8. Auxiliary Transmission Fluid Pump - Air Bleed

> 1. **Do the auto idle stop system operation** . If the auto idle stop system does not operate for at least 15 seconds, repeat this procedure and recheck, or do the procedure with the HDS.

9. **Transmission Fluid Level - Check**

Procedure After Replacing TCM and Transmission or Only TCM

10. Auxiliary Transmission Fluid Pump - Air Bleed

> 1. Turn the vehicle to the ON mode, then wait for at least 2 seconds.
>
> 2. Turn the vehicle to the OFF mode, then wait for at least 10 seconds.
>
> **NOTE:** Do not start the engine.
>
> 3. Turn the vehicle to the ON mode, then make sure the shift position indicator does not blink.
>
> - If the shift position indicator does not blink, the air bleed is complete.
> - If the shift position indicator blinks, repeat from step 2.

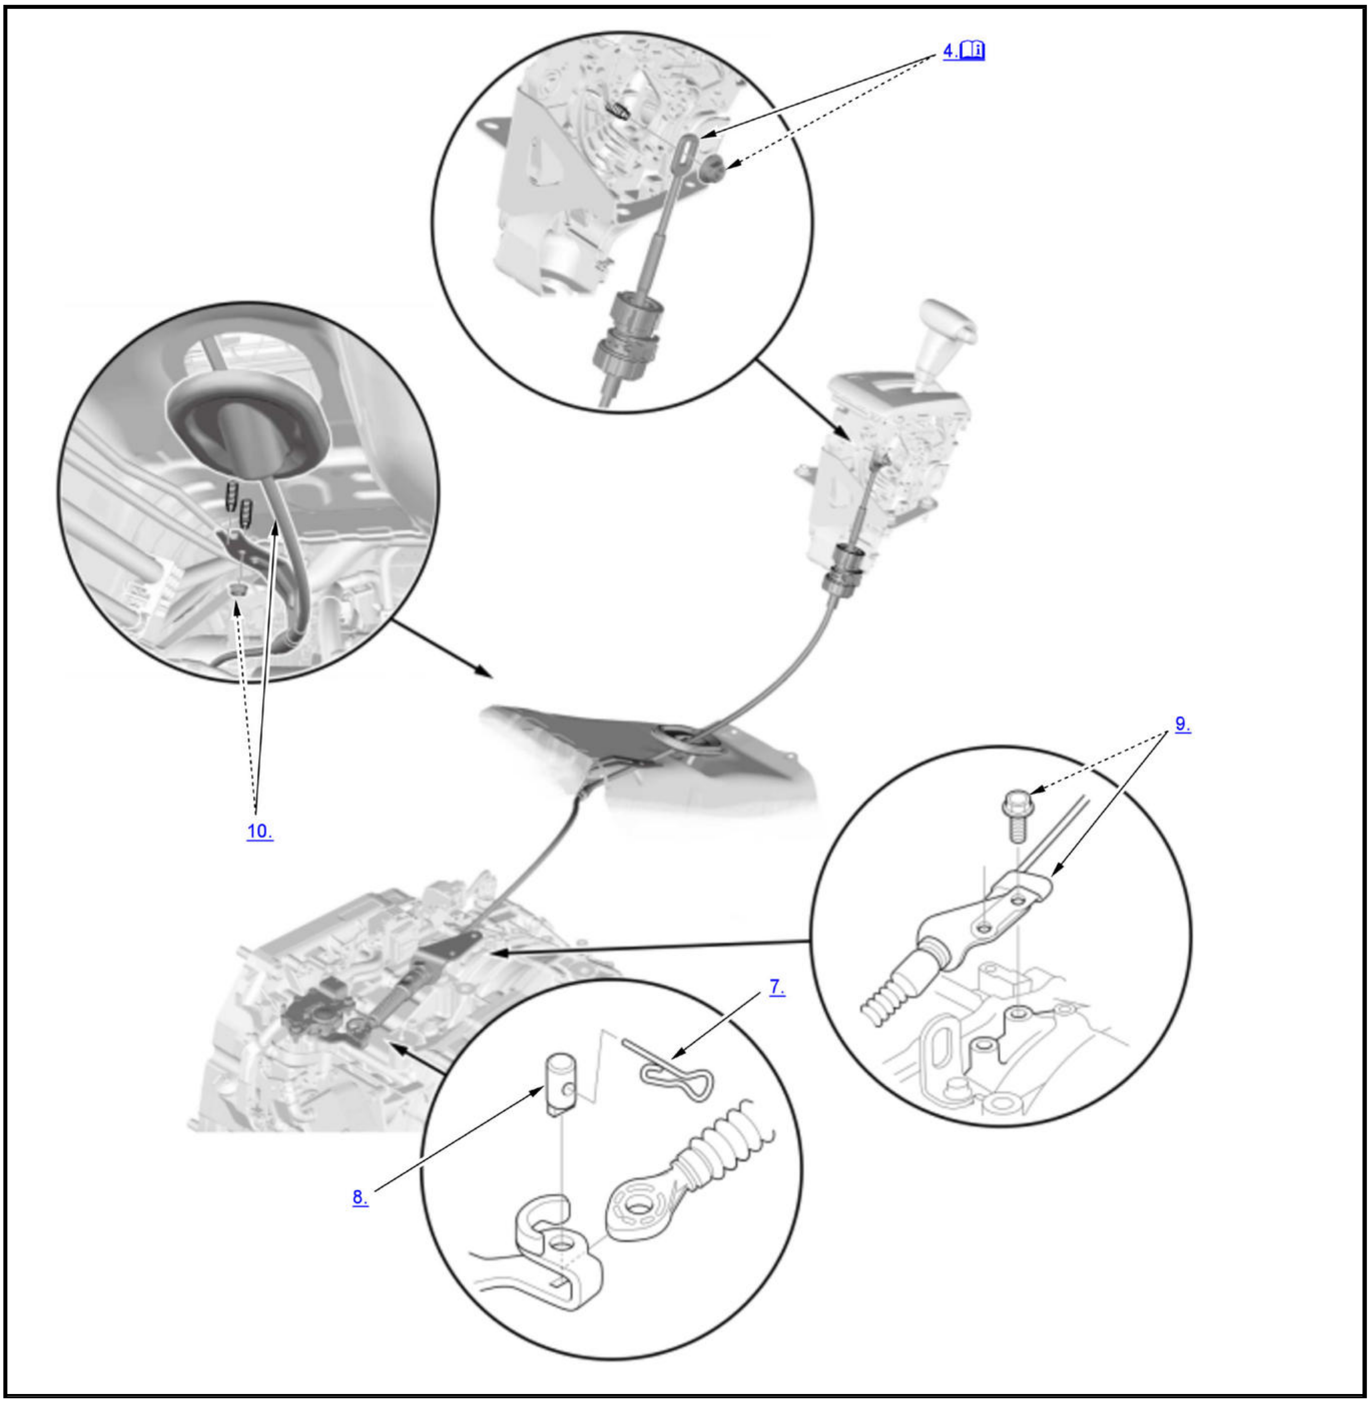
SHIFT CABLE REMOVAL, INSTALLATION, AND ADJUSTMENT

Removal

SRS components are located in this area. Review **the SRS component locations** and **the precautions and procedures** before doing repair or service.

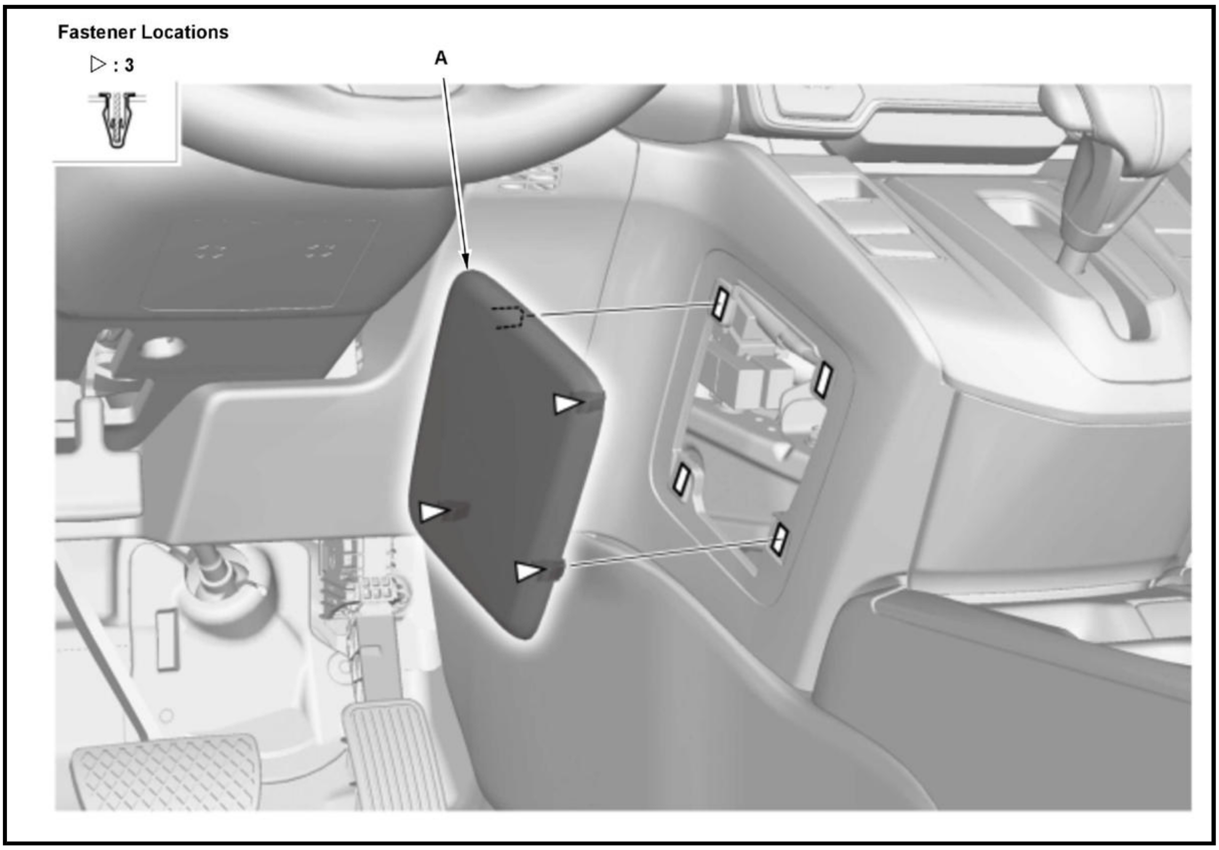
NOTE:

- ℹ Where icon is shown further information.
- Do not bend the shift cable excessively.



🕮	Detailed information, notes and precautions

1. **Vehicle - Lift**
2. Center Maintenance Cover - Remove
   1. Remove the center maintenance cover (A),



3. [Front Console Cover - Remove (Driver's Side)]

4. Shift Cable (Shift Lever Side) - Remove

	1. Shift the transmission to R position/mode. 2. Insert a 6.0 mm (0.236 in) pin (A) into the positioning holes (B). **NOTE:** Use only a 6.0 mm (0.236 in) pin with no burrs. 3. Remove the shift cable end nut.

	4. Unlock the retainer lock (A).

	5. Rotate the socket holder retainer (A) in arrow direction (B) until it stops, and push the retainer lock (C) into the socket holder retainer to lock the retainer.

	6. Slide the socket holder (A) away as shown to remove the shift cable (B). **NOTE:** Do not remove the shift cable by pulling the shift cable guide (C).

5. **Air Cleaner - Remove**
6. **Throttle Body Inlet Pipe - Remove** (1.5 L engine)

7. Lock Pin - Remove
8. Control Pin - Remove
9. Shift Cable Bracket - Remove
10. Shift Cable (Under Side) - Remove

Installation

SRS components are located in this area. Review **the SRS component locations** and **the precautions and procedures** before doing repair or service.

NOTE:

- Where icon is shown further information.
- Do not bend the shift cable excessively.
- Unless otherwise indicated, illustrations used in the procedure are for LHD model.

1

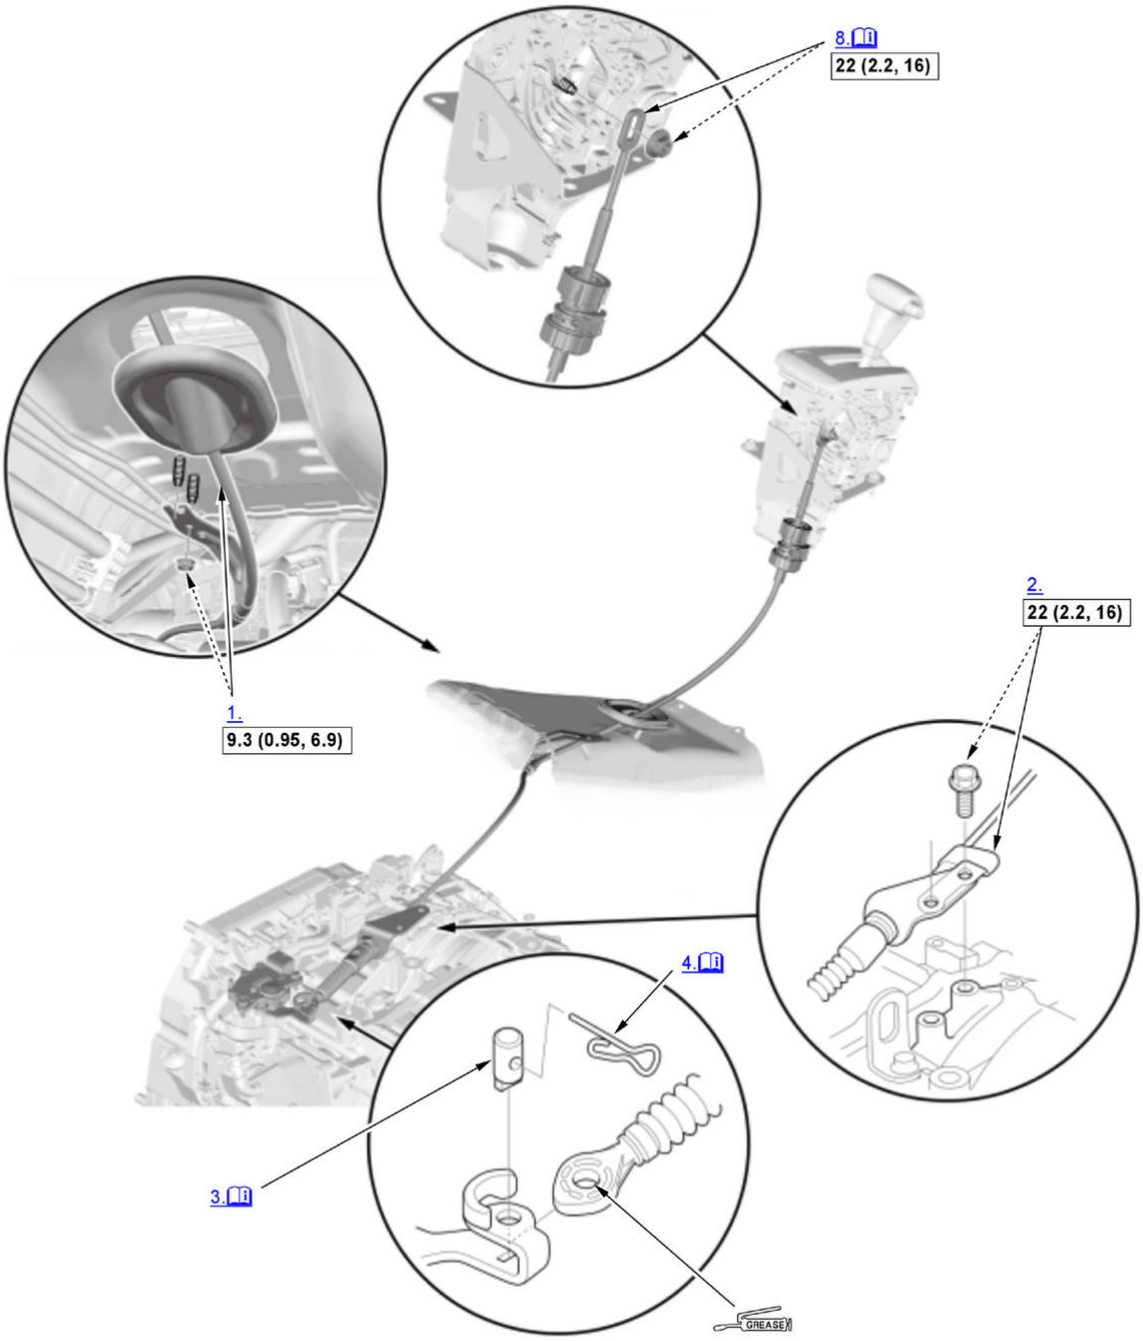


Fig. 1: Shift Cable Replacement Components With Torque Specifications
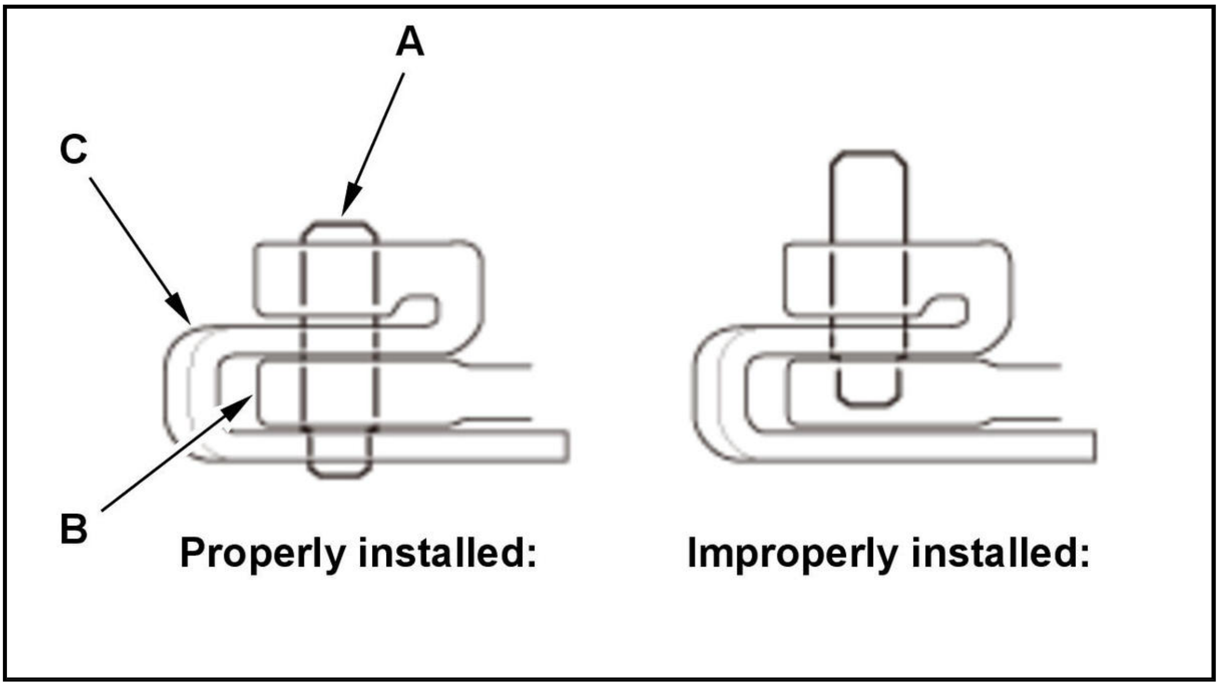
Courtesy of HONDA, U.S.A., INC.

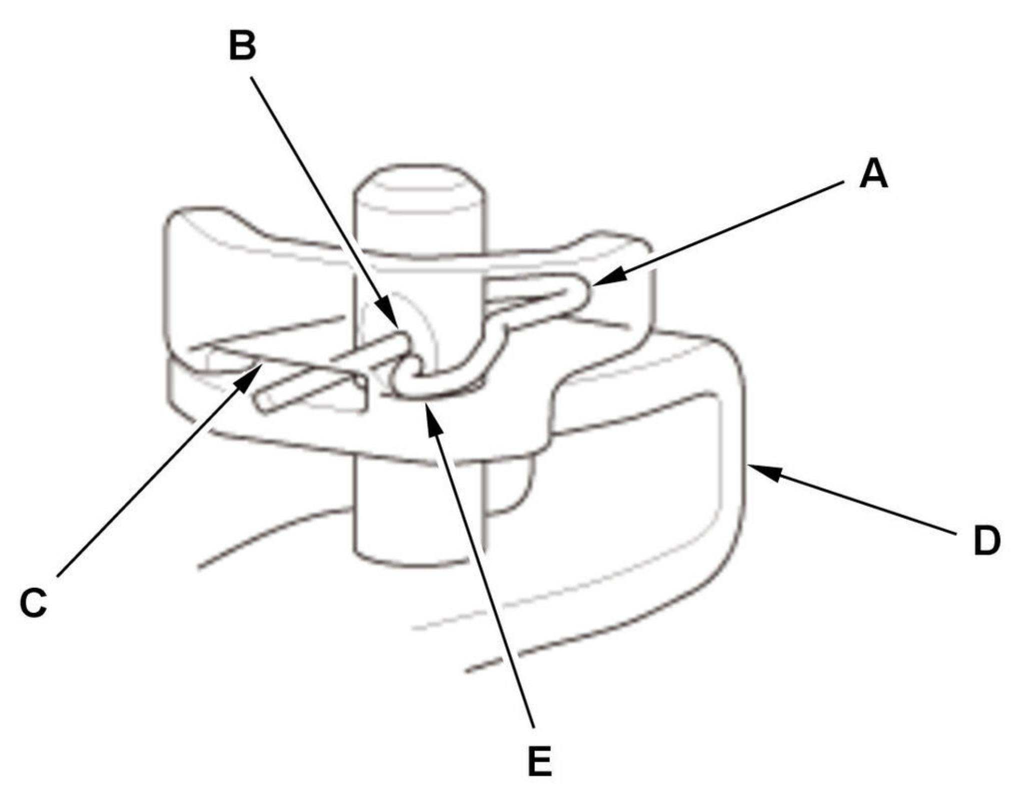
ℹ	Detailed information, notes and precautions
▭	Torque: N.m (kgf.m, lbf.ft)
GREASE	Apply molybdenum grease to inner surface of hole.

1. Shift Cable (Under Side) - Install
2. Shift Cable Bracket - Install
3. Control Pin - Install



NOTE: Make sure the control pin (A) is inserted through the shift cable end (B) and fully seated on the control lever (C).

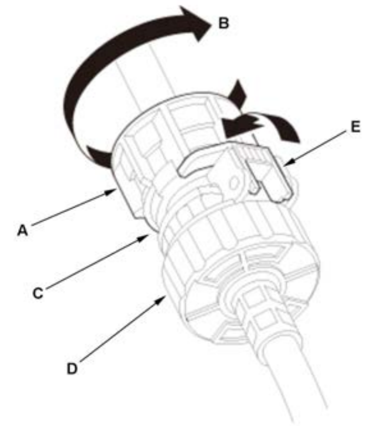
4. Lock Pin - Install



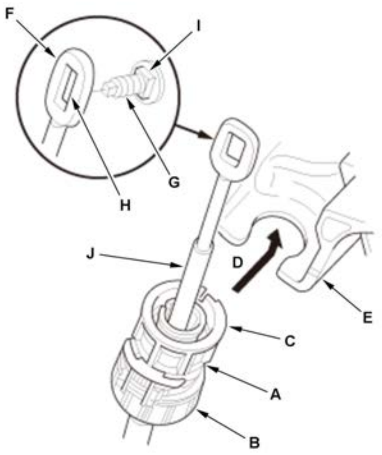
NOTE: Make sure the lock pin (A) is inserted through the control pin hole (B) to the opening (C) of the control lever (D) so that the hooked end (E) of the lock pin locks into the control pin hole.

5. **Throttle Body Inlet Pipe - Install** (1.5 L engine)
6. **Air Cleaner - Install**
7. Shift Cable - Adjust
8. Shift Cable (Shift Lever Side) - Install

	1. Unlock the retainer lock (A).



2. Rotate the socket holder retainer (A) in arrow direction (B) until it stops to create clearance (C) between the socket holder (D) and holder retainer, and push the retainer lock (E) into the socket holder retainer to lock the retainer.



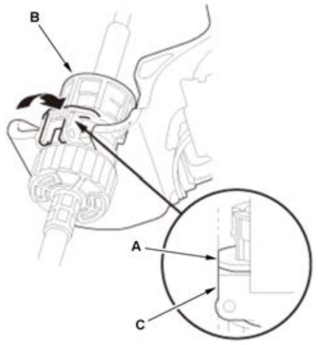
F
I
H
G
J
D
E
C
A
B

3. Align the shift cable slot (A) between the socket holder (B) and the socket holder retainer (C) with the opening (D).

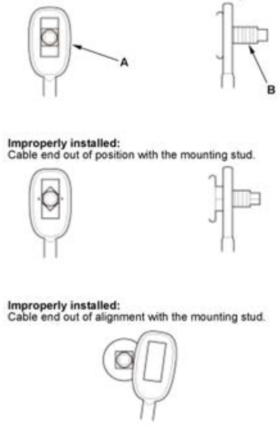
4. Slide the socket holder into the shift cable bracket (E) while installing the shift cable end (F) over the mounting stud (G) by aligning its square hole (H) with the square fitting (I) at the bottom of the stud.

NOTE:

- Do not install the shift cable by holding the shift cable guide (J).
- When the socket holder is installed in the shift cable bracket, the retainer lock is unhinged and releases the holder retainer lock, then the holder retainer returns under spring force to secure the shift cable.



5. Push the retainer lock (A) fully to lock the socket holder retainer (B), and make sure that the retainer lock fits into the hinged-joint (C). If the retainer lock does not fit with the edge of the hinged-joint, rotate the holder retainer clockwise while pushing the retainer lock until it locks.



Properly installed:
Cable end rides on the bottom of the mounting stud.
A
B
Improperly installed:
Cable end out of position with the mounting stud.
Improperly installed:
Cable end out of alignment with the mounting stud.

6. Make sure that the shift cable end (A) is properly installed on the mounting stud (B).

- If the cable end is out of position with the mounting stud, remove the shift cable from the shift cable bracket, then reinstall the cable end over the mounting stud before reinstalling the shift cable to the shift cable bracket. Do not install the shift cable end on the mounting stud with the shift cable install on the shift cable bracket.
- If the shift cable end does not ride at the bottom of the mounting stud, rotate the stud to align the square fitting with the hole.

9. 6.0 mm (0.236 in) Pin - Remove

10. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

11. Shift Cable - After Install Check

1. Turn the vehicle to the ON mode.

2. Move the shift lever through all positions/modes, and check that the shift position indicator follows the shift lever operation.

3. Shift the transmission to P position/mode, and check that the shift lock works properly.

4. Push the shift lock release, and check that the shift lever releases. Also check that the shift lever locks when it is shifted back to P.

5. Check that the back-up lights come on when the transmission is in R position/mode.

6. Start the engine.

NOTE: Check that the engine starts in P or N position/mode, and does not start in any other positions/modes.

7. Make sure the vehicle is turned to the OFF (LOCK) mode with the shift lever in P position/mode. If it is not, adjust the shift cable again.

Adjustment

NOTE: Do not bend the shift cable excessively.

1. Center Maintenance Cover - Remove
2. **Front Console Cover - Remove (Driver's Side)**
3. Shift Cable (Shift Lever Side) - Disconnect
4. Shift Cable - Adjust

	1. Push the shift cable (A) until it stops, then release it. **NOTE:** Do not hold the shift cable guide (B) to adjust the shift cable. 2. Pull the shift cable back one step from the P position so that the shift position is in R. 3. Turn the vehicle to the ON mode. 4. Check that the R indicator comes on. 5. Turn the vehicle to the ACCESSORY mode.

5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

6. Shift Cable - After Adjust Check

1. Turn the vehicle to the ON mode.

2. Move the shift lever through all positions/modes, and verify the transmission range switch matches with the shift position indicator.

3. Shift the transmission to P position/mode, and check that the shift lock works properly.

4. Push the shift lock release, and check that the shift lever releases. Also check that the shift lever locks when it is shifted back to P.

5. Check that the back-up lights come on when the transmission is in R position/mode.

6. Start the engine.

NOTE: Check that the engine starts in P or N position/mode, and does not start in any other positions/modes.

7. Make sure the vehicle is turned to the OFF (LOCK) mode with the shift lever in P position/mode. If it is not, adjust the shift cable again.

TRANSMISSION FLUID (HCF-2) LEVEL CHECK AND REPLACEMENT

Replacement

NOTE:

- **How to read the torque specifications** .
- Keep all foreign particles out of the transmission.
- For your safety, drain the transmission fluid when the engine is cool.
- Unless otherwise indicated, illustrations used in the procedures are for a 1.5L engine model.

1. **Vehicle - Lift**
2. **Engine Undercover Lid - Remove**
3. Engine - Warm Up

1. Start the engine, and warm up the engine by raising the engine speed around 3, 000 rpm until the cooling fans comes on.

2. Turn the engine off.

4. Transmission Fluid - Drain

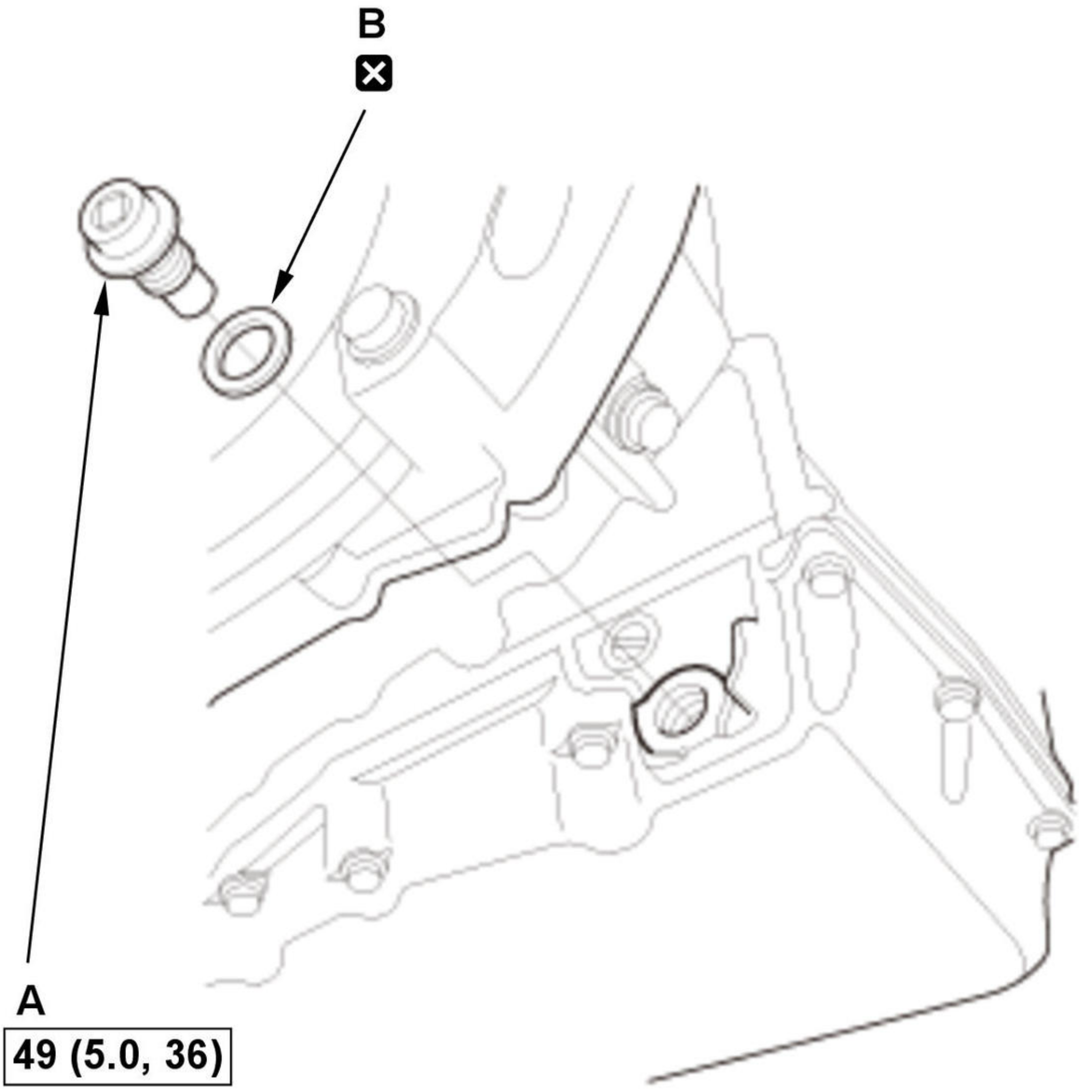


Fig. 2: Transmission Fluid Drain Plug Torque Specifications
Courtesy of HONDA, U.S.A., INC.

1. Remove the drain plug (A) with the sealing washer (B), and drain the transmission fluid for at least 5 minutes.

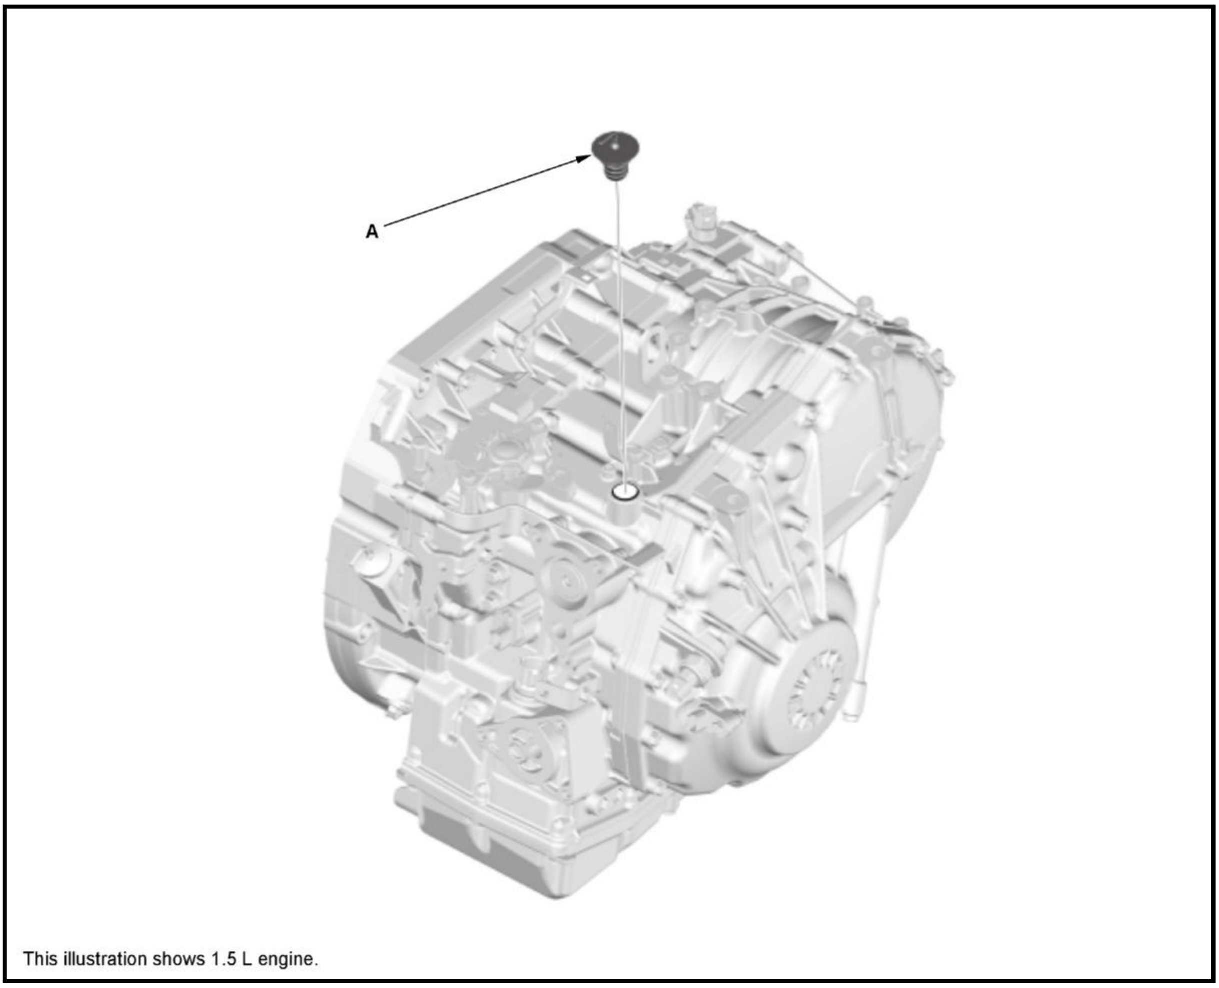
NOTE:

- Be careful not to burn yourself by nearby parts as they may be hot.
- Remove metal particles from the magnetic surface of the drain plug.

2. Reinstall the drain plug with a new sealing washer.

5. Transmission Fluid - Refill

   1. Lower the vehicle.



This illustration shows 1.5 L engine.

2. Remove filler cap (A).

NOTE: The position of the filler cap is different depending on the model.

3. Refill the transmission with the recommended fluid into the filler hole. Always use Honda HCF-2 Continuously Variable Transmission Fluid.

NOTE: Using the wrong type of fluid will damage the transmission.

Transmission Fluid (HCF-2) Capacity:	
2WD:	
B	**3.6 L (3.8 US qt) at change**
B	**5.8 L (6.1 US qt) at oil pan, valve body assembly, and transmission fluid pump removal, installation, and replacement***
B	**7.6 L (8.0 US qt) at overhaul**
AWD:	
B	**4.2 L (4.4 US qt) at change**
B	**4.8 L (5.1 US qt) at transfer removal, installation, and replacement**
B	**6.8 L (7.2 US qt) at oil pan, valve body assembly, and transmission fluid pump removal, installation, and replacement***
B	**8.4 L (8.9 US qt) at overhaul**

NOTE:

*The actual transmission fluid (HCF-2) capacity will vary from the specified capacity based on the length of time the transmission fluid pan is off the transmission. Avoid leaving the transmission fluid pan off for extend periods of time.

4. Install the filler cap with the lever toward the front of the vehicle.

6. **Auxiliary Transmission Fluid Pump - Air Bleed** (With auto idle stop system)
7. Transmission Fluid Level - Check
8. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

9. Maintenance Minder - Reset (With Maintenance Minder System)

1. If the Maintenance Minder required to replace the transmission fluid, **reset the Maintenance Minder with the gauge** (see "Resetting the Maintenance Minder").If the Maintenance Minder did not require to replace the transmission fluid, **reset the Maintenance Minder with the HDS** (see "Resetting the Individual Maintenance Items").

Check

NOTE:

- **How to read the torque specifications** .
- Keep all foreign particles out of the transmission.

1. **Vehicle - Lift**
2. **Engine Undercover Lid - Remove**
3. Transmission Fluid Level - Check

	**NOTE:** • Be careful not to burn yourself by nearby parts as they may be hot. • When checking the transmission fluid level at the check bolt, it is not uncommon to find the fluid in the upper or lower level. • Do the transmission fluid level check immediately, after the shift lever operation. 1. Start the engine. 2. While pressing the brake pedal firmly, shift the transmission to P

R

N

D

S

L

S

D

N

→

R

→

P position/mode, waiting at least 3 seconds between each gear shift.

3. Turn the engine off.

4. Remove the check bolt (A) with the sealing washer (B).

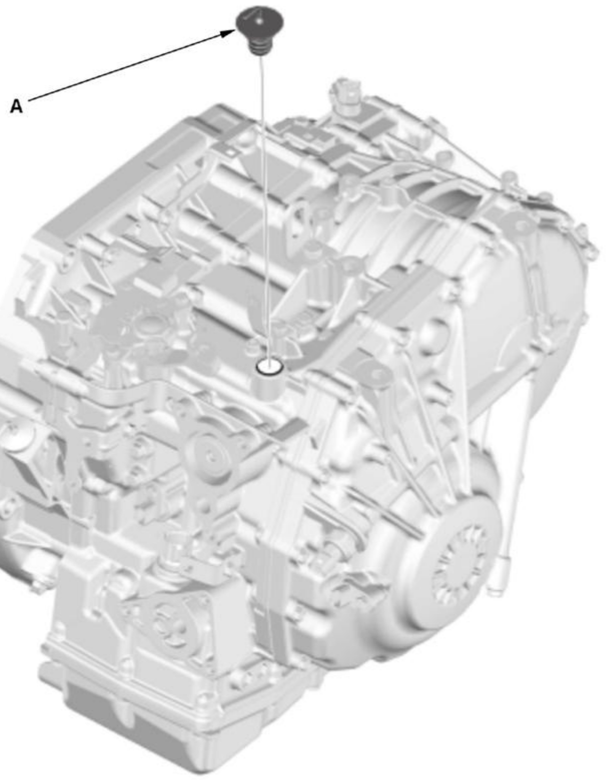
5. Check the transmission fluid level.

NOTE: The transmission fluid is at the proper level if the transmission fluid is dripping from the check hole gradually.

- If the transmission fluid is dripless from the check hole, check for transmission fluid leaks at the transmission, the transmission fluid pan, the transmission fluid hoses, and the transmission fluid lines. If a problem is found, fix it before filling the transmission with transmission fluid, then go to step 3
- If the transmission fluid is flowing out of the check hole, go to step 3-12.

6. Temporarily install the check bolt with the sealing washer.

7. Lower the vehicle.



This illustration shows 1.5 L engine.

8. Remove filler cap (A).

NOTE: The position of the filler cap is different depending on the model.

9. Refill the transmission with the recommended fluid into the filler hole at the suitable amount. Always use Honda HCF-2 Continuously Variable Transmission Fluid.

NOTE: Using the wrong type of fluid will damage the transmission.

10. Install the filler cap with the lever toward the front of the vehicle.

11. Go to step 3-1, then recheck.

	12. Wait until the transmission fluid is at the proper level. **NOTE:** The transmission fluid is at the proper level if the transmission fluid is dripping from the check hole gradually.

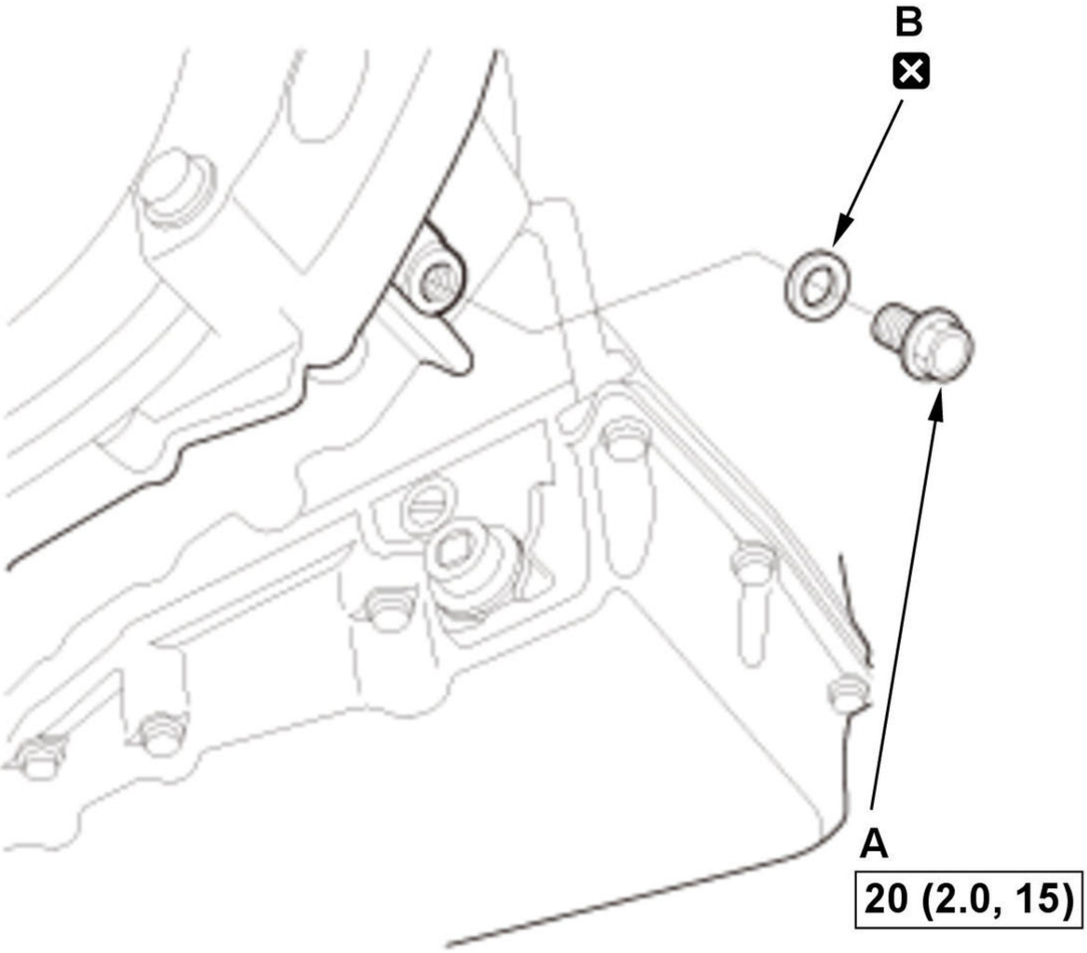


Fig. 3: Transmission Fluid Check Bolt Torque Specifications
Courtesy of HONDA, U.S.A., INC.

13. After checking the transmission fluid level, install the check bolt (A) with a new sealing washer (B).

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

ADJUSTMENT

INPUT SHAFT THRUST CLEARANCE ADJUSTMENT

Special Tools Required

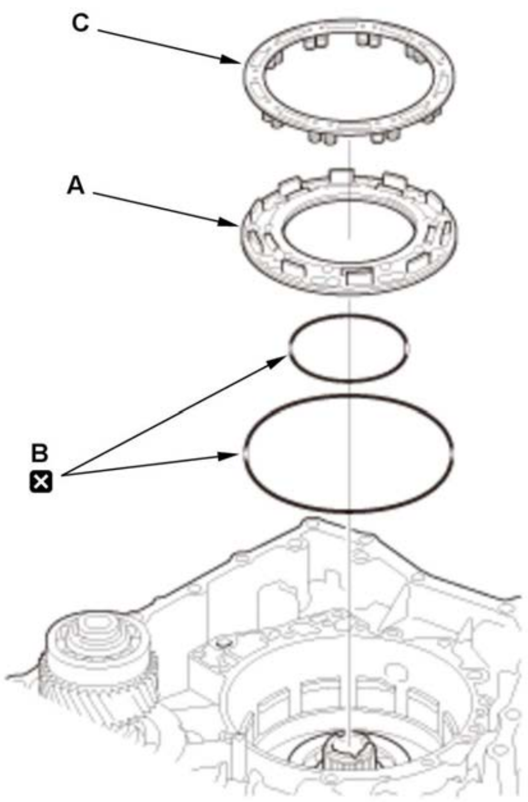
Image	Description/Tool Number
	Reverse Brake Spring Compressor Set 070AF-RJ2A100
	Magnet Stand Base 07979-PJ40001
	Snap Ring Pliers 07LGC-0010100

Adjustment

NOTE:

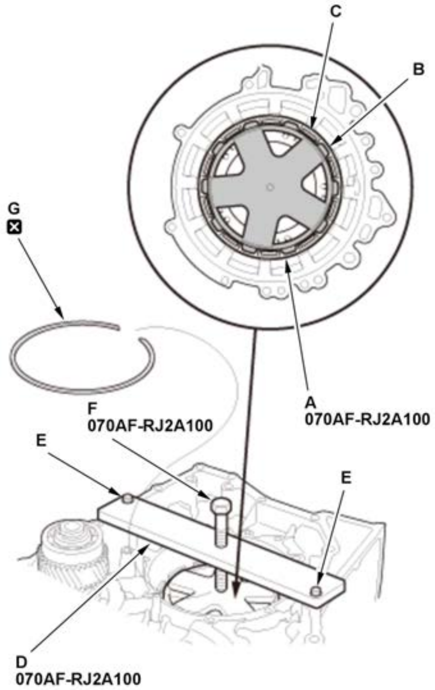
- How to read the torque specifications .
- If the transmission was disassembled, the input shaft thrust clearance must be adjusted.
- Apply a light coat of clean transmission fluid on all parts before installation.

1. Reverse brake piston - Install



1. Install the reverse brake piston (A) with new O-rings (B).

2. Install the spring retainer/return spring assembly (C).



3. Put the reverse brake spring compressor attachment (A) on the spring retainer/return spring assembly (B).

NOTE: Be sure the attachment is set over the return springs, not on the reverse brake piston (C).

4. Install the reverse brake spring compressor plate (D) with facing the UP mark to the upside using bolts (E).

5. Make sure that the reverse brake spring compressor bolt (F) is properly installed on the dent in the surface of the reverse brake spring compressor attachment.

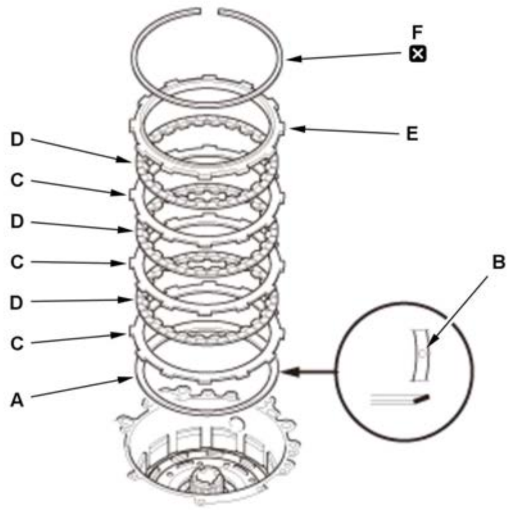
6. Compress the return springs using the reverse brake spring compressor until the snap ring securing the spring retainer/return spring can be installed.

7. Install a new snap ring (G).

- Be careful not to deform the snap ring by opening/closing it excessively.
- Make sure the snap ring is firmly installed in the groove.

8. Remove the reverse brake spring compressor.

2. Reverse Brake - Install



1. Install the disc spring (A).

NOTE: Be sure to install the disc spring with the indented mark (B) facing the upward.

2. Starting with the reverse brake plate (C), alternately install the reverse brake plates and the reverse brake discs (D).

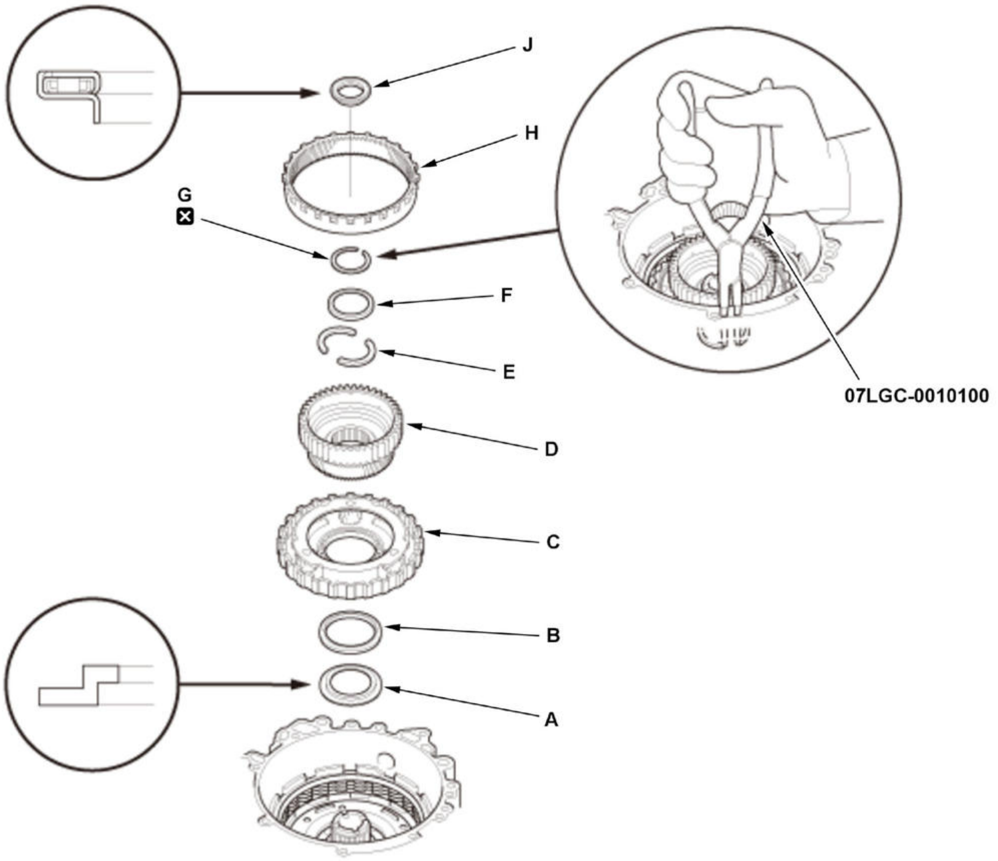
3. Install the reverse brake end-plate (E) with the flat side toward the top disc.

4. Install a new snap ring (F).

  - Be careful not to deform the snap ring by opening/closing it excessively.
  - Make sure the snap ring is firmly installed in the groove.

3. Planetary Carrier Assembly - Install

1. Install the 40 x 63 x 5.5 mm washer (A) in the direction shown.



2. Install these parts in the following order:

- 50 x 65 x 3 mm thrust washer (B)
- Planetary carrier assembly (C)
- Sun gear (D)
- 32.5 mm cotters (E)

- Cotter retainer (F)

3. Install a new snap ring (G) using the snap ring pliers.

NOTE:

- Be careful not to deform the snap ring by opening/closing it excessively.
- Make sure the snap ring is firmly installed in the groove.

4. Install the ring gear (H).

5. Install the 24.5 x 39.1 x 3.2 mm thrust needle bearing (J) in the direction shown.

4. Input Shaft Assembly - Install

	1. Install the input shaft assembly (A) by aligning the clutch discs (B) with the sun gear (C), and aligning the clutch guide (D) with the ring gear (E).

	2. Measure the depth (A) between the surface of the transmission housing (B) and the clutch guide (C), then make sure the measured value of the depth is within the recorded value when removing.

5. Stator Shaft - Install

 	1. Install the 29.55 x 45 x 3.62 mm thrust needle bearing (A) in the direction shown. 2. Install the 32 x 42 mm thrust shim (B). **NOTE:** If you install a new 32 x 42 mm thrust shim, use the same thickness shim as the old one, or use the 2.10 mm (0.0827 in) thickness of the 32 x 42 mm thrust shim. 3. Install the stator shaft (C) with the dowel pin (D).

6. Stator Shaft Flange - Install

 	1. Install the stator shaft flange (A) with the dowel pins (B) and new O-rings (C) by aligning the hole (D) of the stator shaft flange with the dowel pin (E) of the stator shaft.

7. Manual Valve Body - Install

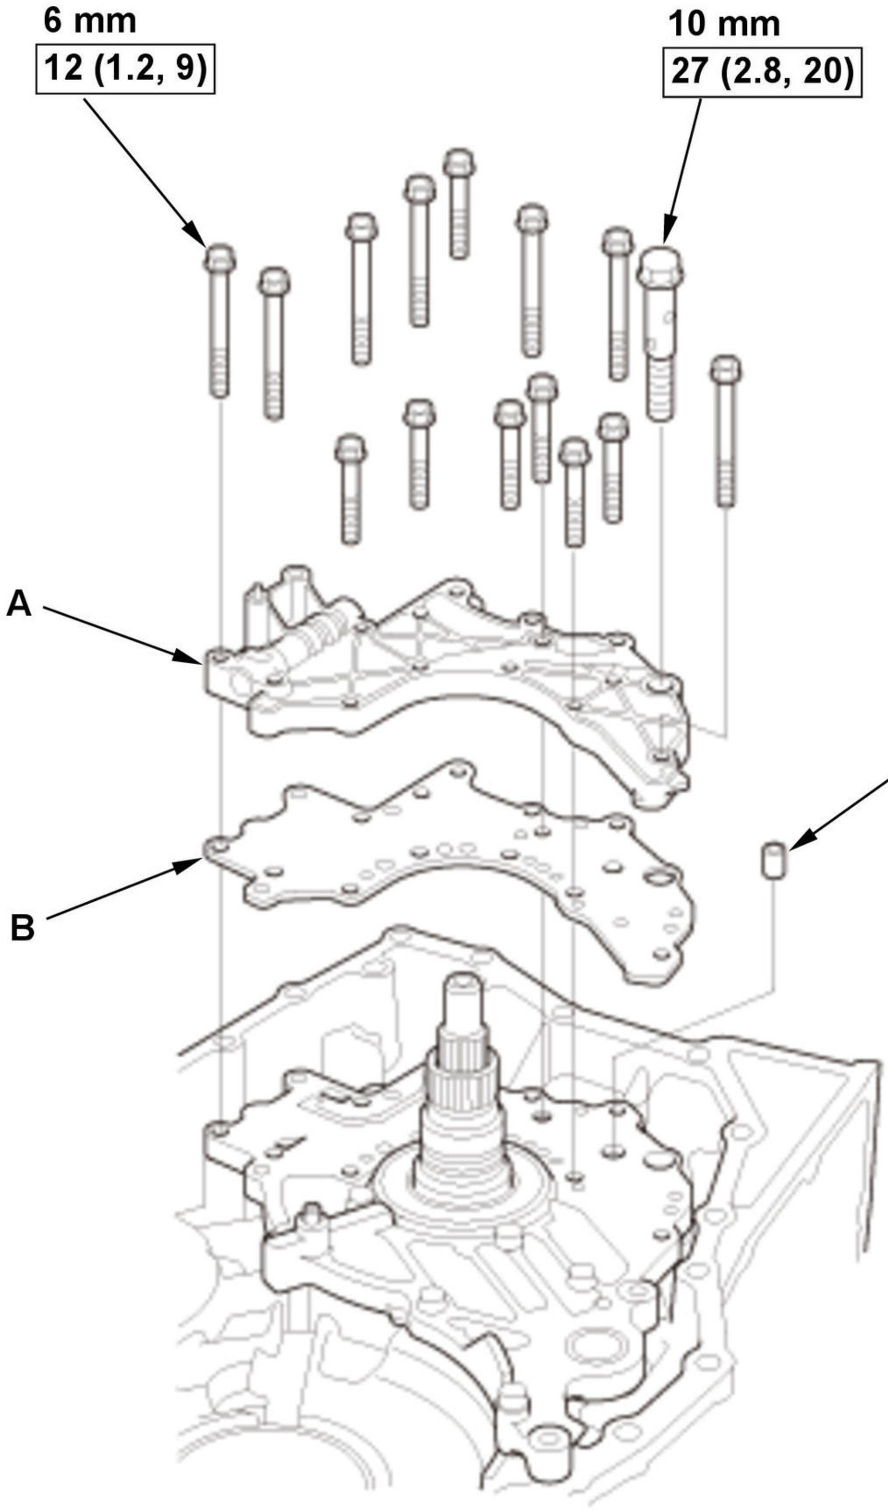


Fig. 4: Manual Valve Body Bolts Torque Specifications
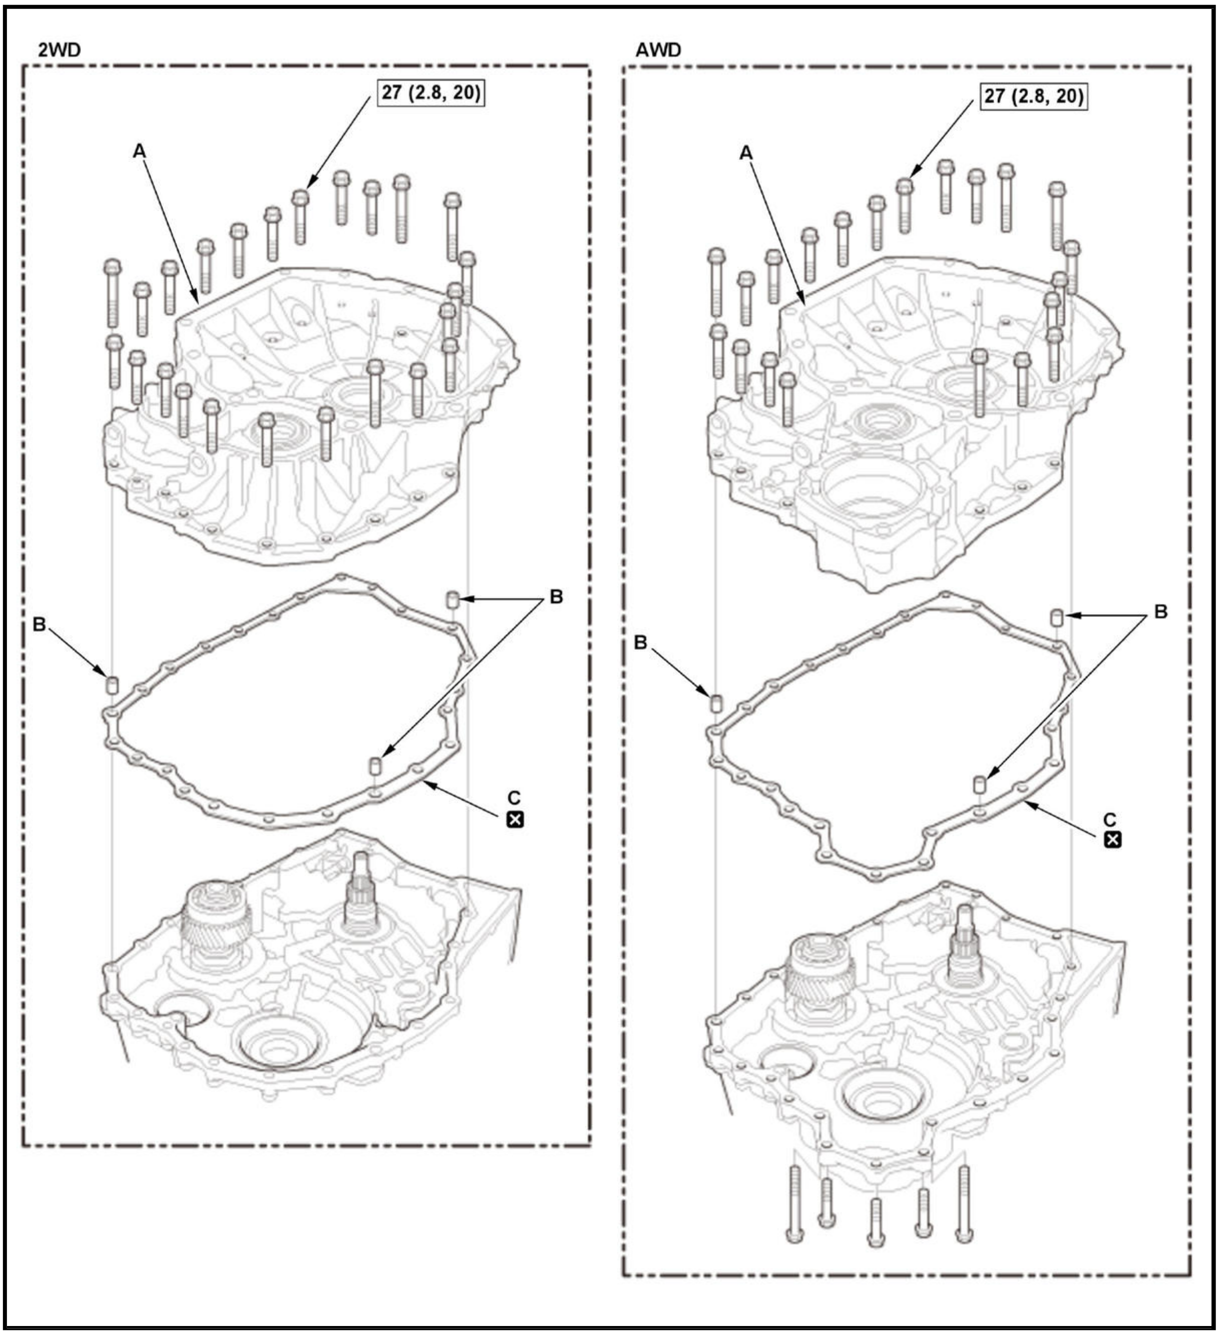
Courtesy of HONDA, U.S.A., INC.

1. Install the manual valve body (A) with the separator plate (B) and the dowel pin (C).

8. Torque Converter Housing - Install

   1. Install the torque converter housing (A) with the dowel pins (B) and a new gasket (C), then tighten the bolts in a crisscross pattern in at least two steps.



9. Input Shaft Thrust Clearance - Adjust

	1. Install the magnet stand base as shown. 2. Set a dial indicator (A) on the tip of the input shaft (B). 3. Zero the dial indicator. 4. Measure the input shaft thrust clearance by lifting the input shaft up. **NOTE:** Take measurements in at least three places, and use the average as the actual clearance. 5. If the clearance is out of the standard, remove the 32 x 42 mm thrust shim, and measure its thickness. 6. Select a new 32 x 42 mm thrust shim.

	32 x 42 mm Thrust Shim 7. Install a selected 32 x 42 mm thrust shim, then recheck the clearance.

No.	Thickness
A	1.65 mm (0.0650 in)
B	1.70 mm (0.0669 in)
C	1.75 mm (0.0689 in)
D	1.80 mm (0.0709 in)
E	1.85 mm (0.0728 in)
F	1.90 mm (0.0748 in)
G	1.95 mm (0.0768 in)
H	2.00 mm (0.0787 in)
I	2.05 mm (0.0807 in)
J	2.10 mm (0.0827 in)
K	2.15 mm (0.0846 in)
L	2.20 mm (0.0866 in)
M	2.25 mm (0.0886 in)
N	2.30 mm (0.0906 in)
O	2.35 mm (0.0925 in)
P	2.40 mm (0.0945 in)
Q	2.45 mm (0.0965 in)
R	2.50 mm (0.0984 in)
S	2.55 mm (0.1004 in)
T	2.60 mm (0.1024 in)

Standard:	**0.15-0.25 mm (0.0059-0.0098 in)**

TRANSMISSION HOUSING DRIVEN PULLEY SHAFT THRUST CLEARANCE ADJUSTMENT

Adjustment

1. **Secondary Drive Gear - Install**
2. **Driven Pulley Shaft Bearing (Transmission Housing Side) - Install**
3. Driven Pulley Shaft Thrust Clearance - Adjust

	1. Clean the cotter groove of the driven pulley shaft. 2. Install the 25.5 mm cotters (A). 3. Measure the clearance between the 25.5 mm cotters and the driven pulley shaft bearing (B) using a feeler gauge (C). **NOTE:** Take measurements in at least three places, and use the average as the actual clearance. 4. If the clearance is out of the standard, remove the 25.5 mm cotters, and measure its thickness.

	5. Select new 25.5 mm cotters. **25.5 mm Cotters** 6. Install the selected 25.5 mm cotters, then recheck the clearance.

No.	Thickness
A	2.9 mm (0.114 in)
B	3.0 mm (0.118 in)
C	3.1 mm (0.122 in)
D	3.2 mm (0.126 in)

Standard:	**0-0.13 mm (0-0.0051 in)**

TEST

CVT PRESSURE TEST

Special Tools Required

Image	Description/Tool Number
	Pressure Gauge Adapter 070AJ-RT4A101
	A/T Oil Pressure Gauge Set 07406-0020400 or 07406-0020401

CVT DRIVE PULLEY PRESSURE INSPECTION PORT
CVT DRIVEN PULLEY PRESSURE INSPECTION PORT

Test

NOTE:

- **How to read the torque specifications** .
- Check for DTCs. If any DTCs are stored, troubleshoot and clear them first.
- Do not allow dust or other foreign particles to enter the port while installing the A/T oil pressure gauge.
- Be sure to check the transmission fluid level after each pressure port test. When installing or removing the A/T oil pressure gauge, transmission fluid may run out of the pressure inspection ports.
- Do not test pressure for more than 10 seconds at a time.
- Do not move the shift lever while raising the engine speed.
- Disable the VSA by **enter the VSA maintenance mode** .
- VSA DTC(s) may come on during the test-drive. If the VSA DTC(s) come on, clear the DTC(s) after testing is done with the HDS.
- Unless otherwise indicated, illustrations used in the procedures are for a 1.5L engine model.

1. A/T Oil Pressure Gauge - Set

	1. When testing the oil pressure at each inspection port, select a suitable adapter from the following table, and connect each adapter to the A/T oil pressure gauge.

PRESSURE GAUGE ADAPTER
070AJ-RT4A101
PRESSURE GAUGE ADAPTER A
PRESSURE GAUGE ADAPTER B
PRESSURE GAUGE ADAPTER C
PRESSURE GAUGE ADAPTER D
PRESSURE GAUGE ADAPTER E

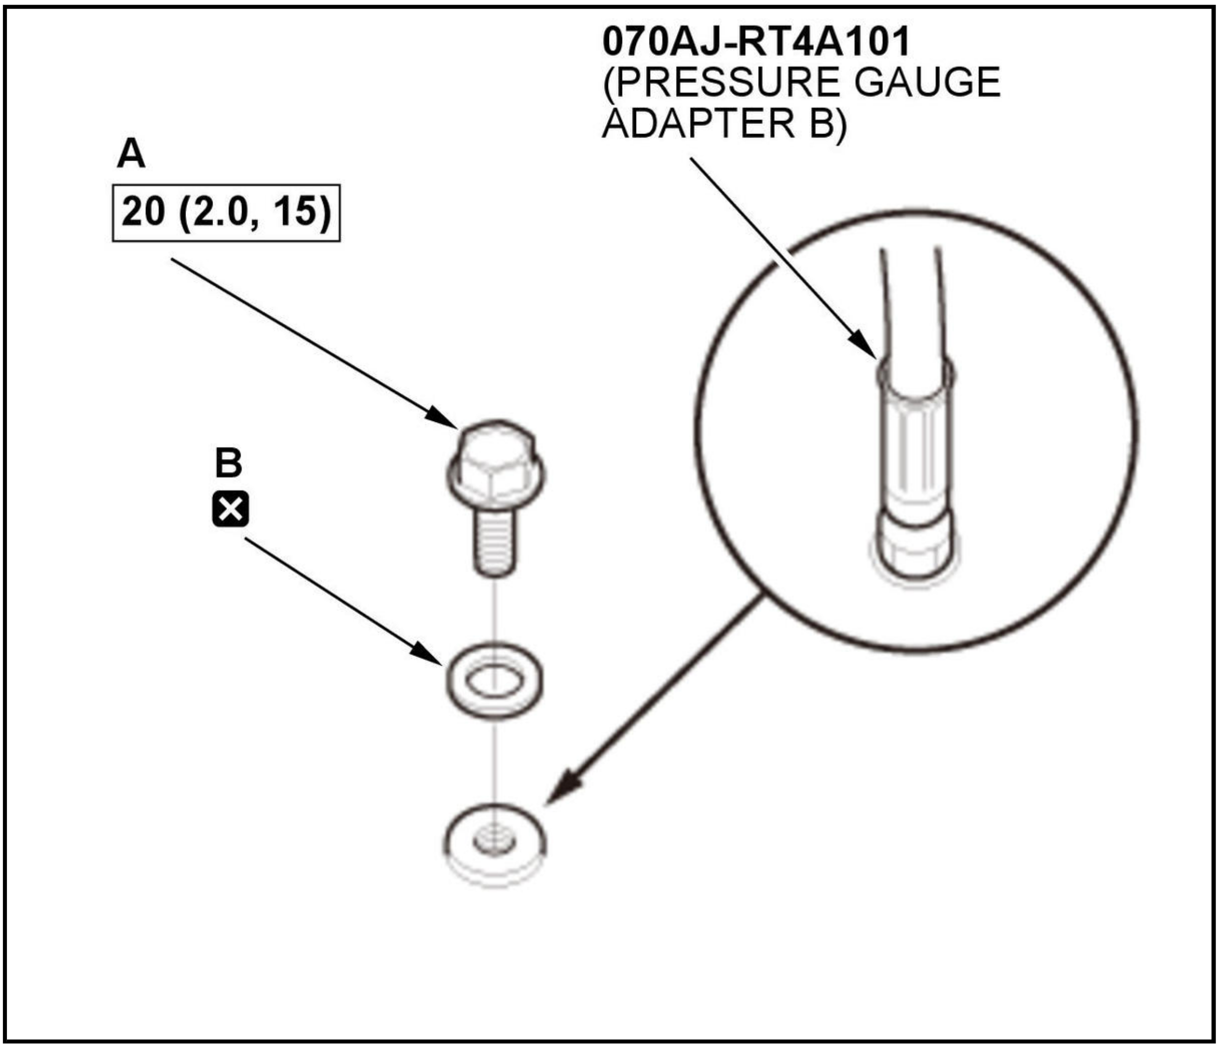
Inspection port	Tool
CVT drive pulley pressure	Pressure gauge adapter B
CVT driven pulley pressure	- Pressure gauge adapter A - Pressure gauge adapter E
Reverse brake pressure	Pressure gauge adapter B

Inspection port	Tool
Forward clutch pressure	Pressure gauge adapter B

2. **Vehicle - Lift**
3. **Engine Undercover - Remove**
4. **Transmission Fluid Level - Check**
5. Forward Clutch Pressure - Test

 07406-0020400 or 07406-0020401 07MAJ-PY40120 07MAJ-PY4011A or 07AAJ-PY4A100 070AJ-RT4A101 (PRESSURE GAUGE ADAPTER B)	1. Assemble the pressure gauge; install the 2, 210 mm A/T pressure hose, the A/T pressure adapter, and pressure gauge adapter B to the A/T oil pressure gauge set.

2. Remove the sealing bolt (A) with the sealing washer (B).



3. Install the pressure gauge to the forward clutch pressure inspection port.

4. Start the engine, and warm it up to normal operating temperatures (the radiator fan comes on twice).

5. Shift the transmission to D position/mode.

6. Measure the forward clutch pressure at the engine idling while firmly pressing the brake pedal.

Pressure	Specifications
Forward clutch	450-730 kPa (4.60-7.40 kgf/cm 2, 65.4-105.2 psi)

7. Turn the engine off.

8. If the forward clutch pressure is out of the specifications, refer to the problem and probable causes listed in the table.

Problem	Probable causes
No or low forward clutch pressure	• Transmission fluid pump defective • CVT clutch pressure control solenoid valve defective • Forward clutch defective • Valve body assembly defective • Manual valve body defective

9. Remove the pressure gauge.

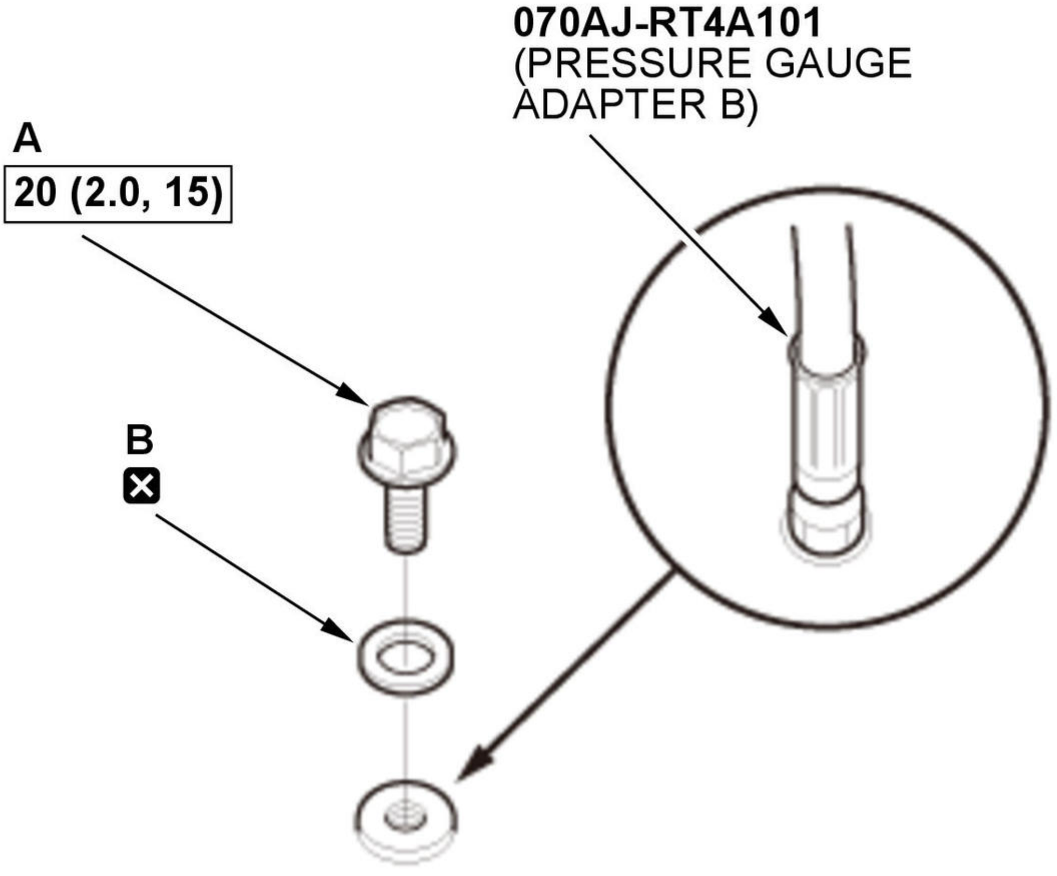
10. Install the sealing bolt with a new sealing washer to the forward clutch pressure inspection port.

NOTE: Do not reuse the old sealing washer.

6. CVT Drive Pulley Pressure - Test

 07406-0020400 or 07406-0020401 07MAJ-PY40120 07MAJ-PY4011A or 07AAJ-PY4A100 070AJ-RT4A101 (PRESSURE GAUGE ADAPTER B)	1. Assemble the pressure gauge; install the 2, 210 mm A/T pressure hose, the A/T pressure adapter, and pressure gauge adapter B to the A/T oil pressure gauge set.

2. Remove the sealing bolt (A) with the sealing washer (B).



070AJ-RT4A101
(PRESSURE GAUGE
ADAPTER B)
A
20 (2.0, 15)
B
☒

3. Install the pressure gauge to the CVT drive pulley pressure inspection port.

4. Start the engine, and warm it up to normal operating temperatures (the radiator fan comes on twice).

5. Shift the transmission to N position/mode.

6. With the engine idling, measure the CVT drive pulley pressure at engine idling while firmly pressing the brake pedal.

Pressure	Specifications
CVT drive pulley	260-540 kPa (2.70-5.50 kgf/cm 2, 38.4-78.2 psi)

7. Turn the engine off.

8. If the CVT drive pulley pressure is out of the specifications, refer to the problems and probable causes listed in the table.

Problems	Probable causes
No or low CVT drive pulley pressure	• Transmission fluid pump defective • CVT drive pulley pressure control solenoid valve defective • Valve body assembly defective
CVT drive pulley pressure too high	• CVT drive pulley pressure control solenoid valve defective • Valve body assembly defective

9. Remove the pressure gauge.

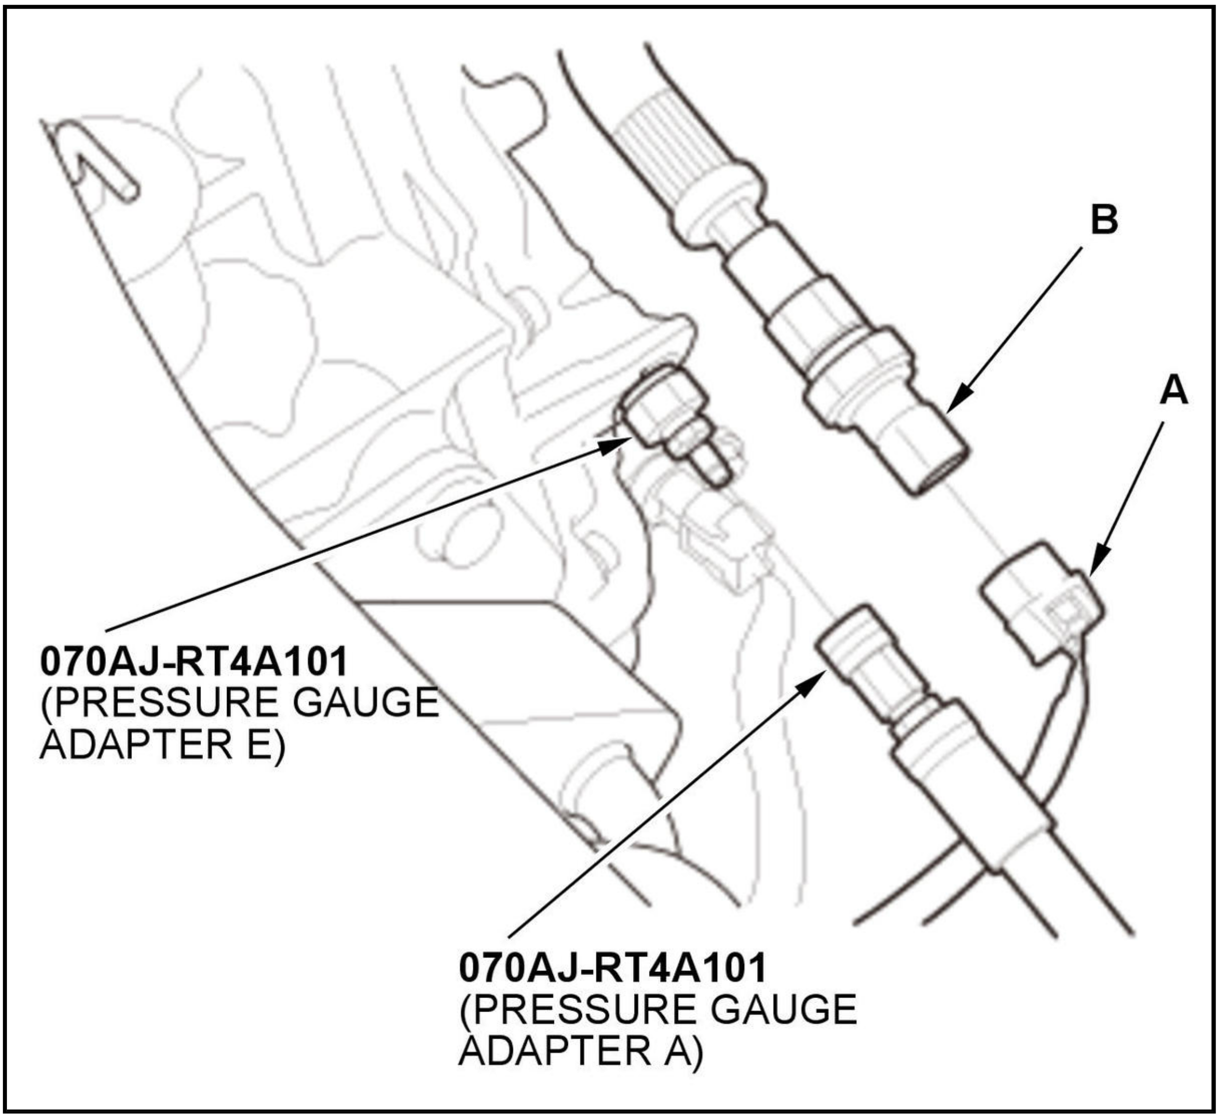
10. Install the sealing bolt with a new sealing washer to the CVT drive pulley pressure inspection port.

NOTE: Do not reuse the old sealing washer.

7. CVT Driven Pulley Pressure - Test

 07AAJ-PLYA100 07MAJ-PY40120 070AJ-RT4A101 (PRESSURE GAUGE ADAPTER A) A B	**NOTE:** • CVT driven pulley pressure may be above 3, 740 kPa (38.14 kgf/cm 2, 542.4 psi) when there is a transmission problem that causes the TCM to go into fail-safe operation. • When troubleshooting, you must use the A/T high pressure gauge to measure the CVT driven pulley pressure. 1. **Remove the air cleaner** . 2. **Remove the CVT driven pulley pressure sensor (A)** 3. Temporarily install the CVT driven pulley pressure sensor with the sealing washer (B) to pressure gauge adapter A. 4. Assemble the pressure gauge; install the A/T high pressure gauge and the A/T pressure adapter to pressure gauge adapter A.

5. Install pressure gauge adapter E (quick connector) to the CVT driven pulley pressure inspection port.



6. Install the pressure gauge to pressure gauge adapter E (quick connector).

7. Connect the connector (A) to the CVT driven pulley pressure sensor (B).

8. Temporarily install the air cleaner.

9. Start the engine, and warm it up to normal operating temperatures (the radiator fan comes on twice).

10. Shift the transmission to N position/mode.

11. With the engine idling, measure the CVT driven pulley pressure at engine idling while firmly pressing the brake pedal.

Pressure	Specifications
CVT driven pulley	490-900 kPa (5.00-9.20 kgf/cm 2, 71.1-130.8 psi)

12. Turn the engine off.

13. If the CVT driven pulley pressure is out of the specifications, refer to the problems and probable causes listed in the table.

Problems	Probable causes
No or low CVT driven pulley pressure	• Transmission fluid pump defective • CVT driven pulley pressure control solenoid valve defective • Valve body assembly defective

Problems	Probable causes
CVT driven pulley pressure too high	• CVT driven pulley pressure control solenoid valve defective • Valve body assembly defective

14. Remove the air cleaner.

15. Disconnect the connector from the CVT driven pulley pressure sensor.

16. Remove the pressure gauge and pressure gauge adapter E (quick connector).

17. Remove the CVT driven pulley pressure sensor.

18. **Install the CVT driven pulley pressure sensor** .

19. **Install the air cleaner** .

8. Reverse Brake Pressure - Test

 07406-0020400 or 07406-0020401 07MAJ-PY40120 07MAJ-PY4011A or 07AAJ-PY4A100 070AJ-RT4A101 (PRESSURE GAUGE ADAPTER B)	1. Assemble the pressure gauge; install the 2, 210 mm A/T pressure hose, the A/T pressure adapter, and pressure gauge adapter B to the A/T oil pressure gauge set. 2. **Remove the air cleaner** .

3. Remove the sealing bolt (A) with the sealing washer (B).

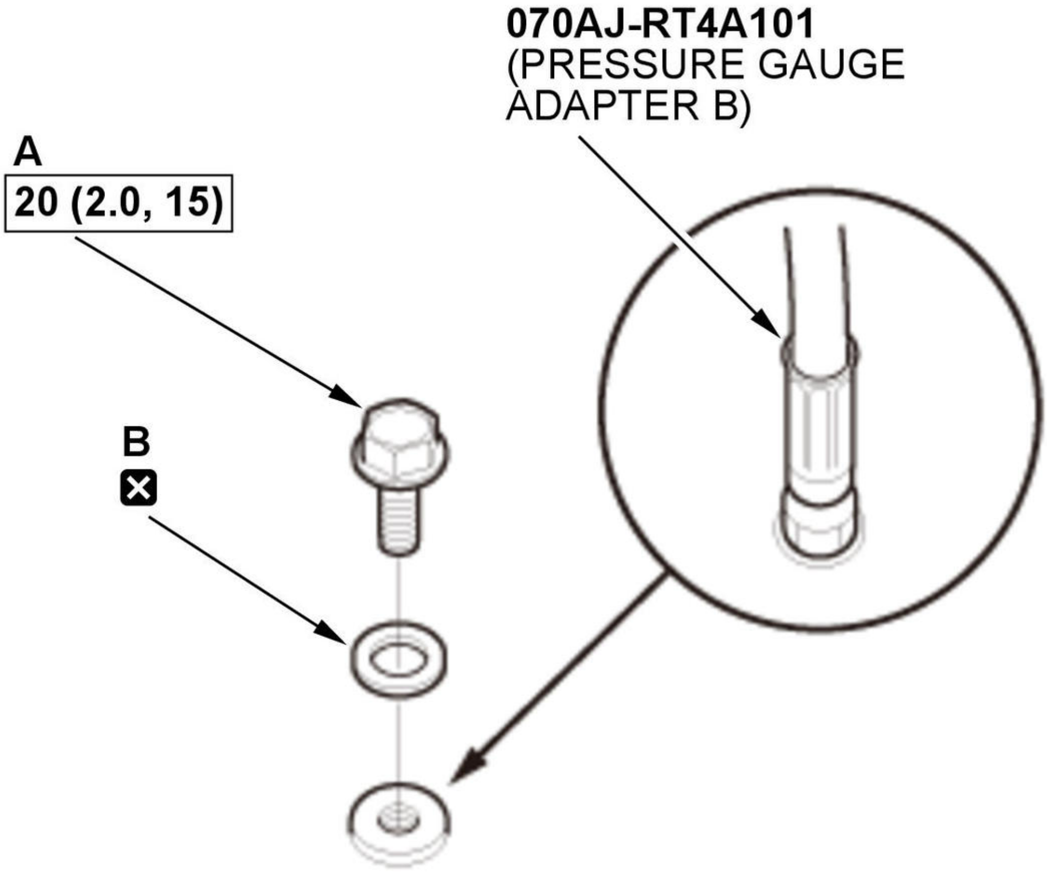


Fig. 5: Sealing Bolt Torque Specifications
Courtesy of HONDA, U.S.A., INC.

4. Install the pressure gauge to the reverse brake pressure inspection port.

5. Temporarily install the air cleaner.

6. Start the engine, and warm it up to normal operating temperatures (the radiator fan comes on twice).

7. Shift the transmission to R position/mode.

8. With the engine idling, measure the reverse brake pressure at engine idling while firmly pressing the brake pedal.

Pressure	Specifications
Reverse brake	50-440 kpa (0.50-4.50 kgf/cm 2, 7.1-64.0 psi)

9. Turn the engine off.

10. If the reverse brake pressure is out of the specifications, refer to the problem and probable causes listed in the table.

Problem	Probable causes
No or low reverse brake pressure	• Transmission fluid pump defective • CVT clutch pressure control solenoid valve defective • Reverse brake defective • Valve body assembly defective

Problem	Probable causes
	- Manual valve body defective

11. Remove the air cleaner.

12. Remove the pressure gauge.

13. Install the sealing bolt with a new sealing washer to the reverse brake pressure inspection port.

NOTE: Do not reuse the old sealing washer.

14. **Install the air cleaner** .

9. **Transmission Fluid Level - Check**
10. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

CVT ROAD TEST (1.5 L ENGINE)

Test

1. **HDS - Connect**
2. Engine - Warm Up

1. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on twice).

3. Vehicle - Road Test

1. Park the vehicle on level ground.

2. Apply the parking brake, and block all four wheels.

3. Shift the transmission to D position/mode while pressing the brake pedal. Press the accelerator pedal, and release it suddenly. The engine should not stall.

4. Repeat step 3 in all positions/modes.

5. Prepare the HDS and the MVCI to take a SNAPSHOT (refer to the HDS user's guide for more details if needed):

- Set the Trigger Type to Parameter.
- Adjust the Parameter setting to APP Sensor A (V) above 1.1 V.
- Set the Record Time to 60 seconds.
- Set the Trigger Point to (Negative) - 30 seconds.

6. Find a suitable level road.

7. When you are ready to do the test, press OK on the HDS.

8. Accelerate quickly until APP Sensor A (V) reads 1.2 V. Maintain a steady throttle at 1.2 V until the vehicle reaches a reasonable speed, then slow the vehicle, and come to a stop.

9. Save the snapshot if the entire event was recorded, or increase the recording time setting as necessary, and repeat step 8.

10. Adjust the parameter setting to 2.2 V.

11. Test-drive the vehicle again. Accelerate quickly until APP Sensor A (V) reads 2.3 V. Maintain a steady throttle at 2.3 V until the vehicle reaches a reasonable speed, then slow the vehicle, and come to a stop.

12. Save the snapshot if the entire event was recorded, or increase the recording time setting as necessary, and repeat step 11.

13. Accelerate quickly until the accelerator pedal is to the floor. Maintain a steady pedal until the vehicle reaches reasonable speed, then slow to a stop, and save the snapshot.

14. Review each snapshot individually, and compare APP Sensor A (V), the Vehicle Speed, and the Engine Speed to the following table:

D Position/Mode

APP Sensor A (V)	Vehicle Speed	Engine Speed
1.2 V	25 mph (40 km/h)	1, 050-1, 650 rpm
	37 mph (60 km/h)	1, 120-1, 720 rpm
	62 mph (100 km/h)	1, 431-2, 031 rpm
2.3 V	25 mph (40 km/h)	1, 840-2, 440 rpm
	37 mph (60 km/h)	1, 960-2, 560 rpm
	62 mph (100 km/h)	2, 140-2, 740 rpm
4.5 V	25 mph (40 km/h)	3, 800-4, 400 rpm
	37 mph (60 km/h)	5, 100-5, 700 rpm
	62 mph (100 km/h)	5, 700-6, 300 rpm

S Position/Mode

APP Sensor A (V)	Vehicle Speed	Engine Speed
1.2 V	25 mph (40 km/h)	1, 740-2, 340 rpm
	37 mph (60 km/h)	2, 030-2, 630 rpm
	62 mph (100 km/h)	2, 660-3, 260 rpm
2.3 V	25 mph (40 km/h)	2, 030-2, 630 rpm
	37 mph (60 km/h)	2, 220-2, 820 rpm
	62 mph (100 km/h)	2, 660-3, 260 rpm
4.5 V	25 mph (40 km/h)	3, 800-4, 400 rpm
	37 mph (60 km/h)	5, 100-5, 700 rpm
	62 mph (100 km/h)	5, 700-6, 300 rpm

L Position/Mode

APP Sensor A (V)	Vehicle Speed	Engine Speed
1.2 V	25 mph (40 km/h)	2, 717-3, 317 rpm
	37 mph (60 km/h)	3, 380-3, 980 rpm
	62 mph (100 km/h)	4, 140-4, 740 rpm
2.3 V	25 mph (40 km/h)	2, 717-3, 317 rpm
	37 mph (60 km/h)	3, 380-3, 980 rpm
	62 mph (100 km/h)	4, 140-4, 740 rpm
4.5 V	25 mph (40 km/h)	3, 800-4, 400 rpm
	37 mph (60 km/h)	4, 700-5, 300 rpm
	62 mph (100 km/h)	5, 300-5, 900 rpm

15. Park the vehicle on an upward slope (about 16 degrees), apply the parking brake, and shift the transmission to P position/mode. Release the brake; the vehicle should not move.

NOTE: Always use the parking brake to hold the vehicle when stopped on an incline. Depending on the grade of the incline, the vehicle could roll if the brake is released.

CVT ROAD TEST (2.4 L ENGINE) (2017 2018 2019)

Test

1. **HDS - Connect**
2. Engine - Warm Up

    1. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on twice).

3. Vehicle - Road Test

    1. Park the vehicle on level ground.

    2. Apply the parking brake, and block all four wheels.

    3. Shift the transmission to D position/mode while pressing the brake pedal. Press the accelerator pedal, and release it suddenly. The engine should not stall.

    4. Repeat step 3 in all positions/modes.

    5. Prepare the HDS and the MVCI to take a SNAPSHOT (refer to the HDS user's guide for more details if needed):

        - Set the Trigger Type to Parameter.
        - Adjust the Parameter setting to APP Sensor A (V) above 1.1 V.
        - Set the Record Time to 60 seconds.
        - Set the Trigger Point to (Negative) - 30 seconds.

    6. Find a suitable level road.

    7. When you are ready to do the test, press OK on the HDS.

    8. Accelerate quickly until APP Sensor A (V) reads 1.2 V. Maintain a steady throttle at 1.2 V until the vehicle reaches a reasonable speed, then slow the vehicle, and come to a stop.

    9. Save the snapshot if the entire event was recorded, or increase the recording time setting as necessary, and repeat step 8.

    10. Adjust the parameter setting to 2.2 V.

    11. Test-drive the vehicle again. Accelerate quickly until APP Sensor A (V) reads 2.3 V. Maintain a steady throttle at 2.3 V until the vehicle reaches a reasonable speed, then slow the vehicle, and come to a stop.

    12. Save the snapshot if the entire event was recorded, or increase the recording time setting as necessary, and repeat step 11.

    13. Accelerate quickly until the accelerator pedal is to the floor. Maintain a steady pedal until the vehicle reaches reasonable speed, then slow to a stop, and save the snapshot.

    14. Review each snapshot individually, and compare APP Sensor A (V), the Vehicle Speed, and the Engine Speed to the following table:

D Position/Mode

APP Sensor A (V)	Vehicle Speed	Engine Speed
1.2 V	25 mph (40 km/h)	850-1, 450 rpm
	37 mph (60 km/h)	850-1, 450 rpm
	62 mph (100 km/h)	1, 291-1, 891 rpm
2.3 V	25 mph (40 km/h)	2, 500-3, 100 rpm
	37 mph (60 km/h)	2, 800-3, 400 rpm
	62 mph (100 km/h)	3, 200-3, 800 rpm
4.5 V	25 mph (40 km/h)	4, 300-4, 900 rpm
	37 mph (60 km/h)	5, 300-5, 900 rpm
	62 mph (100 km/h)	6, 250-6, 850 rpm

S Position/Mode

APP Sensor A (V)	Vehicle Speed	Engine Speed
1.2 V	25 mph (40 km/h)	1, 700-2, 300 rpm
	37 mph (60 km/h)	2, 020-2, 620 rpm
	62 mph (100 km/h)	2, 660-3, 260 rpm
2.3 V	25 mph (40 km/h)	2, 550-3, 150 rpm
	37 mph (60 km/h)	2, 850-3, 450 rpm
	62 mph (100 km/h)	3, 430-4, 030 rpm
4.5 V	25 mph (40 km/h)	4, 300-4, 900 rpm
	37 mph (60 km/h)	5, 300-5, 900 rpm
	62 mph (100 km/h)	6, 250-6, 850 rpm

L Position/Mode

APP Sensor A (V)	Vehicle Speed	Engine Speed
1.2 V	25 mph (40 km/h)	2, 100-2, 700 rpm
	37 mph (60 km/h)	2, 840-3, 440 rpm
	62 mph (100 km/h)	3, 900-4, 500 rpm
2.3 V	25 mph (40 km/h)	2, 640-3, 240 rpm
	37 mph (60 km/h)	3, 040-3, 640 rpm
	62 mph (100 km/h)	3, 800-4, 500 rpm
4.5 V	25 mph (40 km/h)	4, 300-4, 900 rpm
	37 mph (60 km/h)	5, 300-5, 900 rpm
	62 mph (100 km/h)	6, 250-6, 850 rpm

15. Park the vehicle on an upward slope (about 16 degrees), apply the parking brake, and shift the transmission to P position/mode. Release the brake; the vehicle should not move.

NOTE: Always use the parking brake to hold the vehicle when stopped on an incline. Depending on the grade of the incline, the vehicle could roll if the brake is released.

CVT SOLENOID VALVE TEST

Test

NOTE:

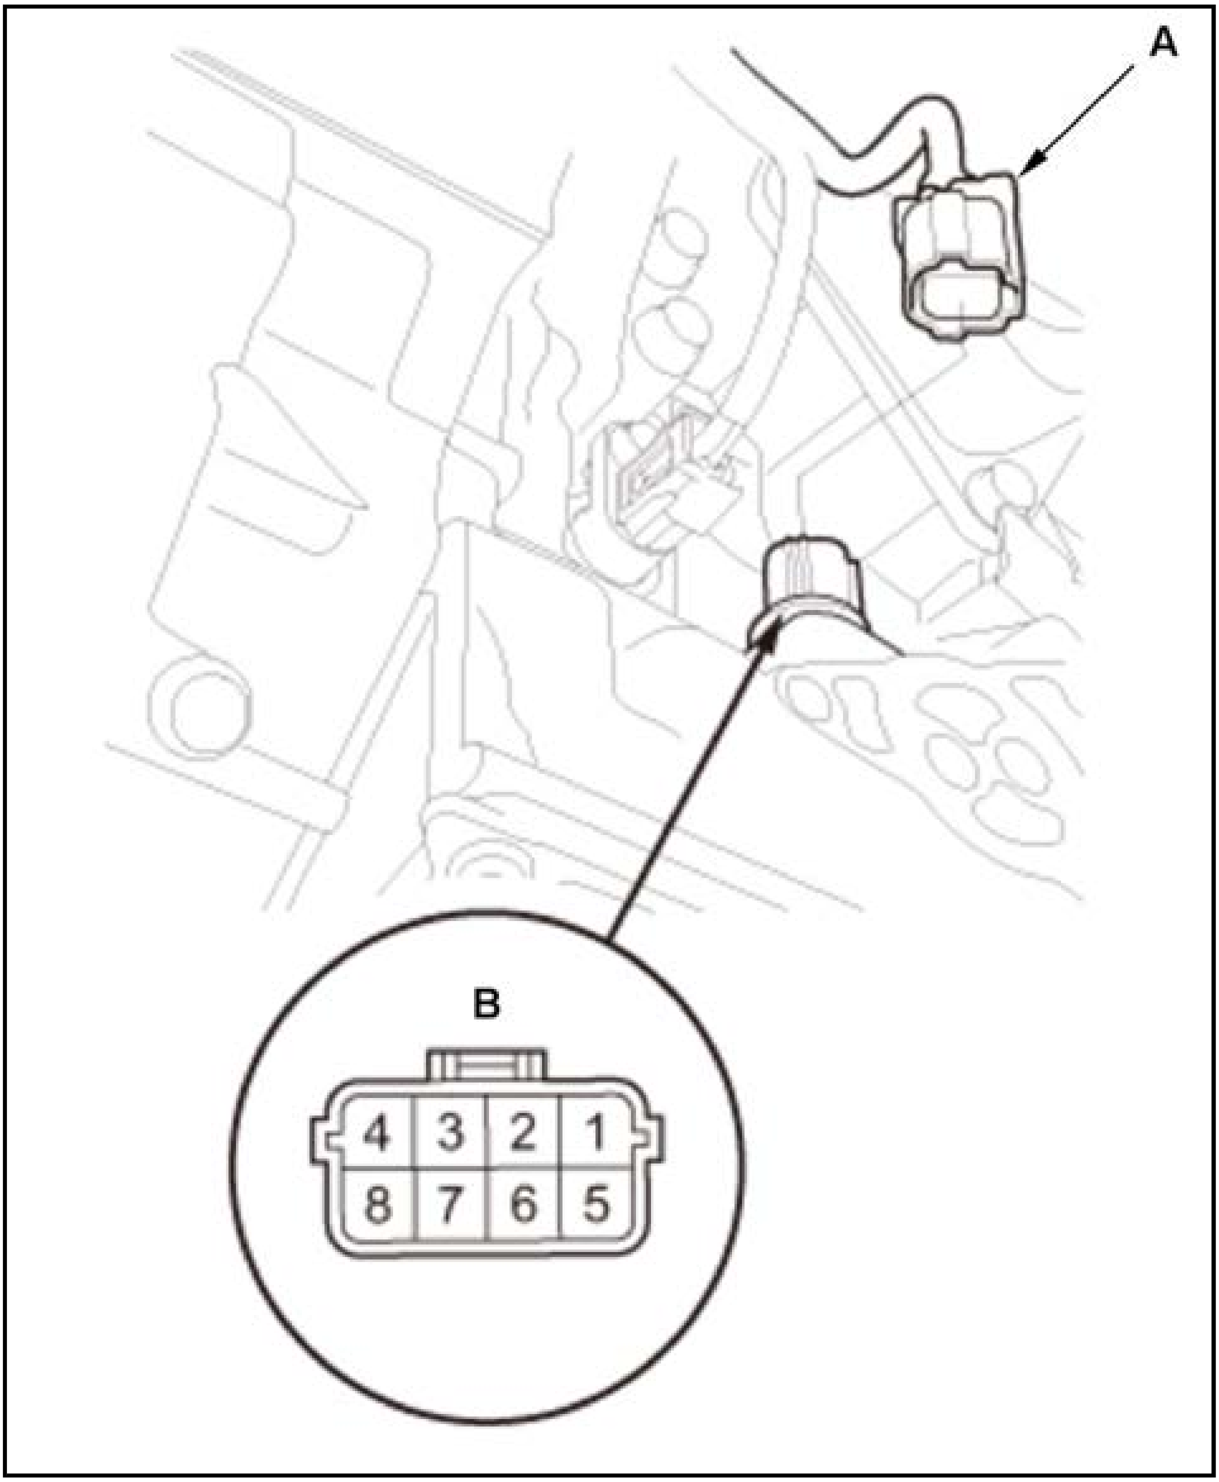
- Keep all foreign particles out of the transmission.
- Unless otherwise indicated, illustrations used in the procedure are for 1.5 L engine.

Solenoid Valve Resistance Check

1. Vehicle - Lift
2. Front Engine Undercover Lid - Remove
3. Solenoid Valve - Resistance Check

1. Disconnect the connector (A).

NOTE: To prevent damage, cover the connector using a shop towel.



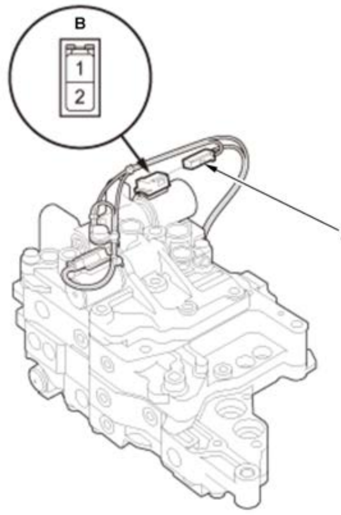
2. Measure the resistance between the connector (male terminals) (B) and body ground according to the table.

- If the resistance is within the standard, the test is complete, and install all removed parts.
- If the resistance is out of the standard, check the solenoid valve operation.

Solenoid valve	Terminal	Standard Resistance
CVT clutch pressure control solenoid valve	No. 1	4.7-5.9 Ω
CVT drive pulley pressure control solenoid valve	No. 8	5.0-6.3 Ω
CVT driven pulley pressure control solenoid valve	No. 3	5.0-6.3 Ω
CVT lock-up clutch control solenoid valve	No. 4	5.0-6.3 Ω
Shift solenoid valve B	No. 5	10.6-13.5 Ω
Shift solenoid valve O/P	No. 2	10.6-13.5 Ω

CVT Clutch Pressure Control Solenoid Valve

4. CVT Clutch Pressure Control Solenoid Valve - Operation Check



1. **Remove the valve body assembly**

2. Disconnect the connector (A).

3. Connect a jumper wire from the positive battery terminal to connector (male terminals) No. 2 (B), and connect another jumper wire from the negative battery terminal to connector terminal No. 1.

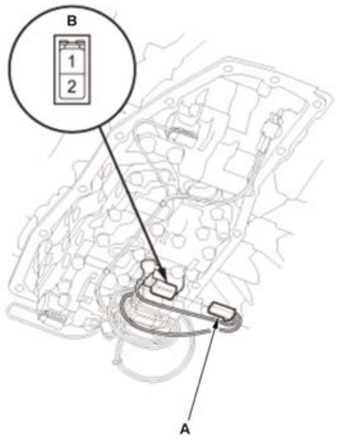
- If a clicking sound is heard, repair or replace the solenoid wire harness.
- If no clicking sound is heard, **replace the CVT clutch pressure control solenoid valve** .

5. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

CVT Drive Pulley Pressure Control Solenoid Valve

6. CVT Drive Pulley Pressure Control Solenoid Valve - Operation Check



1. **Remove the transmission fluid pan** .

NOTE: The actual transmission fluid (HCF-2) capacity will vary from the specified capacity based on the length of time the transmission fluid pan is off the transmission. Avoid leaving the transmission fluid pan off for extend periods of time.

2. **Remove the transmission fluid strainer**

3. Disconnect the connector (A).

4. Connect a jumper wire from the positive battery terminal to connector (male terminals) No. 2 (B), and connect another jumper wire from the negative battery terminal to connector terminal No. 1.

- If a clicking sound is heard, repair or replace the solenoid wire harness.

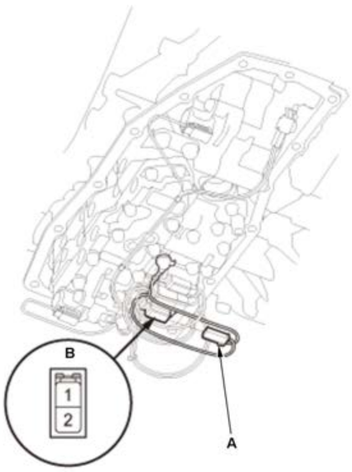
- If no clicking sound is heard, **replace the CVT drive pulley pressure control solenoid valve** .

7. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

CVT Driven Pulley Pressure Control Solenoid Valve

8. CVT Driven Pulley Pressure Control Solenoid Valve - Operation Check



1. **Remove the transmission fluid pan** .

NOTE: The actual transmission fluid (HCF-2) capacity will vary from the specified capacity based on the length of time the transmission fluid pan is off the transmission. Avoid leaving the transmission fluid pan off for extend periods of time.

2. **Remove the transmission fluid strainer**

3. Disconnect the connector (A).

4. Connect a jumper wire from the positive battery terminal to connector (male terminals) No. 2 (B), and connect another jumper wire from the negative battery terminal to connector terminal No. 1.

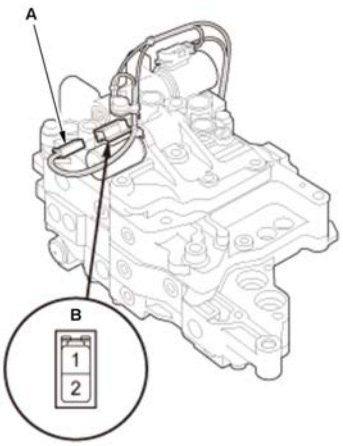
- If a clicking sound is heard, repair or replace the solenoid wire harness.
- If no clicking sound is heard, **replace the CVT driven pulley pressure control solenoid valve** .

9. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

CVT Lock-Up Clutch Control Solenoid Valve

10. CVT Lock-Up Clutch Control Solenoid Valve - Operation Check



1. **Remove the valve body assembly**

2. Disconnect the connector (A).

3. Connect a jumper wire from the positive battery terminal to connector (male terminals) No. 2 (B), and connect another jumper wire from the negative battery terminal to connector terminal No. 1.

- If a clicking sound is heard, repair or replace the solenoid wire harness.
- If no clicking sound is heard, **replace the CVT lock-up clutch control solenoid valve** .

11. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Shift Solenoid Valve B

12. Shift Solenoid Valve B - Operation Check

	1. **Remove the transmission fluid pan** . **NOTE:** The actual transmission fluid (HCF-2) capacity will vary from the specified capacity based on the length of time the transmission fluid pan is off the transmission. Avoid leaving the transmission fluid pan off for extend periods of time. 2. Disconnect the connector (A). 3. Connect a jumper wire from the positive battery terminal to connector (male terminals) No. 1 (B), and connect another jumper wire from the negative battery terminal to the solenoid valve body. • If a clicking sound is heard, repair or replace the solenoid wire harness. • If no clicking sound is heard, **replace shift solenoid valve B** .

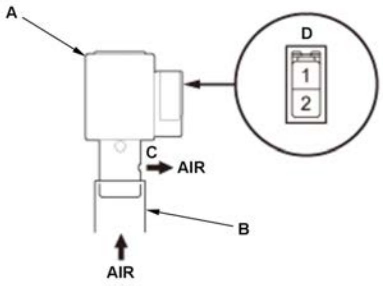
13. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Shift Solenoid Valve O/P

14. Shift Solenoid Valve O/P - Operation Check

	1. **Remove the transmission fluid pan** . **NOTE:** The actual transmission fluid (HCF-2) capacity will vary from the specified capacity based on the length of time the transmission fluid pan is off the transmission. Avoid leaving the transmission fluid pan off for extend periods of time. 2. Disconnect the connector (A). 3. Connect a jumper wire from the positive battery terminal to connector (male terminals) No. 1 (B), and connect another jumper wire from the negative battery terminal to the solenoid valve body. • If a clicking sound is heard, go to the next step. • If no clicking sound is heard, **replace the shift solenoid valve O/P** .



4. **Remove the shift solenoid valve O/P**

(A).

5. Connect a tube (B) to the shift solenoid valve O/P.

6. Blow air into the tube.

- If the air goes out of the port (C), go to the next step.
- If the air does not go out of the port, **replace the shift solenoid valve O/P** .

7. Connect a jumper wire from the positive battery terminal to connector (male terminals) No. 1 (D), and connect another jumper wire from the negative battery terminal to the solenoid valve body.

8. Blow air into the tube.

- If the air goes out of the port, **replace the shift solenoid valve O/P** .
- If the air does not go out of the port, repair or replace the solenoid wire harness.

15. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

SHIFT LOCK SOLENOID TEST

Test

1. **HDS - Connect**
2. Shift Lock Solenoid - Test

1. Select the Shift Lock Solenoid Test in the Miscellaneous Test Menu, and check that the shift lock solenoid operates with the HDS.

2. Check that the shift lever can be moved out of P position/mode when the Shift Lock Solenoid is ON. Move the shift lever back to P position/mode, and check that it locks when the Shift Lock Solenoid is OFF.

3. Check that the shift lock releases when the shift lock release is pushed, and check that it locks when the shift lock release is released.

4. If the shift lock solenoid does not work properly, **go to the shift lock system circuit troubleshooting**

.

STALL SPEED TEST

Test

1. **Transmission Fluid Level - Check**
2. **HDS - Connect**
3. Engine - Warm Up

1. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on twice).

4. Stall Speed - Test

NOTE:

- Do not test stall speed for more than 10 seconds at a time.
- Record the engine speed at 6 to 8 seconds after pressing the accelerator pedal. Higher engine speed will be indicated for 5 seconds.
- Stall speed tests should be used for diagnostic purposes only.
- The stall speed should be the same in all positions/modes.
- Do not test stall speed with a pressure gauge installed.

1. Apply the parking brake, and block all four wheels.

2. Make sure the A/C switch is OFF.

3. Shift the transmission to D position/mode while pressing the brake pedal firmly, then press the accelerator pedal for 6 to 8 seconds, and note the engine speed.

NOTE: Do not move the shift lever or remove your foot off the brake pedal, while raising the engine speed.

4. Allow 2 minutes for cooling, then repeat the test in the all positions/modes.

Stall Speed rpm	
1.5 L engine:	
B	**Specification: 2, 500 rpm**
B	**Service Limit: 2, 350-2, 650 rpm**
2.4 L engine:	
B	**Specification: 2, 300 rpm**
B	**Service Limit: 2, 150-2, 450 rpm**

5. If any of the stall speeds are out of the service limit, refer to the problems and probable causes listed in the table.

Problems	Probable Causes
Stall speed rpm	• Low transmission fluid level • Transmission fluid deteriorated • Transmission fluid pump worn, binding, or foreign material in transmission fluid pump • Torque converter assembly defective • Forward clutch assembly defective • Input shaft worn or damaged • Reverse brake defective • Valve body assembly defective • Lubrication pipe defective • Stator shaft defective • TCM defective
Stall speed rpm	• Torque converter assembly defective • Valve body assembly defective • Lubrication pipe defective

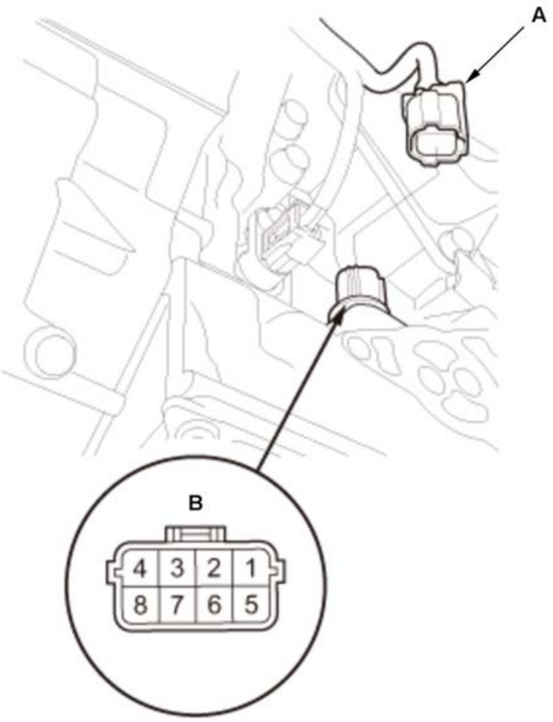
Problems	Probable Causes
	- Stator shaft defective - Engine output low - TCM defective

TRANSMISSION FLUID TEMPERATURE SENSOR TEST

Test

NOTE: Unless otherwise indicated, illustrations used in the procedure are for the model not equipped with the CVTF cooler.

1. Vehicle - Lift
2. Front Engine Undercover Lid - Remove
3. Transmission Fluid Temperature Sensor - Test



1. Disconnect the connector (A).

NOTE: To prevent damage, cover the connector using a shop towel.

2. Measure the resistance between connector (male terminals) No. 6 and No. 7 (B).

- If the resistance is within the standard, the test is complete.
- If the resistance is out of the standard, replace the transmission fluid temperature sensor .

Standard:	**50 Ω-25 kΩ**

4. All Removed Parts - Install

1. Install the parts in the reverse order of removal.
NOTE: Check the connector for corrosion, dirt, or oil, and clean or repair if necessary.

INSPECTION

CVT DIFFERENTIAL BACKLASH INSPECTION

Inspection

1. Differential Backlash - Inspect

	1. Install the driveshaft and the intermediate shaft on the differential, then place the axles on V-blocks. 2. Check the backlash of the pinion gears (A) using a dial indicator (B). 3. If the backlash is out of the standard, replace the differential carrier .

Standard:	**0.05-0.15 mm (0.0020-0.0059 in)**

CVT DIFFERENTIAL CARRIER BEARING PRELOAD INSPECTION

Special Tools Required

Image	Description/Tool Number
	Bearing Driver Attachment, 72 x 75 mm 07746-0010600
	Driver Handle, 15 x 135L 07749-0010000

Image	Description/Tool Number
	Attachment, 78 x 90 mm 07GAD-SD40101
	Preload Inspection Tool 07HAJ-PK40201

Inspection

NOTE:

- **How to read the torque specifications** .
- If the transmission was disassembled, the differential carrier tapered roller bearing preload must be adjusted.
- Apply a light coat of clean transmission fluid on all parts before installation.
- Unless otherwise indicated, illustrations used in the procedure are for AWD.

1. Differential Carrier Tapered Roller Bearing Outer Race (Torque Converter Housing Side) - Install

	1. Install the 76 mm thrust shim (A). 2. Install the 41 x 76.2 x 1 mm spacer (B) by aligning the tab (C) with the groove (D). 3. Install the differential carrier tapered roller bearing outer race (E) using the 15 x 135L driver handle and the 72 x 75 mm bearing driver attachment so there is no clearance between the bearing outer race, the 41 x 76.2 x 1 mm spacer, the 76 mm thrust shim, and the torque converter housing.

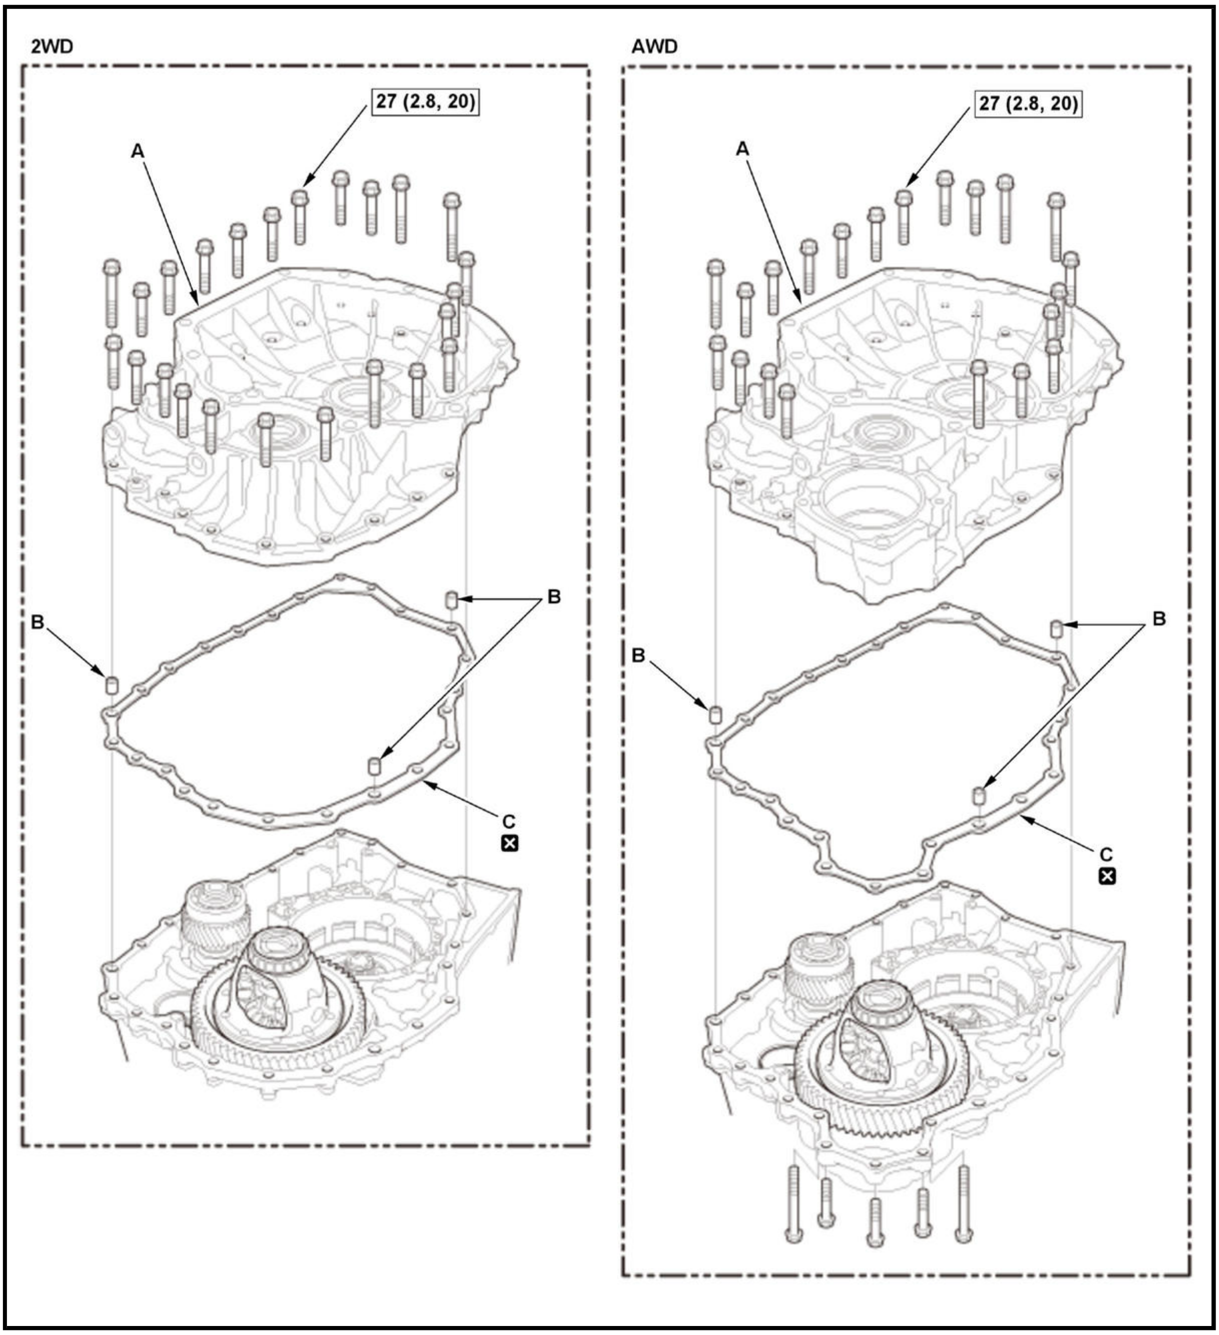
2. Differential Carrier Tapered Roller Bearing Outer Race (Transmission Housing Side) - Install

	1. Install the 41 x 92 x 1 mm spacer (A) by aligning the tab (B) with the groove (C). 2. Install the differential carrier tapered roller bearing outer race (D) using the 15 x 135L driver handle and the 78 x 90 mm attachment so there is no clearance between the bearing outer race, the 41 x 92 x 1 mm spacer, and the transmission housing.

	3. Apply transmission fluid to the bearing outer race (A) and the carrier bearings of the CVT differential assembly (B). 4. Install the CVT differential assembly.

3. Torque Converter Housing - Install

1. Apply transmission fluid to the bearing outer race of the torque converter housing.



2. Install the torque converter housing (A) with the dowel pins (B) and a new gasket (C), and tighten the bolts in a crisscross pattern in at least two steps.

4. Differential Carrier Tapered Roller Bearing Preload - Inspect

	1. Rotate the differential assembly in both directions to seat the bearings using the preload inspection tool. 2. Measure the starting torque using the preload inspection tool, a torque wrench (A), and a socket (B). **NOTE:** Measure the starting torque at normal room temperature in both directions. 3. If the measurement is out of the standard, remove the 76 mm thrust shim, and measure its thickness. 4. Select a new 76 mm thrust shim.

NOTE:

- To increase the starting torque, increase thickness of the 76 mm thrust shim.
- To decrease the starting torque, decrease the thickness of the 76 mm thrust shim.
- Changing the 76 mm thrust shim to the next size will increase or decrease starting torque about 0.3-0.4 N.m (3-4 kgf.cm, 2-3 lbf.in).
- Do not use more than two thrust shims to adjust the starting torque.

Type A 76 mm Thrust Shim

Type B 76 mm Thrust Shim

Type C 76 mm Thrust Shim

Type D 76 mm Thrust Shim

5. Install a selected 76 mm thrust shim, then recheck the starting torque.

FINAL DRIVE SHAFT TAPERED ROLLER BEARING PRELOAD INSPECTION

Special Tools Required

Image	Description/Tool Number
	Driver Handle, 15 x 135L 07749-0010000
	Bearing Driver Attachment, 62 x 64 mm 07947-6340400
	Preload Inspection Tool 07HAJ-PK40201
	Bearing Driver Attachment, 78 x 80 mm 07NAD-PX40100

Inspection

NOTE:

- **How to read the torque specifications** .
- If the transmission was disassembled, the final drive shaft tapered roller bearing preload must be adjusted.
- The final drive shaft tapered roller bearing preload must be inspected and adjusted with the differential assembly. The final drive shaft tapered roller bearing preload value needs the differential carrier tapered roller bearing preload measurements. Incorrect measurements may be indicated if the differential carrier tapered roller bearing preload inspection has not been completed.
- Apply a light coat of clean transmission fluid on all parts before installation.

1. **Differential Carrier Tapered Roller Bearing Preload - Inspect**
2. Final Drive Shaft Tapered Roller Bearing Outer Race (Torque Converter Housing Side) - Install

	1. Install the oil guide plate (A) and the 80 mm thrust shim (B). 2. Install the final drive shaft tapered roller bearing outer race (C) using the 15 x 135L driver handle and the 78 x 80 mm bearing driver attachment so there is no clearance between the bearing outer race, the 80 mm thrust shim, the oil guide plate, and the torque converter housing.

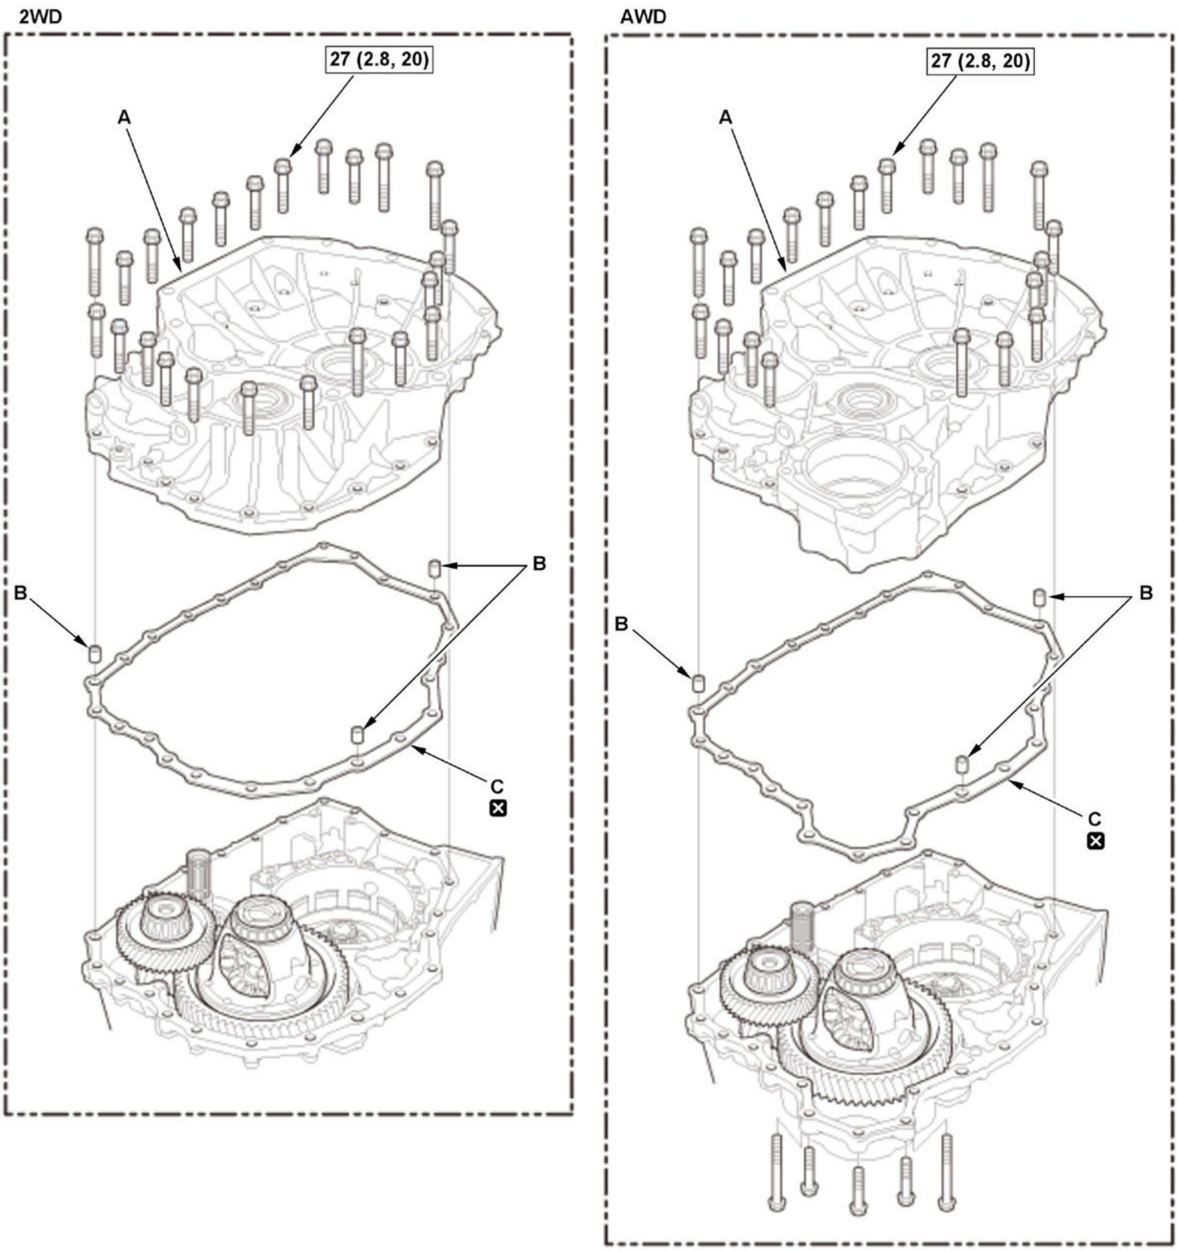
3. Final Drive Shaft Tapered Roller Bearing Outer Race (Transmission Housing Side) - Install

	1. Install the final drive shaft tapered roller bearing outer race (A) until it bottoms using the 15 x 135L driver handle and the 62 x 64 mm bearing driver attachment.

	2. Apply transmission fluid to the carrier bearing outer race (A) and the carrier bearings of the CVT differential assembly (B). 3. Install the CVT differential assembly. 4. Apply transmission fluid to the tapered roller bearing outer race (C) and the tapered roller bearings of the final drive shaft assembly (D). 5. Install the final drive shaft assembly.

4. Torque Converter Housing - Install

   1. Apply transmission fluid to the bearing outer races of the torque converter housing.



[Fig. 6: Torque Converter Housing Bolts Torque Specifications](#)
Courtesy of HONDA, U.S.A., INC.

2. Install the torque converter housing (A) with the dowel pins (B) and a new gasket (C), and tighten the bolts in a crisscross pattern in at least two steps.

5. Final Drive Shaft Tapered Roller Bearing Preload - Inspect

	1. Rotate the differential assembly in both directions to seat the bearings using the preload inspection tool. 2. Measure the starting torque using the preload inspection tool, a torque wrench (A), and a socket (B). **NOTE:** Measure the starting torque at normal room temperature in both directions. 3. If the measurement is out of the standard, remove the 80 mm thrust shim, and measure its thickness. 4. Select a new 80 mm thrust shim.

- To increase the starting torque, increase thickness of the 80 mm thrust shim.
- To decrease the starting torque, decrease the thickness of the 80 mm thrust shim.
- Changing the 80 mm thrust shim to the next size will increase or decrease the starting torque about 0.5- 0.6 N.m (5.10-6.12 kgf.cm, 3.8-4.5 lbf.in).
- Do not use more than two thrust shims to adjust the starting torque.

Type A 80 mm Thrust Shim

Type B 80 mm Thrust Shim

5. Install a selected 80 mm thrust shim, then recheck the starting torque.

No.	Thickness

Standard	
B	**New Bearing:**
B	**6.88-27.39 N.m (70.1-279.3 kgf.cm, 60.9-242.5 lbf.in)**
B	**Reused Bearing:**
B	**5.63-26.15 N.m (57.4-266.6 kgf.cm, 49.8-231.4 lbf.in)**

FORWARD CLUTCH CLEARANCE INSPECTION

Special Tools Required

Image	Description/Tool Number
	Clutch Compressor Attachment 07ZAE-PRP0100
	Clutch Compressor Attachment 64 mm 07ZAE-PRPA110

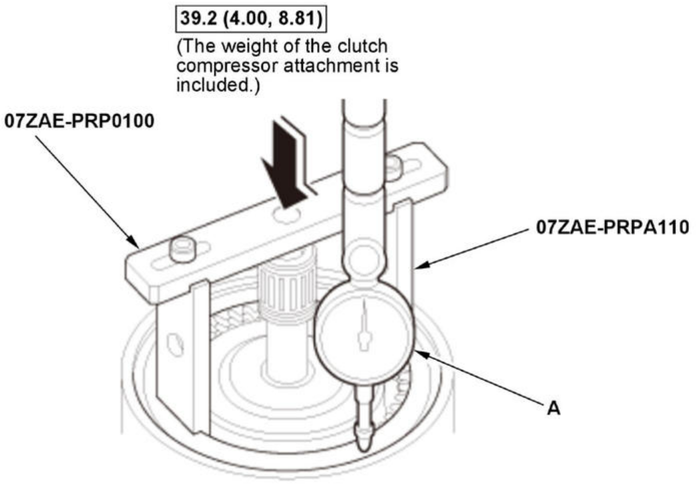
Inspection

NOTE: How to read the torque specifications .

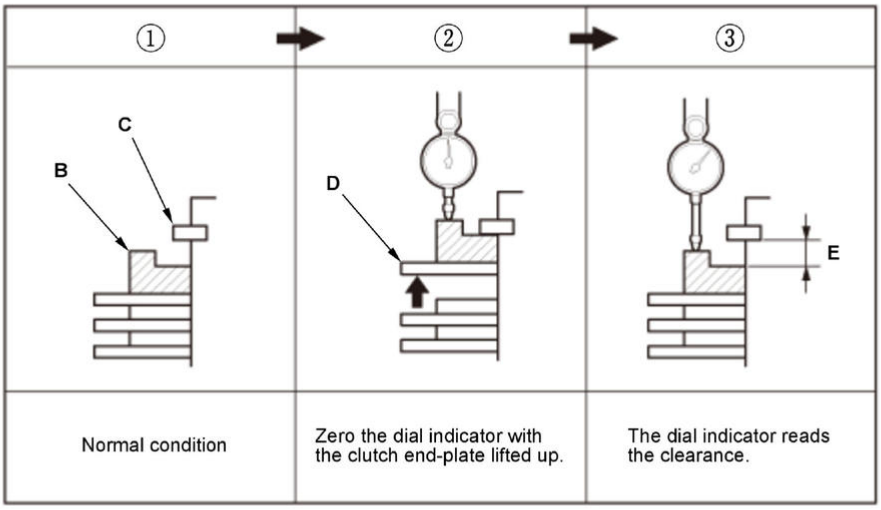
1. Forward Clutch Clearance - Inspect

 	1. Secure the input shaft assembly (A) in a bench vise (B) with wood blocks (C). **NOTE:** After this procedure, remove any wood chips that may be stuck to the spline.

2. Set a dial indicator (A) on the clutch end-plate (B).



39.2 (4.00, 8.81)
(The weight of the clutch compressor attachment is included.)
07ZAE-PRP0100
07ZAE-PRPA110
A



①	②	③
Normal condition	Zero the dial indicator with the clutch end-plate lifted up.	The dial indicator reads the clearance.

3. Zero the dial indicator with the clutch end-plate lifted up to the snap ring (C) by lifting the top disk (D) up.

4. Release the top disk.

5. Put the clutch compressor attachment with the 64 mm clutch compressor attachment on the clutch end-plate.

NOTE: Be sure to set the clutch compressor attachment with the indented mark facing upward.

6. Press the clutch compressor attachment down with 39.2 N (4.00 kgf, 8.81 lbf) (the weight of the clutch compressor attachment is included) using a force gauge, and read the dial indicator. The dial indicator reads the clearance (E) between the clutch end-plate and the top disc.

NOTE: Take measurements in at least three places, and use the average as the actual clearance.

Standard:	**0.8-1.0 mm (0.031-0.039 in)**

7. If the clearance is out of the standard, replace the input shaft assembly.

DTC TROUBLESHOOTING INDEX

CVT SYSTEM DTC TROUBLESHOOTING INDEX (1.5 L ENGINE)

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshot with the HDS, and **review the General Troubleshooting Information**.

NOTE:

*(1): The DTC in parentheses is the flash code the shift position indicator indicates when the data link connector (DLC) is connected to the HDS, and in the SCS mode.

*(2): This code is caused by an electrical circuit problem and cannot be caused by a mechanical problem in the transmission.

*(3): This code is stored whenever DTCs P1898 and P1899 are detected.

REWRITE

TCM UPDATE (1.5 L ENGINE)

Rewriting

NOTE: High temperatures in the engine compartment might cause the TCM to become too hot to run the update. If the engine has been running before this procedure, open the hood and cool the engine compartment.

1. TCM - Update

LEARNING RESET CLEAR

TCM RESET (1.5 L ENGINE)

Procedure

NOTE:

- Make sure to reset the learned value of CVT system when replacing hydraulically-controlled parts in order not to cause any damage the transmission.
- This procedure is not required, if the TCM, and the transmission fluid pump and/or the valve body assembly are replaced simultaneously.

1. HDS - Connect
2. TCM - Reset

1. Select the A/T SYSTEM with the HDS.

2. Reset the TCM with the HDS while the engine is stopped.

3. Turn the vehicle to the OFF (LOCK) mode.

4. Turn the vehicle to the ON mode, then wait for 30 seconds.

5. Turn the vehicle to the OFF (LOCK) mode, then disconnect the HDS from the DLC.

SYMPTOM TROUBLESHOOTING

CVT SYMPTOM TROUBLESHOOTING - HDS DOES NOT COMMUNICATE WITH THE TCM (1.5 L ENGINE)

HDS does not communicate with the TCM

NOTE: Before you troubleshoot, record all freeze data and any on-board snapshots, and review the **General Troubleshooting Information**.

1. CVT system communication check

   -1. **Connect the HDS to the DLC** .

   -2. Turn the vehicle to the ON mode.

   -3. Check the Mode Menu of the CVT system with the HDS.

   Does the HDS show the Mode Menu of the CVT system?

   YES

   The CVT system communication is OK. Intermittent failure, the system is OK at this time.

   NO

   Go to step 2.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the following fuses.

Fuse	No. A16
B	No. D17

Are the fuses OK?

YES

The fuses are OK. Reinstall the fuses, then go to step 3.

NO

Replace the fuse(s), and recheck. If the fuse blows again, repair a short to ground in the blown fuse circuit(s).

3. Open wire check (+B/+B TCU line)

-1. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM from damage.

-2. Disconnect the following connector.

TCM 50P connector

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
Test point 1	TCM 50P connector No. 1
Test point 2	Body ground

Is there battery voltage?

YES

The +B/+B TCU wire is OK. Go to step 4.

NO

Repair an open in the +B/+B TCU wire between the under-hood fuse/relay box and the TCM.

4. Open wire check (IG1/IG1 MISS SOL line)

-1. Turn the vehicle to the ON mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
	TCM 50P connector: disconnected
Test point 1	TCM 50P connector No. 8
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 wire is OK. Go to step 5.

NO

Repair an open in the IG1 wire between the under-dash fuse/relay box and the TCM.

5. Open wire check (GND1 (TCU) line, GND2 (TCU) line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
Test point 1	**TCM 50P connector No. 9**
	TCM 50P connector No. 10
Test point 2	Body ground

Is there 1.0 Ω or less?

YES (CAN gateway 12P connector type)

The GND1 (TCU) wire and the GND2 (TCU) wire are OK. Go to step 6.

YES (CAN gateway 16P connector type)

The GND1 (TCU) wire and the GND2 (TCU) wire are OK. Go to step 7.

NO

Repair an open in the GND1 (TCU) wire and/or the GND2 (TCU) wire between the TCM and ground (G151), or repair poor ground (G151).

6. Open wire check (F-CAN A_H line, F-CAN A_L line)

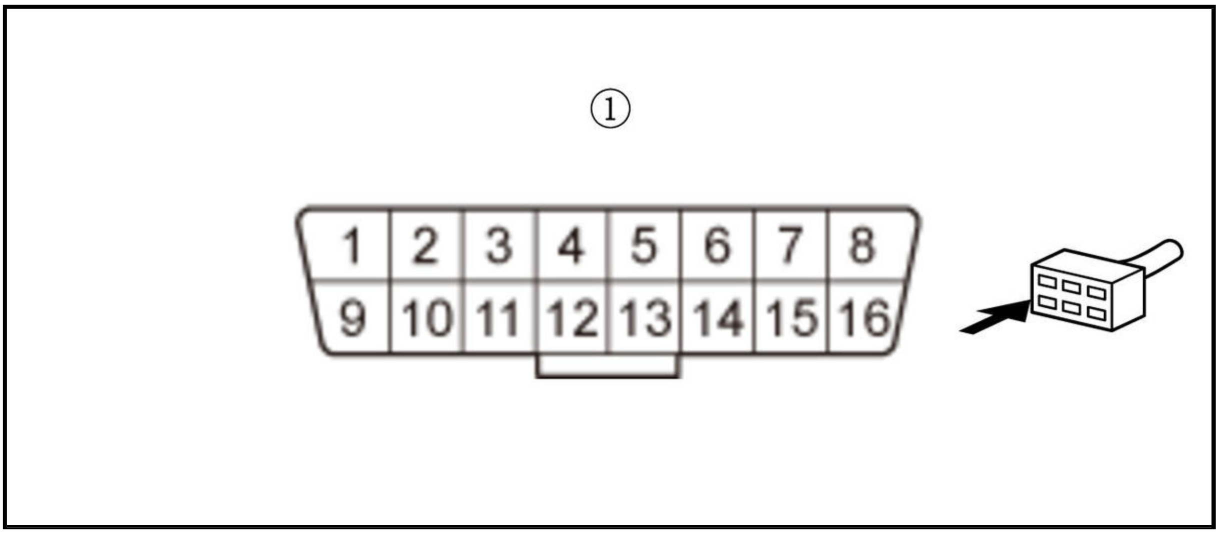
-1. Measure the resistance between test points 1 and 2.

F-CAN A_H wire

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
Test point 1	DLC (16P) (female terminals) No. 6 : ①
Test point 2	**TCM 50P connector No. 3**

F-CAN A_L wire

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
Test point 1	DLC (16P) (female terminals) No. 14 : ①
Test point 2	**TCM 50P connector No. 11**



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Repair an open in the F-CAN A_H wire and/or the F-CAN A_L wire between the DLC and the TCM.

7. Open wire check (F-CAN A_H line, F-CAN A_L line)

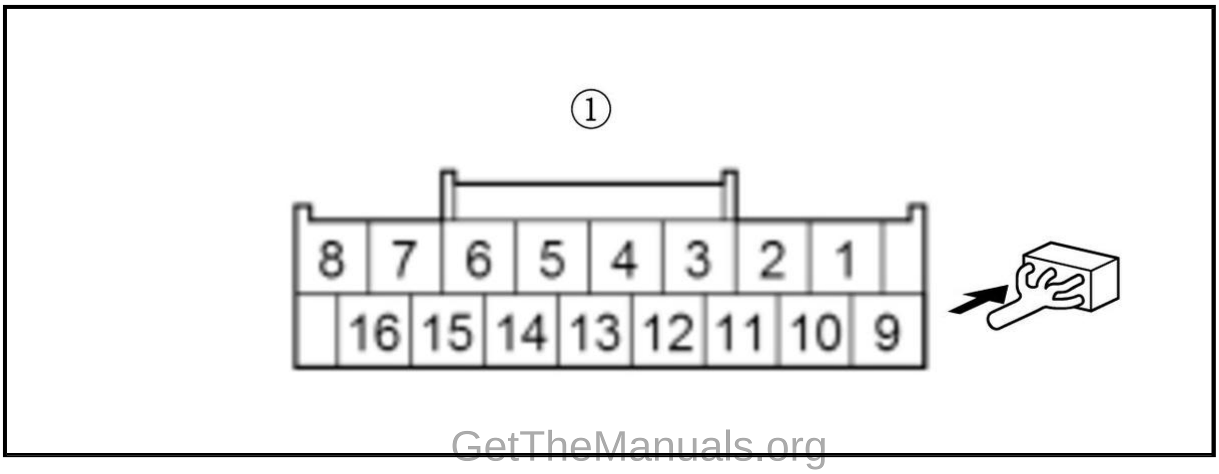
-1. Disconnect the following connector.

CAN gateway 16P connector

-2. Measure the resistance between test points 1 and 2 individually.

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	**TCM 50P connector No. 3**
Test point 2	CAN gateway 16P connector (female terminals) No. 3: ①

Test point 1	**TCM 50P connector No. 11**
Test point 2	CAN gateway 16P connector (female terminals) No. 11: ①



Is there 1.0 Ω or less?

YES

The F-CAN A_H wire and the F-CAN A_L wire are OK. Go to step 8.

NO

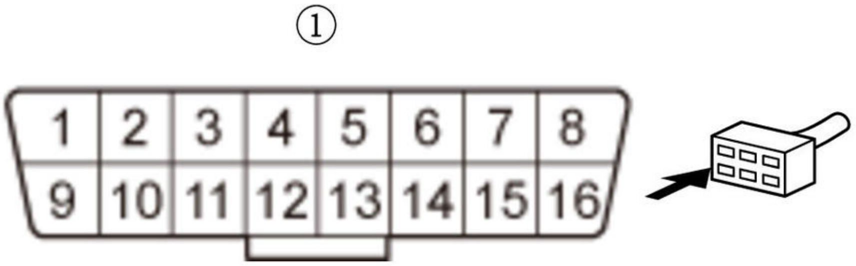
Repair an open in the F-CAN A_H wire and/or the F-CAN A_L wire between the CAN gateway and the TCM.

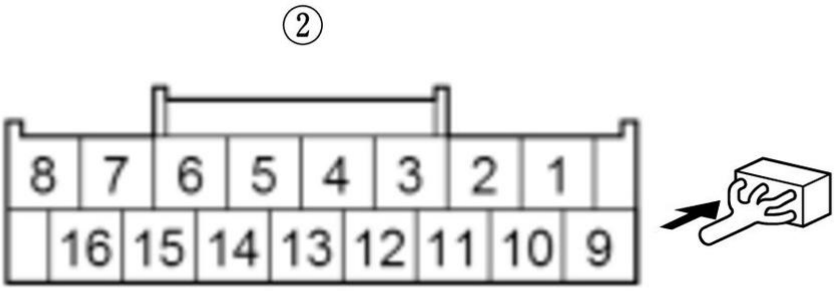
8. Open wire check (DIAG-CAN_H line, DIAG-CAN_L line)

-1. Measure the resistance between test points 1 and 2 individually.

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	DLC (16P) (female terminals) No. 6: ①
Test point 2	CAN gateway 16P connector (female terminals) No. 2: ②

Test point 1	DLC (16P) (female terminals) No. 14: ①
Test point 2	CAN gateway 16P connector (female terminals) No. 10: ②





Is there 1.0 Ω or less?

YES

The DIAG-CAN_H wire and the DIAG-CAN_L wire are not open. Go to step 9.

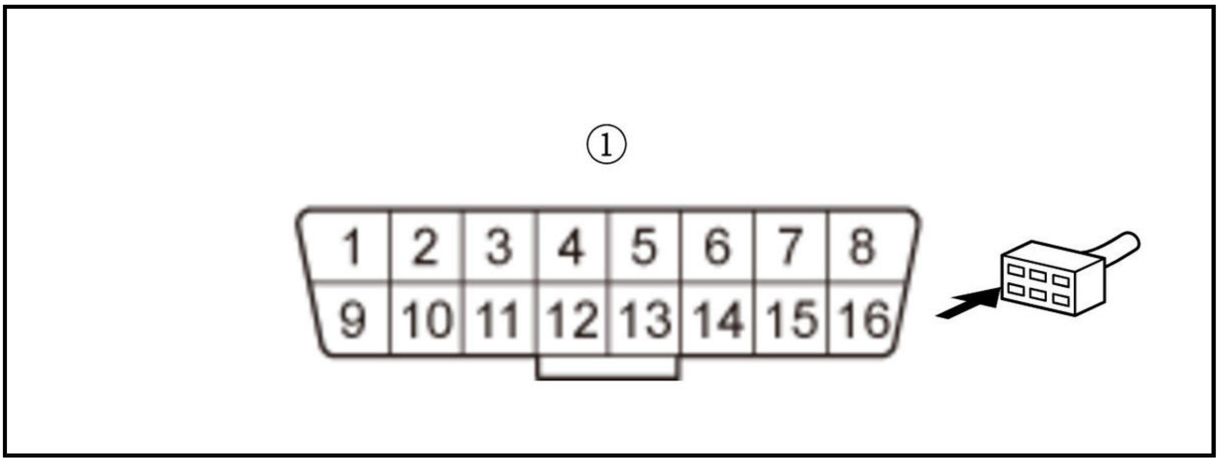
NO

Repair an open in the DIAG-CAN_H wire and/or the DIAG-CAN_L wire between the CAN gateway and the DLC.

9. Shorted wire check (DIAG-CAN_H line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	DLC (16P) (female terminals) No. 6: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The DIAG-CAN_H wire is not shorted to ground. Go to step 10.

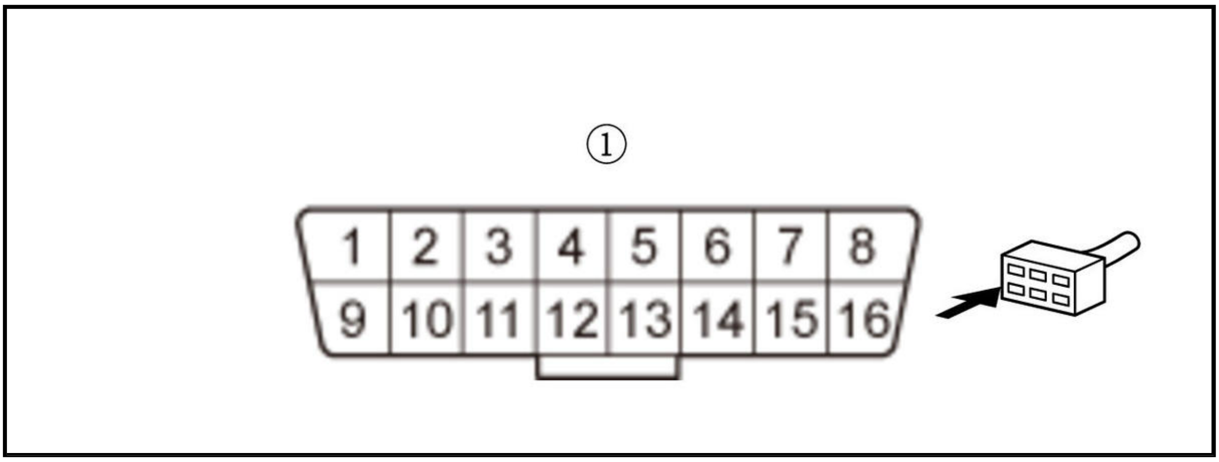
NO

Repair a short to ground in the DIAG-CAN_H wire between the CAN gateway and the DLC.

10. Shorted wire check (DIAG-CAN_H line to DIAG-CAN_L line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	TCM 50P connector: disconnected
B	CAN gateway 16P connector: disconnected
Test point 1	DLC (16P) (female terminals) No. 6: ①
Test point 2	DLC (16P) (female terminals) No. 14: ①



Is there 1 MΩ or more?

YES

The DIAG-CAN_H wire and the DIAG-CAN_L wire are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting, or **replace the original TCM** .

NO

Repair a short in the DIAG-CAN_H wire to the DIAG-CAN_L wire between the CAN gateway and the DLC.

SYMPTOM TROUBLESHOOTING INDEX

CVT SYSTEM SYMPTOM TROUBLESHOOTING INDEX

NOTE: Do an all DTC check with the HDS, and troubleshoot any DTCs first before following the repair procedures listed in the index.

Symptom	Probable cause(s)	Notes
With the vehicle in the ON mode, the shift position indicator displays an improper indication, or it never displays at all	• F-CAN communication line error • Gauge control module defective • TCM defective (1.5 L engine) • PCM defective (except 1.5 L engine) • Transmission range switch defective or out of adjustment • Transmission range switch circuit • Shift cable broken or out of adjustment • Control pin broken • Control shaft, roller, detent lever, and detent spring worn or damaged	• **Check the F-CAN communication line** (1.5 L engine). • **Check the F-CAN communication line** (2.4 L engine). • **Check the F-CAN communication line by using the gauge control module self-diagnostic function** . • **Inspect the transmission range switch** . • Inspect the open or short in the wire between the TCM and transmission range switch. • **Check for a loose shift cable at the shift lever and the control lever**. • Check the control shaft, roller, detent lever, and detent spring for wear and damage.
Shift lever cannot be moved from P position/mode while	• Shift lock solenoid defective • Shift lock solenoid control circuit	• **Test the shift lock solenoid**. • **Troubleshoot the shift lock system circuit**.

Symptom	Probable cause(s)	Notes
pressing on the brake pedal	- Shift lock mechanism defective - Transmission range switch defective - Transmission range switch circuit - Brake pedal position switch circuit - Brake pedal position switch defective - Accelerator pedal position sensor circuit - Accelerator pedal position sensor defective - Throttle body defective	- **Inspect the transmission range switch** . - **Inspect the APP sensor signal** . - **Check the throttle body** .
HDS does not communicate with the TCM	- DLC circuit error - TCM defective	- **Troubleshoot the TCM communication circuit**. - **Troubleshoot the DLC circuit** .
Engine does not start	- Shift cable broken or out of adjustment - Control pin broken - Transmission range switch defective or out of adjustment - Drive plate worn or damaged - Torque converter assembly defective - Torque converter ring gear worn or damaged - Transmission assembly and drive plate installation defective	- **Check for a loose shift cable at the shift lever and the control lever**. - **Inspect the transmission range switch** . - Inspect the drive plate for wear and damage. If the drive plate is worn or damaged, **replace it** . - Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

Symptom	Probable cause(s)	Notes
Engine runs, but vehicle does not move in any positions/modes	- Low transmission fluid (HCF-2) level - Transmission range switch defective or out of adjustment - Engine output low - Transmission fluid strainer or CVTF warmer strainer clogged - Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged - Pulley pressure feed pipe defective	- **Check the transmission fluid (HCF-2) level**. - **Inspect the transmission range switch** . - Adjust the engine output. - **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris. - Check the drive pulley, the driven pulley, the pulley shafts, the steel

Symptom	Probable cause(s)	Notes
	- Input shaft assembly worn or damaged - Secondary drive/driven gear worn or damaged - Final driven gear worn or damaged - Sun gear worn or damaged - Control shaft, roller, detent lever, and detent spring worn or damaged - Control lever worn or damaged - Parking brake pawl and parking shaft worn or damaged - Manual valve worn or damaged - Transmission fluid pump worn, binding, or foreign material in transmission fluid pump - Transmission fluid pump drive chain or transmission fluid pump drive/driven sprocket worn or damaged - Valve body assembly defective - Joint pipes defective - Stator shaft worn or damaged - Torque converter assembly defective - Torque converter ring gear worn or damaged - Transmission assembly and drive plate installation defective	belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** . - Check the pulley pressure feed pipe and the sealing ring for wear and damage. - Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage. - Check the secondary drive/driven gear for wear and damage. - Check the final driven gear for wear and damage. - Check the sun gear for wear and damage. If the sun gear is worn or damaged, replace it and also check the planetary carrier pinion gears, the forward clutch, and the drive pulley shaft splines for wear and damage. - Check the control shaft, roller, detent lever, and detent spring for wear and damage. - Check the control lever for wear and damage. - Check the parking brake pawl and the parking shaft for wear and damage. If the parking brake pawl or the parking shaft are worn or damaged, replace them and also check the park gear for wear and damage. - Check the manual valve for wear and damage. - Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** . - Check the transmission fluid pump drive chain and the transmission fluid pump drive/driven sprocket for wear and damage. - Check the valve body assembly for wear and damage. - Check the joint pipes and O-rings for wear and damage. - Check the stator shaft for wear and damage.

Symptom	Probable cause(s)	Notes
		- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

Symptom	Probable cause(s)	Notes
Vehicle does not move in D, S, or L positions/modes	- Transmission range switch defective or out of adjustment - Shift cable broken or out of adjustment - Control pin broken - Engine output low - Forward clutch defective - Reverse brake piston defective - Sun gear worn or damaged - Manual valve worn or damaged - Valve body assembly defective - Stator shaft worn or damaged	- **Inspect the transmission range switch** . - **Check for a loose shift cable at the shift lever and the control lever**. - Adjust the engine output. - **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly. - Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate. - Check the sun gear for wear and damage. If the sun gear is worn or damaged, replace it and also check the planetary carrier pinion gears, the forward clutch, and the drive pulley shaft splines for wear and damage. - Check the manual valve for wear and damage. - Check the valve body assembly for wear and damage. - Check the stator shaft for wear and damage.

Symptom	Probable cause(s)	Notes
Vehicle does not move in R position/mode	- Transmission range switch defective or out of adjustment - Shift cable broken or out of adjustment - Control pin broken	- **Inspect the transmission range switch** . - **Check for a loose shift cable at the shift lever and the control lever**. - Inspect the reverse brake piston and the O-rings. Check the spring

Symptom	Probable cause(s)	Notes
	- Reverse brake defective - Reverse brake piston defective - Planetary carrier assembly worn or damaged - Sun gear worn or damaged - Ring gear worn or damaged - Thrust needle bearing or thrust washer on planetary carrier assembly seized, worn, or damaged - Manual valve worn or damaged - Valve body assembly defective - Stator shaft worn or damaged	retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate. - Check the planetary carrier assembly for wear and damage. If the planetary carrier assembly is worn or damaged, replace it and also check the planetary carrier pinion gears, the reverse brake, and the drive pulley shaft splines for wear and damage. - Check the sun gear for wear and damage. If the sun gear is worn or damaged, replace it and also check the planetary carrier pinion gears, the forward clutch, and the drive pulley shaft splines for wear and damage. - Check the ring gear for wear and damage. If the ring gear is worn or damaged, replace it and also check the planetary carrier assembly and the reverse brake for wear and damage. - Check the thrust needle bearing and the thrust washer on the planetary carrier assembly for seize, wear, and damage. If the thrust needle bearing or the thrust washer are seized, worn, or damaged, replace them and adjust the clearance with the thrust shim. - Check the manual valve for wear and damage. - Check the valve body assembly for wear and damage. - Check the stator shaft for wear and damage.
Engine stalls when shifted to D position/mode from N position/mode	- Engine output low - Reverse brake defective - Reverse brake piston defective - Torque converter assembly defective - Torque converter ring gear worn or damaged	- Adjust the engine output. - Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and

Symptom	Probable cause(s)	Notes
	- Transmission assembly and drive plate installation defective	damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate. - Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

Symptom	Probable cause(s)	Notes
Engine stalls when shifted to R position/mode from N position/mode	- Engine output low - Forward clutch defective - Planetary carrier assembly worn or damaged - Thrust needle bearing or thrust washer on planetary carrier assembly seized, worn, or damaged - Torque converter assembly defective - Torque converter ring gear worn or damaged - Transmission assembly and drive plate installation defective	- Adjust the engine output. - **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly. - Check the planetary carrier assembly for wear and damage. If the planetary carrier assembly is worn or damaged, replace it and also check the planetary carrier pinion gears, the reverse brake, and the drive pulley shaft splines for wear and damage. - Check the thrust needle bearing and the thrust washer on the planetary carrier assembly for seize, wear, and damage. If the thrust needle bearing or the thrust washer are seized, worn, or damaged, replace them and adjust the clearance with the thrust shim. - Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .
No shift to higher or lower ratio	- TCM defective (1.5 L engine) - PCM defective (except 1.5 L engine) - Low transmission fluid (HCF-2) level - Transmission fluid strainer or CVTF warmer strainer clogged - Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged - Pulley pressure feed pipe defective - Transmission fluid pump worn, binding, or foreign	- **Check the transmission fluid (HCF-2) level**. - **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris. - Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** .

Symptom	Probable cause(s)	Notes
	material in transmission fluid pump - Valve body assembly defective - Solenoid wire harness worn or damaged - Stator shaft worn or damaged	- Check the pulley pressure feed pipe and the sealing ring for wear and damage. - Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** . - Check the valve body assembly for wear and damage. - Inspect the solenoid wire harness for open and short. - Check the stator shaft for wear and damage.

Symptom	Probable cause(s)	Notes
Poor acceleration	- TCM defective (1.5 L engine) - PCM defective (except 1.5 L engine) - CVT drive pulley speed sensor defective - Engine output low - Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged - Pulley pressure feed pipe defective - Transmission fluid pump worn, binding, or foreign material in transmission fluid pump - Valve body assembly defective - Joint pipes defective - Solenoid wire harness worn or damaged - Stator shaft worn or damaged - Torque converter assembly defective - Torque converter ring gear worn or damaged - Transmission assembly and drive plate installation defective	- Check the CVT drive pulley speed sensor for wear and damage, and also check the O-ring for wear and damage. - Adjust the engine output. - Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** . - Check the pulley pressure feed pipe and the sealing ring for wear and damage. - Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** . - Check the valve body assembly for wear and damage. - Check the joint pipes and O-rings for wear and damage. - Inspect the solenoid wire harness for open and short. - Check the stator shaft for wear and damage. - Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .
Engine revs up abnormally high while driving, and no acceleration	- TCM defective (1.5 L engine) - PCM defective (except 1.5 L engine)	- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged,

Symptom	Probable cause(s)	Notes
	- Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged - Pulley pressure feed pipe defective - Forward clutch defective - Reverse brake defective - Reverse brake piston defective - Transmission fluid pump worn, binding, or foreign material in transmission fluid pump - Transmission fluid pump drive chain or transmission fluid pump drive/driven sprocket worn or damaged - Valve body assembly defective - Joint pipes defective - Solenoid wire harness worn or damaged - Stator shaft worn or damaged	**replace the transmission housing assembly** . - Check the pulley pressure feed pipe and the sealing ring for wear and damage. - **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly. - Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate. - Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** . - Check the transmission fluid pump drive chain and the transmission fluid pump drive/driven sprocket for wear and damage. - Check the valve body assembly for wear and damage. - Check the joint pipes and O-rings for wear and damage. - Inspect the solenoid wire harness for open and short. - Check the stator shaft for wear and damage.

Symptom	Probable cause(s)	Notes
Excessive shock when accelerating and decelerating	- TCM defective (1.5 L engine) - PCM defective (except 1.5 L engine) - Low transmission fluid (HCF-2) level - Transmission fluid (HCF-2) deteriorated - Drive pulley, driven pulley, pulley shaft, steel belt, and	- **Check the transmission fluid (HCF-2) level**. - Check the transmission fluid (HCF-2) condition. If necessary, **replace the transmission fluid (HCF-2)**. - Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** .

Symptom	Probable cause(s)	Notes
	pulley related parts worn or damaged • Pulley pressure feed pipe defective • Forward clutch defective • Reverse brake defective • Reverse brake piston defective • Valve body assembly defective • Joint pipes defective • Stator shaft worn or damaged • Torque converter assembly defective • Torque converter ring gear worn or damaged • Transmission assembly and drive plate installation defective	• Check the pulley pressure feed pipe and the sealing ring for wear and damage. • **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly. • Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate. • Check the valve body assembly for wear and damage. • Check the joint pipes and O-rings for wear and damage. • Check the stator shaft for wear and damage. • Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .
No engine braking	• TCM defective (1.5 L engine) • PCM defective (except 1.5 L engine) • Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged • Pulley pressure feed pipe defective • Valve body assembly defective • Joint pipes defective • Solenoid wire harness worn or damaged • Stator shaft worn or damaged	• Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** . • Check the pulley pressure feed pipe and the sealing ring for wear and damage. • Check the valve body assembly for wear and damage. • Check the joint pipes and O-rings for wear and damage. • Inspect the solenoid wire harness for open and short. • Check the stator shaft for wear and damage.

Symptom	Probable cause(s)	Notes
Vehicle does not creep on a flat road in D, S, or L positions/modes	- TCM defective (1.5 L engine) - PCM defective (except 1.5 L engine) - CVT drive pulley speed sensor defective - Engine output low - Low transmission fluid (HCF-2) level - Transmission fluid strainer or CVTF warmer strainer clogged - Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged - Pulley pressure feed pipe defective - Transmission fluid pump worn, binding, or foreign material in transmission fluid pump - Valve body assembly defective - Joint pipes defective - Solenoid wire harness worn or damaged - Stator shaft worn or damaged - Torque converter assembly defective - Torque converter ring gear worn or damaged - Transmission assembly and drive plate installation defective	- Check the CVT drive pulley speed sensor for wear and damage, and also check the O-ring for wear and damage. - Adjust the engine output. - **Check the transmission fluid (HCF-2) level**. - **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris. - Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** . - Check the pulley pressure feed pipe and the sealing ring for wear and damage. - Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** . - Check the valve body assembly for wear and damage. - Check the joint pipes and O-rings for wear and damage. - Inspect the solenoid wire harness for open and short. - Check the stator shaft for wear and damage. - Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .
Vehicle moves in N position/mode, shift cable is properly adjusted	- Forward clutch defective - Reverse brake defective - Reverse brake piston defective - Spring retainer/return spring assembly defective - Thrust needle bearing on input shaft assembly seized, worn, or damaged	- **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly. - Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse**

Symptom	Probable cause(s)	Notes
	- Manual valve worn or damaged - Stator shaft worn or damaged	**brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate. - Check the thrust needle bearing on the input shaft assembly for seize, wear, and damage. If the thrust needle bearing is seized, worn, or damaged, replace it and also check the related part of the input shaft assembly for wear and damage. - Check the manual valve for wear and damage. - Check the stator shaft for wear and damage.

Symptom	Probable cause(s)	Notes
Late shift after shifting to D position/mode from N position/mode, and return to N position/mode	- TCM defective (1.5 L engine) - PCM defective (except 1.5 L engine) - Torque converter turbine speed sensor defective - Low transmission fluid (HCF-2) level - Transmission range switch defective or out of adjustment - Shift cable broken or out of adjustment - Control pin broken - Transmission fluid strainer or CVTF warmer strainer clogged - Forward clutch defective - Manual valve worn or damaged - Valve body assembly defective - Joint pipes defective - Stator shaft worn or damaged	- Check the torque converter turbine speed sensor for wear and damage, and also check the O-ring for wear and damage. - **Check the transmission fluid (HCF-2) level**. - **Inspect the transmission range switch** . - **Check for a loose shift cable at the shift lever and the control lever**. - **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris. - **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly. - Check the manual valve for wear and damage. - Check the valve body assembly for wear and damage. - Check the joint pipes and O-rings for wear and damage. - Check the stator shaft for wear and damage.
Late shift after shifting to R position/mode from N position/mode, and return to N position/mode	- TCM defective (1.5 L engine) - PCM defective (except 1.5 L engine) - Torque converter turbine speed sensor defective - Low transmission fluid (HCF-2) level - Transmission range switch defective or out of adjustment - Shift cable broken or out of adjustment - Control pin broken - Transmission fluid strainer or CVTF warmer strainer clogged - Reverse brake defective - Reverse brake piston defective	- Check the torque converter turbine speed sensor for wear and damage, and also check the O-ring for wear and damage. - **Check the transmission fluid (HCF-2) level**. - **Inspect the transmission range switch** . - **Check for a loose shift cable at the shift lever and the control lever**. - **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris. - Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the**

Symptom	Probable cause(s)	Notes
	• Manual valve worn or damaged • Valve body assembly defective • Joint pipes defective • Stator shaft worn or damaged	**clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate. • Check the manual valve for wear and damage. • Check the valve body assembly for wear and damage. • Check the joint pipes and O-rings for wear and damage. • Check the stator shaft for wear and damage.

Symptom	Probable cause(s)	Notes
Unstable engine speed	• TCM defective (1.5 L engine) • PCM defective (except 1.5 L engine) • Low transmission fluid (HCF-2) level • Transmission fluid (HCF-2) deteriorated • Transmission fluid strainer or CVTF warmer strainer clogged • Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged • Pulley pressure feed pipe defective • Forward clutch defective • Reverse brake defective • CVT drive pulley pressure control solenoid valve defective • CVT driven pulley pressure control solenoid valve defective • CVT clutch pressure control solenoid valve defective • CVT lock-up clutch control solenoid valve defective • Shift solenoid valve B defective	• **Check the transmission fluid (HCF-2) level**. • Check the transmission fluid (HCF-2) condition. If necessary, **replace the transmission fluid (HCF-2)**. • **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris. • Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** . • Check the pulley pressure feed pipe and the sealing ring for wear and damage. • **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly. • Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect

Symptom	Probable cause(s)	Notes
	• Shift solenoid valve O/P defective • Transmission fluid pump worn, binding, or foreign material in transmission fluid pump • Valve body assembly defective • Joint pipes defective • Torque converter assembly defective • Torque converter ring gear worn or damaged • Transmission assembly and drive plate installation defective	the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate. • **Inspect the CVT solenoid valve**. • Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** . • Check the valve body assembly for wear and damage. • Check the joint pipes and O-rings for wear and damage. • Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

Symptom	Probable cause(s)	Notes
Excessive shock when starting off	• TCM defective (1.5 L engine) • PCM defective (except 1.5 L engine) • Low transmission fluid (HCF-2) level • Transmission fluid (HCF-2) deteriorated • Transmission fluid strainer or CVTF warmer strainer clogged • Pulley pressure feed pipe defective • Forward clutch defective • Reverse brake defective • Reverse brake piston defective • Valve body assembly defective • Joint pipes defective	• **Check the transmission fluid (HCF-2) level**. • Check the transmission fluid (HCF-2) condition. If necessary, **replace the transmission fluid (HCF-2)**. • **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris. • Check the pulley pressure feed pipe and the sealing ring for wear and damage. • **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly. • Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a

Symptom	Probable cause(s)	Notes
		set. If they are OK, adjust the clearance with the reverse brake end-plate. - Check the valve body assembly for wear and damage. - Check the joint pipes and O-rings for wear and damage.
Vibration in all positions/modes	- Engine output low - Input shaft assembly worn or damaged - Torque converter assembly defective - Torque converter ring gear worn or damaged - Transmission assembly and drive plate installation defective	- Adjust the engine output. - Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage. - Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

Symptom	Probable cause(s)	Notes
Excessive idle vibration in R, D, S, or L positions/modes	- TCM defective (1.5 L engine) - PCM defective (except 1.5 L engine) - Engine output low - Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged - Forward clutch defective - Input shaft assembly worn or damaged - Reverse brake defective - Reverse brake piston defective - Thrust washer on planetary carrier assembly seized, worn, or damaged - Valve body assembly defective - Joint pipes defective - Solenoid wire harness worn or damaged - Torque converter assembly defective - Torque converter ring gear worn or damaged - Transmission assembly and drive plate installation	- Adjust the engine output - Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** . - **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly. - Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage. - Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . 	defective	clearance with the reverse brake end-plate. - Check the thrust washer on the planetary carrier assembly for seize, wear, and damage. If the thrust washer is seized, worn, or damaged, replace it and adjust the clearance with the thrust shim. - Check the valve body assembly for wear and damage. - Check the joint pipes and O-rings for wear and damage. - Inspect the solenoid wire harness for open and short. - Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .
Excessive idle vibration in N and P positions/modes	- TCM defective (1.5 L engine) - PCM defective (except 1.5 L engine) - Engine output low - Forward clutch defective - Input shaft assembly worn or damaged - Reverse brake defective - Reverse brake piston defective - Torque converter assembly defective - Torque converter ring gear worn or damaged - Transmission assembly and drive plate installation defective	- Adjust the engine output. - **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly. - Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage. - Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate. - Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

Symptom	Probable cause(s)	Notes
Noise from transmission in N and P positions/modes	- Forward clutch defective - Input shaft assembly worn or damaged - Reverse brake defective - Reverse brake piston defective - Thrust needle bearing or thrust shim on input shaft assembly seized, worn, or damaged - Planetary carrier assembly worn or damaged - Sun gear worn or damaged - Ring gear worn or damaged - Thrust needle bearing or thrust washer on planetary carrier assembly seized, worn, or damaged - Transmission fluid pump worn, binding, or foreign material in transmission fluid pump	- **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly. - Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage. - Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate. - Check the thrust needle bearing and the thrust shim on the input shaft assembly for seize, wear, and damage. If the thrust needle bearing or the thrust shim are seized, worn, or damaged, replace them and also check the related part of the input shaft assembly for wear and damage. - Check the planetary carrier assembly for wear and damage. If the planetary carrier assembly is worn or damaged, replace it and also check the planetary carrier pinion gears, the reverse brake, and the drive pulley shaft splines for wear and damage. - Check the sun gear for wear and damage. If the sun gear is worn or damaged, replace it and also check the planetary carrier pinion gears, the forward clutch, and the drive pulley shaft splines for wear and damage. - Check the ring gear for wear and damage. If the ring gear is worn or damaged, replace it and also check the planetary carrier assembly and the reverse brake for wear and damage. - Check the thrust needle bearing and the thrust washer on the planetary

Symptom	Probable cause(s)	Notes
		carrier assembly for seize, wear, and damage. If the thrust needle bearing or the thrust washer are seized, worn, or damaged, replace them and adjust the clearance with the thrust shim. • Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** .

Symptom	Probable cause(s)	Notes
Noise from transmission in D, S, or L positions/modes	• Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged • Input shaft assembly worn or damaged • Secondary drive/driven gear worn or damaged • Final driven gear worn or damaged • Control shaft, roller, detent lever, and detent spring worn or damaged • Parking brake pawl and parking shaft worn or damaged • Parking pawl spring worn or damaged	• Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** . • Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage. • Check the secondary drive/driven gear for wear and damage. • Check the final driven gear for wear and damage. • Check the control shaft, roller, detent lever, and detent spring for wear and damage. • Check the parking brake pawl and the parking shaft for wear and damage. If the parking brake pawl or the parking shaft are worn or damaged, replace them and also check the park gear for wear and damage. • Check the parking pawl spring for wear and damage.

Symptom	Probable cause(s)	Notes
Noise from transmission in R position/mode	• Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged • Input shaft assembly worn or damaged • Reverse brake defective • Reverse brake piston defective	• Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** . • Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged,

Symptom	Probable cause(s)	Notes
	• Spring retainer/return spring assembly defective • Secondary drive/driven gear worn or damaged • Final driven gear worn or damaged • Thrust needle bearing or thrust shim on input shaft assembly seized, worn, or damaged • Planetary carrier assembly worn or damaged • Sun gear worn or damaged • Ring gear worn or damaged • Thrust needle bearing or thrust washer on planetary carrier assembly seized, worn, or damaged • Control shaft, roller, detent lever, and detent spring worn or damaged • Parking brake pawl and parking shaft worn or damaged • Parking pawl spring worn or damaged	replace it and also check the related part of the input shaft assembly for wear and damage. • Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate. • Check the secondary drive/driven gear for wear and damage. • Check the final driven gear for wear and damage. • Check the thrust needle bearing and the thrust shim on the input shaft assembly for seize, wear, and damage. If the thrust needle bearing or the thrust shim are seized, worn, or damaged, replace them and also check the related part of the input shaft assembly for wear and damage. • Check the planetary carrier assembly for wear and damage. If the planetary carrier assembly is worn or damaged, replace it and also check the planetary carrier pinion gears, the reverse brake, and the drive pulley shaft splines for wear and damage. • Check the sun gear for wear and damage. If the sun gear is worn or damaged, replace it and also check the planetary carrier pinion gears, the forward clutch, and the drive pulley shaft splines for wear and damage. • Check the ring gear for wear and damage. If the ring gear is worn or damaged, replace it and also check the planetary carrier assembly and the reverse brake for wear and damage. • Check the thrust needle bearing and the thrust washer on the planetary carrier assembly for seize, wear, and damage. If the thrust needle bearing or the thrust washer are seized, worn,

Symptom	Probable cause(s)	Notes
		or damaged, replace them and adjust the clearance with the thrust shim. • Check the control shaft, roller, detent lever, and detent spring for wear and damage. • Check the parking brake pawl and the parking shaft for wear and damage. If the parking brake pawl or the parking shaft are worn or damaged, replace them and also check the park gear for wear and damage. • Check the parking pawl spring for wear and damage.

Symptom	Probable cause(s)	Notes
Stall speed high	• TCM defective (1.5 L engine) • PCM defective (except 1.5 L engine) • Low transmission fluid (HCF-2) level • Transmission fluid (HCF-2) deteriorated • Forward clutch defective • Input shaft assembly worn or damaged • Reverse brake defective • Reverse brake piston defective • Transmission fluid pump worn, binding, or foreign material in transmission fluid pump • Valve body assembly defective • Joint pipes defective • Stator shaft worn or damaged • Torque converter assembly defective • Torque converter ring gear worn or damaged • Transmission assembly and drive plate installation defective	• **Check the transmission fluid (HCF-2) level**. • Check the transmission fluid (HCF-2) condition. If necessary, **replace the transmission fluid (HCF-2)**. • **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly. • Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage. • Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate. • Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** . • Check the valve body assembly for wear and damage.

Symptom	Probable cause(s)	Notes
		- Check the joint pipes and O-rings for wear and damage. - Check the stator shaft for wear and damage. - Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .
Stall speed low	- TCM defective (1.5 L engine) - PCM defective (except 1.5 L engine) - Engine output low - Valve body assembly defective - Joint pipes defective - Stator shaft worn or damaged - Torque converter assembly defective - Torque converter ring gear worn or damaged - Transmission assembly and drive plate installation defective	- Adjust the engine output. - Check the valve body assembly for wear and damage. - Check the joint pipes and O-rings for wear and damage. - Check the stator shaft for wear and damage. - Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .
Judder when starting off	- Low transmission fluid (HCF-2) level - Transmission fluid (HCF-2) deteriorated - Transmission fluid strainer or CVTF warmer strainer clogged - Transmission fluid pump worn, binding, or foreign material in transmission fluid pump - Valve body assembly defective - Joint pipes defective	- **Check the transmission fluid (HCF-2) level**. - Check the transmission fluid (HCF-2) condition. If necessary, **replace the transmission fluid (HCF-2)**. - **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris. - Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** . - Check the valve body assembly for wear and damage. - Check the joint pipes and O-rings for wear and damage.

Symptom	Probable cause(s)	Notes
Shift lever does not operate smoothly	- Transmission range switch defective or out of adjustment - Shift cable broken or out of adjustment - Control pin broken	- **Inspect the transmission range switch** . - **Check for a loose shift cable at the shift lever and the control lever**.

Symptom	Probable cause(s)	Notes
	- Control shaft, roller, detent lever, and detent spring worn or damaged - Control lever worn or damaged - Parking brake pawl and parking shaft worn or damaged - Manual valve worn or damaged - Stator shaft worn or damaged	- Check the control shaft, roller, detent lever, and detent spring for wear and damage. - Check the control lever for wear and damage. - Check the parking brake pawl and the parking shaft for wear and damage. If the parking brake pawl or the parking shaft are worn or damaged, replace them and also check the park gear for wear and damage. - Check the manual valve for wear and damage. - Check the stator shaft for wear and damage.
Transmission will not shift into P position/mode, or transmission cannot shift out of P position/mode	- TCM defective (1.5 L engine) - PCM defective (except 1.5 L engine) - Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged - Transmission range switch defective or out of adjustment - Shift cable broken or out of adjustment - Control pin broken - Control shaft, roller, detent lever, and detent spring worn or damaged - Control lever worn or damaged - Parking brake pawl and parking shaft worn or damaged - Park gear worn or damaged - Parking pawl spring worn or damaged - Manual valve worn or damaged - Valve body assembly defective - Stator shaft worn or damaged	- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** . - **Inspect the transmission range switch** . - **Check for a loose shift cable at the shift lever and the control lever**. - Check the control shaft, roller, detent lever, and detent spring for wear and damage. - Check the control lever for wear and damage. - Check the parking brake pawl and the parking shaft for wear and damage. If the parking brake pawl or the parking shaft are worn or damaged, replace them and also check the park gear for wear and damage. - Check the park gear for wear and damage. - Check the parking pawl spring for wear and damage. - Check the manual valve for wear and damage. - Check the valve body assembly for wear and damage. - Check the stator shaft for wear and damage.
Torque converter clutch does not	- Shift solenoid valve B defective	- **Inspect shift solenoid valve B**.

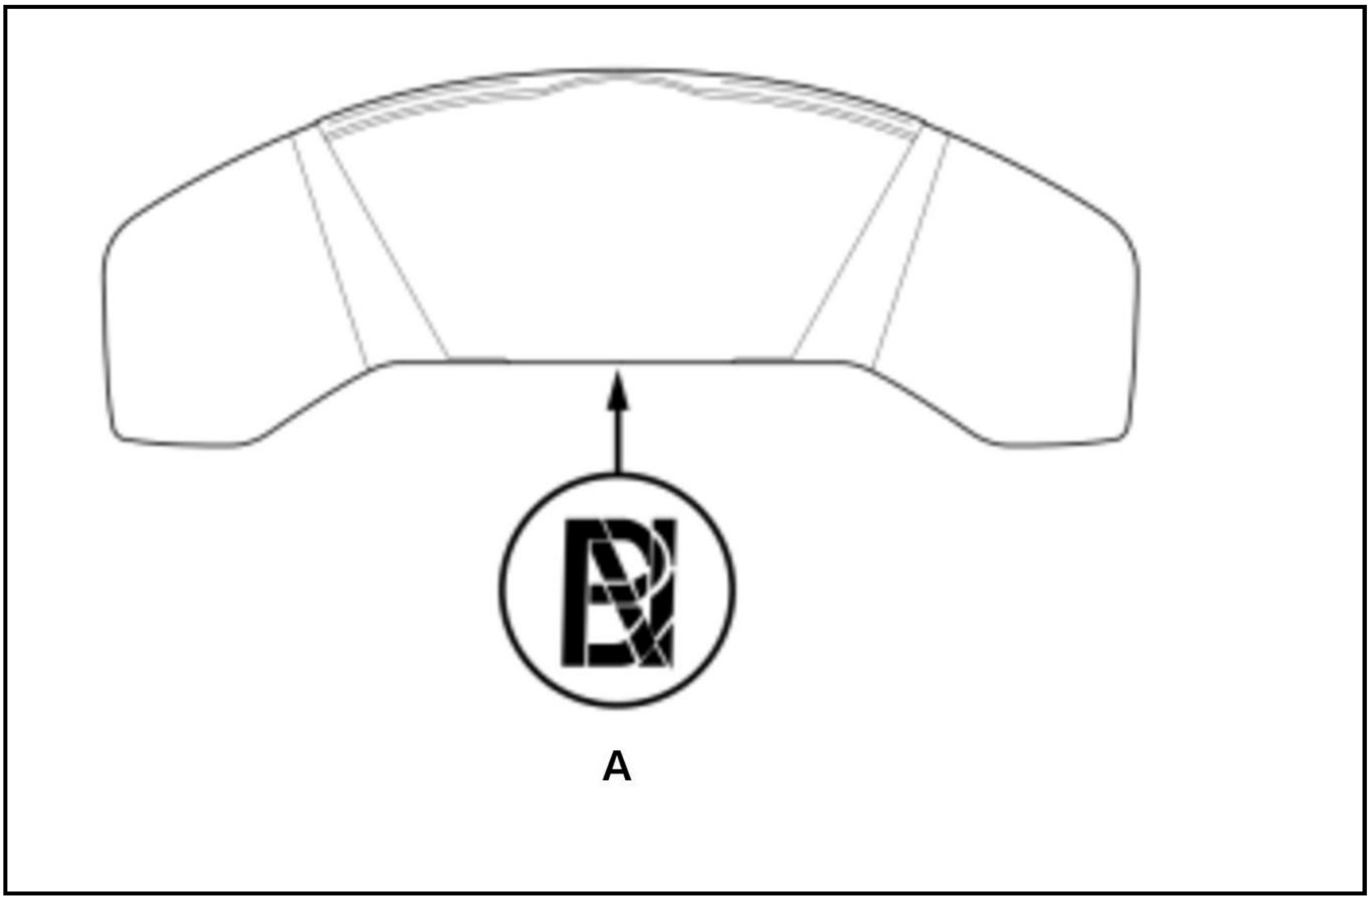
Symptom	Probable cause(s)	Notes
disengage; engine stalls easily	- CVT lock-up clutch control solenoid valve defective - Torque converter clutch piston defective - Valve body assembly defective	- **Inspect the CVT lock-up clutch control solenoid valve**. - Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** . - Check the valve body assembly for wear and damage.

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE CVT SYSTEM

How to Check for DTCs with the Honda Diagnostic System (HDS)

When the transmission control module (TCM) or the powertrain control module (PCM) senses an abnormality in the input or output systems, the shift position indicator (A) in the gauge control module will usually blink as shown.



When the Honda Diagnostic System (HDS) is connected to the data link connector (DLC) located under the driver's side of the dashboard, and then the vehicle is turned to the ON mode, and the appropriate menu is selected, it will indicate the diagnostic trouble code (DTC).

If the shift position indicator or the malfunction indicator lamp (MIL) has been reported on, or if a driveability problem is suspected, follow this procedure:

1. **Connect the HDS to the DLC**

2. Check for Pending or Confirmed DTCs with the HDS.

3. Record the freeze data and the on-board snapshots for all PGM-FI DTCs and A/T DTCs.

4. If there is a PGM-FI DTC, first check the PGM-FI system as indicated by the DTC.

5. Clear the DTC and the data.

6. Drive the vehicle for several minutes under the same conditions as those indicated by the freeze data or the on-board snapshot, and then recheck for the DTC. If the A/T DTC returns, go to the indicated DTC's troubleshooting. If the DTC does not return, there was an intermittent problem within the circuit. Make sure all pins and terminals in the circuit are tight.

Symptom Troubleshooting Versus DTC Troubleshooting

Some symptoms will not set DTCs or cause the shift position indicator to blink. If the MIL was reported ON or the shift position indicator has been blinking, check for DTCs. If the vehicle has an abnormal symptom, and there are no DTCs stored, do the symptom troubleshooting. Check the list of probable cause(s) for the symptom, in the sequence listed, until you find the problem.

How to Troubleshoot Circuits at the TCM Connector (1.5 L engine)

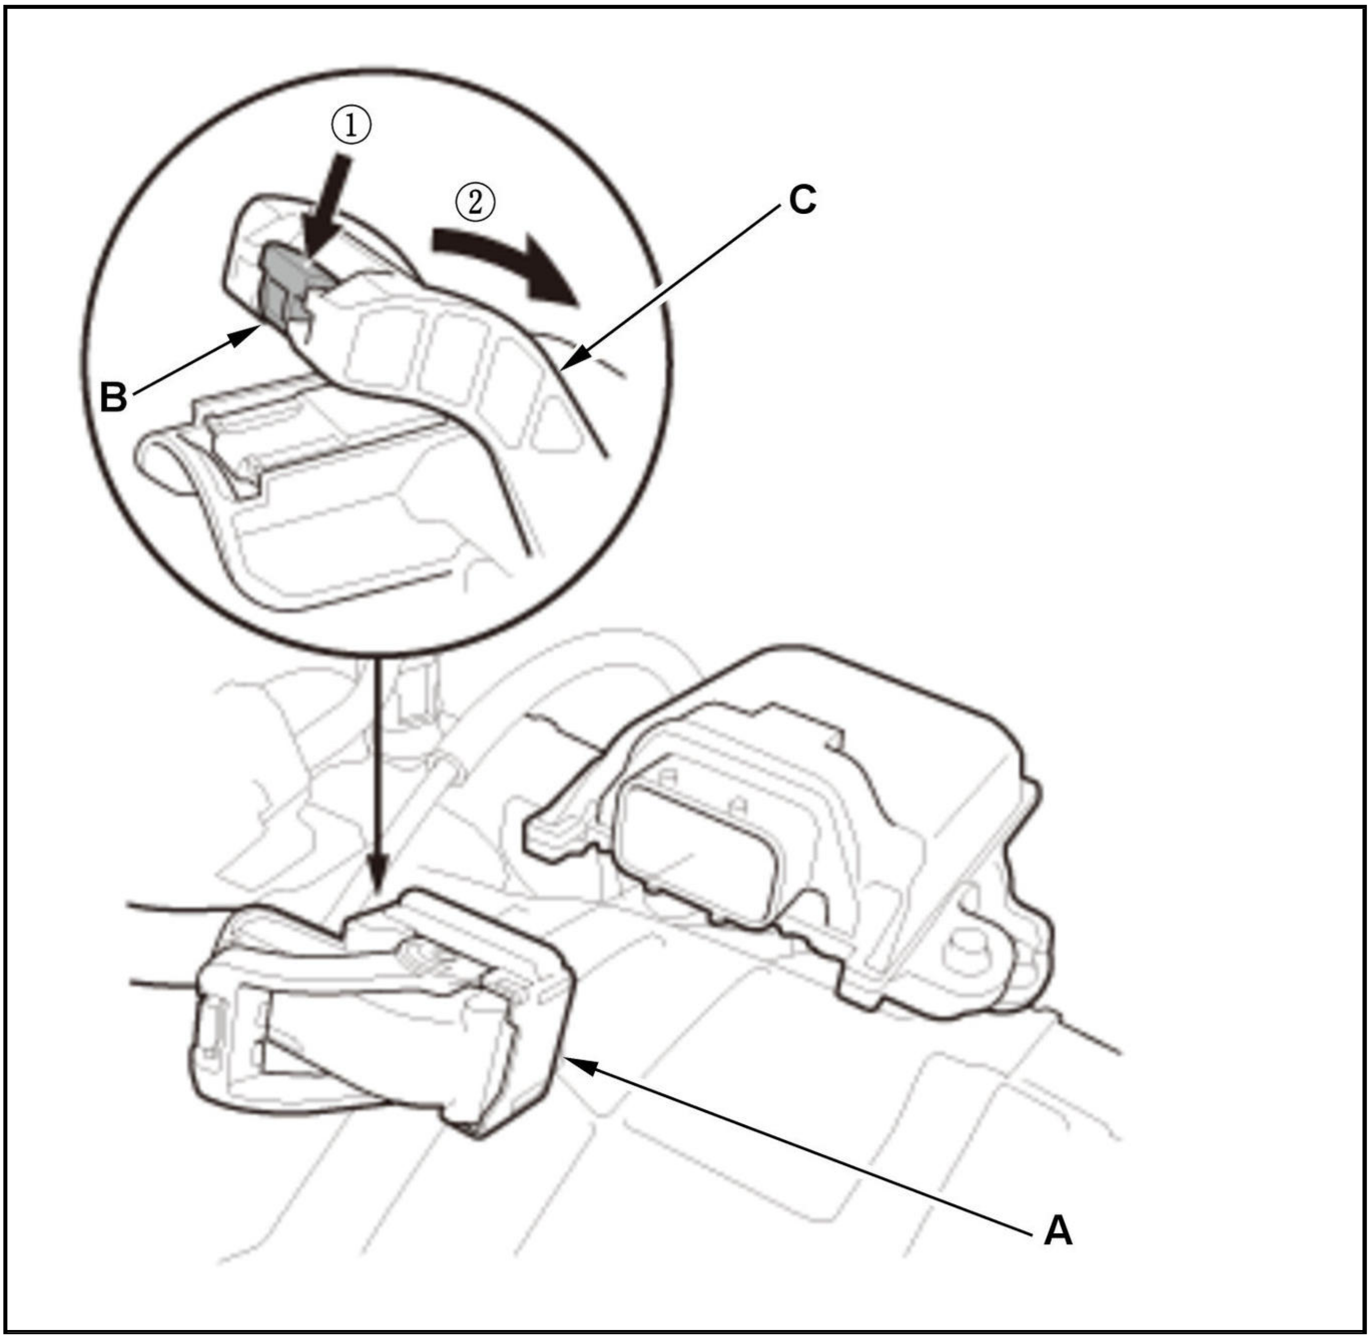
Special Tools Required

Male Pin Probe 07ZAJ-RDJA110

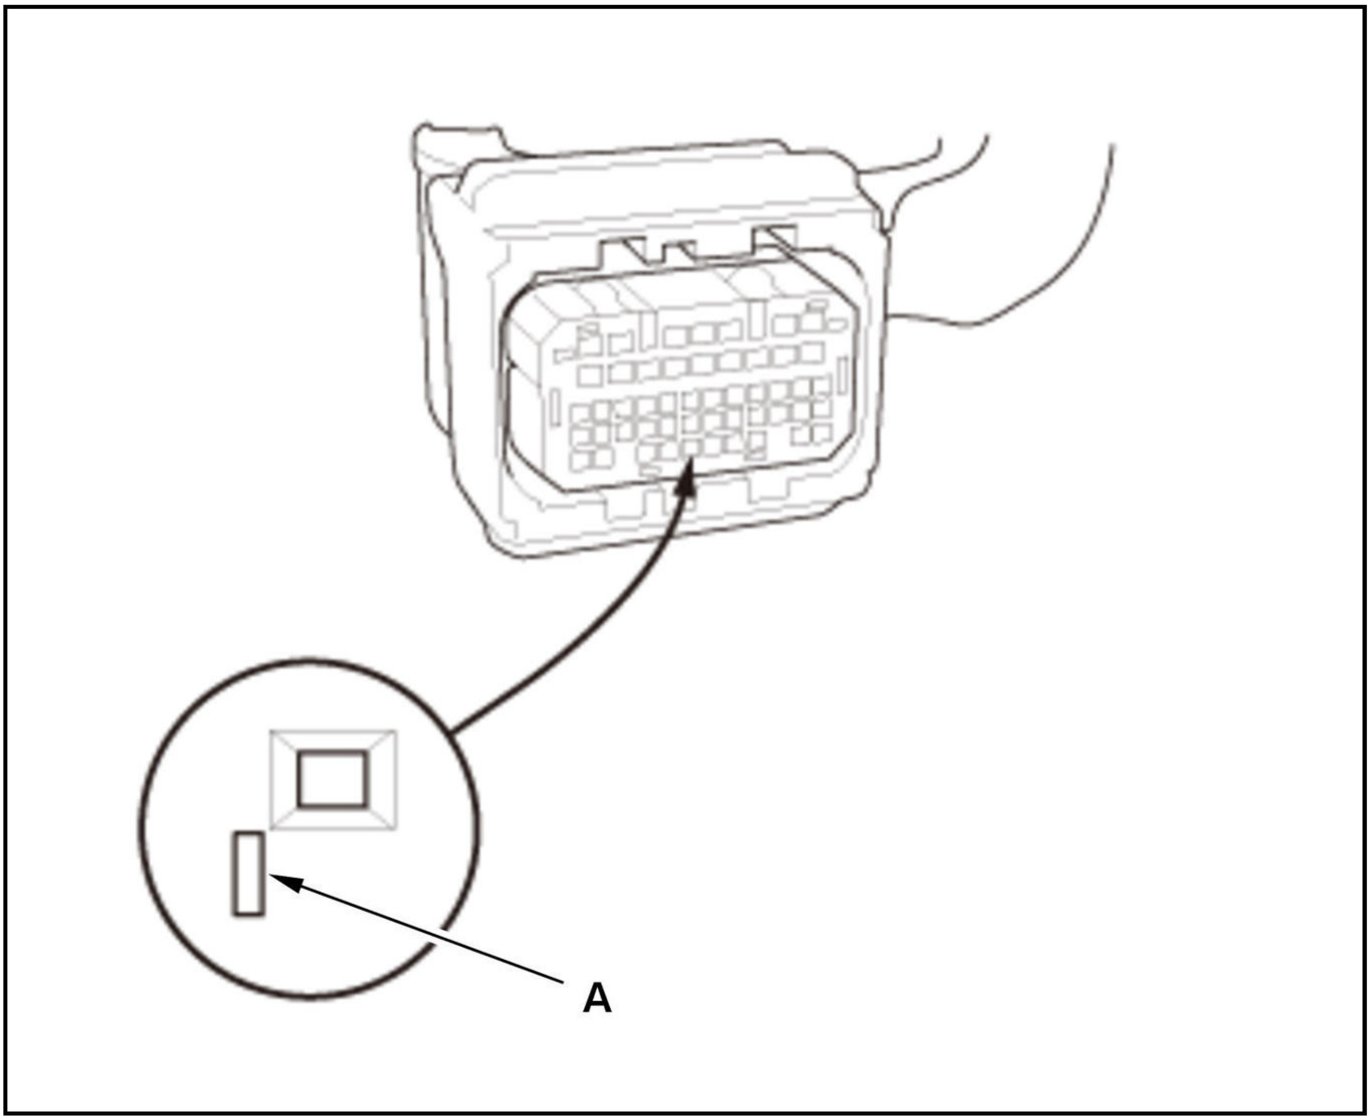
1. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the TCM from damage.

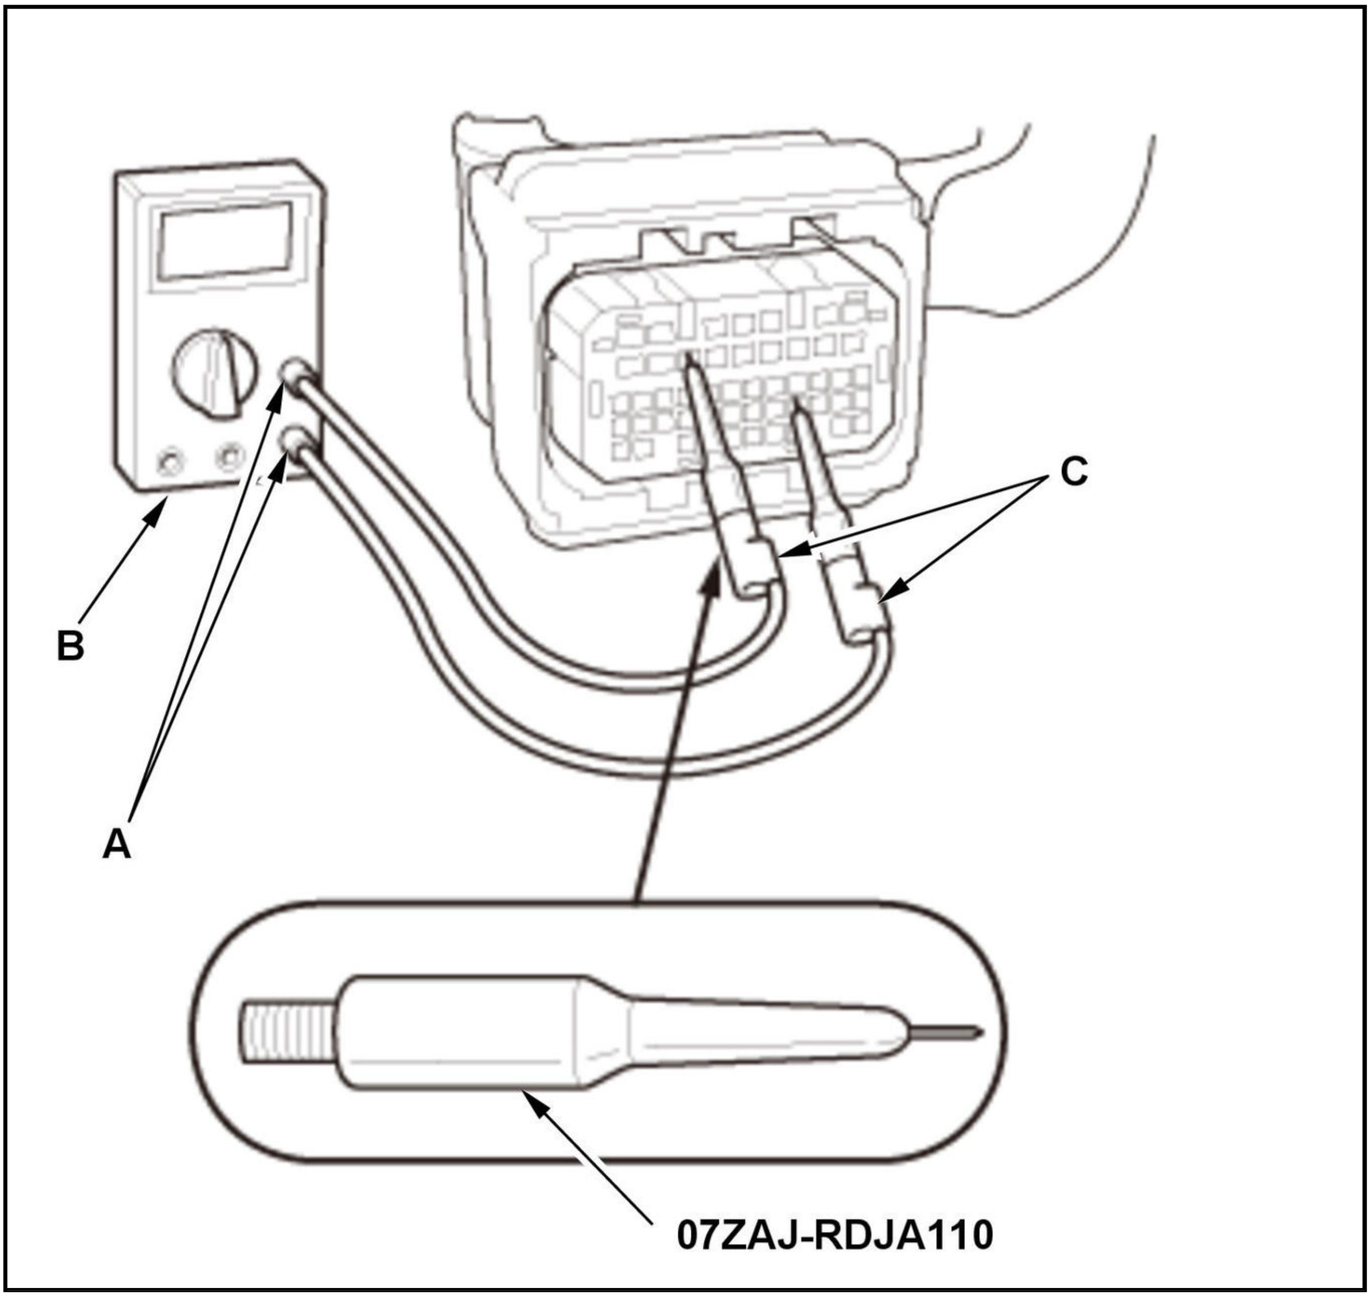
2. Disconnect the connector (A) by pushing the lock (B) and pulling the lever (C) in the numbered sequence shown.



3. When diagnosis/troubleshooting is done at the TCM connector, use the terminal test port (A) above the terminal you need to check.



4. Connect one side of the patch cord terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminals (C) to the pin probe male.



Gently contact the pin probe (male) at the terminal test port from the terminal side. Do not force the tips into the terminals.

NOTICE:

- For accurate results, always use the pin probe (male).
- To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.
- Do not puncture the insulation on a wire. Punctures can cause or eventually lead to poor or intermittent electrical connections.

How to Troubleshoot Circuits at the PCM Connectors

Special Tools Required (for some models)

Pin Probe Male 07ZAJ-RDJA110

NOTE: The PCM stays on for up to an hour after the vehicle is turned to the OFF (LOCK) mode. Jumping the SCS line after turning the vehicle to the OFF (LOCK) mode cancels this function. Disconnecting the PCM during this function, without jumping the SCS line first, can damage the PCM.

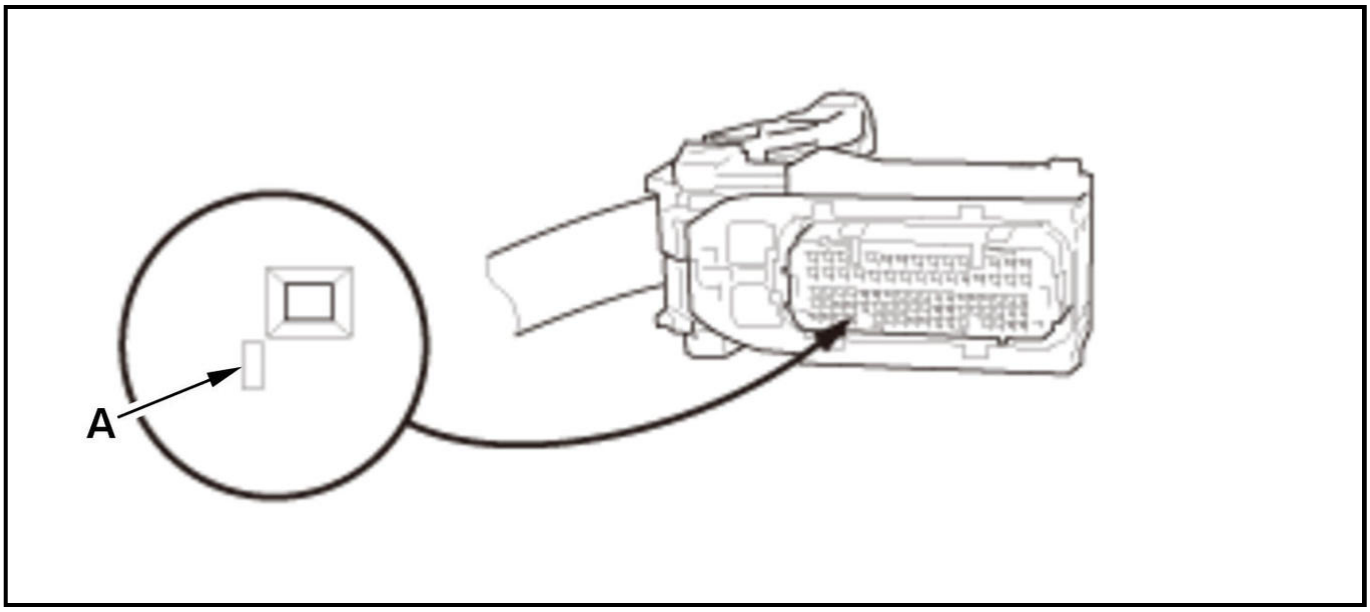
1. Jump the SCS line with the HDS, and wait more than 1 minute.

NOTE: This step must be done to protect the PCM from damage.

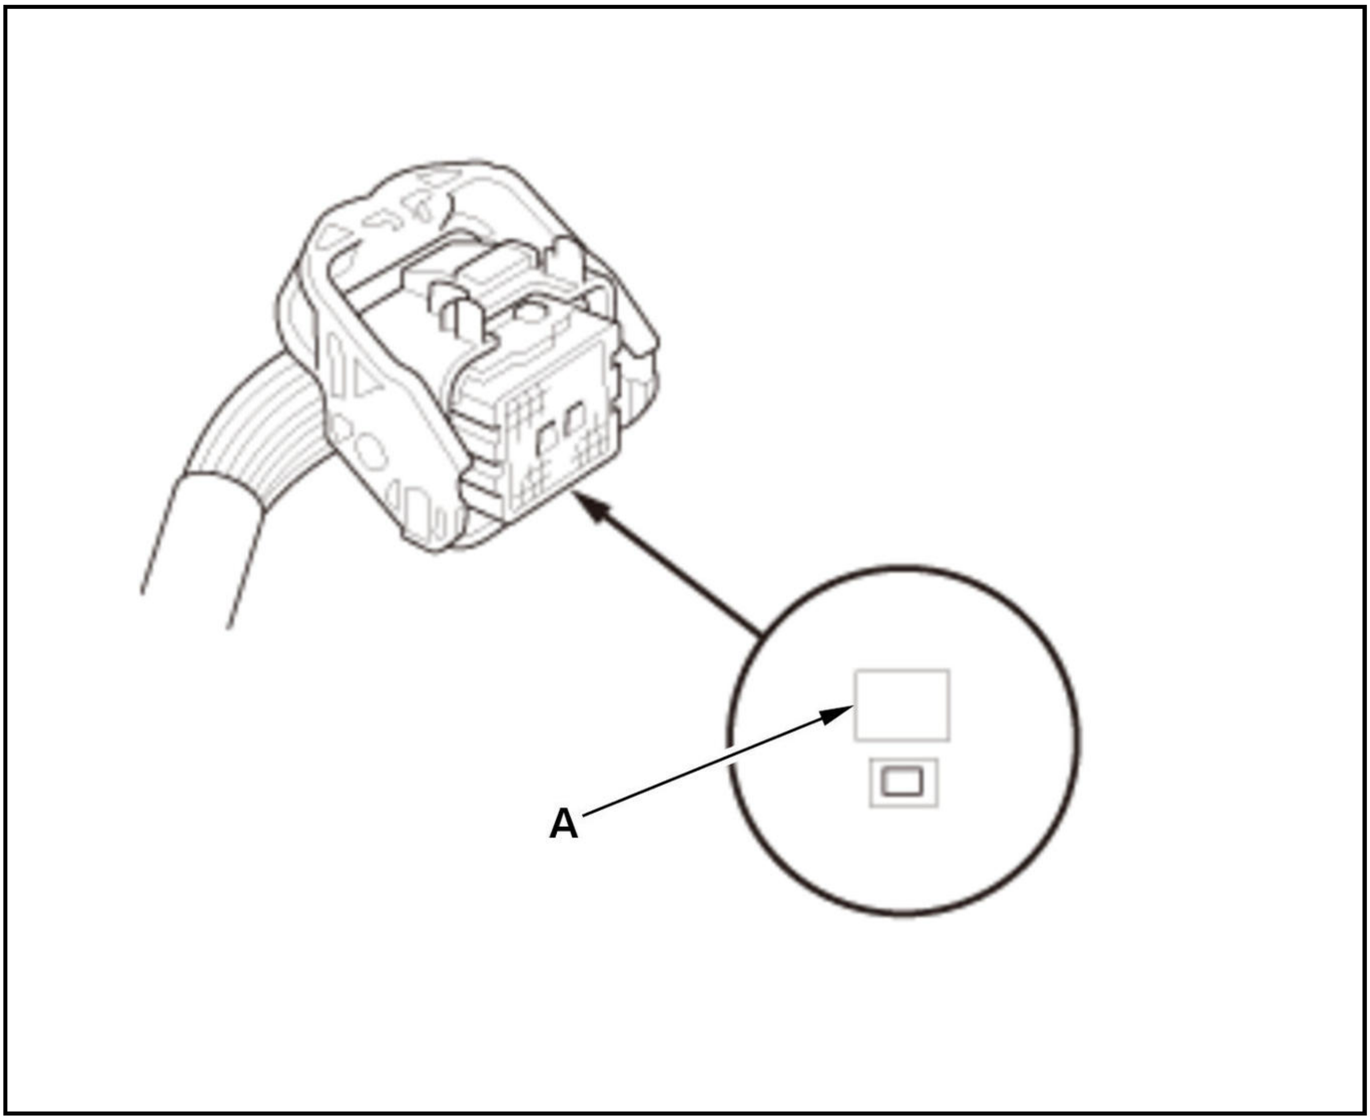
2. **Disconnect PCM connectors**

3. When diagnosis/troubleshooting is done at the PCM connectors, use the terminal test port (A) above the terminal you need to check.

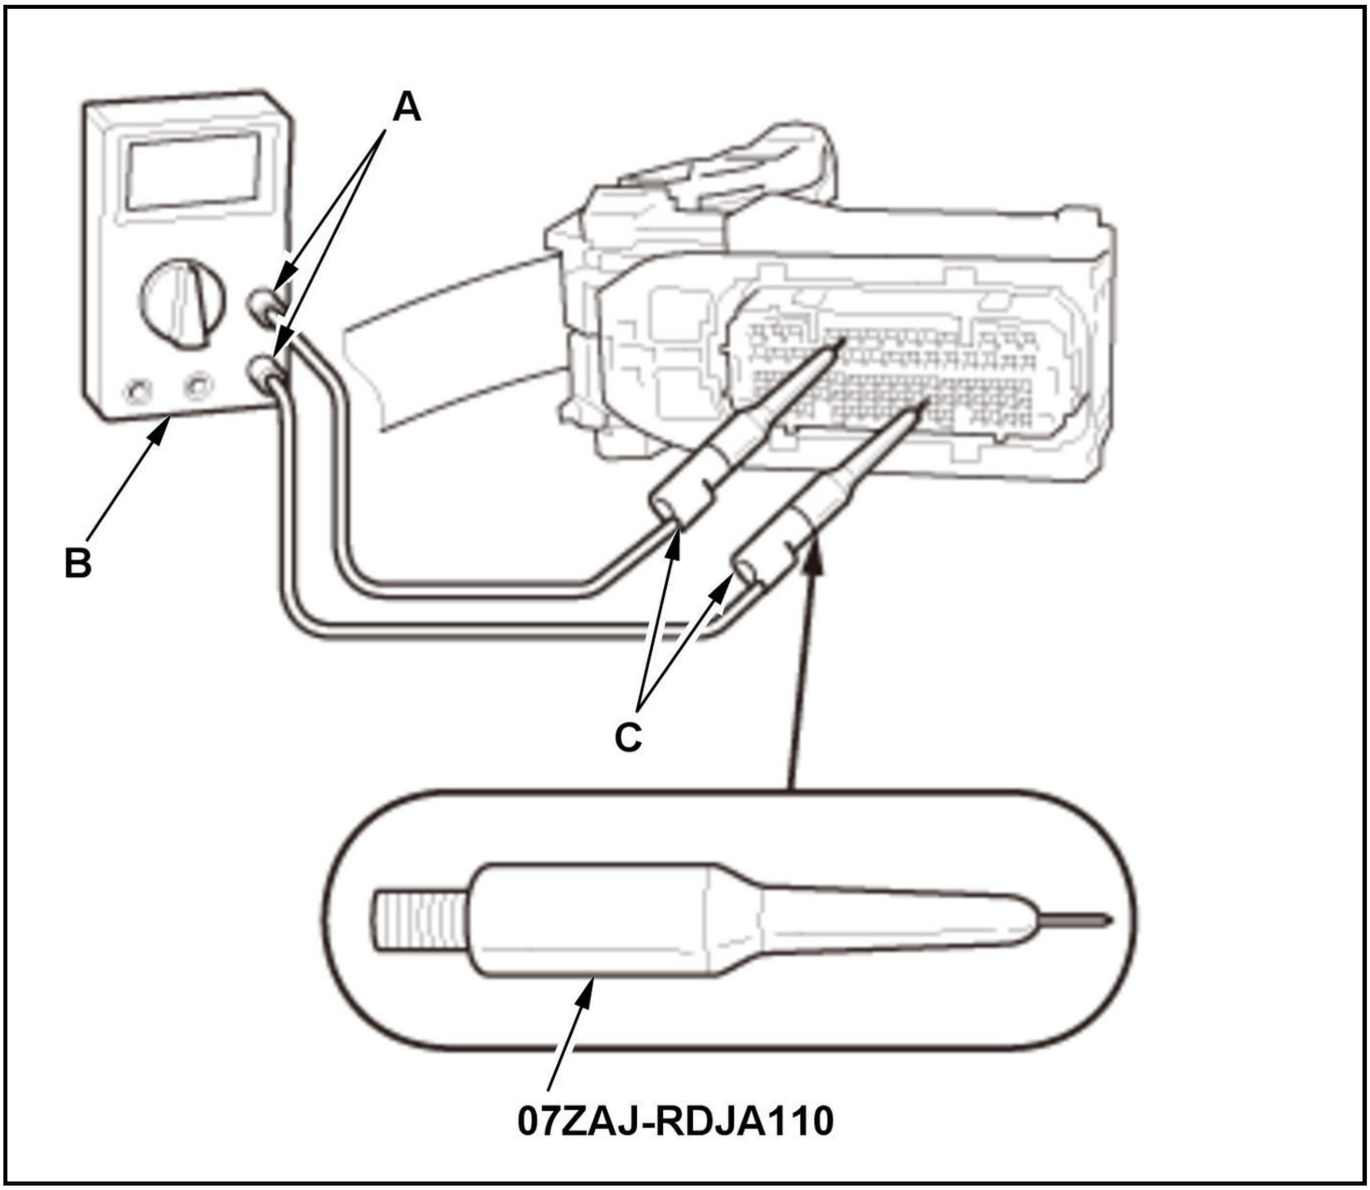
1.5 L engine



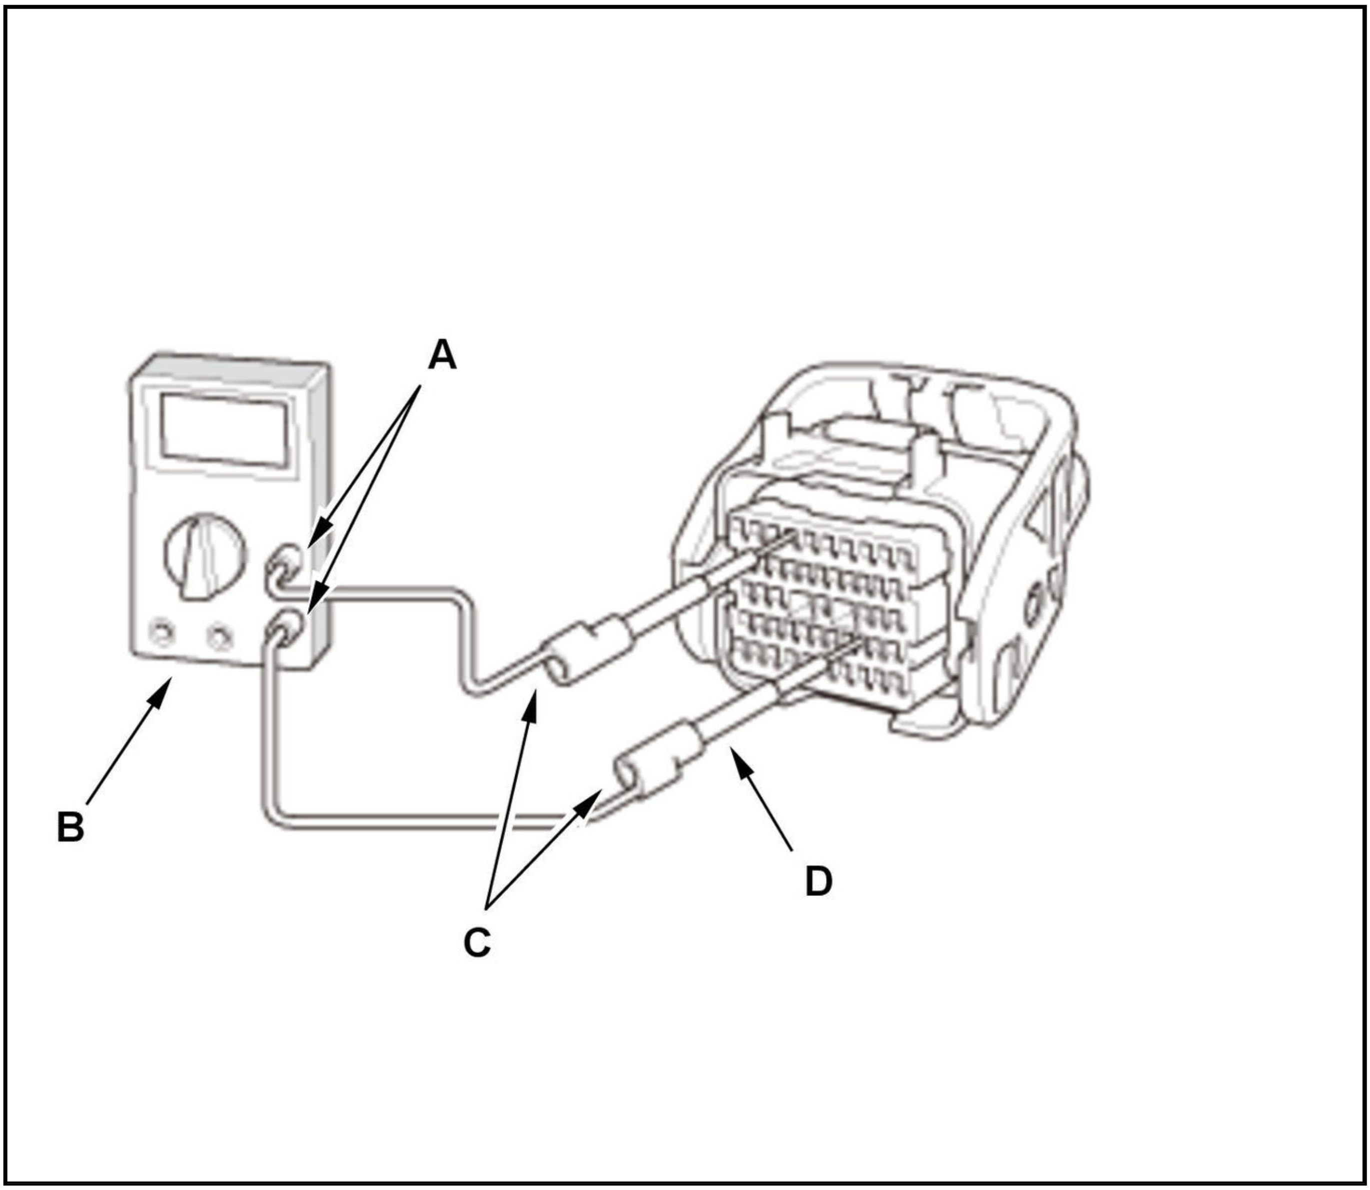
Except 1.5 L engine



4. 1.5 L engine: Connect one side of the patch cord terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminal (C) to the pin probe male.



5. Except 1.5 L engine: Connect one side of the patch cord terminals (A) to a commercially available digital multimeter (B), and connect the other side of the terminal (C) to a commercially available banana jack (Pomona Electronics Tool No. 3563 or equivalent) (D).



Gently contact the pin probe (male) at the terminal test port from the terminal side. Do not force the tips into the terminals.

NOTICE:

- For accurate results, always use the pin probe (male).
- To prevent damage to the connector terminals, do not insert test equipment probes, paper clips, or other substitutes as they can damage the terminals. Damaged terminals cause a poor connection and an incorrect measurement.
- Do not puncture the insulation on a wire. Punctures can cause or eventually lead to poor or intermittent electrical connections.

Clear A/T DTCs Procedure

1. **Connect the HDS to the DLC** .

2. Clear the DTC(s) on the HDS screen.

OBD Status

The OBD STATUS shows the current system status of each DTC and all of the parameters. This function is used to see if the repair was successfully completed. The results of diagnostic tests for the DTC are displayed as:

- PASSED: The on-board diagnosis is successfully completed.

- FAILED: The on-board diagnosis has completed but failed.
- NOT COMPLETED: The on-board diagnosis was running but is out of the enable conditions of the DTC.

How to End a Troubleshooting Session (required after any troubleshooting) (1.5 L engine)

NOTE: **Reset the TCM** with the HDS while the engine is stopped.

1. Turn the vehicle to the OFF (LOCK) mode.

2. Turn the vehicle to the ON mode, and wait for 30 seconds.

3. Turn the vehicle to the OFF (LOCK) mode, and disconnect the HDS from the DLC.

4. Start the engine, and warm it up to normal operating temperature (the radiator fan comes on twice).

5. To verify that the problem is repaired, test-drive the vehicle for several minutes at speeds over 31 mph (50 km/h) or under the same conditions as those indicated by the freeze data.

How to End a Troubleshooting Session (required after any troubleshooting)

1. **Reset the PCM with the HDS** .

2. **Do the PCM idle learn procedure**

3. Turn the vehicle to the OFF (LOCK) mode.

4. Disconnect the HDS from the data link connector.

NOTE: The PCM is part of the immobilizer system. If you replace the PCM, you must register the PCM to the keyless access system.

Failure Reproduction Technique

NOTE: Follow these rules while the vehicle is raised on a lift for the test-drive

- In case of the vehicle speed below 31 mph (50 km/h): Disable the VSA by pressing the VSA OFF button.
- In case of the vehicle speed above 31 mph (50 km/h): **Enter the VSA maintenance mode** .
- VSA DTC(s) may come on when test-driving on a lift. If the VSA system sets a DTC(s), clear the DTC(s) with the HDS.

Self-Diagnosis

If the TCM or the PCM detects the failure of a signal from a sensor, a switch, a solenoid valve, or from another control unit, it stores a Pending or Confirmed DTC. Depending on the failure, a DTC is stored in either the first or second drive cycle. When a Confirmed DTC is stored, the TCM or the PCM blinks the shift position indicator and/or turns on the MIL by a signal sent to the gauge control module via F-CAN.

- One Drive Cycle Detection Method:

  When an abnormality occurs in the signal from a sensor, a switch, a solenoid valve, or from another control unit, the TCM or the PCM stores a Pending or Confirmed DTC for the failure and blinks the shift position indicator and/or turns on the MIL immediately.

- Two Drive Cycle Detection Method:

  When an abnormality occurs in the signal from a sensor, a switch, a solenoid valve, or from another control unit in the first drive cycle, the TCM or the PCM stores a Pending DTC. The shift position indicator and the MIL do not turns on at this time. If the failure continues in the second drive cycle, the TCM or the PCM stores a Confirmed DTC and blinks the shift position indicator and/or turns on the MIL.

Fail-Safe Function

When an abnormality occurs in the signal from a sensor, a switch, a solenoid valve, or from another control unit, the TCM or the PCM ignores that signal and substitutes a pre-programmed value for that signal to allow the CVT to continue operating. This causes a DTC to be stored and the shift position indicator to blink and/or the MIL to come on. The transmission may not shift normally during fail-safe operation. Do not run the test-driving diagnosis when the MIL is ON, or the shift position indicator is blinking.

REMOVAL, INSTALLATION, AND INSPECTION

TRANSFER ASSEMBLY REMOVAL, INSTALLATION, AND INSPECTION

Removal and Installation

NOTE: Keep all foreign particles out of the transmission.

1

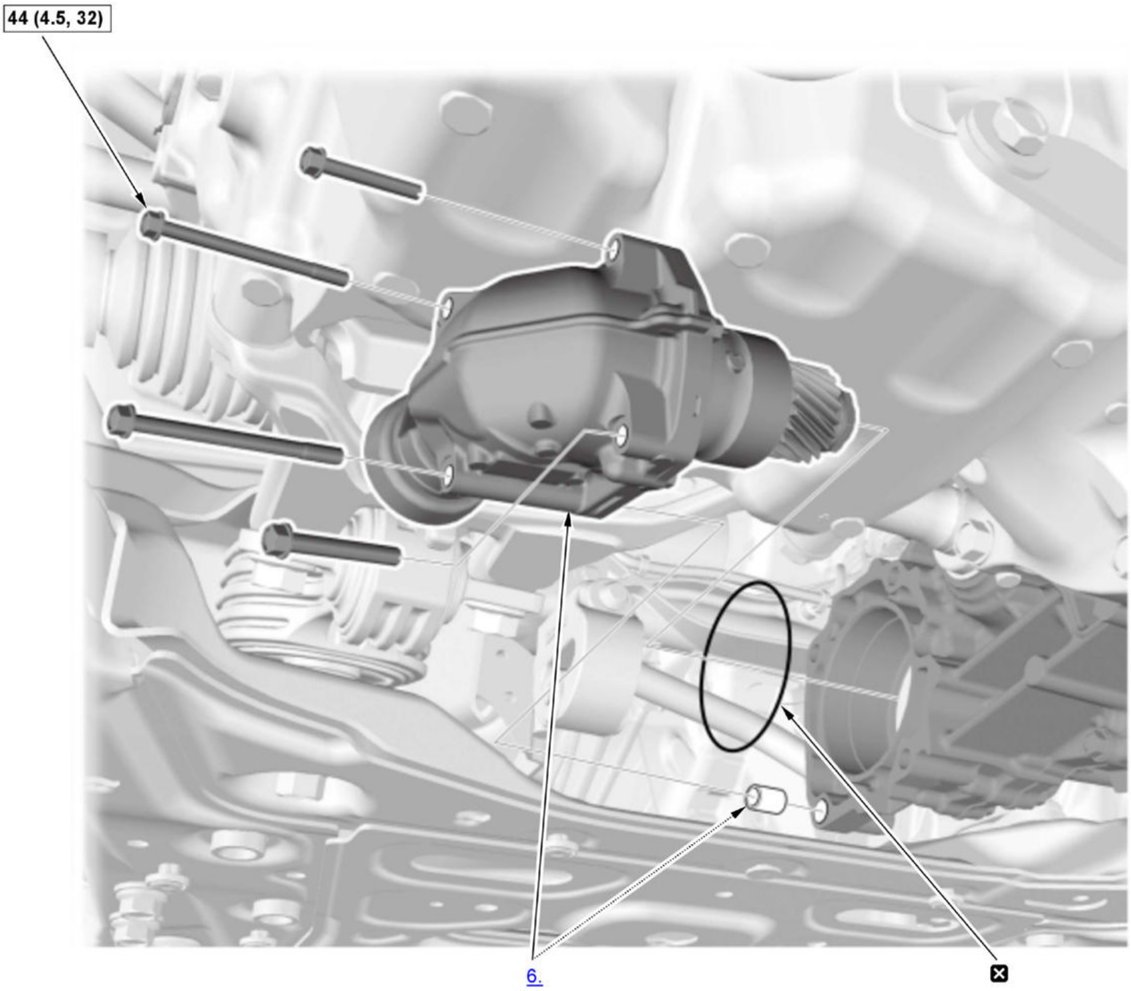


Fig. 7: Transfer Assembly Bolts Torque Specifications
Courtesy of HONDA, U.S.A., INC.

☐	Torque: N.m (kgf.m, lbf.ft)
☒	Replace

1. Vehicle - Lift
2. Engine Undercover - Remove

3. Transmission Fluid (HCF-2) - Drain
4. Exhaust Pipe A - Remove
5. Propeller Shaft (Transfer Side) - Disconnect
6. Transfer Assembly - Remove
7. All Removed Parts - Install

1. Clean the areas where the transfer assembly contacts the transmission with solvent, and dry with compressed air.

2. Install the parts in the reverse order of removal.

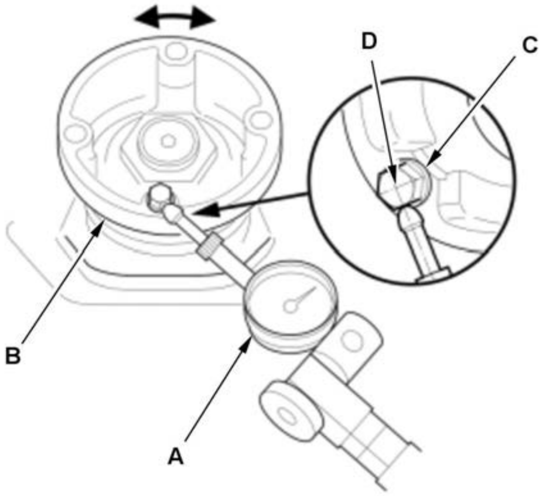
8. Transmission Fluid - Refill
9. Transmission Fluid Level - Check

Inspection

NOTE: How to read the torque specifications .

Transfer Gear Backlash Measurement

1. Vehicle - Lift
2. Engine Undercover - Remove
3. Propeller Shaft (Transfer Side) - Disconnect
4. Transfer Assembly - Transfer Gear Backlash Check



1. Shift the transmission to N.

2. Set a dial indicator (A) on the transfer companion flange setting bolt (B).

NOTE: Position the dial indicator tip (C) on the direct extension of the bolt center (D).

3. Measure the transfer gear backlash.

4. If the transfer gear backlash is out of the standard, replace the transfer assembly.

Standard:	**0.06-0.16 mm (0.0024-0.0063 in)**

Fluid Leak Check

5. Transfer Assembly Fluid (Transmission Side) - Leak Check

1. Check for fluid leaks between the mating faces of the transfer assembly and the transmission.

2. If there is leak:

- Replace the O-ring between the transfer assembly and the transmission.
- Replace the O-ring between the transfer housing and the transfer hypoid drive shaft assembly.

6. Transfer Assembly Fluid (Propeller Shaft Side) - Leak Check

1. Check for fluid leaks between the transfer companion flange and the transfer oil seal.

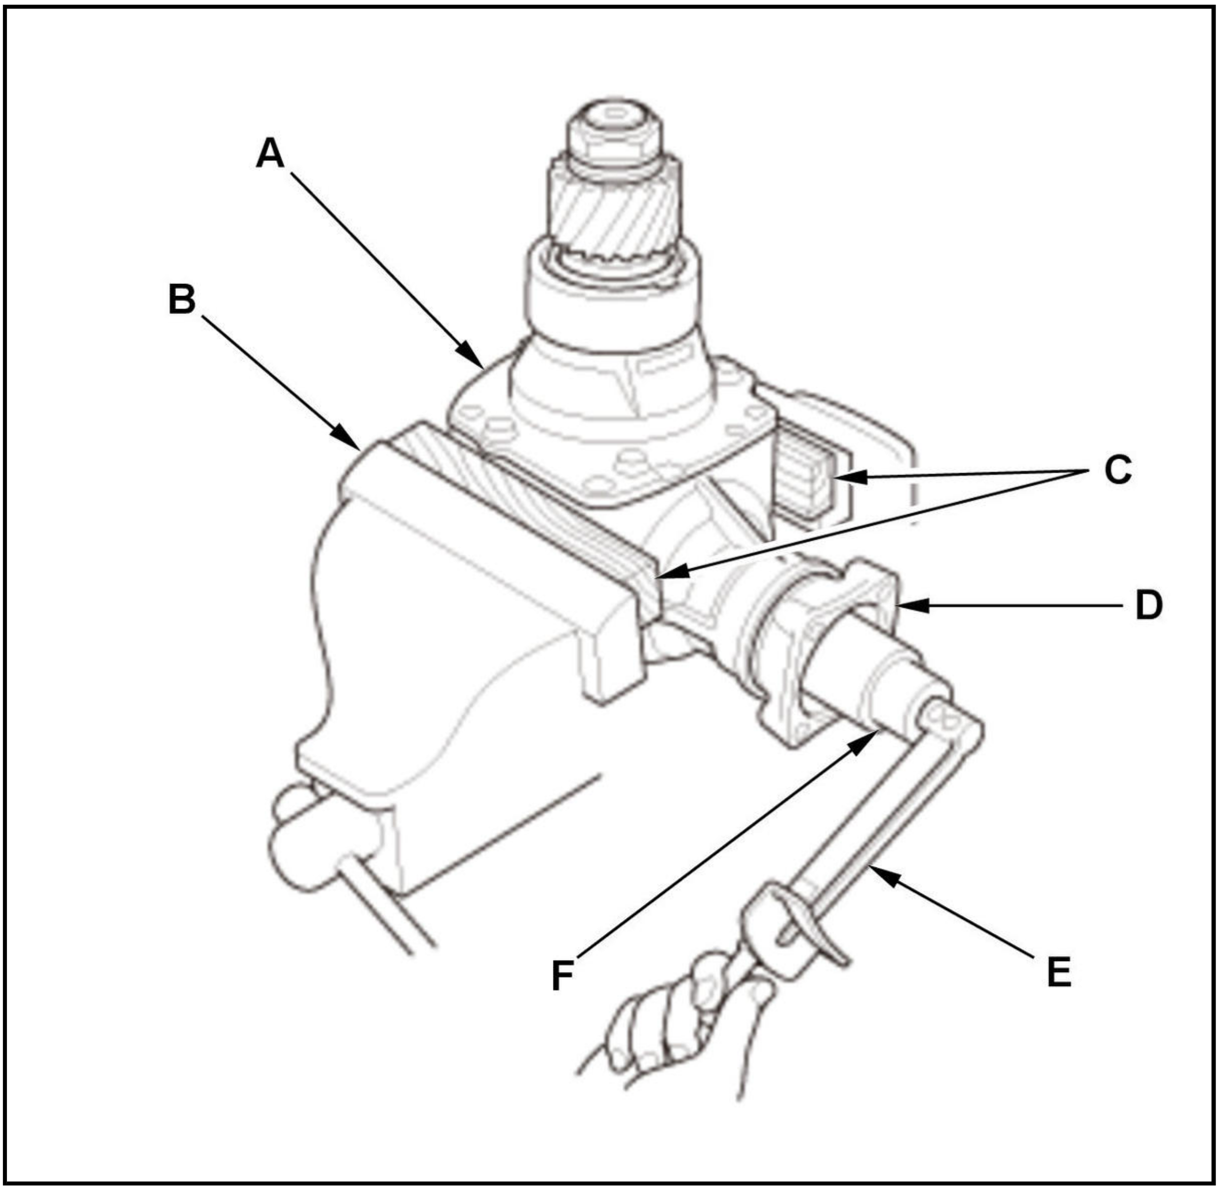
2. If there is leak, replace the transfer oil seal and the O-ring.

Total Starting Torque Measurement

7. **Transmission Fluid (HCF-2) - Drain**
8. Transfer Assembly - Remove
9. Transfer Assembly - Total Starting Torque Check

1. Secure the transfer housing (A) in a bench vise (B).

NOTE: To prevent damaging the transfer housing, always use wood blocks or equivalent materials (C) between the transfer housing and the bench vise.



2. Rotate the companion flange several turns to seat the tapered roller bearings.

3. Measure the total starting torque at the companion flange (D) using a torque wrench (E) and a socket (F).

Standard:	**3.28-8.77 N.m (33.4-89.4 kgf.cm, 29.0-77.6 Ibf.in)**

4. If the total starting torque is out of the standard, replace the transfer assembly.

Transfer Hypoid Drive Gear Tooth Contact Pattern Check

10. Transfer Hypoid Drive Gear/Shaft Assembly - Remove

	1. Remove the transfer hypoid drive gear/shaft assembly (A) with the dowel pin (B) and the O-ring (C).

11. Transfer Hypoid Drive Gear - Tooth Contact Pattern Check

 CORRECT TOOTH CONTACT PATTERN INCORRECT TOOTH CONTACT PATTERN TOE CORRECT HEEL CORRECT FLANK CORRECT FACE CORRECT	1. Check the transfer hypoid drive gear tooth contact pattern. 2. If the transfer gear tooth contact is incorrect, replace the transfer assembly.

12. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

SYMPTOM TROUBLESHOOTING INDEX FOR VIEWER

ENGINE DOES NOT START

Probable cause(s)

- Shift cable broken or out of adjustment
- Control pin broken
- Transmission range switch defective or out of adjustment
- Drive plate worn or damaged
- Torque converter assembly defective
- Torque converter ring gear worn or damaged
- Transmission assembly and drive plate installation defective

NOTES

- Check for a loose shift cable at the shift lever and the control lever.
- Inspect the transmission range switch .
- Inspect the drive plate for wear and damage. If the drive plate is worn or damaged, replace it .
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, replace it as an assembly .

ENGINE REVS UP ABNORMALLY HIGH WHILE DRIVING, AND NO ACCELERATION

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged
- Pulley pressure feed pipe defective
- Forward clutch defective
- Reverse brake defective
- Reverse brake piston defective
- Transmission fluid pump worn, binding, or foreign material in transmission fluid pump
- Transmission fluid pump drive chain or transmission fluid pump drive/driven sprocket worn or damaged
- Valve body assembly defective
- Joint pipes defective
- Solenoid wire harness worn or damaged
- Stator shaft worn or damaged

Notes

- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, replace the transmission housing assembly .
- Check the pulley pressure feed pipe and the sealing ring for wear and damage.
- Inspect the clearance between the forward clutch end-plate and the top disc . If the clearance is out of tolerance, replace the input shaft assembly.
- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. Inspect the clearance between the reverse brake end-plate and the top disc . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, replace it as an assembly .
- Check the transmission fluid pump drive chain and the transmission fluid pump drive/driven sprocket for wear and damage.
- Check the valve body assembly for wear and damage.
- Check the joint pipes and O-rings for wear and damage.
- Inspect the solenoid wire harness for open and short.
- Check the stator shaft for wear and damage.

ENGINE RUNS, BUT VEHICLE DOES NOT MOVE IN ANY POSITIONS/MODES

Probable cause(s)

- Low transmission fluid (HCF-2) level
- Transmission range switch defective or out of adjustment

- Engine output low
- Transmission fluid strainer or CVTF warmer strainer clogged
- Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged
- Pulley pressure feed pipe defective
- Input shaft assembly worn or damaged
- Secondary drive/driven gear worn or damaged
- Final driven gear worn or damaged
- Sun gear worn or damaged
- Control shaft, roller, detent lever, and detent spring worn or damaged
- Control lever worn or damaged
- Parking brake pawl and parking shaft worn or damaged
- Manual valve worn or damaged
- Transmission fluid pump worn, binding, or foreign material in transmission fluid pump
- Transmission fluid pump drive chain or transmission fluid pump drive/driven sprocket worn or damaged
- Valve body assembly defective
- Joint pipes defective
- Stator shaft worn or damaged
- Torque converter assembly defective
- Torque converter ring gear worn or damaged
- Transmission assembly and drive plate installation defective

Notes

- **Check the transmission fluid (HCF-2) level**.
- **Inspect the transmission range switch** .
- Adjust the engine output.
- **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris.
- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** .
- Check the pulley pressure feed pipe and the sealing ring for wear and damage.
- Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage.
- Check the secondary drive/driven gear for wear and damage.
- Check the final driven gear for wear and damage.
- Check the sun gear for wear and damage. If the sun gear is worn or damaged, replace it and also check the planetary carrier pinion gears, the forward clutch, and the drive pulley shaft splines for wear and damage.
- Check the control shaft, roller, detent lever, and detent spring for wear and damage.
- Check the control lever for wear and damage.
- Check the parking brake pawl and the parking shaft for wear and damage. If the parking brake pawl or the parking shaft are worn or damaged, replace them and also check the park gear for wear and damage.
- Check the manual valve for wear and damage.
- Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** .
- Check the transmission fluid pump drive chain and the transmission fluid pump drive/driven sprocket for wear and damage.
- Check the valve body assembly for wear and damage.

- Check the joint pipes and O-rings for wear and damage.
- Check the stator shaft for wear and damage.
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

ENGINE STALLS WHEN SHIFTED TO D POSITION/MODE FROM N POSITION/MODE

Probable cause(s)

- Engine output low
- Reverse brake defective
- Reverse brake piston defective
- Torque converter assembly defective
- Torque converter ring gear worn or damaged
- Transmission assembly and drive plate installation defective

Notes

- Adjust the engine output.
- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

ENGINE STALLS WHEN SHIFTED TO R POSITION/MODE FROM N POSITION/MODE

Probable cause(s)

- Engine output low
- Forward clutch defective
- Planetary carrier assembly worn or damaged
- Thrust needle bearing or thrust washer on planetary carrier assembly seized, worn, or damaged
- Torque converter assembly defective
- Torque converter ring gear worn or damaged
- Transmission assembly and drive plate installation defective

Notes

- Adjust the engine output.
- **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly.
- Check the planetary carrier assembly for wear and damage. If the planetary carrier assembly is worn or damaged, replace it and also check the planetary carrier pinion gears, the reverse brake, and the drive pulley shaft splines for wear and damage.
- Check the thrust needle bearing and the thrust washer on the planetary carrier assembly for seize, wear, and damage. If the thrust needle bearing or the thrust washer are seized, worn, or damaged, replace them and adjust the clearance with the thrust shim.
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

EXCESSIVE IDLE VIBRATION IN N AND P POSITIONS/MODES

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Engine output low
- Forward clutch defective
- Input shaft assembly worn or damaged
- Reverse brake defective
- Reverse brake piston defective
- Torque converter assembly defective
- Torque converter ring gear worn or damaged
- Transmission assembly and drive plate installation defective

Notes

- Adjust the engine output.
- **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly.
- Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage.
- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

EXCESSIVE IDLE VIBRATION IN R, D, S, OR L POSITIONS/MODES

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Engine output low
- Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged
- Forward clutch defective
- Input shaft assembly worn or damaged
- Reverse brake defective
- Reverse brake piston defective
- Thrust washer on planetary carrier assembly seized, worn, or damaged
- Valve body assembly defective
- Joint pipes defective
- Solenoid wire harness worn or damaged
- Torque converter assembly defective
- Torque converter ring gear worn or damaged
- Transmission assembly and drive plate installation defective

Notes

- Adjust the engine output
- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** .
- **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly.
- Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage.
- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- Check the thrust washer on the planetary carrier assembly for seize, wear, and damage. If the thrust washer is seized, worn, or damaged, replace it and adjust the clearance with the thrust shim.
- Check the valve body assembly for wear and damage.
- Check the joint pipes and O-rings for wear and damage.
- Inspect the solenoid wire harness for open and short.
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

EXCESSIVE SHOCK WHEN ACCELERATING AND DECELERATING

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Low transmission fluid (HCF-2) level
- Transmission fluid (HCF-2) deteriorated
- Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged
- Pulley pressure feed pipe defective
- Forward clutch defective
- Reverse brake defective
- Reverse brake piston defective
- Valve body assembly defective
- Joint pipes defective
- Stator shaft worn or damaged
- Torque converter assembly defective
- Torque converter ring gear worn or damaged
- Transmission assembly and drive plate installation defective

Notes

- **Check the transmission fluid (HCF-2) level**.
- Check the transmission fluid (HCF-2) condition. If necessary, **replace the transmission fluid (HCF-2)**.
- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** .
- Check the pulley pressure feed pipe and the sealing ring for wear and damage.
- **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly.

- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- Check the valve body assembly for wear and damage.
- Check the joint pipes and O-rings for wear and damage.
- Check the stator shaft for wear and damage.
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

EXCESSIVE SHOCK WHEN STARTING OFF

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Low transmission fluid (HCF-2) level
- Transmission fluid (HCF-2) deteriorated
- Transmission fluid strainer or CVTF warmer strainer clogged
- Pulley pressure feed pipe defective
- Forward clutch defective
- Reverse brake defective
- Reverse brake piston defective
- Valve body assembly defective
- Joint pipes defective

Notes

- **Check the transmission fluid (HCF-2) level**.
- Check the transmission fluid (HCF-2) condition. If necessary, **replace the transmission fluid (HCF-2)**.
- **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris.
- Check the pulley pressure feed pipe and the sealing ring for wear and damage.
- **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly.
- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- Check the valve body assembly for wear and damage.
- Check the joint pipes and O-rings for wear and damage.

HDS DOES NOT COMMUNICATE WITH THE TCM

Probable cause(s)

- DLC circuit error
- TCM defective

Notes

- **Troubleshoot the TCM communication circuit**.
- **Troubleshoot the DLC circuit** .

JUDDER WHEN STARTING OFF

Probable cause(s)

- Low transmission fluid (HCF-2) level
- Transmission fluid (HCF-2) deteriorated
- Transmission fluid strainer or CVTF warmer strainer clogged
- Transmission fluid pump worn, binding, or foreign material in transmission fluid pump
- Valve body assembly defective
- Joint pipes defective

Notes

- **Check the transmission fluid (HCF-2) level**.
- Check the transmission fluid (HCF-2) condition. If necessary, **replace the transmission fluid (HCF-2)**.
- **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris.
- Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** .
- Check the valve body assembly for wear and damage.
- Check the joint pipes and O-rings for wear and damage.

LATE SHIFT AFTER SHIFTING TO D POSITION/MODE FROM N POSITION/MODE, AND RETURN TO N POSITION/MODE

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Torque converter turbine speed sensor defective
- Low transmission fluid (HCF-2) level
- Transmission range switch defective or out of adjustment
- Shift cable broken or out of adjustment
- Control pin broken
- Transmission fluid strainer or CVTF warmer strainer clogged
- Forward clutch defective
- Manual valve worn or damaged
- Valve body assembly defective
- Joint pipes defective
- Stator shaft worn or damaged

Notes

- Check the torque converter turbine speed sensor for wear and damage, and also check the O-ring for wear and damage.
- **Check the transmission fluid (HCF-2) level**.
- **Inspect the transmission range switch** .
- **Check for a loose shift cable at the shift lever and the control lever**.

- **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris.
- **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly.
- Check the manual valve for wear and damage.
- Check the valve body assembly for wear and damage.
- Check the joint pipes and O-rings for wear and damage.
- Check the stator shaft for wear and damage.

LATE SHIFT AFTER SHIFTING TO R POSITION/MODE FROM N POSITION/MODE, AND RETURN TO N POSITION/MODE

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Torque converter turbine speed sensor defective
- Low transmission fluid (HCF-2) level
- Transmission range switch defective or out of adjustment
- Shift cable broken or out of adjustment
- Control pin broken
- Transmission fluid strainer or CVTF warmer strainer clogged
- Reverse brake defective
- Reverse brake piston defective
- Manual valve worn or damaged
- Valve body assembly defective
- Joint pipes defective
- Stator shaft worn or damaged

Notes

- Check the torque converter turbine speed sensor for wear and damage, and also check the O-ring for wear and damage.
- **Check the transmission fluid (HCF-2) level**.
- **Inspect the transmission range switch** .
- **Check for a loose shift cable at the shift lever and the control lever**.
- **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris.
- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- Check the manual valve for wear and damage.
- Check the valve body assembly for wear and damage.
- Check the joint pipes and O-rings for wear and damage.
- Check the stator shaft for wear and damage.

NO ENGINE BRAKING

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged
- Pulley pressure feed pipe defective
- Valve body assembly defective
- Joint pipes defective
- Solenoid wire harness worn or damaged
- Stator shaft worn or damaged

Notes

- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** .
- Check the pulley pressure feed pipe and the sealing ring for wear and damage.
- Check the valve body assembly for wear and damage.
- Check the joint pipes and O-rings for wear and damage.
- Inspect the solenoid wire harness for open and short.
- Check the stator shaft for wear and damage.

NO SHIFT TO HIGHER OR LOWER RATIO

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Low transmission fluid (HCF-2) level
- Transmission fluid strainer or CVTF warmer strainer clogged
- Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged
- Pulley pressure feed pipe defective
- Transmission fluid pump worn, binding, or foreign material in transmission fluid pump
- Valve body assembly defective
- Solenoid wire harness worn or damaged
- Stator shaft worn or damaged

Notes

- **Check the transmission fluid (HCF-2) level**.
- **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris.
- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** .
- Check the pulley pressure feed pipe and the sealing ring for wear and damage.
- Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** .
- Check the valve body assembly for wear and damage.
- Inspect the solenoid wire harness for open and short.
- Check the stator shaft for wear and damage.

NOISE FROM TRANSMISSION IN D, S, OR L POSITIONS/MODES

Probable cause(s)

- Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged
- Input shaft assembly worn or damaged
- Secondary drive/driven gear worn or damaged
- Final driven gear worn or damaged
- Control shaft, roller, detent lever, and detent spring worn or damaged
- Parking brake pawl and parking shaft worn or damaged
- Parking pawl spring worn or damaged

Notes

- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** .
- Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage.
- Check the secondary drive/driven gear for wear and damage.
- Check the final driven gear for wear and damage.
- Check the control shaft, roller, detent lever, and detent spring for wear and damage.
- Check the parking brake pawl and the parking shaft for wear and damage. If the parking brake pawl or the parking shaft are worn or damaged, replace them and also check the park gear for wear and damage.
- Check the parking pawl spring for wear and damage.

NOISE FROM TRANSMISSION IN N AND P POSITIONS/MODES

Probable cause(s)

- Forward clutch defective
- Input shaft assembly worn or damaged
- Reverse brake defective
- Reverse brake piston defective
- Thrust needle bearing or thrust shim on input shaft assembly seized, worn, or damaged
- Planetary carrier assembly worn or damaged
- Sun gear worn or damaged
- Ring gear worn or damaged
- Thrust needle bearing or thrust washer on planetary carrier assembly seized, worn, or damaged
- Transmission fluid pump worn, binding, or foreign material in transmission fluid pump

Notes

- **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly.
- Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage.
- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- Check the thrust needle bearing and the thrust shim on the input shaft assembly for seize, wear, and damage. If the thrust needle bearing or the thrust shim are seized, worn, or damaged, replace them and also check the related part of the input shaft assembly for wear and damage.

- Check the planetary carrier assembly for wear and damage. If the planetary carrier assembly is worn or damaged, replace it and also check the planetary carrier pinion gears, the reverse brake, and the drive pulley shaft splines for wear and damage.
- Check the sun gear for wear and damage. If the sun gear is worn or damaged, replace it and also check the planetary carrier pinion gears, the forward clutch, and the drive pulley shaft splines for wear and damage.
- Check the ring gear for wear and damage. If the ring gear is worn or damaged, replace it and also check the planetary carrier assembly and the reverse brake for wear and damage.
- Check the thrust needle bearing and the thrust washer on the planetary carrier assembly for seize, wear, and damage. If the thrust needle bearing or the thrust washer are seized, worn, or damaged, replace them and adjust the clearance with the thrust shim.
- Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** .

NOISE FROM TRANSMISSION IN R POSITION/MODE

Probable cause(s)

- Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged
- Input shaft assembly worn or damaged
- Reverse brake defective
- Reverse brake piston defective
- Spring retainer/return spring assembly defective
- Secondary drive/driven gear worn or damaged
- Final driven gear worn or damaged
- Thrust needle bearing or thrust shim on input shaft assembly seized, worn, or damaged
- Planetary carrier assembly worn or damaged
- Sun gear worn or damaged
- Ring gear worn or damaged
- Thrust needle bearing or thrust washer on planetary carrier assembly seized, worn, or damaged
- Control shaft, roller, detent lever, and detent spring worn or damaged
- Parking brake pawl and parking shaft worn or damaged
- Parking pawl spring worn or damaged

Notes

- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** .
- Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage.
- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- Check the secondary drive/driven gear for wear and damage.
- Check the final driven gear for wear and damage.
- Check the thrust needle bearing and the thrust shim on the input shaft assembly for seize, wear, and damage. If the thrust needle bearing or the thrust shim are seized, worn, or damaged, replace them and also check the related part of the input shaft assembly for wear and damage.
- Check the planetary carrier assembly for wear and damage. If the planetary carrier assembly is worn or damaged, replace it and also check the planetary carrier pinion gears, the reverse brake, and the drive

pulley shaft splines for wear and damage.

- Check the sun gear for wear and damage. If the sun gear is worn or damaged, replace it and also check the planetary carrier pinion gears, the forward clutch, and the drive pulley shaft splines for wear and damage.
- Check the ring gear for wear and damage. If the ring gear is worn or damaged, replace it and also check the planetary carrier assembly and the reverse brake for wear and damage.
- Check the thrust needle bearing and the thrust washer on the planetary carrier assembly for seize, wear, and damage. If the thrust needle bearing or the thrust washer are seized, worn, or damaged, replace them and adjust the clearance with the thrust shim.
- Check the control shaft, roller, detent lever, and detent spring for wear and damage.
- Check the parking brake pawl and the parking shaft for wear and damage. If the parking brake pawl or the parking shaft are worn or damaged, replace them and also check the park gear for wear and damage.
- Check the parking pawl spring for wear and damage.

POOR ACCELERATION

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- CVT drive pulley speed sensor defective
- Engine output low
- Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged
- Pulley pressure feed pipe defective
- Transmission fluid pump worn, binding, or foreign material in transmission fluid pump
- Valve body assembly defective
- Joint pipes defective
- Solenoid wire harness worn or damaged
- Stator shaft worn or damaged
- Torque converter assembly defective
- Torque converter ring gear worn or damaged
- Transmission assembly and drive plate installation defective

Notes

- Check the CVT drive pulley speed sensor for wear and damage, and also check the O-ring for wear and damage.
- Adjust the engine output.
- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** .
- Check the pulley pressure feed pipe and the sealing ring for wear and damage.
- Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** .
- Check the valve body assembly for wear and damage.
- Check the joint pipes and O-rings for wear and damage.
- Inspect the solenoid wire harness for open and short.
- Check the stator shaft for wear and damage.
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

SHIFT LEVER CANNOT BE MOVED FROM P POSITION/MODE WHILE PRESSING ON THE BRAKE PEDAL

Probable cause(s)

- Shift lock solenoid defective
- Shift lock solenoid control circuit
- Shift lock mechanism defective
- Transmission range switch defective
- Transmission range switch circuit
- Brake pedal position switch circuit
- Brake pedal position switch defective
- Accelerator pedal position sensor circuit
- Accelerator pedal position sensor defective
- Throttle body defective

Notes

- **Test the shift lock solenoid**.
- **Troubleshoot the shift lock system circuit**.
- **Inspect the transmission range switch** .
- **Inspect the APP sensor signal** .
- **Check the throttle body** .

SHIFT LEVER DOES NOT OPERATE SMOOTHLY

Probable cause(s)

- Transmission range switch defective or out of adjustment
- Shift cable broken or out of adjustment
- Control pin broken
- Control shaft, roller, detent lever, and detent spring worn or damaged
- Control lever worn or damaged
- Parking brake pawl and parking shaft worn or damaged
- Manual valve worn or damaged
- Stator shaft worn or damaged

Notes

- **Inspect the transmission range switch** .
- **Check for a loose shift cable at the shift lever and the control lever**.
- Check the control shaft, roller, detent lever, and detent spring for wear and damage.
- Check the control lever for wear and damage.
- Check the parking brake pawl and the parking shaft for wear and damage. If the parking brake pawl or the parking shaft are worn or damaged, replace them and also check the park gear for wear and damage.
- Check the manual valve for wear and damage.
- Check the stator shaft for wear and damage.

STALL SPEED HIGH

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Low transmission fluid (HCF-2) level
- Transmission fluid (HCF-2) deteriorated
- Forward clutch defective
- Input shaft assembly worn or damaged
- Reverse brake defective
- Reverse brake piston defective
- Transmission fluid pump worn, binding, or foreign material in transmission fluid pump
- Valve body assembly defective
- Joint pipes defective
- Stator shaft worn or damaged
- Torque converter assembly defective
- Torque converter ring gear worn or damaged
- Transmission assembly and drive plate installation defective

Notes

- **Check the transmission fluid (HCF-2) level**.
- Check the transmission fluid (HCF-2) condition. If necessary, **replace the transmission fluid (HCF-2)**.
- **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly.
- Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage.
- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** .
- Check the valve body assembly for wear and damage.
- Check the joint pipes and O-rings for wear and damage.
- Check the stator shaft for wear and damage.
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

STALL SPEED LOW

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Engine output low
- Valve body assembly defective
- Joint pipes defective
- Stator shaft worn or damaged
- Torque converter assembly defective
- Torque converter ring gear worn or damaged

- Transmission assembly and drive plate installation defective

Notes

- Adjust the engine output.
- Check the valve body assembly for wear and damage.
- Check the joint pipes and O-rings for wear and damage.
- Check the stator shaft for wear and damage.
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

TORQUE CONVERTER CLUTCH DOES NOT DISENGAGE; ENGINE STALLS EASILY

Probable cause(s)

- Shift solenoid valve B defective
- CVT lock-up clutch control solenoid valve defective
- Torque converter clutch piston defective
- Valve body assembly defective

Notes

- **Inspect shift solenoid valve B**.
- **Inspect the CVT lock-up clutch control solenoid valve**.
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .
- Check the valve body assembly for wear and damage.

TRANSMISSION WILL NOT SHIFT INTO P POSITION/MODE, OR TRANSMISSION CANNOT SHIFT OUT OF P POSITION/MODE

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged
- Transmission range switch defective or out of adjustment
- Shift cable broken or out of adjustment
- Control pin broken
- Control shaft, roller, detent lever, and detent spring worn or damaged
- Control lever worn or damaged
- Parking brake pawl and parking shaft worn or damaged
- Park gear worn or damaged
- Parking pawl spring worn or damaged
- Manual valve worn or damaged
- Valve body assembly defective
- Stator shaft worn or damaged

Notes

- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** .

- **Inspect the transmission range switch** .
- **Check for a loose shift cable at the shift lever and the control lever**.
- Check the control shaft, roller, detent lever, and detent spring for wear and damage.
- Check the control lever for wear and damage.
- Check the parking brake pawl and the parking shaft for wear and damage. If the parking brake pawl or the parking shaft are worn or damaged, replace them and also check the park gear for wear and damage.
- Check the park gear for wear and damage.
- Check the parking pawl spring for wear and damage.
- Check the manual valve for wear and damage.
- Check the valve body assembly for wear and damage.
- Check the stator shaft for wear and damage.

UNSTABLE ENGINE SPEED

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Low transmission fluid (HCF-2) level
- Transmission fluid (HCF-2) deteriorated
- Transmission fluid strainer or CVTF warmer strainer clogged
- Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged
- Pulley pressure feed pipe defective
- Forward clutch defective
- Reverse brake defective
- CVT drive pulley pressure control solenoid valve defective
- CVT driven pulley pressure control solenoid valve defective
- CVT clutch pressure control solenoid valve defective
- CVT lock-up clutch control solenoid valve defective
- Shift solenoid valve B defective
- Shift solenoid valve O/P defective
- Transmission fluid pump worn, binding, or foreign material in transmission fluid pump
- Valve body assembly defective
- Joint pipes defective
- Torque converter assembly defective
- Torque converter ring gear worn or damaged
- Transmission assembly and drive plate installation defective

Notes

- **Check the transmission fluid (HCF-2) level**.
- Check the transmission fluid (HCF-2) condition. If necessary, **replace the transmission fluid (HCF-2)**.
- **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris.
- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** .
- Check the pulley pressure feed pipe and the sealing ring for wear and damage.
- **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly.

- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- **Inspect the CVT solenoid valve**.
- Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** .
- Check the valve body assembly for wear and damage.
- Check the joint pipes and O-rings for wear and damage.
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

VEHICLE DOES NOT CREEP ON A FLAT ROAD IN D, S, OR L POSITIONS/MODES

Probable cause(s)

- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- CVT drive pulley speed sensor defective
- Engine output low
- Low transmission fluid (HCF-2) level
- Transmission fluid strainer or CVTF warmer strainer clogged
- Drive pulley, driven pulley, pulley shaft, steel belt, and pulley related parts worn or damaged
- Pulley pressure feed pipe defective
- Transmission fluid pump worn, binding, or foreign material in transmission fluid pump
- Valve body assembly defective
- Joint pipes defective
- Solenoid wire harness worn or damaged
- Stator shaft worn or damaged
- Torque converter assembly defective
- Torque converter ring gear worn or damaged
- Transmission assembly and drive plate installation defective

Notes

- Check the CVT drive pulley speed sensor for wear and damage, and also check the O-ring for wear and damage.
- Adjust the engine output.
- **Check the transmission fluid (HCF-2) level**.
- **Check the transmission fluid strainer** and the **CVTF warmer strainer** for debris. If the transmission fluid strainer or the CVTF warmer strainer is clogged, find the damaged components that caused debris.
- Check the drive pulley, the driven pulley, the pulley shafts, the steel belt, and pulley related parts for wear and damage. If there are worn or damaged, **replace the transmission housing assembly** .
- Check the pulley pressure feed pipe and the sealing ring for wear and damage.
- Check the transmission fluid pump for wear and damage. If the transmission fluid pump is worn or damaged, **replace it as an assembly** .
- Check the valve body assembly for wear and damage.
- Check the joint pipes and O-rings for wear and damage.
- Inspect the solenoid wire harness for open and short.

- Check the stator shaft for wear and damage.
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

VEHICLE DOES NOT MOVE IN D, S, OR L POSITIONS/MODES

Probable cause(s)

- Transmission range switch defective or out of adjustment
- Shift cable broken or out of adjustment
- Control pin broken
- Engine output low
- Forward clutch defective
- Reverse brake piston defective
- Sun gear worn or damaged
- Manual valve worn or damaged
- Valve body assembly defective
- Stator shaft worn or damaged

Notes

- **Inspect the transmission range switch** .
- **Check for a loose shift cable at the shift lever and the control lever**.
- Adjust the engine output.
- **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly.
- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- Check the sun gear for wear and damage. If the sun gear is worn or damaged, replace it and also check the planetary carrier pinion gears, the forward clutch, and the drive pulley shaft splines for wear and damage.
- Check the manual valve for wear and damage.
- Check the valve body assembly for wear and damage.
- Check the stator shaft for wear and damage.

VEHICLE DOES NOT MOVE IN R POSITION/MODE

Probable cause(s)

- Transmission range switch defective or out of adjustment
- Shift cable broken or out of adjustment
- Control pin broken
- Reverse brake defective
- Reverse brake piston defective
- Planetary carrier assembly worn or damaged
- Sun gear worn or damaged
- Ring gear worn or damaged
- Thrust needle bearing or thrust washer on planetary carrier assembly seized, worn, or damaged

- Manual valve worn or damaged
- Valve body assembly defective
- Stator shaft worn or damaged

Notes

- **Inspect the transmission range switch** .
- **Check for a loose shift cable at the shift lever and the control lever**.
- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- Check the planetary carrier assembly for wear and damage. If the planetary carrier assembly is worn or damaged, replace it and also check the planetary carrier pinion gears, the reverse brake, and the drive pulley shaft splines for wear and damage.
- Check the sun gear for wear and damage. If the sun gear is worn or damaged, replace it and also check the planetary carrier pinion gears, the forward clutch, and the drive pulley shaft splines for wear and damage.
- Check the ring gear for wear and damage. If the ring gear is worn or damaged, replace it and also check the planetary carrier assembly and the reverse brake for wear and damage.
- Check the thrust needle bearing and the thrust washer on the planetary carrier assembly for seize, wear, and damage. If the thrust needle bearing or the thrust washer are seized, worn, or damaged, replace them and adjust the clearance with the thrust shim.
- Check the manual valve for wear and damage.
- Check the valve body assembly for wear and damage.
- Check the stator shaft for wear and damage.

VEHICLE MOVES IN N POSITION/MODE, SHIFT CABLE IS PROPERLY ADJUSTED

Probable cause(s)

- Forward clutch defective
- Reverse brake defective
- Reverse brake piston defective
- Spring retainer/return spring assembly defective
- Thrust needle bearing on input shaft assembly seized, worn, or damaged
- Manual valve worn or damaged
- Stator shaft worn or damaged

Notes

- **Inspect the clearance between the forward clutch end-plate and the top disc** . If the clearance is out of tolerance, replace the input shaft assembly.
- Inspect the reverse brake piston and the O-rings. Check the spring retainer/return spring assembly for wear and damage. **Inspect the clearance between the reverse brake end-plate and the top disc** . If the clearance is out of tolerance, inspect the reverse brake discs and reverse brake plates for wear and damage. If the discs and plates are worn or damaged, replace them as a set. If they are OK, adjust the clearance with the reverse brake end-plate.
- Check the thrust needle bearing on the input shaft assembly for seize, wear, and damage. If the thrust needle bearing is seized, worn, or damaged, replace it and also check the related part of the input shaft assembly for wear and damage.
- Check the manual valve for wear and damage.

- Check the stator shaft for wear and damage.

VIBRATION IN ALL POSITIONS/MODES

Probable cause(s)

- Engine output low
- Input shaft assembly worn or damaged
- Torque converter assembly defective
- Torque converter ring gear worn or damaged
- Transmission assembly and drive plate installation defective

Notes

- Adjust the engine output.
- Inspect the input shaft assembly for wear and damage. If the input shaft assembly is worn or damaged, replace it and also check the related part of the input shaft assembly for wear and damage.
- Inspect the torque converter assembly for wear and damage. If the torque converter assembly is worn or damaged, **replace it as an assembly** .

WITH THE VEHICLE IN THE ON MODE, THE SHIFT POSITION INDICATOR DISPLAYS AN IMPROPER INDICATION, OR IT NEVER DISPLAYS AT ALL

Probable cause(s)

- F-CAN communication line error
- Gauge control module defective
- TCM defective (1.5 L engine)
- PCM defective (except 1.5 L engine)
- Transmission range switch defective or out of adjustment
- Transmission range switch circuit
- Shift cable broken or out of adjustment
- Control pin broken
- Control shaft, roller, detent lever, and detent spring worn or damaged

Notes

- **Check the F-CAN communication line** (1.5 L engine).
- **Check the F-CAN communication line** (2.4 L engine).
- **Check the F-CAN communication line by using the gauge control module self-diagnostic function** .
- **Inspect the transmission range switch** .
- Inspect the open or short in the wire between the TCM and transmission range switch.
- **Check for a loose shift cable at the shift lever and the control lever**.
- Check the control shaft, roller, detent lever, and detent spring for wear and damage.

STANDARDS AND SERVICE LIMITS (2020-21)

CVT AND CVT DIFFERENTIAL

Item	Measurement	Qualification	Standard or New	Service Limit
Transmission fluid	Capacity (AWD)	Fluid change	4.2 L (4.4 US qt)	-
		Transfer removal, installation, and replacement	4.8 L (5.1 US qt)	-
		Oil pan, valve body assembly, and transmission fluid pump removal, installation, and replacement	6.8 L (7.2 US qt)*	*Standard amount
		Overhaul	8.4 L (8.9 US qt)	-
	Capacity (2WD)	Fluid change	3.6 L (3.8 US qt)	-
		Oil pan, valve body assembly, and transmission fluid pump removal, installation, and replacement	5.8 L (6.1 US qt)*	*Standard amount
		Overhaul	7.6 L (8.0 US qt)	-
	Fluid type	B	Use Honda HCF-2.**NOTE:** Using the wrong type of fluid will damage the transmission.	
Hydraulic pressure	Forward clutch pressure	At idle in D	450-730 kPa (4.60-7.40 kgf/cm 2, 65.4-105.2 psi)	-
	Reverse brake pressure	At idle in R	50-440 kPa (0.50-4.50 kgf/cm 2, 7.1-64.0 psi)	-
	CVT drive pulley pressure	At idle in N	260-540 kPa (2.70-5.50 kgf/cm 2, 38.4-78.2 psi)	-
	CVT driven pulley pressure	At idle in N	490-900 kPa (5.00-9.20 kgf/cm 2, 71.1-130.8 psi)	-
Stall speed	Check with vehicle on level ground	B	2,500 rpm	2,350-2,650 rpm
Forward clutch	Clearance between clutch end-plate and top disc	B	0.8-1.0 mm (0.031-0.039 in)	-
Reverse brake	Clearance between reverse brake end-plate and top disc	B	0.9-1.1 mm (0.035-0.043 in)	Adjust
Input shaft	Thrust clearance	B	0.15-0.25 mm (0.0059-	Adjust

Item	Measurement	Qualification	Standard or New	Service Limit
			0.0098 in)	
Driven pulley shaft	Thrust clearance	B	0-0.13 mm (0-0.0051 in)	Adjust
Final drive shaft	Tapered roller bearing starting torque: differential assembly and final drive shaft total preload	For new bearing	6.88-27.39 N.m (70.1-279.3 kgf.cm, 60.9-242.5 lbf.in)	Adjust
		For reused bearing	5.63-26.15 N.m (57.4-266.6 kgf.cm, 49.8-231.4 lbf.in)	Adjust

Item	Measurement	Qualification	Standard or New	Service Limit
CVT differential carrier	Tapered roller bearing starting torque: preload	For new bearing	1.35-3.07 N.m (13.8-31.3 kgf.cm, 12.0-27.2 lbf.in)	Adjust
		For reused bearing	1.06-2.78 N.m (10.8-28.3 kgf.cm, 9.4-24.6 lbf.in)	Adjust
CVT differential pinion gear	Backlash	B	0.05-0.15 mm (0.0020-0.0059 in)	-
Transfer assembly	Transfer gear backlash	B	0.06-0.16 mm (0.0024-0.0063 in)	-
	Tapered roller bearing total starting torque (preload)	B	3.28-8.77 N.m (33.4-89.4 kgf.cm, 29.0-77.6 lbf.in)	-
